

The SAGE Handbook of
Qualitative Business
and Management
Research Methods

Edited by
Catherine Cassell,
Ann L Cunliffe
and Gina Grandy

About the pagination of this eBook

This eBook contains a multi-volume set.

To navigate this eBook by page number, you will need to use the volume number and the page number, separated by a hyphen.

For example, to go to page 5 of volume 1, type "1-5" in the Go box at the bottom of the screen and click "Go."

To go to page 5 of volume 2, type "2-5" ... and so forth.

The SAGE Handbook of Qualitative Business and Management Research Methods

Sara Miller McCune founded SAGE Publishing in 1965 to support the dissemination of usable knowledge and educate a global community. SAGE publishes more than 1000 journals and over 800 new books each year, spanning a wide range of subject areas. Our growing selection of library products includes archives, data, case studies and video. SAGE remains majority owned by our founder and after her lifetime will become owned by a charitable trust that secures the company's continued independence.

List of Figures

3.1	The multiple layers of the abductive process	39
8.1	Typology of approaches categorizing postcolonial vs colonial research	124
19.1	Example of visual mapping and temporal bracketing (Howard-Grenville et al., 2013)	313
21.1	Eisenhardt's positivist view of the case study	348
26.1	Categorical complexities	446
26.2	Two-step hybrid approach to analysis	450
29.1	The <i>Mmogo-Method</i> TM	502
29.2	A Fulla doll	508

List of Tables

3.1	Framework for qualitative interpretive science research	38
3.2	Qualitative research strategies and methods of analysis for interpretive social science	40
4.1	Three logics of inference	59
13.1	Critical realist research designs (amended from Ackroyd and Karlsson 2014)	207
13.2	CR research strategies, explanations and examples	208
18.1	The grid	298
18.2	Project flow and phases	300
18.3	Synopsis of the AR distinctive features	304
19.1	Four conceptions of process thinking applied to organizational identity	310
20.1	Three profiles of strategy as practice research design	335
23.1	Reflexivity in qualitative research	394
24.1	UK study on motherhood, part-time work and professional careers: Demography and profiles of research participants	410
26.1	Intersectionality themes using qualitative research methods	435
26.2	Examples of intersectional research using qualitative methods	436
28.1	Utility of frequently used non-probability sampling techniques	486
31.1	Audiences and outputs	533
31.2	A writing template (adapted from Myers, 2013)	535

Notes on the Editors and Contributors

THE EDITORS

Catherine Cassell has a longstanding interest in research methodology and the use of qualitative methods in the business, organization, and management fields. She has co-edited four books for Sage on qualitative organizational research and published numerous papers about the uses of qualitative research in the organizational psychology and management field more generally. Her latest text, *Interviews for Business and Management Students*, was published by Sage in 2015. Catherine was the founding chair of the British Academy of Management's Special Interest group in Research Methodology – a group she is still heavily involved with – and a founding member of the steering committee of the European Academy of Management's Special Interest Group in Research Methods and Research Practice. She is inaugural co-editor of *Qualitative Research in Organizations and Management*: an international journal, and on the editorial boards of numerous other journals. She is a Fellow of the British Academy of Management and an Academic Fellow of the Chartered Institute of Personnel and Development. Having previously held a number of senior academic appointments, she is Dean of Birmingham Business School at the University of Birmingham, U.K.

Ann L. Cunliffe is Professor of Organization Studies at Fundação Getulio Vargas-EAESP, Sao Paulo, Brazil. She held positions at the Universities of Bradford and Leeds in the UK, and the Universities of New Mexico, New Hampshire, and California State University in the USA. Ann's current research lies at the intersection of organizational studies, philosophy, and communications, exploring how leaders and managers shape organizational life, selves, and action in living conversations. In particular, she is interested in examining the relationship between language and responsive and ethical ways of managing organizations. Other interests include: leadership, selfhood, qualitative research methods, embodied sensemaking, developing reflexive approaches to management research, practice, and learning. Her recent publications include the book *A Very Short, Fairly Interesting and Reasonably Cheap Book about Management* (2014). She has published articles in *Organizational Research Methods*, *Human Relations*, *Management Learning*, *Journal of Management Studies*, and the *British Journal of Management*. She organizes the biennial Qualitative Research in Management and Organization Conference in New Mexico, USA.

Gina Grandy is Professor and RBC Women in Leadership Scholar with the Hill and Levene Schools of Business at the University of Regina located in Saskatchewan, Canada. Her research interests include leadership, gender and women's experiences at work, stigmatized work, identity, qualitative research methods, and case writing. She is the Associate Editor for the *Case Research Journal* and serves on the international advisory board for *Management Learning* and

Gender in Management: An International Journal. Her research has been published widely in such journals as *Human Relations*, the *Journal of Business Ethics*, the *Journal of Management Studies*, *Gender, Work and Organization*, *Organization, Management Learning*, *Gender in Management*, *Qualitative Research in Organizations and Management*, and the *Case Research Journal*.

THE CONTRIBUTORS

Chahrazad Abdallah is Associate Professor at ESG UQAM in Montreal, Canada. She holds a PhD in Management from HEC Montréal, Canada. Her research focuses on strategizing in pluralistic settings, specifically artistic organizations. She also has a strong interest in qualitative research methods, particularly ethnography. Her current research focuses on creativity as an ambiguous discursive practice. Her work was published in the *Journal of Management Studies*, *Organizational Change Management*, and the *Revue Française de Gestion*.

Ozan Alakavuklar's research is focused on the ethics and politics of organizing, the critical analysis of management education, business schools and non-capitalist forms of organizing, particularly social movements, and community organizing practices. Recently he undertook ethnographic research into the organizing of free food stores. He is a senior lecturer in the School of Management at Massey Business School, based at Albany in Auckland, New Zealand.

Fahreen Almagir's research centers on advancing organizational theory from the perspective of rights and capability of involved and affected communities in response to globalization and sustainable development initiatives. She is Lecturer in Business Ethics at Monash University, Australia, and formerly Postdoctoral Researcher in the School of Management at Massey Business School, New Zealand.

Joëlle Basque is a Research Fellow at HEC Montréal, Canada. She holds a PhD in organizational communication from Université de Montréal and her expertise is in discourse analysis, qualitative research methods, and identity construction processes in organizations. She is currently leading two major research projects with important Canadian organizations to understand the role of organizational identity in strategic planning. Her research interests include the relations between strategic discourses and strategic planning, as well as collective creativity in organizations. So far, she has studied these topics in cultural organizations and police agencies.

Emma Bell is Professor of Organization Studies at the Open University, UK. Her approach to understanding management draws on insights from the social sciences and humanities to critically explore meaning-making in organizations. Key themes include change and organizational loss, learning and knowledge production, and the role of spirituality and belief in organization. Her work has been published in journals including the *British Journal of Management*, the *International Journal of Management*, and *Reviews, Human Relations and Organization*. She has also published several books, including *Reading Management and Organization in Film* (2008), *Business Research Methods* (2015, with Alan Bryman), and *A Very Short, Fairly Interesting and Reasonably Cheap Book about Management Research*

(2013, with Richard Thorpe). Emma is current Past Co-Chair of the Critical Management Studies Division of the Academy of Management and joint Editor-in-Chief of the journal *Management Learning*.

Angelo Benozzo teaches Work and Organizational Psychology and Qualitative Research Methods at the University of Valle d'Aosta, Italy. His current research interests include gender and sexual identity in the workplace and emotion in organizations. He studies these topics using the interpretative key of critical and poststructural and posthuman theories. He has recently published articles in: *Gender, Work and Organizations*; the *Journal of Vocational Behaviors*, *Sexualities*, *Qualitative Inquiry*, and *Cultural Studies* and *Critical Methodologies*. He is currently an Associate Editor of *Qualitative Research in Organizations and Management*.

Sylwia Ciuk is a Senior Lecturer in Organization Studies at Oxford Brookes Business School, Oxford Brookes University, UK. She is a sociologist whose research interests have been evolving around the issues of power, control, and resistance in organizational change as well as critical perspectives on leadership development. More recently, she has been exploring different aspects of language diversity in subsidiaries of multinational enterprises, particularly in relation to their micro-political dimension. She has authored and co-authored several academic articles and book chapters, both in English and in Polish. Her work has been published in *Management Learning* and the *Journal of Global Mobility*.

Sandra Corlett is a Principal Lecturer in Organization and Human Resource Management at Newcastle Business School, Northumbria University, in Newcastle, UK, and Chair of the British Academy of Management's Special Interest Group on Identity. Her research interests are in identity, vulnerability, manager and follower learning and development, and qualitative research methods. Her work has been published in *Gender in Management: An International Journal*, the *Journal of Business Ethics*, *Management Learning*, and the *Scandinavian Journal of Management*. Sandra is co-editor of a special issue on identity, in the *International Journal of Management Reviews*, and co-editor of a Routledge Studies in HRD text entitled *Identity as a Foundation for Human Resource Development*.

Kevin G. Corley, PhD (Pennsylvania State), is a Professor of Management at the W. P. Carey School of Business at Arizona State University, USA. His research largely springs from the question, 'why do people in organizations experience change the way they do?' Answering this question has led Professor Corley to do field research examining the processes by which managers and employees organize around their roles and practices, as well as how they make sense of the changes that occur within their organization. Examining these processes has led him to focus on foundational concepts such as identity, image, identification, culture, and learning. His research has appeared in the *Academy of Management Journal*, the *Academy of Management Review*, *Administrative Science Quarterly*, *Organization Science*, and the *Academy of Management Annals*. He recently served as an Associate Editor at the *Academy of Management Journal* focused on qualitative methods, and helped co-edit a special issue on mixed-methods research at for *Organizational Research Methods*.

Andrew Dickson's research revolves around the use of psychoanalysis to critically consider the structure and function of organizations and institutions, particularly in the 'health' sector.

Methodologically, his focus is on critical qualitative research methods such as autoethnography. He is Senior Lecturer in the School of Management in Massey Business School, based in the Manawatu, New Zealand.

Carolyn Downs is a Lecturer at Lancaster University, UK, and focuses on leading EU-funded research on enterprise and employment with groups vulnerable to social exclusion. She specializes in participatory action research. Carolyn's research has been recognized as having considerable impact, appearing in the *European Commission Handbook of Good Practices for Encouraging Migrant Enterprise* (2016).

Virginia Eatough is a Reader in the Department of Psychological Sciences at Birkbeck, University of London, UK. Her research focuses on the experiential structure of feelings and how individuals ascribe meaning to their emotional experiences. She draws on the philosophies of hermeneutics and phenomenology to explore both the thematic and the tacit, pre-reflective dimensions of interpretation and understanding. Her work has appeared in a range of leading journals, including *The British Journal of Psychology*, *Theory and Psychology*, *Phenomenology and Practice*, *Qualitative Research in Psychology*, and *The British Journal of Social Psychology*. She is author of chapters on hermeneutics in *Research Methods in Psychology* (4th Edition), the *Handbook of Qualitative Psychology*, and *Analysing Qualitative Data in Psychology: A Practical & Comparative Guide*, all from Sage.

Fernando F. Fachin is Assistant Professor in the Department of Management and Economics at the Royal Military College of Canada. He obtained his PhD in management at HEC Montréal and has taught at McGill University, Canada. He is a member of the Strategy as Practice Study Group at HEC Montréal and the Research Group on Language, Organization and Governance at Université de Montréal. His research deals with identity, strategy, entrepreneurship, process thinking, and open innovation. He is currently studying the role of space and technology as agents in the organizing process of identity work. He has received and been nominated for awards at the Academy of Management Annual Meeting.

Laura Galuppo is an Assistant Professor in Work and Organizational Psychology at the Psychology Department, Faculty of Psychology, Catholic University of Milan, Italy. Her current research focuses on social sustainability in organizations, organizational learning, collaborative research, and organizational ethnography.

Robert P. Gephart, Jr. is Professor of Strategic Management and Organization at the University of Alberta, Canada, and a Research Associate at IAE Lyon, University of Jean Moulin, France. Dr. Gephart currently serves as an Associate Editor for *Organizational Research Methods* and has published in several respected journals, including *Administrative Science Quarterly*, the *Academy of Management Journal*, the *Journal of Management*, *Qualitative Sociology*, *Organizational Research Methods*, and *Organization Studies*. He is also the author of *Ethnostatistics: Qualitative Foundations for Quantitative Research* (Sage, 1988) and a co-editor of *Postmodern Management and Organization Theory* (Sage, 1996). He received the 2015 Sage Publications / Organizational Research Methods Division Career Achievement Award and has twice been awarded an Academy of Management Journal Outstanding Reviewer Award. He received his PhD from the University of British Columbia, Canada. Dr. Gephart's current interests are qualitative research methods, risk, sensemaking, and ethnostatistics.

Caroline Gatrell is Professor of Organisation Studies at the University of Liverpool Management School, UK. Caroline's research centers on work, family, and health. From a sociocultural perspective, she examines how working parents (both fathers and mothers) manage boundaries between paid work and their everyday lives. In so doing she explores interconnections between gender, bodies, and employment, including development of the concept 'Maternal Body Work'. Her work is published in leading journals including: *Human Relations*; *British Journal of Management*; *Gender, Work & Organization*; *Social Science & Medicine*; and the *International Journal of Management Reviews*. She is Co-Editor in Chief, *International Journal of Management Reviews*.

Dennis A. Gioia is the Robert and Judith Auritt Klein Professor of Management in the Smeal College of Business at Penn State University, USA. He received his doctorate from Florida State University, USA. Prior to his academic career he worked as an engineer for Boeing Aerospace at Cape Kennedy during the Apollo lunar program and for Ford Motor Company as corporate recall coordinator. Current research and writing interests focus on the ways in which identity, image, reputation, and learning are involved in sensemaking, sensegiving, and organizational change.

Giampietro Gobo, PhD, is Professor of Methodology of Social Research and Evaluation Methods, at the University of Milan, Italy. Former Director of the center ICONA (Innovation and Organizational Change in the Public Administration), he was the first chair of the 'Qualitative Methods' Research Network of ESA (European Sociological Association). Consulting Editor of the *International Journal of Qualitative Research in Work and Organizations*, he has published over 50 articles in the areas of qualitative and quantitative methods. His books include *Doing Ethnography* (Sage 2017, 2nd edition, with A. Molle), *Qualitative Research Practice* (Sage 2004, co-edited with C. Seale, J.F. Gubrium and D. Silverman), and *Collecting Survey Data: An Interactional Approach* (Sage 2014 with S. Mauceri). His interests concern the decolonization of methodology, the reduction of inequality in women's scientific careers, and the relationship between quantum physics and social sciences. He is currently undertaking projects in the area of coordination and workplace studies.

Mara Gorli is an Assistant Professor in Work and Organizational Psychology at the Faculty of Economics, Department of Psychology, Catholic University of Milan, Italy. Her main research interests are in organizational learning, in the impact of organizational change on people and relationships, and in reflexivity in organizations. As member of the Center for Research and Studies in Healthcare Management (CERISMAS), she combines organizational research and intervention with a passion for visual, ethnographic, and qualitative methodologies.

Nancy Harding is Professor of Human Resource Management at the University of Bath, School of Management, UK, a rather grand title for someone who started her working life as a typist and working on production lines in factories in the Welsh valleys. Her research and teaching focus on critical approaches to understanding organizations, and her particular interest is working lives. She is an accidental feminist – class had a major influence on her early life, but she found that being a woman restricted her academic career. She has published papers in many of the expected academic journals, and published several books, including an exploration of the social construction of the manager in *The Social Construction of Management: Texts and*

Identities (Routledge, 2003), and the construction of the employee in *On Being at Work: The Social Construction of the Employee* (Routledge, 2013). The construction of the organization, whose publication date is extending into the future, will complete a planned trilogy.

Fahad M. Hassan is a Researcher and Tutor at Lancaster University, UK. Fahad's research centers on career, workplace, and family. He studies the lives of professionals from the socio-cultural perspective of work and family. His published work '(Academic) Leadership Development in Pakistani Universities' (2014) focuses on organizational leadership development processes.

Simon Hayward has an MBA and DBA from Alliance Manchester Business School, UK, and his first degree in English was from Oxford University, UK. He is a leadership expert in the fields of distributed, authentic, and complexity leadership. His first book, *Connected Leadership*, was WHSmith's Business Book of the Month in January 2016, in their top ten for several months, and is distributed internationally. It was shortlisted by the Chartered Management Institute for Book of the Year. He is a regular media commentator on leadership issues, in the press and on television and radio. Simon has worked with major clients in North America, and across Europe and Asia for over 26 years, advising on enterprise leadership issues, developing senior leaders, and designing global change programs. He is CEO of Cirrus, a leading provider of leadership development and assessment services.

Judith A. Holton, PhD, is Associate Professor of Management at Mount Allison University, Canada. In addition to research methodology, her research interests include leadership and management of complex systems, organizational change, and learning and innovation in knowledge work. She has written a number of methodological papers and books about grounded theory and was the founding editor of *The Grounded Theory Review*, a peer-reviewed journal dedicated to classic grounded theory research. She is co-author, with Barney Glaser, of *The Grounded Theory Seminar* (Sociology Press, 2007) and *The Grounded Theory Review Methodology Reader* (Sociology Press, 2012) and, with Isabelle Walsh, of *Classic Grounded Theory: Applications with Qualitative and Quantitative Data* (Sage, 2017). She has also published her work in *Organizational Research Methods*, *Management Learning*, *The Learning Organization*, *Leadership and Organization Development Journal*, *Advances in Developing Human Resources*, and *The Grounded Theory Review*.

J. Miguel Imas lectures on organizational-social psychology at the Faculty of Business and Law, Kingston University, UK. He holds a BSc and PhD in Social Psychology from the LSE (UK) and has been visiting professor at the Getulio Vargas Foundation (Brazil) and the University of Chile (Chile). Miguel has undertaken extensive (visual) ethnographic research in Latin America, where he has engaged with indigenous as well as deprived communities and organizations. He has contributed to developing similar research in South Africa and Zimbabwe. His work has been published in several journals on postcolonialism, art-resistance, and bare-foot entrepreneurs.

Bob Kayseas is a Saskatchewan born First Nations scholar from the Fishing Lake First Nation, located in east central Saskatchewan. Bob is the Vice-President Academic and a Professor at the First Nations University of Canada. He obtained a degree in Business

Administration and a Master of Business Administration from the University of Regina and a Ph.D (Enterprise and Innovation) from the Australian Graduate School of Entrepreneurship, Swinburne University of Technology in Melbourne, Australia. Bob has established a recognized scholarly program of research centered on Aboriginal entrepreneurship and economic development. He is actively engaged in both the research and practice of entrepreneurship and economic development. Dr. Kayseas is also the Chair of FLFN Ventures Ltd – a corporate entity owned by the Fishing Lake First Nation. The company manages one joint venture with Horizon North Logistics Inc. and Beardy & Okemasis First Nation at BHP Billiton's Discovery Lodge camp near Jansen, Sask.

Juliette Koning is Professor in Organizational Studies at Oxford Brookes Business School, Oxford Brookes University, UK and Research Fellow at the Security Institute for Governance and Leadership in Africa of Stellenbosch University, South Africa. She is a social anthropologist who has two broad research interests: the study of small business organizations in Southeast Asia (particularly those of ethnic Chinese owner-managers) and the study of private security organizations in South Africa and the UK. Driven by her 'anthropological roots', her research explores organizational identity and identity work (gender, age, ethnicity); ethical leadership (religion/belief); small organizations (SMEs, ethnic entrepreneurship), and research methodology (organizational ethnography). She has published in such journals as *Entrepreneurship, Theory & Practice*; *Journal of Business Ethics*; *Entrepreneurship & Regional Development*; *Management Learning*; and *Qualitative Research in Organizations and Management*. Juliette is co-convenor of the Standing Working Group on Organizational Ethnography at EGOS (European Group for Organizational Studies).

Monika Kostera is Professor Ordinaria and Chair of Management at the Jagiellonian University in Kraków, Poland, as well as Professor and Chair in Management at Durham University, UK, and Professor at Linnaeus University, Sweden. She holds several visiting professorships. She has authored and edited 40 books in Polish and English, including *Management in a Liquid Modern World* with Zygmunt Bauman, Irena Bauman, and Jerzy Kociatkiewicz (Polity), as well as a number of articles published in journals including *Organization Studies*, *Journal of Organizational Behavior Management*, and *British Journal of Management*. Her current research interests include archetypes, narrative organization studies, ethnography, work disalienation, and the humanistic turn in management.

Nivedita Kothiyal is currently an independent researcher and teaches part-time at the York Management School, University of York, USA. Until recently, she was an Associate Professor at the Institute of Rural Management Anand (IRMA) in India. She holds a PhD in Human Resource Management with over 15 years of experience in research, teaching, consultancy, and training. Her research is interested in decent work, gender and diversity management, workforce development and skill building, and corporate social responsibility. In her research, she draws on postcolonial theory and critical management studies. Her research has been published in field-leading journals, including the *British Journal of Management* and *Indian Journal of Industrial Relations*, and edited volumes including *Managing Alternative Organisations in India* by Cambridge University Press.

Glen E. Kreiner is the John and Becky Surma Dean's Research Fellow in the Smeal College of Business at Penn State University, USA. Professor Kreiner received his PhD from Arizona

State University, USA. He is primarily a qualitative researcher with a special emphasis on grounded theory, but he also publishes conceptual and quantitative research. He studies issues such as identity (at the organizational, occupational, and individual levels), stigma, dirty work jobs, work-home boundaries, and intellectual disabilities in the workplace. He has published in a wide variety of management journals, including the *Academy of Management Journal*, *Academy of Management Review*, *Organization Science*, and *Journal of Applied Psychology* and has served on multiple editorial boards. When he's not playing the role of professor, he enjoys life with his family, gardening, baking, and the theatre.

Donna Ladkin is Professor of Leadership and Ethics at The Graduate School of Management, Plymouth University, UK. A philosopher and musician by background, her approach highlights the esthetic and ethical qualities at the heart of leadership and how it gets done. The role of embodiment in both the performance of leadership and the process of ethical engagement has been a key theme in her research, which is also informed by her practice as a yoga practitioner and teacher. She is the author of *Rethinking Leadership: A New Look at Old Leadership Questions*, *Authentic Leadership: Clashes, Convergences and Coalescences* (co-edited with Chellie Spiller and shortlisted as one of 10 Best Leadership Books of the Year by the International Leadership Association (ILA)), *The Physicality of Leadership* (co-edited with Steven S. Taylor), and *Mastering the Ethical Dimension of Organizations*, which was shortlisted for the CMI's Book of the Year award in 2016.

Chris Land is Professor of Work and Organization at Anglia Ruskin University. His research is particularly concerned with the relationship between work and value, ranging from political economic approaches grounded in the labor theory of value, to questions concerning the cultural values animating specific orientations and oppositions to work. His research practice is ethnographically informed, though practical constraints mean that text and talk often replace embodied action as the objects of study. He is currently Head of the Department of Human Resources and Organizational Behaviour in the Lord Ashcroft International Business School, and is on the editorial boards of *Organization Studies* and *Organization*.

Ann Langley is Professor of management at HEC Montréal, Canada and holder of the Chair in Strategic Management in Pluralistic Settings. Her research focuses on strategic change, inter-professional collaboration, and the practice of strategy in complex organizations. She is particularly interested in process-oriented research and methodology and has published a number of papers on that topic. In 2013, she was co-guest editor with Clive Smallman, Haridimos Tsoukas, and Andrew Van de Ven of a Special Research Forum of *Academy of Management Journal* on Process Studies of Change in Organizations and Management. She is also co-editor of the journal *Strategic Organization*, and co-editor with Haridimos Tsoukas of a book series, *Perspectives on Process Organization Studies*, published with Oxford University Press. She is adjunct professor at Université de Montréal, Canada, and University of Gothenburg, Sweden.

Sharon Mavin is Professor of Leadership and Organization Studies and Director of Newcastle University Business School, Newcastle University, UK; a Fellow of the British Academy of Management; Chair of the University Forum of Human Resource Development; co-Editor of *Gender in Management: An International Journal*; and an Associate Editor of *International Journal of Management Reviews*. Her research interests are in women's leadership, female misogyny, doing gender, identity, vulnerability, dirty work, and gendered media representa-

tions. She is widely published in journals such as *Human Relations*, *British Journal of Management*, *Organization*, *International Journal of Management Reviews*, *Gender, Work & Organization*, *Qualitative Research in Organizations and Management: An International Journal*, and *Gender and Management: An International Journal*.

Alexandra Michel is faculty at the Graduate School of Education at the University of Pennsylvania, USA, where she also received her doctorate (Wharton School). Her ongoing ethnographic research tracks four cohorts of investment bankers for over a decade, documenting how innovations in the work practices of knowledge intensive firms (1) shape the psychology and embodiment of participants and (2) diffuse through our economy. Her research has appeared in *Administrative Science Quarterly*, *Organization Science*, in various sociology, anthropology, and psychology journals, and as a book manuscript (*Bullish on Uncertainty: How Organizational Cultures Transform Participants*, Oxford Press).

Jose F. Molina-Azorin is an Associate Professor in the Department of Management at the University of Alicante, Spain. His research focuses on strategic management, specifically competitive strategy, strategic groups, determinants of firm performance, microfoundations, dynamic capabilities, and the relationships between competitive strategy, organizational design, environmental management, and quality management. His research also focuses on mixed methods. Together with using mixed methods in his strategic topics, he has also examined the application and added value of mixed methods research in strategy and other management fields through systematic methodological reviews. His research on mixed methods has been published in several book chapters and in methodological journals including *Organizational Research Methods*, the *Journal of Mixed Methods Research*, the *International Journal of Multiple Research Approaches*, and *Quality & Quantity*, among other outlets. He is Co-editor of the *Journal of Mixed Methods Research*, and helped co-edit a special issue on mixed methods research at *Organizational Research Methods*.

Michael D. Myers is Professor of Information Systems at the University of Auckland Business School, New Zealand. His research interests are in the areas of qualitative research methods and the social, organizational, and cultural aspects of information systems. Michael wrote *Qualitative Research in Business & Management*, published by Sage Publications in 2013 (2nd edition). He has also published research articles in many journals including *European Journal of Information Systems*, *Information and Management*, *Information and Organization*, *Information Systems Journal*, *Information Systems Research*, *Information Technology & People*, *Journal of Management Information Systems*, *Journal of Strategic Information Systems*, *Journal of Information Technology*, and *MIS Quarterly*. Michael won the Best Paper award (with Heinz Klein) for the most outstanding paper published in *MIS Quarterly* in 1999. He previously served as Senior Editor of *MIS Quarterly* from 2001–5 and as Senior Editor of *Information Systems Research* from 2008–10.

Joe O'Mahoney is a Professor in Organizational Studies in Cardiff Business School, UK. He has co-authored a book on critical realist research methods, and researches realist approaches to organization theory, especially in the area of management ideas and worker identities.

Rebecca Piekkari is Professor of International Business at the Aalto University, School of Business (formerly Helsinki School of Economics) in Finland. She has published on

qualitative research methods, particularly on the use of case studies in international business. Her most recent book, entitled *Rethinking the Case Study in International Business and Management Research*, was co-edited with Catherine Welch and published by Edward Elgar in May 2011. During the past few years, she has also developed a special interest in multi-lingual organizations and the methodological challenges associated with fieldwork that crosses language boundaries. Rebecca has worked as Visiting Professor at several well-known business schools and universities and taught the case studies particularly to PhD students.

Craig Pritchard's current academic practice involves various forms of critical action research into the development of alternative NZ dairy industries in Aotearoa/New Zealand. He is Associate Professor in Massey Business School's School of Management, based in the Manawatu.

Katrina Pritchard is an Associate Professor in the School of Management at Swansea University, UK. Her research interests include the construction of identity and professional knowledge, digital media and devices at work, and diversity, with a specific focus on age and gender. Katrina is interested in a broad range of methodological issues in organizational studies, including digital and visual approaches.

Alexandra Rheinhardt is a PhD student in the Smeal College of Business at Penn State University, USA. Her main research interests revolve around individual level identity and identification (including how identity is primed and the consequences of identification), organizational level identity, individual and organizational roles and role-relationships, as well as leadership. She primarily conducts qualitative and conceptual research.

Silvio Ripamonti is an Assistant Professor in Work and Organizational Psychology at the Psychology Department, Faculty of Psychology, Catholic University of Milan, Italy. His current research focuses on management learning, aging, organizational learning, and HRM in organizations.

Jenny K. Rodriguez is Lecturer in Employment Studies at the University of Manchester, UK. Her research interests span across two areas: intersectionality in work and organizations, and international human resource management. Her published work has reported on these issues in Latin America, the Hispanic Caribbean and the Middle East. Her current research explores intersectional inequality from a transnational feminist perspective, and the interplay between identity, work, and regulation, specifically looking at the experiences of transnational skilled migrants.

Linda Rouleau is Professor at the Management Department of HEC Montreal, Canada. Her research work focuses on micro-strategy and strategizing in pluralistic contexts. She is also doing research on the strategic sensemaking role of middle managers and leaders. She is co-editor of the *Cambridge Handbook of Strategy as Practice*. In the last few years, she has published in peer-reviewed journals such as *Academy of Management Review*, *Organization Science*, *Accounting, Organizations and Society*, *Journal of Management Studies*, and *Human Relations*. She is co-responsible for the G6PS (Strategy-as-Practice Study Group, HEC Montreal). She is also leading an international and interdisciplinary network on 'Organizing in Extreme Contexts'.

Mark N.K. Saunders is Professor of Business Research Methods at Birmingham Business School, University of Birmingham, UK. His research interests include research methods, organizational trust, and SMEs. Mark's research has been published in a range of journals including *British Journal of Management*, *Human Relations*, *Journal of Small Business Management*, and *Social Science and Medicine*. His books include *Research Methods for Business Students* (currently in its 7th edition), *Handbook of Research Methods on Trust* (currently in its 2nd edition), and *Handbook of Research Methods on Human Resource Development*.

Giuseppe Scaratti is Professor in Work and Organizational Psychology at the Psychology Department, Faculty of Economics, Catholic University of Milan, Italy. His current research interests are on practice-based approaches to the study of knowing, learning, and change in organizations, HRM and knowledge management in organizations, evaluation, social sustainability, and qualitative research methods in organizational research. As Director of the Psychology of Work Service (Department of Psychology) and of Trailab (Transformative Action Interdisciplinary Laboratory – Faculty of Economics) he is involved in research projects and intervention on the field with multiple organizations and stakeholders.

Bettina Schneider is currently the Associate Vice-President Academic and an Associate Professor in Business and Public Administration in the Department of Indigenous Science, Environment, and Economic Development at the First Nations University of Canada (FNUUniv). Bettina is a non-Indigenous scholar, originally from the United States. She received her MS in Community Development and her PhD in Native American Studies from the University of California, Davis, USA. Bettina has also worked as a consultant for First Nations Development Institute, First Nations Oweesta Corporation, and Opportunity Finance Network. Her research has predominantly focused on Indigenous community and economic development strategies, Native and Aboriginal financial institutions, Indigenous-relevant business and financial literacy curricula, and First Nations financial reporting and accountability relationships.

Barbara Simpson is Professor of Leadership and Organisational Dynamics at Strathclyde Business School in Glasgow, UK. Her PhD in Management, which was awarded by the University of Auckland in 1998, marked a sea change from her earlier career as a physics-trained geothermal scientist. Nevertheless, traces of this past experience remain evident in her work today, which brings the principles of action, flow, and movement to bear on the processes of creativity, innovation, leadership, and change. She has pursued these interests in diverse organizational settings including hi-tech businesses, professional firms, public utilities, arts companies, SMEs, and micro-enterprises involved in the manufacture of plastics and food products. Her current research is deeply informed by the philosophies of the American Pragmatists, especially George Herbert Mead's thinking on process and temporality. She has published her work in journals including *Organization Studies*, *Human Relations*, *Organization*, *R&D Management*, and the *Journal of Management Inquiry*.

Amanda Sinclair is an author, researcher, teacher, and consultant in leadership, change, gender, and diversity. She is a Professorial Fellow at Melbourne Business School, The University of Melbourne. Her books include: *Doing Leadership Differently* (1998); *Leadership for the Disillusioned* (2007); *Leading Mindfully* (2016); and *Women Leading* (with Christine Nixon, 2017). Amanda has been at the forefront of leadership research in gender, sexualities,

bodies, and identities. As a yoga and meditation teacher she believes that bodies and minds – together – nourish rich and generative practices of researching, thinking, leading, and living. She is a passionate advocate for, and experimenter in, academic writing, and longs for academic writing which is as surprising and pleasurable as a good novel. Her partner, four adult children, and other animals help remind her of these and other important things.

Ning Su is Associate Professor of General Management, Strategy and Information Systems at the Ivey Business School, Western University, Canada. His research examines global innovation and outsourcing strategies, with a focus on field-based case studies and qualitative research methods. His work is published in journals such as the *Management Information Systems Quarterly* (MISQ), *MIT Sloan Management Review*, and *Decision Sciences*. Professor Su is the recipient of the inaugural Early Career Award of the Association for Information Systems, the 40 Most Outstanding MBA Professors Under 40 of Poets&Quants, the Giarratani Rising Star Award runner-up of the Industry Studies Association, and Best Article Awards from the Decision Sciences Institute and IBM Research.

Scott Taylor is Reader in Leadership & Organization Studies at Birmingham Business School, University of Birmingham, UK. His research focuses on the meaning of work and workplaces in people's lives. Scott approaches this through interpretive analysis of qualitative data, using interview, documents, and participant observation to gather empirical material. He has worked with a range of sociological analytical perspectives, such as semiotics, Weberian analysis, autonomous Marxism, and contemporary feminist theory. Scott is currently director of undergraduate programs at Birmingham Business School, Associate Editor of *Organization*, and has served as the US Academy of Management Critical Management Studies division chair.

Leah Tomkins is a Senior Lecturer in Organization Studies at The Open University, UK. Her research focuses on the experiences of work and organization, including the ways in which these are both enabled and constrained by discursive, historical context. She draws on the philosophies of hermeneutics and phenomenology to try to make sense of organizations and the people who inhabit and lead them, critiquing popular notions of 'authentic leadership' and 'the caring organization' for downplaying the lived experiences of work in its day-to-day, un-heroic moments. Her work has appeared in a range of leading journals, including *Organization Studies*, *Organization*, *Academy of Management Learning and Education*, *Management Learning*, *Business Ethics Quarterly*, and *The Humanistic Psychologist*.

Keith Townsend is Associate Professor at Griffith University, Brisbane, Australia. His research interests focus primarily on line managers (particularly frontline managers) and employee voice, but has a keen interest in understanding approaches to qualitative research methods. His research has been published in a range of journals including *Human Resource Management Journal*, *Work, Employment and Society*, and *Human Resource Management* (US). He has also published research methods books titled *Method in the Madness: Research Stories You Won't Read in Text-Books* and *Handbook of Qualitative Research Methods in HRM: Innovative Techniques*.

Steve Vincent is Chair in Work and Organization at Newcastle University Business School, UK. He has co-authored a book on critical realist research methods, and uses critical realism

to inform his research, which touches on skills and soft-skills at work, self-employed workers, work organization, and the labor process.

Catherine Welch is Associate Professor of International Business at the University of Sydney, Australia. She has a long-standing interest in qualitative research methods, and at the moment her research lies in applying process approaches to the study of firm internationalization. Together with Rebecca Piekkari, she has edited two volumes on qualitative research published by Edward Elgar: *Handbook of Qualitative Research Methods for International Business* (2004) and *Rethinking the Case Study in International Business and Management Research* (2011). She has published on numerous aspects of doing qualitative research, including interviewing, writing-up, and the case study. She, Rebecca Piekkari, and their co-authors have published their work on the case study in *Organizational Research Methods*, *Journal of International Business Studies*, *International Journal of Management Reviews*, and *Industrial Marketing Management*.

Alia Weston is an Assistant Professor at OCAD University, Toronto. She has expertise in the areas of business management and design, and her research is focused on understanding how creativity and business can contribute to positive social change. Key themes in her research include exploring creative resistance within resource constrained environments, and exploring how alternative business practices can contribute to solving challenges in society. Alia has contributed to research about alternative and postcolonial work practices in Africa and Latin America, and her work has been published in a diverse range of media. This includes scholarly work in *Organization* journal, edited collections on *Critical Perspectives on Entrepreneurship*, and *Precarious Spaces: The Arts, Social & Organizational Change*, as well as the *Globe and Mail*, a leading Canadian newspaper. In conjunction with her research, she hosts workshops and exhibitions which engage with issues related to creative and sustainable work practices. A notable example is the *(Re)² Reconstructing Resilience* conference and art exhibition.

Rebecca Whiting is a lecturer in the Department of Organizational Psychology at Birkbeck, University of London, UK. Her research interests include aspects of the contemporary workplace such as the discursive construction of work identities (for example, the older worker), concepts (such as age, gender, and work-life, boundaries), and digital technologies at work. She is also interested in the particular challenges of qualitative digital research and visual methodologies.

Andrea Whittle is a Professor of Management at Newcastle University Business School, UK. Her research is driven by a fascination with how people interact and use language in organizational settings to construct their reality. Her research is informed by ethnomethodology, discourse analysis, and conversation analysis, and she has written about a variety of organizational settings, including organizational change, strategy, management consulting, and public inquiries.

Suze Wilson's research involves the critical analysis of leadership and particularly why and how it has become normalized for us to equate 'leadership' with grandiose expectations of 'transformation', 'vision', and 'charisma'. She is interested in theorizing and practicing leadership in ways that are more inclusive and humble. Suze is senior lecturer in the School of Management at Massey Business School based in the Manawatu, New Zealand.

Introduction: Qualitative Research in Business and Management

Catherine Cassell, Ann L. Cunliffe and Gina Grandy

Welcome to *The Sage Handbook of Qualitative Business and Management Research Methods*. The *Handbook* aims to provide a state-of-the-art overview of qualitative research methods in the business and management field. Our intention is to provide a comprehensive review of the history and traditions that underpin qualitative research within management and organisations; outline a number of contemporary methods and their relevance; and explore some of the challenges that may lie ahead for qualitative researchers. In doing so, we draw from a wide range of research traditions. While any handbook seeks to be comprehensive, it will inevitably offer a view of the field informed by a particular lens. In this case, that lens is the view of the three editors, all experienced qualitative scholars, and also the viewpoint of our contributors, who are all leading-edge, international qualitative researchers. A number of chapters are targeted at those who are relatively new to the field, while others are aimed at experienced

qualitative researchers. Some chapters cover methods that are well established, whereas others highlight new and unfolding methods or areas of investigation. We encourage you to dip in and out of the *Handbook*, following up on any traditions, methods or issues that particularly capture your interest.

Our philosophy in putting together the *Handbook* is that we have sought to recognise and celebrate the diversity of qualitative business and management research methods. The three editors all come from different traditions and we may make quite different methodological and philosophical choices in relation to our own qualitative research practices. However, we are committed to encouraging rather than problematising such diversity and believe it is important, especially for new researchers, to be aware of the range of philosophical positions, epistemologies, methodologies and methods available. As John Van Maanen noted back in 1995, 'From examples of novel practices can come individual and collective experiments and

perhaps as a result we can loosen up some of the writer's cramps that seem so prevalent in our field' (1995, p. 139). Loosening researcher's cramps by supporting diversity maintains the richness of our field and legitimates different ways of theorising, writing and enacting researcher roles. The authors in the *Handbook* are therefore researching management and/or organisations from within different disciplines (including strategy, organisational psychology, organisational communications, sociology, international business and education) using a wide range of traditions and methods. Inevitably, while acknowledging that the *Handbook* is wide in coverage, we also recognise that we will never be able to fully capture a developing and ever-changing domain.

This introductory chapter positions what follows in the *Handbook* by outlining some of the characteristics of the current state of qualitative business and management research methods and highlighting some of the debates and challenges in the field. We also introduce the different sections of the *Handbook* to offer the reader an overview of what follows. The chapters have been arranged across two thematic volumes; the first focussing on 'History and Traditions', and the second covering 'Methods and Challenges'. For ease of navigation, in this chapter we have included notes in parentheses wherever specific chapters or sections are mentioned, to indicate which companion volume ('History' or 'Methods') the chapter appears in. We invite you to join with us on this journey through what is a thriving and exciting methodological domain.

CHARACTERISING QUALITATIVE RESEARCH IN THE BUSINESS AND MANAGEMENT FIELD

Given the diversity outlined above, how can we characterise qualitative business, management and organisational research? The

first comment we would make is that there is increasing interest in the uses and opportunities offered by research informed by qualitative methods. Qualitative research can now be found in many different areas within the 'discipline' of business, management and organisational research, including those traditionally seen as founded upon objectivity, 'facts', numbers and quantification. For example, we now see qualitative research in accounting (Boll, 2014; Lee & Humphrey, 2006); entrepreneurship (Díaz García & Welter, 2011); finance (Kaczynski, et al., 2014; Salmona, et al., 2015); human resource management (Townsend et al., 2016); international business (Doz, 2011; Moore, 2012); information systems (Hoeftnagel et al., 2014); marketing (Bellenger et al., 2011; Rokka & Canniford, 2016); organisational behaviour (Cassell & Symon, 2004; O'Leary & Sandberg, 2016; Symon & Cassell, 2012); organisational communication (Brummans, 2014; Tracy et al., 2014); organisational psychology (Crozier & Cassell, 2016; Neergaard & Uhløi, 2008; Symon & Cassell, 2006) and strategy (Anteby et al., 2014; Bettis et al., 2014). Hence qualitative research now takes place and is also published in most, if not all, of the sub-disciplines of business and management. There has also been a number of new journals focussing upon qualitative methods and issues, for example the *Journal of Organizational Ethnography* established in 2012; *Qualitative Research in Financial Markets* established in 2009; and *Qualitative Research in Organizations and Management; an International Journal* established in 2006. Furthermore, there have been a number of special issues of management journals focussing upon work informed by qualitative research methods. Sometimes these special issues bring together a range of different qualitative methods to support the development of a particular research topic, for example exploring and understanding dirty work (Grandy et al., 2014) or international marketing (Andriopoulos & Slater, 2013). Other special issues focus upon the uses of a

particular type of method across a range of topics, for example case studies (Lee et al., 2007); shadowing (McDonald & Simpson, 2014); stories (Donnelly et al., 2013) or video (Jarzabkowski et al., 2014). Additionally, others are connected to qualitative research conferences, for example, QRM Conference 2012 ‘Embodiment, Imagination and Meaning’, in *Qualitative Research in Organizations and Management*.

Within sub-areas of the discipline it is evident that qualitative research has developed at different rates and with different foci. However, many of the common debates around methods such as philosophical approaches, quality criteria, different tools of analysis and the role of software in data analysis have been critiqued within these different areas. For example, there have been debates about quality criteria within qualitative management research more generally (see Amis & Silk, 2008; Bluhm et al., 2011; Symon et al., 2016), as well as how it relates to specific research designs and subject areas (see Gibbert et al., 2008 on case study research; Healy & Perry, 2000 on market research; and Welch et al., 2013 on international business).

There has also been differential progress towards the use and acceptance of qualitative research in various geographical communities of qualitative researchers. The use of qualitative management research in North America, Europe and the rest of the world has developed at different rates and has been informed by different traditions (Lee & Humphrey, 2006). Üsdiken (2014) notes that there is less qualitative research published in US journals than their European alternatives. Bengtsson et al. (1997) suggest that the transatlantic gap can also be explained by different methodological approaches in that European research is more frequently idiographic and processual, whereas, in contrast, US research is dominated by nomothetic approaches with their emphasis upon quantitative analysis across large samples to test hypotheses. This is still relevant today, and perhaps partially explained by cultural differences in

postgraduate research training. In the UK, Europe and Australasia it is not unusual to see such training focus around learning the craft of research, with courses on research philosophy, and qualitative and quantitative research methods to advanced levels. In the US, postgraduate training is usually discipline-based (e.g. accounting, organisational behaviour, marketing), focussing on extending disciplinary knowledge. Research philosophy is rarely covered and the positivist assumptions underpinning much of the coursework remain unchallenged. This has had not just a methodological impact but also a philosophical one. For example, critical, practice-based and discursive approaches to research are more common to European, Australasian, and Latin American business and management researchers – and US-based organisational communications researchers – because of their philosophical training. Other parts of the world also have different epistemological traditions, some of which may not be as open to qualitative research. For example, Chen (2016) discusses the challenges of teaching qualitative research in China, where, he argues, there is a lack of support for qualitative research because it is seen as subjective, biased and unrepresentative. In addressing such concerns, Chen (2016, p. 72) outlines the importance of an experiential learning strategy that draws upon a pedagogy familiar within Chinese management learning of the ‘unity of knowing and doing’.

We recognise there is a potential danger in characterising traditions as US or European. We do acknowledge that there is diversity within continents and regional locations and that some caution is required. For example, Knoblauch et al. (2002, p. 2), in discussing the variety of qualitative research in Europe, highlight how scientific enterprises such as qualitative research are imprinted by cultures – not only by ‘epistemic cultures’, but also by their surrounding institutions, traditions and political, as well as economic contexts. They suggest that in the European context, the impact of specific national traditions of

thinking upon qualitative research can particularly be seen in countries that have passed through a Communist era, such as Poland and Slovenia.

Having noted the diversity in histories and development, we would also characterise qualitative research in this field as one where there is currently considerable methodological innovation. Indeed, as Buchanan & Bryman (2007) highlight, recent methodological innovation within the field of management and organisational research more generally has been located around qualitative and interpretive methods. Three trends are particularly worthy of mention here: first, the opportunities offered by increasingly sophisticated communication technologies; second, advances in the use of visual methods; and third, innovations in how researchers 'do' and write up qualitative research. Taking new technologies first, the development of the internet and new forms of social media have opened up a variety of online contexts available for the qualitative researcher to study (Zicker & Carter, 2010). The recent emergence of virtual ethnography, where participant observation can occur in a variety of locations such as online chat rooms, offers new opportunities for accessing the culture of online communities. Other terms used in this area include netnography and webnography. The former is a term coined by Kozinets (2010) and the latter by Purli (2007), both intended to refer to particular types of online ethnography. Other qualitative researchers have looked at the opportunities for using standard qualitative methods online, for example interviewing (Morgan & Symon, 2004; Salmons, 2015) and online focus groups (Stewart & Williams, 2005). Within the *Handbook*, we deal with some of these new methods of collecting research data in chapters such as *netnography* by Kozinets and *analysing web images* by Pritchard and Whiting. We also consider some of the distinctive challenges that such methods pose, for example in Whiting and Pritchard's chapter on *digital ethics*.

Turning now to developments in visual methods, although previously under-explored in organisation and management research (Davison et al., 2012; Meyer et al., 2013), Bell & Davison (2013) suggest that this is changing. Whereas in the past the emphasis upon the linguistic turn had led to visuality typically being neglected, this is now being re-addressed in organisation and management studies. An indication of this visual turn is the increased resources available for qualitative management and organisational researchers interested in such methods (e.g. Invisio <http://in-visio.org/>) and the special issues on visual methods that have been produced by different journals (e.g. *Accounting, Auditing and Accountability Journal*, 2009; *Qualitative Research in Organizations and Management*, 2012; *Organizational Research Methods*, 2016). Hence it is not surprising that this *Handbook* contains a number of chapters and, indeed, a special section on visual methods. As Davison et al. (2012) suggest, visual methods particularly lean towards qualitative analysis, and within this collection we have chapters on *photographs* (Warren); *drawing* (Ward and Shortt); and *collages* (Plakoyiannaki and Stavradi). The use of video is also highlighted in the chapters on *multimodality* (Viney, Clarke and Cornelissen); and *ethnographic documentaries* (Morgan, Game & Slutskaya). A key issue in all these developments is the possibility of both established and emerging approaches and methods to offer new research insights (Gill, 2014; Jarret & Liu, 2016; Ray & Smith, 2012).

The turn to visual methods has clearly also opened up novel ways to 'do' and present or write up qualitative research. We have also seen attention directed to other innovative ways to do and present qualitative research. Qualitative researchers have brought to light the significance of smell to workplace and research experiences (Baxter & Ritchie, 2013; Riach & Warren, 2015), the body as a critical aspect informing the researcher's experiences (Mavin & Grandy, 2016a,

2016b), as well as that which informs the everyday experiences of leadership (Ladkin, 2014; Sinclair, 2005, 2011, 2014), and the role of emotion in research (Rivera & Tracy, 2014). Rivera & Tracy's (2014) qualitative research on the experiences of border patrol officers is a particularly poignant piece which draws from vignettes, participant observation, shadowing and interviews to sharply bring to light how emotion does inform our experiences of work and research. Their piece vividly surfaces what it *feels* like to do such 'dirty work', something we suggest can only emerge through an innovative approach to doing and writing-up qualitative research. Overall, rare and rich insights are afforded through reflexive, embodied, emotive and aesthetically driven qualitative research.

In a related vein, yet at the same time in ways moving us away from methods more generally, an increased interest in qualitative management research draws attention to the role of the individual researcher. Within the methodological literature this has been evidenced by the increased focus upon researcher positioning and reflexive research practice (Cunliffe & Karunanayake, 2013; Hibbert et al., 2014). There is a burgeoning literature within organisation studies about the role and contribution of researcher reflexivity (e.g. Cunliffe, 2003; Johnson & Duberley, 2003; Weick, 2002). Given the closeness of the researcher to the research participants within qualitative research, this is particularly pertinent for qualitative researchers. For Alvesson and Sköldbberg (2009, p. 9), reflexivity 'means that serious attention is paid to the way different kinds of linguistic, social, political and theoretical elements are woven together in the process of knowledge development, during which empirical material is constructed, interpreted and written'. The benefits of researcher reflexivity are seen to be numerous, ranging from enabling us to think about our own thinking (Haynes, 2012) and our own bodies (Mavin & Grandy, 2016a, 2016b; Sinclair, 2014); questioning the taken-for-granted in our own and others beliefs (Ripamonti et al.,

2016); emphasising the inclusion of the researcher (Hardy et al., 2001); and creating 'more imaginative, more nuanced and richer interpretations' (Cunliffe, 2011, p. 409) from our data. Reflexive thinking also enables the opening up of new possibilities with different types of research questions (Sandberg & Alvesson, 2010), new ways of theoretical thinking (Shotter, 2008) and new ways of engaging with participants and the outcomes of such engagements (Corlett, 2013; Holton & Grandy, 2016). Moreover, within qualitative organisational research, reflexivity is moving towards being seen as standard practice. Indeed, authors have suggested it should be a regular part of research methods training (e.g. Symon & Cassell, 2004). Considerations of reflexivity within the literature have expanded beyond the purely methodological; as Weick (2002, p. 893) suggests, theory construction in the current millennium can be seen as an exercise in 'disciplined reflexivity'.

In summary, we would portray the field of qualitative business and management research methods as characterised by diversity in epistemologies and methods, with novel methodologies and approaches being developed all the time. We have suggested that there is now a more nuanced approach to the role of the researcher and to reflexivity, and more generally an exciting future ahead. Within the *Handbook* we have captured some of that diversity and the chapters offer thought-provoking explorations to those interested in using these methods.

KEY CHALLENGES

Any academic domain faces challenges and critique, and here we outline some of the challenges currently experienced by qualitative management researchers. The increased prevalence of qualitative research has resulted in the emergence of a number of debates including the status and quality of qualitative business and management research. Recent

commentaries have focussed upon the extent to which qualitative research has made it into the mainstream (e.g. Bluhm et al., 2011; Üsdickén, 2014) and the increased acceptance (or not) of qualitative research within top journals in the field. Some argue that considerable progress has been made. However, this advancement is not universally recognised by qualitative researchers. While Üsdickén's (2014) review of 40 years of management publications argues that there is an increase in the amount of qualitative research published in those journals, we suggest that an increase of 14.3 per cent over a 30 year period is hardly a radical change.

These debates inevitably link in to discussions of quality in qualitative research and how quality is defined (e.g. Symon et al., 2016; Tracy, 2010; Welch et al., 2013). This has long been a problem within the evaluation of qualitative management research in that criteria associated with a positivist paradigm informed by quantitative approaches have been inappropriately applied to qualitative research (Easterby-Smith et al., 2008; Johnson et al., 2006). This has led to various authors creating alternative sets of criteria for qualitative research and some arguing that without the expansion of such evaluation criteria, some of the work produced by qualitative management researchers may be undermined (Amis & Silk, 2008). Organisation studies scholars argue that the criteria for evaluating qualitative management research need to be contingent upon the philosophical tradition within which such research is conducted (Cunliffe, 2011; Golden-Biddle & Locke, 1993; Johnson et al. 2006), the implication being that the different traditions outlined in the first section of the *Handbook* would draw upon different evaluation criteria. To supplement this, Tracy (2010) identifies eight flexible 'big tent' criteria – a worthy topic, rich rigour, sincerity, credibility, resonance, significant contribution, ethics and meaningful coherence – markers of goodness for qualitative research. She argues that while criteria are contextual

and not value free, they provide important heuristics that reflect the core values of a particular craft. The use of criteria appropriate to the philosophical and methodological positioning of the research would lead to a more level playing field for qualitative business and management research.

Such criteriological debates link into concerns about the move towards increasing standardisation within qualitative management research (Cassell, 2016). In outlining sources of standardisation, Cassell cites the recommendations made by different journal editors about what qualitative researchers need to do in order to get their papers published in the top international outlets. Such prescriptive types of editorials and articles are critiqued extensively by Symon et al. (2016, p. 1), who argue that they serve to produce '(inappropriate) homogeneous evaluation criteria' with the consequence of 'marginalising alternative perspectives and disciplining individual qualitative researchers into particular normative practices'. A concern with a move to formulaic treatment of research questions has been critiqued more generally elsewhere within our field (e.g. Alvesson & Gabriel, 2013), but Cornelissen (2016) notes that there is also a move towards what he describes as factor analytic approaches to qualitative research, where data analysis strategies mimic the principles of quantitative analysis. Our concern is that this potentially serves to limit creativity within qualitative research – a state, as Van Mannen (1995, p. 139) provocatively observed, of 'technocratic unimaginativeness' where 'our generalizations often display a mind-numbing banality and an inexplicable readiness to reduce the field to a set of unexamined, turgid, hypothetical thrusts designed to render organizations systematic and organization theory safe for science'. As noted earlier, we see diversity as something to celebrate, rather than to be constrained.

We would also be remiss not to acknowledge the challenges that qualitative researchers can confront in trying to balance the need to stay within what can be restrictive page

limits with the inclusion of enough ‘raw’ data to present a persuasive account for their reviewers. Pratt (2009) suggests that qualitative researchers include both ‘power’ and ‘proof’ quotes as a means to persuade the reviewers of the rigour of the findings. This, however, can often be challenging within page limits historically designed for research that employs quantitative methods.

Institutional requirements can also create a challenge. Pressure to publish a defined number of articles in top (often mainstream) journals within a specified time frame has an impact on a researcher’s ability to engage in more longitudinal and ethnographic studies – good qualitative research takes time! Negotiating institutional review boards and ethics committees when doing snowball sampling (confidentiality issues), ethnography (does everyone that the researcher encounters need to sign a consent form?), and getting consent when doing participatory action research (see Burns et al., 2014) requires persistence, but is often rewarded by rich, in-depth insights into organisational life.

Such debates are characteristic of lively methodological engagement. We would argue that the production of a *Handbook* to highlight, critique and review the contribution of qualitative research to our field is somewhat timely. Clearly, considerable progress has been made in this area, but there is also room for so much more. We would hope that the *Handbook*, through its coverage of these different debates within a methodological context, enables us to progress these debates in a constructive way and draw attention to the many opportunities that qualitative research methods offer to our diverse research field.

INTRODUCING THE *HANDBOOK*

Putting together the content of the *Handbook* felt like an important responsibility in that it could be interpreted as the editorial team defining the content of the field, though, as

noted earlier, as shaped by our own perspective and position within it. Feedback from the reviewers of the collection and our international advisory board helped to develop the content. In the end, we found out that the challenges in putting the *Handbook* together very much mirrored the challenges facing the discipline and practice of qualitative management research. We wanted the content to reflect the diversity of the methodological field, including epistemologies, methods and research designs. Hence the reader will find chapters from a wide array of philosophical stances to qualitative management research ranging from *positivist qualitative research* (Su), *interpretative science* (Gephart) and *constructionism* (Grandy), to analytic techniques informed by post-structuralism such as *discourse* (Fairhurst and Cooren) and *sociomateriality* (Riach), to those informed by post-positivism, for example *fuzzy set qualitative content analysis* (Sinkovics et al.). Perhaps unsurprisingly, the challenges outlined in the previous sections are all addressed within different contributions of the *Handbook*, so we have chapters on publishing qualitative research aimed at beginners to the field, *writing for different audiences* (Myers), together with the more challenging questions and debates about *conducting and publishing rigorous qualitative research* (Rheinhardt et al.).

The book starts by addressing some of the wide variety of traditions within which qualitative research is conducted. The aim here is to provide an overview of those different traditions and we cover long-established philosophical approaches such as *positivism* (Su); *interpretivism* (Gephart); *pragmatism* (Simpson); *hermeneutics* (Tomkins & Eatough); *critical realism* (Vincent & Mahoney) and *ethnomethodology* (Whittle); alongside more recent approaches such as *critical management studies* (Pritchard et al.); *poststructuralism* (Benozzo); *mixed methods* (Molina-Azurin); *feminism* (Harding); *constructionism* (Grandy); *postcolonialism* (Weston & Imas) and *indigenous methodologies* (Schneider & Kayseas). Each of those

chapters provides an overview of the philosophical approach, together with summaries of key debates and the implications for qualitative business and management research.

The next section of the book focusses upon research designs within qualitative business and management research. Again, our aim here was to represent the key approaches used within the field with a particular focus on what perhaps can be seen as traditional research design approaches within qualitative research. We start with chapters on *field research* (Michel) and *workplace ethnographies* (Ciuk et al.), which help characterise some of the first forays into qualitative research by management researchers. Holton's chapter on *grounded theorizing* provides needed clarity to the debate on grounded theory as a design in qualitative research. She distinguishes between grounded theory as a general methodology in its own right and the inductive approach typically employed by qualitative researchers often referred to as grounded theory. She advocates for the use of grounded theorising, not grounded theory, to depict that which is employed by qualitative researchers. There are also chapters on *action research* (Scaratti et al.) and *case studies* (Piekkari & Welch), both of which have long traditions in qualitative management research. Chapters on *process* (Fachin & Langley) and *practice designs* (Abdallah et al.) conclude this section.

As noted earlier, there is an increased emphasis within qualitative business and management research about the role of the researcher in the research process. Within lies a recognition that we are part of the organisational world that we study and therefore this will impact the methods, process and outcomes of our research in a variety of different ways. Section Three includes a number of chapters that focus explicitly on the researcher's role. Within this section considerable attention is paid to reflexivity and the implications in practice of taking a reflexive stance. The key issues and challenges are outlined in reflexivity and positionality (Corlett & Mavin) and

the problematic issue of how the researcher achieves some critical distance, if indeed this is possible, is critiqued (Hayward & Cassell). Fahad et al. provide an informative insider account of the reflexive challenges faced by men interviewing women, while Sinclair & Ladkin provide an interesting account of the possibilities that come for the researcher when they acknowledge and embrace writing from the body as a qualitative researcher. Rodriguez's chapter on *intersectionality and qualitative research* brings to light how gender and other 'markers' of difference are recreated and sustained within systems of power and inequality and how qualitative research opportunities and challenges arise through this methodological framework. Both Sinclair & Ladkin and Rodriguez offer insights into the researched and the researcher. Our editorial aim in this section is to problematise the role of the qualitative researcher and explore a range of different dimensions of the lived experience of qualitative research.

Volume one concludes with a section on some of the challenges associated with conducting qualitative research. Taylor & Land discuss the key issue of *access and departure*, something that faces every qualitative researcher and is increasingly discussed within the qualitative literature. Publication is an often-cited challenge for the qualitative management researcher and here we have two different insightful approaches to the topic. Whereas Myers offers *writing for different audiences* as a resource for the novice qualitative researcher, Reinhardt et al. offer suggestions for how we understand conducting and *publishing rigorous qualitative research*, recognising that rigour may be defined in a variety of ways by different qualitative researchers. The increasing globalisation of management research offers both opportunities and challenges and these are addressed by Gobo in his chapter about globalisation and *qualitative research across boundaries*. The distinctive challenges of ethics in international research are also explored by Bell & Kothiyal. The increased impact of

globalisation and the use of novel communication technologies offers a series of new ethical challenges, as critiqued by Whiting & Pritchard in their chapter on *digital ethics*. The chapter in this section by Saunders & Townsend offers discussion on an issue of key importance for qualitative researchers: *choosing research participants*.

Volume two of the *Handbook* turns to consider methods more specifically. Given the extensive variety in methods as noted earlier, the volume outlines both the traditional approaches with a long history, such as interviews (Lee & Aslam), and those that are relatively new. Where well-used approaches are discussed, the intention is to provide the reader a new angle or perspective on those methods, for example Lee & Aslam discuss the nature of the *wholesome interview* and Learmonth & Griffin offer us a new way of understanding images of women at work through *analysing fiction* in Disney films. Section 5, on contemporary methods, includes methods of data collection and analysis, although in some chapters the method encapsulates both, as can be seen in the chapters on *autoethnography* (Haynes) and *stories and narrative* (Gabriel). Novel methods often underemployed by qualitative researchers in business and management are also covered, for example *diary studies* (Radcliffe), *shadowing* (McDonald) and *archival analysis* (Mills and Helms Mills). Contemporary theoretical approaches such as *sociomateriality* (Davies & Riach) and *dramaturgical methods* (Birch) are showcased alongside methods that have had a long history within the field, for example *group methods* (Coule). Other chapters in this section focus upon alternative ways of analysing language, for example *rhetoric* (Hamilton), *discourse* (Fairhurst & Cooren) and *stories and narrative* (Gabriel). The section concludes with a new look at one of the longstanding ways of analysing qualitative data, *thematic analysis* (King & Brooks).

As noted earlier, there has been an increased usage within business, organisation and management fields of visual methods. In recognising

these developments, we decided to devote a full section within the *Handbook* to these approaches, though we recognise that the visual is also considered in other places within the *Handbook*. The chapters in Section 6 illustrate the potential of different visual methods such as *photographs* (Warren), *drawing* (Ward & Shortt) and *collages* (Plakoyiannaki & Stavrakaki). The possibilities for videos in qualitative research are also on the rise. In a particularly unique approach, Morgan et al. discuss how research participants can create their own videos through *ethnographic documentaries*. Analysis of visual images is more directly addressed in Viney et al.'s chapter on *semiotics and symbols* and Pritchard and Whiting's chapter on *analysing web images*. Our prediction is that as time progresses there will be even more methodological developments within the area of visual methods of qualitative research.

The final section of the *Handbook* covers methodological developments. This section focusses upon contemporary methods that have had little airing in the qualitative business and management field. For example, Rippin & Hyde produce an intriguing account of the use of *sewing* as a critical research method technique, whereas Beech & Broad introduce us to the concept of *ethnomusicality* and what that means for research methods. Adopting an innovative approach in presenting methodological developments, Rivera threads insights from Yoda (*Star Wars*) throughout her thorough account of the important topic of *emotion and qualitative research*, while Durepos & Mills outline *ANTI-history* as an alternative approach to historiography. Using the internet for research into ethnographic communities is the focus of Kozinets' chapter on *netnography*. Alvesson & Sandberg critique the metaphors traditionally used for research design and through the use of different metaphors offer some alternative conceptualisations of the research process. This section also highlights some of the developments at the more quantitative end of qualitative data analysis such as *pattern-matching* (Sinkovics, N.) and *fuzzy set qualitative comparative analysis* (Ott et al.).

CONCLUSIONS

In putting together this *Handbook* we have sought to capture the essence of what is an ever-evolving, exciting and diverse field for business and management research. The chapters weave in and out of philosophical, conceptual and empirical considerations relevant for those already engaged in qualitative research, but also relevant for those new to qualitative research and those simply curious about the possibilities afforded through qualitative research in business and management. The chapters also incorporate extensive reference lists, which can serve as a resource for those who want to delve deeper into a particular topic or study. Not only does the content reflect considerable breadth and depth in topics as it relates to qualitative research, the contributors provide perspectives from across the world, spanning such countries as Italy, Canada, the United States, the UK, India, Brazil, Greece and New Zealand, amongst others.

Putting together this *Handbook* has been a valuable learning experience for us as well. We continue to be intrigued by the different and complementary approaches that emerge across the chapters and sections of the *Handbook* and excited by the prospects they offer in terms of our own development as researchers and the insights they offer for organisation scholars and practitioners. We sincerely hope that this collection serves as a valuable resource and stimulates new paths for qualitative researchers in business and management to explore. We encourage you to read on to see what might inspire you for your next study.

Positivist Qualitative Methods

Ning Su

POSITIVISM

Positivism is a major paradigm of academic inquiry. A paradigm represents a basic world-view collectively held by a community. Thomas Kuhn defines the concept of paradigm as ‘universally recognized scientific achievements that, for a time, provide model problems and solutions for a community of practitioners’ (Kuhn, 1996, p. 10). More broadly speaking, a paradigm can be viewed as a network of basic, metaphysical assumptions underlying an area of academic inquiry. Paradigms can be categorized along several key dimensions, including ontology, which addresses whether the ‘reality’ represents an objective existence external to and independent from individual cognition, or a product of individuals’ subjective consciousness; epistemology, which addresses how the world can be understood and how such knowledge can be transmitted among human beings; and methodology, which addresses whether the researcher focuses on identifying and

verifying the relationships and regularities between the various elements, or analyzing individuals’ subjective experience and interpretation, of the world (e.g. Burrell & Morgan, 1979).

Positivism has a long history and a critical role in the development of science. According to some, the tradition of positivism can be traced back to the time of the Renaissance. For example, Italian scientist and scholar Galileo Galilei’s (1564–1642) *Sidereus Nuncius*, or *The Starry Messenger* (1610), included using systematic astronomical observations to prove and extend the Copernican model. This work was to some extent the precursor of modern positivist science (Drake, 1978). French philosopher Auguste Comte (1798–1857) was considered the founder of the doctrine of positivism and the discipline of sociology. Comte’s work proposed that society evolves through three successive stages: the theological, the metaphysical, and the positive (Giddens, 1972). In his account of the structure of sciences,

Comte emphasized data of experience as the basis of knowledge. After Comte, positivism, more broadly defined, developed through different phases pioneered by different schools in history. Examples include critical positivism pioneered by Ernst Mach (1838–1916), and the subsequent logical positivism, logical empiricism, or neo-positivism in the twentieth century embracing examples of empirical sciences in philosophy (e.g. Bunge, 1996).

In today's sociological studies, especially those focusing on business and management, the use of the word 'positivist' frequently emphasizes an objectivist epistemology which seeks to 'explain and predict what happens in the social world by searching for regularities and causal relationships between its constituent elements' (Burrell & Morgan, 1979, p. 5). Consistent with the dominant, traditional approaches in the natural sciences, such objectivist epistemology assumes that the phenomenon under investigation and the investigator have an independent relationship, where knowledge accumulates as new verified hypotheses are added to the existing stock of knowledge and falsified hypotheses eliminated (*ibid.*). This objectivist epistemological position usually lies on the foundation of an ontology that assumes the existence of the physical and social world to be an external reality; this reality can be apprehended through the construction of a set of time- and context-free generalizations capturing the essence of the reality (Guba & Lincoln, 1994). Aligned with these ontological and epistemological assumptions, positivist research tends to emphasize the identification and empirical testing of hypotheses in propositional form, with quantitative approaches such as surveys and controlled experiments being the most common methods (*ibid.*).

POSITIVISM AND QUALITATIVE RESEARCH

The history of qualitative research can be traced back to the various social investigations

in the nineteenth century and the subsequent development of anthropology and sociology (Bogdan & Biklen, 1982). Today, 'qualitative research' has evolved into a vibrant and somewhat contested field, rather than a monolithic approach with clearly defined boundaries. In business and management, the term 'qualitative research' has been used by different scholars in different, and sometimes contradictory, ways. According to Van Maanen (1979, p. 520), 'the label qualitative methods has no precise meaning in any of the social sciences. It is at best an umbrella term covering an array of interpretive techniques which seek to describe, decode, translate, and otherwise come to terms with the meaning, not the frequency, of certain more or less naturally occurring phenomena in the social world'. Similarly, Strauss & Corbin (1998, p. 10) refer to qualitative research as 'any type of research that produces findings not arrived at by statistical procedures or other means of quantification'. Such research centers on a 'nonmathematical process of interpretation, carried out for the purpose of discovering concepts and relationships in raw data and then organizing these into a theoretical explanatory scheme' (*ibid.*, p. 11). Overall, common to many of the definitions of qualitative research is a focus on the phenomenon in its relatively natural setting and a non-mathematical data analysis process.

The positivist paradigm and qualitative research methods may seem to contradict each other. Specifically, positivism was traditionally considered to be chiefly associated with quantitative methods, whereas qualitative research tends to be associated with more subjectivist positions of the researchers. However, the positivist paradigm and qualitative methods can coexist in harmony. In fact, positivist qualitative research represents a uniquely useful and extensively adopted genre of academic inquiry. Ontologically, positivist qualitative research assumes the existence of an objective, external reality that can be apprehended and summarized, although not readily quantified. Epistemologically, positivist qualitative research focuses on

searching for, through non-statistical means, regularities and causal relationships between different elements of the reality, and summarizing identified patterns into generalized findings. Methodologically, positivist qualitative research tends to emphasize a nomothetic rather than idiographic approach; this approach utilizes systematic research protocols and techniques to develop and test theoretical models or propositions in accordance with the canons of scientific rigor (Burrell & Morgan, 1979).

Furthermore, when carefully combined, positivism and qualitative research form a synergistic relationship. The complementarity between the positivist stance and qualitative methods manifests itself in several ways. First, qualitative methods expand the scope of positivist research. Qualitative research is especially suitable for exploring emerging phenomena and identifying new theory development opportunities. For example, Bourgeois & Eisenhardt (1988) examined the then rapidly emerging microcomputer industry, and identified the decision-making processes in industries with extremely high rates of technological and competitive change, which the authors termed 'high-velocity' environments. The notion of high-velocity industry has since inspired a rich stream of research (e.g. Eisenhardt, 1989a; Bogner & Barr, 2000; Clark & Collins, 2002).

Second, qualitative methods extend the depth of positivist research. For example, Mintzberg's (1978) seminal work on the patterns in strategy formation distinguished between emergent and deliberate strategy. Building on the conceptualization of strategy as patterned action, Mirabeau & Maguire's (2014) publication further unpacked the process by which emergent strategy originates from autonomous strategic behavior and eventually becomes realized within organizational settings. Capitalizing on qualitative methods, this stream of research on emergent strategy offers an increasingly refined, in-depth view of strategy formation, while opening up new avenues for further examination.

Third, qualitative methods enrich the context of positivist research. Qualitative methods are especially valuable for exploring dynamic, embedded phenomena such as historical change, contextual fields, and social processes, which often cannot be adequately captured by quantitative techniques. For example, Burgelman (1994) examined the Intel Corporation's strategic business exit processes in dynamic environments. Dyer & Nobeoka (2000) investigated the Toyota Corporation's creation and management of knowledge-sharing processes with its supplier network. Both studies offer context-rich, memorable examples of critical management issues, concepts, and theoretical findings.

Finally, positivist qualitative research can be readily integrated with quantitative methods. There are different ways to combine these two approaches. For example, McNamara & Bromiley (1997) used interviews with corporate managers at a bank to explore how to empirically test a set of hypotheses, before developing a model based on the available data for further quantitative analysis. Koh et al. (2004) conducted two complementary studies, with a qualitative study identifying specific psychological contract obligations in information technology (IT) outsourcing relationships, and a quantitative study testing the impact of fulfilled obligations on IT outsourcing success.

POSITIVIST QUALITATIVE RESEARCH PROCESS

In positivist qualitative research, the input of the research process typically consists of a variety of data, especially unstructured data. The sources of data include interviews, observations, videos, and documents (Patton, 2001). These different formats of data are extensively used in different fields of business and management (e.g. Gersick, 1989; Orlikowski, 2002; Kane et al., 2014). Interviews usually consist of open-ended or

semi-structured questions about subjects' experience, perceptions, and knowledge. In the final publication, interviews are usually incorporated in the form of direct quotations. Observations and videos capture actions, interactions, conversations, practices, processes, and other dynamics at multiple levels, including individual, interpersonal, group, community, organizational, interorganizational, and industry. The data are incorporated into the final publication as field notes. Documents include written records, official publications and reports, correspondence, press releases, memorabilia, artistic works, photographs, films, and videotapes. Excerpts of documents can be included in the final publication to support and explain the findings. A key benefit of utilizing the diverse forms of data is the creation of a 'thick description' capturing both detailed content and rich context of the studied phenomena (e.g. Geertz, 1973).

Positivist qualitative research in business and management emphasizes novel, relevant, testable, and empirically valid theories as output (e.g. Eisenhardt, 1989b). The specific output can take different forms. The most common types include new themes, patterns, concepts, insights, and propositions (e.g. Patton, 2001). Specifically, in theoretical qualitative research, findings can consist of formal concepts and frameworks. For example, based on interviews within a large multinational corporation, Burgelman (1983) identified a process model of internal corporate venturing in major diversified firms. Leveraging 'direct research' (Mintzberg, 1979), Mintzberg & McHugh (1985) elaborated strategy formation in an 'adhocracy' and emphasized the type of 'emergent' strategies. In more applied types of qualitative research, the findings can consist of a set of substantive practices. For example, Peters & Waterman (1982) used qualitative inquiry to identify a set of patterns among the best-run companies in the US. Similarly, Covey (1990) discovered seven habits of highly effective individuals. To convert varied forms

of qualitative data into high-quality findings, a number of research methodologies have been developed and adopted. The most prominent methodologies related to positivist qualitative research include grounded theory and case study.

POSITIVIST QUALITATIVE RESEARCH AND GROUNDED THEORY

Grounded theory represents a widely used methodology applicable across different paradigms (Walsh et al., 2015). Grounded theory was pioneered by Glaser & Strauss (1967). The principles behind grounded theory are well aligned with positivism (Bryant, 2002). The tenets of grounded theory have also provided a valuable toolkit for qualitative researchers (Holton & Walsh, 2016) and contributed to the legitimization and systemization of qualitative research methods. Before Glaser and Strauss's work, qualitative research methods mostly focused on using an explicit coding procedure to convert qualitative data into a 'crudely quantifiable form' for further testing of provisional hypotheses, or focused on generating theoretical ideas, including new concepts, properties, and hypotheses, without going through a systematic coding process. Combining prior approaches, Glaser (1965) created the constant comparative method, which achieved the twin goals of generating theory more systematically through explicit coding and supporting provisional testing of hypotheses.

Glaser & Strauss (1967, p. 106) explain 'the basic, defining rule for the constant comparative method' as, 'while coding an incident for a category, compare it with the previous incidents in the same and different groups coded in the same category'. Specifically, this process can be described in four stages. The first stage involves comparing incidents applicable to each category emerging from the data. Through constant

comparison, the researcher identifies each category's dimensions, conditions, consequences, and relation to other categories. The second stage centers on integrating categories and properties. As the researcher continues making sense of the data, the diverse categories and properties start to relate to one another and become a more unified whole. The third stage focuses on delimiting the theory. As the emergent theory solidifies and the list of categories becomes theoretically saturated, the researcher starts discovering the underlying uniformity in the categories and properties. This results in the formulation of the theory with a smaller set of higher-level concepts. The fourth stage presents the coded data, memos, and the theory in writing. The constant comparative method can be applied to generate both substantive theories, which address specific empirical areas of inquiry, and formal theories, which center on conceptual areas of inquiry. Constant comparison constitutes the core of the Glaserian approach of grounded theory methodology.

Strauss & Corbin's (1990) subsequent work on a different approach to grounded theory methodology prescribed a set of systematic and specific techniques for developing theory from qualitative data (*ibid.*; Corbin & Strauss, 1990). These techniques center on three basic types of coding: open, axial, and selective. Open coding involves an interpretive process by which the data are broken down analytically and given conceptual labels. In open coding, events, actions, and interactions are compared with others for similarities and differences; conceptually similar events, actions, or interactions are grouped together to form categories and subcategories. Axial coding relates categories to their subcategories through the 'coding paradigm' of conditions, context, action or interaction strategies, and consequences. The hypothetical relationships proposed deductively are verified repeatedly against incoming data, while the development of categories continues as the data accumulate. Selective coding takes place in the later phases of the

study. The selective coding process unifies all categories around a core category. The core category might emerge from the identified categories, or take the form of a more abstract term. The core category emerging from selective coding represents the central phenomenon of the study.

These specific and systematic coding techniques introduced by Strauss & Corbin (1990) have been extensively adopted by qualitative studies in business and management. For example, to explore how cooperation emerged in a highly competitive setting, Browning et al. (1995) conducted a grounded theory analysis of observation, interview, and archival data collected at a consortium in the semiconductor manufacturing industry. In the data analysis, the researchers first performed open coding, assigning each incident in the entire data set to an emergent open coding scheme. The resulting 130 codes were subsequently reduced into increasingly abstract categories through axial coding, which produced 24 categories. Finally, in a process of selective coding, these categories were further collapsed and renamed, yielding the 17 categories as the paper's key results. Based on these categories, the authors then identified and drew on complexity theory as a novel framework to further explain and theorize from the phenomenon (*ibid.*). As another example, Harrison & Rouse (2015) followed a three-stage process, including developing first-order concepts through open coding, discovering second-order themes through axial coding, and aggregating theoretical dimensions by iterating between data and theory. The analytical process allowed the authors to inductively build a process model explaining feedback interactions in creative projects.

Both Glaserian and Straussian approaches to grounded theory have laid the foundation of qualitative research, and some studies have drawn on elements from both. Meanwhile, these two approaches also differ significantly. The divide was evident in Glaser's (1992) criticism of the Straussian approach. Several differences are most salient. First, the

Glaserian approach requires the researcher to rely on theoretical sensitivity and investigate the field without bringing precise research questions or preconceived theories. The Straussian approach, in contrast, allows the guidance of predefined research questions and preexisting theoretical frameworks. Second, the Glaserian approach emphasizes an inductive analytic process, where theories strictly emerge from the data. The Straussian approach combines elements of both inductive and deductive methods, and centers on abductive reasoning which involves continual validation. Abduction refers to ‘a type of reasoning that begins by examining data and after scrutiny of these data, entertains all possible explanations for the observed data, and then forms a hypothesis to confirm or disconfirm until the researcher arrives at the most plausible interpretation of the observed data’ (Bryant & Charmaz, 2007, p. 186). Third, the Glaserian approach relies on substantive coding and theoretical coding to form theoretical models. The Straussian approach has specified a coding paradigm, with the potential risk of ‘forcing’ categories on the data (Glaser, 1992), but can help researchers generate findings in a structured manner.

In exploring the philosophical underpinnings of grounded theory, subsequent investigations have suggested that while extensively adopted by interpretivist research, both the Glaserian and Straussian approaches, as the foundation of the grounded theory methodology, in fact, have a significant level of consistency with the positivist paradigm (e.g. Denzin & Lincoln, 1994; Charmaz, 2000; Bryant & Charmaz, 2007). For example, the Glaserian approach builds on ‘assumptions of an objective, external reality, a neutral observer who discovers data, reductionist inquiry of manageable research problems, and objectivist rendering of data’ (Glaser & Strauss, 1967, p. 510). The Straussian approach embeds similar assumptions, with additional emphasis on the positivism-inclined process of provisional verification of the findings.

Meanwhile, it is worth noting that other aspects of the grounded theory methodology also resonate with other paradigms, especially as the grounded theory approach has also evolved over time (e.g. Annells, 1997; Bryant, 2002). For example, some argue that the Glaserian school assumes a critical realist approach, whereas the Straussian school aligns with a relativist and constructivist stance (Annells, 1997).

As grounded theory becomes increasingly adopted by researchers and adapted in different ways, Charmaz (2000; 2001; 2006; 2008) suggests that the methodology can be broadly categorized into two forms: constructivist and objectivist grounded theory. Constructivist grounded theory is aligned with the interpretive tradition. It emphasizes the phenomena of study and views data and theoretical analysis as closely intertwined, and co-created through the interaction and interpretation of the researcher and research participants. The theory emerging from this experience is therefore an interpretation that is based on, and specific to, the researcher’s view. Objectivist grounded theory is ‘a form of positivist qualitative research’ (Charmaz, 2006, p. 188). It views data as representing external, knowable reality and theoretical analysis as a process of careful discovery by unbiased observers. Objectivist grounded theory, therefore, emphasizes stricter adherence to the prescribed research procedures. This constructivist–objectivist dichotomy provides the clarity much needed for distinguishing different grounded theory studies. Meanwhile, a specific study might contain elements of both approaches and whether the study can be judged to be constructivist or objectivist ‘depends on the extent to which its key characteristics conform to one tradition or the other’ (ibid., p. 130). Overall, grounded theory has been embraced by positivist qualitative researchers and has in part inspired the creation and systemization of related research methodologies and strategies. A prominent example is case study.

POSITIVIST QUALITATIVE RESEARCH AND CASE STUDY

Case study represents an important genre of social science research. The early major proponents of case study research include the works of Yin (1981a; 1981b; 1984; 2014) and Stake (1978; 1995; 2005). Yin (1984) defines case study as an overarching research strategy and outlines its defining features. Specifically, ‘a case study inquiry copes with the technically distinctive situation in which there will be many more variables of interest than data points, and as one result, relies on multiple sources of evidence, with data needing to converge in a triangulating fashion, and as another result benefits from the prior development of theoretical propositions to guide data collection and analysis’ (Yin, 2003, p. 13). This is consistent with Stake’s (1995; 2005) definition of a case as a functioning body, a bounded system, ‘not a methodological choice but a choice of what is to be studied’ (2005, p. 443), and case study as ‘both a process of inquiry about the case and the product of that inquiry’ (2005, p. 444). Case study usually differs from the other forms of research in that it focuses on the in-depth investigation of a phenomenon in its real-world context, and is especially valuable when the boundaries between phenomenon and context are ambiguous (Yin, 2003). Case study is inclusive and pluralistic, with the potential to accommodate diverse paradigms and research techniques, both qualitative and quantitative (ibid.; Stake, 2005).

Qualitative researchers have been especially active in embracing case study, frequently citing the seminal work of Yin and Stake. Yin and Stake’s approaches, meanwhile, also have significant differences. Yin’s (1984; 2014) descriptions of case study tend to be oriented toward a ‘realist’ perspective. The meticulous and methodical guidelines provided by Yin make the work especially valuable for positivist qualitative research. According to Yin, case studies can

be categorized into three types: exploratory, descriptive, and explanatory; case studies can also be categorized into single or multiple cases and holistic or embedded cases. The single-case study is appropriate when the case is critical to confirming, challenging, or extending the examined theory, extreme or unusual by deviating from norms, common in everyday occurrences, revelatory of previously inaccessible phenomena, or longitudinal by investigating the same case at multiple points in time. Single-case studies encompass holistic and embedded designs. A holistic design examines the global nature of the case, whereas an embedded design investigates multiple subunits within the case. In the multiple-case study, several cases are selected to serve either as literal replications by predicting similar results, or theoretical replications by predicting contrasting results. A multiple-case study may also consist of multiple holistic or embedded cases. A special type of multiple-case study is a two-case study, with the second case serving as confirmation or contrast (ibid.).

Stake’s (1978; 1995; 2005) approach to case study, in comparison, seems more consistent with the interpretivist or constructivist paradigm (e.g. Appleton, 2002; Grandy, 2010). For example, Stake’s (1995) seminal text *The Art of Case Study Research* often emphasizes construction rather than discovery of knowledge and multiple perspectives about cases. Stake also categorizes case studies into three types: intrinsic, instrumental, and collective. Intrinsic case study focuses on understanding one particular case, with the case itself – rather than some abstract construct or generic phenomenon – representing the focus of interest. An instrumental case study, instead, is undertaken to generate insights into an issue or derive generalizable conclusions. Collective, or multiple, case study is conducted when several cases are examined jointly for the purpose of investigating a phenomenon, population, or general condition. Overall, the more ‘intrinsic’ the interest of inquiry is in the case, the

more the study focuses on the case's idiosyncratic context, issue, and story. Stake's work differs from Yin's methodical, positivist-oriented approach, but collectively these two approaches enrich the repertoire of methods for qualitative research.

Eisenhardt (1989b) further formalized theory-building from multiple-case study research into a nine-step process. This model has incorporated elements of Yin's (1984) approach as well as grounded theory (e.g. Glaser & Strauss, 1967; Strauss, 1987). Specifically, first, the researcher defines the research focus and question. A priori specification of constructs is allowed, but the initial theoretical framework is tentative. Second, cases are chosen through theoretical sampling, as new cases are added to replicate previous cases, extend emergent theory, fill theoretical categories, or serve as examples of polar types. Third, research instruments and protocols are crafted based on the research question. Fourth, data collecting overlaps with analysis through the continuous creation of field notes. Fifth, within-case analysis allows the unique patterns of each case to emerge. Sixth, cross-case comparison identifies higher-level patterns. Tactics such as using categories or dimensions, conducting pairwise analysis, and dividing the data by sources, can be applied. Seventh, iterative tabulation of evidence continuously sharpens constructs and verifies relationships, yielding a theory that fits closely with data. Eighth, the emergent concepts, theory, or hypotheses are compared with the extant literature. Finally, theoretical saturation signals the closure of the iterative theory building process (*ibid.*). This well-defined, structured process aligns closely with the positivist paradigm, and has been extensively adopted by positivist qualitative research in business and management over the last decades (Eisenhardt & Graebner, 2007).

As an example, Brown & Eisenhardt (1997) used a multiple-case study of six firms in the computer industry to examine how organizations can successfully engage in continuous change. Specifically, the authors first

positioned the study in the theoretical literature on organizational change, which focused on the punctuated equilibrium model and radical change. Having identified the important but understudied continuous, incremental change as the research focus, the authors selected six computer firms, using each firm as a replication to confirm or disconfirm emerging conceptual insights. The authors visited the firms and conducted semi-structured, open-ended interviews with both lower- and higher-level managers regarding the evolution of product development projects. Using the interviews as well as supplementary data, the authors wrote an independent case study for each firm, with a focus on the features of multiple-product innovation. Through subsequent comparison of different permutations of pairs of cases for similarities and differences, a set of organizational structures and processes related to continuous change emerged. The author crystallized the findings into three key properties: 'semisttructures', 'links in time', and 'sequenced steps', and finally linked the ideas to existing literatures, including complexity theory and the resource-based view of the firm, to make further theoretical contributions (*ibid.*). This study uses a methodical approach to search for the 'objective', generalizable best practices, and demonstrates a clear positivist orientation. Other examples following this approach include the studies of Hallen & Eisenhardt (2012), Davis & Eisenhardt (2013), and Su (2013).

POSITIVIST QUALITATIVE RESEARCH IN DIVERSE DISCIPLINES

Positivist qualitative studies have been adopted by many disciplines, such as sociology, psychology, policy, law, health, education, and business. In business, positivist qualitative research has been applied in many major fields, including, but not limited to, management, information systems, international business, organizational behavior,

marketing, accounting, and operations. In management, qualitative research, with both positivist and non-positivist stances, has been extensively applied (Lee, 1991; Bansal & Corley, 2011). Similarly, in information systems, there is a plurality of qualitative research approaches, both positivist and non-positivist (Orlikowski & Baroudi, 1991; Mingers, 2001; Dubé & Paré, 2003). The field of international business also moves toward methodological pluralism by embracing diverse approaches, including both positivist and ‘alternative’ qualitative research (Welch et al., 2011). In organizational behavior, qualitative research has long had an important place (Johns, 2006). The field of marketing has long embraced qualitative methods as well (Calder, 1977; Belk, 2007), although qualitative research tends to be associated with an interpretivist approach in marketing. In the field of accounting, similarly, qualitative research in general has a long tradition (Chua, 1986; Vaivio, 2008). In operations management, there has been an increasing use of qualitative research (Barratt et al., 2011). Many of the qualitative studies in the field of operations management adopt a positivist stance.

While the prevalence of positivist qualitative research varies with specific disciplines and publication outlets, the approach has established its position as a key genre of publication. The following are some examples of empirical research leveraging positivist qualitative methods. Positivist qualitative research regularly appears in the *Academy of Management Journal* (e.g. Hallen & Eisenhardt, 2012), *Administrative Science Quarterly* (e.g. Lawrence & Dover, 2015), *Organization Science* (e.g. Cattani et al., 2013), the *Strategic Management Journal* (e.g. Joseph & Ocasio, 2012), the *Journal of International Business Studies* (e.g. Orr & Scott, 2008), *MIS Quarterly* (e.g. Levina & Ross, 2003), and *Information Systems Research* (e.g. Jarvenpaa & Leidner, 1998).

Since positivist qualitative research shares the same philosophical stance as many quantitative studies, journals with a

quantitative focus have also featured positivist qualitative studies, complementing quantitative research. Examples of these outlets include *Management Science* (e.g. Faraj & Xiao, 2006), *Production and Operations Management* (e.g. Pagell et al., 2014), the *Journal of Operations Management* (e.g. Choi & Hong, 2002), and *Decision Sciences* (e.g. Levina & Su, 2008). In addition, positivist qualitative research is especially valuable for identifying and illustrating ‘best practices’ from multiple business cases. This approach has therefore been extensively applied in publications in practitioner-oriented journals, such as the *Harvard Business Review* (e.g. Lacity et al., 1995) and the *MIT Sloan Management Review* (e.g. Su et al., 2016).

Across these disciplines, positivist qualitative research has provided a useful toolkit for studying a wide range of phenomena. These phenomena encompass multiple levels, from microfoundations to macro dynamics, spanning the levels of individual, group, organizational subunit, organization, and interorganizational network (Hitt et al., 2007). For example, at the individual level, Molinsky (2013) used self-reflections of 50 students to understand the psychological mechanisms by which individuals adapt to new cultural settings. At the organizational level, Su (2013) used 95 interviews with middle- and senior-level managers, direct observations, and archival data at 13 offshore IT service suppliers – which encompassed all the most globally recognized players in China’s IT outsourcing industry – to examine how these organizations grow their business in multiple markets and make decisions regarding their internationalization. At the interorganizational level, Dyer & Nobeoka (2000) combined interviews with more than 30 executives from Toyota; interviews with executives from 10 of Toyota’s first-tier suppliers in Japan and 11 Toyota suppliers in the US; and archival and survey data to examine how the company creates and manages a high-performance, knowledge-sharing production network. All these studies have

both offered rich depictions of complex, contemporary phenomena and made significant, novel contributions to theories.

POSITIVIST QUALITATIVE RESEARCH IN THE AGE OF DIGITIZATION AND GLOBALIZATION

Positivist qualitative research has unique value propositions in today's business environment. Our world is being transformed by two major trends: digitization and globalization (Manyika et al., 2011, 2014). The emergence of information and communications technologies is changing the foundation and fabric of economies and societies, giving rise to new forms of organizing (e.g. Boudreau & Lakhani, 2013; Kuek et al., 2015; Lifshitz-Assaf, forthcoming), while disrupting incumbent ones. A variety of innovative digital technologies, such as the mobile Internet (e.g. Ghose et al., 2013), cloud computing (e.g. Su, 2011), big data (e.g. Tambe, 2014) and analytics (e.g. Martens et al., 2016), 3D printing (e.g. Su & Pirani, 2013), search engine (e.g. Ghose et al. 2014), online recommendation systems (e.g. Panniello et al., 2016), and artificial intelligence (e.g. Dhar, 2016), are shaping the world's informational, economic, and social relationships (e.g. El Sawy et al., 2010; Sundararajan et al., 2013; Dhar et al., 2014) and giving rise to new industries and market categories.

Simultaneously, digitization accelerates globalization (e.g. Agerfalk & Fitzgerald, 2008; Chen & Horton, 2016; Aral et al., 2017). The global flow of capital, trade, and increasingly, information, ideas, and innovation, has shifted the world's business landscape (Manyika et al., 2014). Emerging markets have grown into not only new hubs of global commerce in terms of scale, but also worldwide centers of innovation and entrepreneurship (e.g. *The Economist*, 2015). Emerging market-based organizations, and

their underlying socioeconomic ecosystems, are largely new and can differ significantly from traditional ones. For example, research has shown that in emerging markets, individuals' sensemaking and organizations' strategic decision-making can be especially dynamic and innovative (Su, 2015). The convergence of digitization and globalization leads to increasing innovation and interaction, thereby presenting new opportunities and a compelling need for further academic inquiry.

In this rapidly changing environment, positivist qualitative research can be an especially valuable tool for advancing academic theories, for several reasons. First, qualitative research is suitable for investigating the emergent, ambiguous, dynamic, and less-understood phenomena brought about by digitization and globalization. In this environment, the flexible, contextualized characteristics of qualitative inquiry have an advantage over quantitative methods because qualitative research is 'open to unanticipated events' and 'offers holistic depictions of realities' (Rynes & Gephart, 2004, p. 455) that encompass a wide range of variables, relationships, meanings, and processes.

Second, positivist qualitative research, particularly, can help motivate researchers with a positivist stance to explore these emerging phenomena. Positivist researchers represent a large academic community. Some disciplines, such as finance and operations, or topics, such as big data and analytics research, mostly adopt a positivist paradigm. A positivist stance can help engage a dialogue with a diverse set of communities. Positivist qualitative research can also be readily combined with quantitative methods. For example, the theoretical concepts, relationships, and frameworks that emerge from positivist qualitative research can be further examined with quantitative methods. Such integration of qualitative and quantitative approaches can enrich our understanding of diverse phenomena.

Third, the positivist paradigm accepts the notion of the 'generalizability' of findings. When studying the emerging phenomena in

digitization and globalization, researchers are able, therefore, to examine whether these new phenomena can generate new theories, whether the new theories can help reconceptualize existing phenomena, whether the new phenomena can in fact be understood by existing theories, and whether the new phenomena are qualitatively different from existing ones. These questions can meaningfully contribute to the creation and accumulation of knowledge.

Finally, from a methodological perspective, the trends of digitization and globalization give rise to new opportunities and challenges. The increasing availability of data, combined with the innovative application of analytic techniques such as data mining, can potentially complement or even extend traditional positivist qualitative methods. Data in different languages and from diverse cultural contexts could also become a rich source of information and inspiration for theory development.

Overall, embracing a plurality of philosophical perspectives and research methods allows scholars to examine the changing landscape of global business from diverse frames of reference. Positivist qualitative research, with its significant tradition and extensive adoption in diverse disciplines, provides an important toolkit for understanding today's ever-changing economy and society.

CONCLUSION

Positivist qualitative research represents an important, established genre of academic inquiry. Ontologically, it assumes an objective external reality that is apprehensible although not readily quantifiable. Epistemologically, it focuses on identifying regularities, relationships, patterns, and generalizable findings from this reality. Methodologically, it emphasizes the application of systematic protocols and techniques to develop and test theoretical models or propositions based on the canons of scientific

rigor. When carefully designed and meticulously executed, positivist qualitative research can synergistically combine the strengths of positivist paradigm and qualitative inquiry. Based on diverse forms of data, positivist qualitative research generates novel and reliable concepts and theories regarding complex and oftentimes contemporary phenomena. Grounded theory is a widely used methodology for positivist qualitative research, while case study prescribes methodical procedures that are especially useful for generating positivist theoretical insights from qualitative data. Diverse disciplines have embraced positivist qualitative research.

Positivist qualitative research has its challenges. Due to its oftentimes field-based nature and highly methodical research process, it can require significant time and commitment, as well as access to research sites for in-depth investigation. Demonstration of rigor by following the prescribed procedures and guidelines is important (Miles & Huberman, 1994; Dubé & Paré, 2003; Siggelkow, 2007; Gibbert et al., 2008; Yin, 2014). Meanwhile, however, a key merit of positivist qualitative research, as well as qualitative inquiry in general, is the celebration of novelty and creativity (Bansal & Corley, 2011). Therefore, researchers should also actively explore different styles within positivist qualitative research and pursue methodological innovation. When applying positivist qualitative methods, researchers need to maintain a fine balance between rigor and creativity, and seek to generate insights that are both empirically valid and theoretically ground-breaking. Today's age of digitization and globalization can represent an excellent opportunity for applying and advancing positivist qualitative research.

Qualitative Research as Interpretive Social Science

Robert P. Gephart, Jr.

Qualitative research has recently become so prominent (Gephart, 2004) that it is 'taking over the social sciences and related professional fields' (Denzin & Lincoln, 2005, p. ix). Yet some scholars have questioned the viability of a scientific approach to non-positivist qualitative research. For example, 'when the interpretive perspective of science is adopted ... the generally accepted standards and practices for writing and assessing the convincingness of this work become increasingly difficult to apply' (Golden-Biddle & Locke, 1993, p. 595). This argument shifts the focus from the integrity of research methods used to produce knowledge to a concern with the convincingness of the text to readers. More strongly, 'once researchers drop the notion that organization studies need to model reality and search for essentialist underlying structures via scientific study, they can embrace a more diverse and interpretive approach' (Wicks & Freeman, 1998, p. 130).

Indeed, the term 'science' is absent in titles, keywords and abstracts in the journal *Qualitative Research on Organizations and Management*. And the journal *Organization Science* provides no explicit discussion of qualitative organization science despite frequent qualitative papers published in its pages. This evidence suggests that qualitative organizational scholars today are more concerned with producing humanistic, literary, political and idiosyncratic knowledge (Denzin & Lincoln, 2005, p. x) than with producing verifiable scientific knowledge of organizations (following Schutz, 1973b, p. 53). This unfortunate situation has emerged in organizational research despite the long-standing interest in producing trustworthy, meaningful and evidence-based knowledge of organizations that is useful in practice. The lack of concern with advancing a non-positivist scientific approach to organizational research may be limiting the social value, credibility and influence of the field.

There is an alternative. Over 60 years ago the philosopher and sociologist Alfred Schutz (1973) contributed a methodology for interpretive social science that inspired many important ideas used in organizational research, including sensemaking (Garfinkel, 1967; Weick, 1995), structuration theory (Giddens, 1976; Barley, 1986) and ‘abductive reasoning’ (Blaikie, 1993; Dunne and Dougherty, 2016). The goal of this chapter is to further develop Schutz’s approach to qualitative research as an interpretive social science (Blaikie, 1993, p. 42) that can develop into an influential field that provides verifiable and meaningful knowledge of organizations.

I approach this task by addressing research within the ‘interpretive paradigm’ of social science (Burrell & Morgan, 1979; Hassard, 1993; Gephart, 2004, 2013). The chapter addresses the following questions: (1) what is interpretive, qualitative science? (2) how does interpretive qualitative science differ from other approaches to qualitative research? (3) how can scholars use qualitative methods to produce interpretive social science? and (4) why does organizational research need a scientific approach to interpretive research?

To do answer these questions, the chapter first explores the philosophical and sociological foundations of interpretive social science (Schutz, 1967, 1973a, b); Garfinkel, 1967). The next section on ‘Qualitative research and scientific knowledge’ explains what qualitative interpretive social science is and how it differs from other qualitative approaches and, particularly, from qualitative positivism. The section on ‘Elements of an interpretive science of organizations’ elaborates a method for interpretive social science and demonstrates further how it differs from other approaches to qualitative research. The qualitative methods that can be used to produce interpretive social science are then presented in the context of Schutz’s model of interpretive social science. The chapter also provides examples of organizational research to illustrate interpretive social science concerns, methods and

contributions, and to demonstrate why organizational research needs a qualitative, interpretive and scientific approach. The broader value of interpretive social science, why it is needed in organizational research, and future challenges and directions are addressed in the conclusion.

Qualitative Research and Scientific Knowledge

Qualitative organizational research is a multi-method process that uses ‘qualitative data’, including linguistic symbols and stories, verbal communication and written texts to understand organizational processes. It produces rich descriptions of naturally occurring behaviour in real life organizations as well as concepts and theories for understanding organizational realities (Gephart, 2004 and 2013). Of the four ‘paradigms’ of qualitative research (positivist, interpretive, critical and postmodern; Gephart, 2004, 2013; Hassard, 1993), only qualitative positivism and the scientific streams of interpretivism aspire and claim to produce scientific knowledge research.

Qualitative positivism (Gephart, 2004, 2013) uses a natural science approach that substitutes qualitative methods and data for quantitative methods and data. Positivism assumes that science can mirror reality, and, through reliable and valid methods similar to quantitative methods, it can uncover facts and determinant causal inter-relationships among variables (Gephart, 2013, p. 291). Qualitative positivism thus mimics quantitative positivism and has only limited concern with the meanings social phenomena have for social actors in everyday settings.

Interpretive science research is defined here as research that systematically constructs scientific theory and concepts (knowledge) as ‘second order’ interpretations based on inductive and abductive analysis of members’ actual common sense or ‘first order’ concepts and actions and meanings. This

second order scientific theory is verifiable, reproducible, logical, holds practical meaning to lay actors and offers abstract, objective meaning to interpretive scientists.

There are important differences between interpretive social science and positivist social science. These differences arise from the fact that interpretive social science takes an insider view that privileges social actors' knowledge of social contexts and their commonsense meanings. It seeks to understand members' tacit knowledge, shared meanings and the informal norms everyday actors use to act in the world. Interpretive theory is built from, and refers back to, commonsense meanings. In contrast, positivist social science privileges an outsider view of culture and behaviour, imposes scientific meanings on observations of everyday behaviour and generally lacks concern for members' commonsense meanings and interpretations.

The interpretive social science approach focuses on description and understanding of 'the actual human interactions, meanings and processes that constitute real-life organizational settings' (Gephart, 2004, p. 455) and examines how commonsense meanings are created and used by members for practical purposes. Interpretive social science uses controlled inferences (Schutz, 1973b, p. 51), formal logic, induction, deduction, retrodution and abductive reasoning to interpret qualitative data (Blaikie, 1993).

The initial tasks for interpretive social science are to describe and understand the commonsense constructs and subjective interpretations of social actors, to 'explore the general principles' by which social actors organize their experiences and to develop a theoretical system composed of second-level scientific constructs that objectively describe, predict and explain social organizational behaviour (Schutz, 1973a, p. 34). Research is 'interpretive' when it starts from and returns to 'the subjective meaning of the actions of human beings from which all social reality originates' (Schutz, 1973b, p. 62). It is scientific when it produces theory

that can be tested and falsified, agrees with experience, explains commonsense concepts of nature, accepts a set of rules for scientific procedure that is valid for all empirical sciences and deals with the pre-given meaning of social reality (Schutz, 1973a, p. 49).

Other non-scientific approaches to qualitative research focus on subjective meanings and human meaning-making, but seek different kinds of understanding 'based on the varying ontological, and methodological beliefs' to which the researchers subscribe (Bhattacharya, 2008, p. 2). These approaches, including hermeneutics, emancipatory social theories, feminism, critical theories, queer theory and the sociologies of everyday life, are described in Bhattacharya (2008) and Douglas et al. (1980).

The interpretive social science research produces: 'historically situated tales' of what particular people do in particular places at certain times; 'reasoned interpretations' of what this conduct means for social actors (Van Maanan, 1998, p. xi-xii); theoretical frameworks of propositions and arguments describing determinant relations among scientific constructs; and 'empirically ascertainable' and verifiable relations among concepts (Schutz, 1973b, p. 65).

In the pages that follow, I develop this conception of interpretive social science further and provide examples of organizational research that display features of this approach to science.

Natural Science and Social Science

A long-standing debate exists concerning the proper methodology for social science (Schutz, 1973a). One view assumes a basic difference between the structure of nature and the structure of the social world that necessitates distinct methods for natural and social science. A second view examines human behaviour in the same way that natural scientists look at nature. It assumes that only the methods of natural science can

establish reliable knowledge (Schutz, 1973a). Schutz (1973a, b) offers a third view and middle ground. He argues that the phenomena social science examines have different structures than natural science phenomena because the observational field of social science has a pre-given structure, meaning and relevance for human beings living there. Social science needs to investigate exactly what the natural science methods extract – tacitly held beliefs of commonsense reasoning that produce and sustain our ability to distinguish and make sense of nature and all objects of culture (Schutz, 1973b, p. 58). By presupposing shared meanings, positivism solves the ‘fundamental problem of social science before scientific inquiry starts’ (Schutz, 1973b, p. 55). A more valid approach requires ‘particular devices foreign to the natural sciences’ (Schutz, 1973b, p. 58), so that theory can agree with commonsense experience – something all the sciences of human affairs have done.

Qualitative interpretive social science starts from the first order ‘constructs’ of commonsense reasoning and seeks to understand members’ subjective interpretations. It then creates second order scientific constructs from commonsense constructs. The scientific constructs are objective, ideal type theoretical constructs formed in accordance with procedural rules valid for all empirical sciences and that embody testable general hypotheses. Scientific constructs differ from the constructs of common sense, since they must be objective in the sense that propositions from them can be subjected to controlled verification and cannot refer to private, uncontrolled experience (p. 62). The interpretive science approach thus starts from the premise that commonsense knowledge is foundational to knowing the world. It accepts the application of natural science methods to second order social science concepts, but proposes additional devices foreign to natural science that can bridge commonsense and scientific concepts.

ELEMENTS OF AN INTERPRETIVE SCIENCE OF ORGANIZATIONS

Weber’s (1978) *Economy and Society: An Outline of Interpretive Sociology* describes an organizational ‘science concerning itself with the interpretive science of social action and thereby a causal explanation of its course and consequences’ (Weber, 1978, p. 4). Weber was concerned to scientifically understand the ‘subjective meaning’ of phenomena, which he conceives as understanding that is ‘subjective’ because its goal is to understand what the other actor ‘means’ in an action, in contrast to what an observer might impute. Subjective meaning can be shared and it is not introspection or the private affair of an actor. It can also be controlled in common sense. Also, predictions based on subjective meanings are usually made in common-sense thinking with great success. Hence, we can predict that a letter addressed to a specific individual will reach the addressee, and it generally does. Thus, subjective understanding refers to what the actor ‘means’ by an action in meanings that can be shared with other actors.

Schutz’s (1973a, 1973b) aim was to put Weber’s interpretive sociology on a firmer grounding. To do so he provided a methodology of ideal types for understanding social action (Blaikie, 1993, p. 42). This is premised on the idea that commonsense knowledge is foundational to knowing the world and is based on a system of constructs that register the typicality of the world in a shared (intersubjective) manner. The bridge between common sense and scientific meaning is the methodology of social types that involves social actors’ uses of typifications of both persons and courses of action (Blaikie, 1993, p. 43). Schutz (1973a) notes that actors engage in ‘typification’ during commonsense reasoning. Any actual perception of an object is transferred to similar objects that are thereafter viewed as ‘the same type’ of object. The typicality of the world lies in the shared world of meaning

that existed before us and that is experienced using a stock of knowledge of typical objects (Schutz, 1973a, pp. 6–8). We need to interpret this commonsense world in order to act in the world (Schutz, 1973a, p. 10).

Schutz gives primacy to commonsense knowledge with his well-known postulate of subjective interpretation (p. 11): to understand what an action means, one must understand the meaning the action has for the actor. One cannot understand an institution or organization without understanding what it means to individuals who orient their behaviour towards it. Thus, the world is not 'my private world' (p. 11) because one's knowledge of it is from the outset intersubjective and socialized.

Three assumptions are needed for actors to produce shared meanings. First, social actors must assume that people in a common setting will see and recognize common objects of the world even if their backgrounds, purposes and the systems of relevance they use to interpret objects and events differ (Schutz, 1973a, p. 11). Second, actors must assume that an inter-changeability of standpoints exists such that members could change places and see what the other sees (pp. 11–12). Third, actors must assume a congruency of systems of relevance, whereby any differences in perspectives that originate in biographies are irrelevant and hence actors can see objects in an identical manner (p. 12). These common assumptions allow members to develop the sense that the objects of shared meaning are objective and detached from each actor's unique definition of the situation, biographical circumstances and purposes at hand, and thus supersede the thought objects of peoples' private experience (p. 12).

Central to Schutz's ideal type method is the premise that people make sense of others and the social world by creating constructs of typical social relationships and motives. Most relationships are constituted by distant persons and can be grasped only by forming a construct of a typical way of behaviour with a typical pattern of underling

motives and attitudes, where the other and their conduct are just instances or exemplars of the broader type. Course of action types are idealized typifications of actions, projects and motives that social actors had in the past and will display or enact in the future. Action types sustain ongoing social interaction. They include future-oriented, 'in-order-to' motives (p. 21) that describe the goals and motives another person seeks in choosing an action and past-oriented, 'because motives' (p. 22) that explain after the fact why someone acted. Schutz (1973a, p. 28) was primarily concerned with types of 'rational action' that presuppose rational consideration of the alternative means to an end; clear insight into these ends, means and alternatives; and determination of their importance. Other forms of action can be analysed as departures from this rational model.

Schutz (1973a, p. 34) clearly emphasized that social science requires description and analysis of the subjective point of view – the interpretations of action and settings made by the actors involved. He validates this argument by addressing two questions (1973a, pp. 34–6). First, how is it possible to grasp subjective meaning scientifically? This involves replacing the objects of common sense related to unique events with a model of the social world in which typified events relevant to the social scientific problem occur. Then one constructs a model of the typical interaction (e.g. a salesman selling an auto) and analyses the typical meaning the interaction might have for the types of actors who originate the interaction.

Second, how is it possible to grasp subjective meaning structures using a system of objective knowledge? First, one needs to develop methodological devices for obtaining objective and verifiable knowledge of subjective meaning structures that allow for discovery via controlled inference (Schutz, 1973a). The knowledge must be possible to state in propositional form and capable of verification by observation (pp. 51–2). Second, the scientific attitude must guide objective consideration of

subjective knowledge. This involves a disinterested observer who is detached from their biographical situation and who seeks truth in accordance with pre-established features of the scientific method and pre-existing knowledge of the scientific field involved. The 'scientific problem' then determines what is relevant to the solution, to data, and to abstractions and generalizations that emerge. The relevancies of scientific inquiry are determined solely by the scientific attitude. Observations must also be interpreted in terms of their subjective meaning for actors. (p. 40).

Schutz (1973b, pp. 63–4) provided a detailed description of the interpretive social science method. Table 3.1 summarizes Schutz's work (1973a, 1973b, 1967) and incorporates common steps in interpretive qualitative research (Gephart, 2004, 2013). This framework is general because Schutz focused on establishing

philosophical foundations for an interpretive social science. Thus, he neglected methodological issues of how the actor's perspective is grasped, how interpretive social science models are to be tested and how theory originates in the experience of the scientist (Freeman, 1980, pp. 129–30).

The method begins with a first order description when a researcher observes the social world and describes members' commonsense constructs, methods and subjective meanings (steps 1–3). Next, (steps 4a and 4b) the researcher constructs typical course-of-action patterns that correspond to observed events (Schutz, 1973a, pp. 40–4 and pp. 63–4). These first order descriptions are coordinated to the 'personality type' (actor type) of the subject and this 'model of conscious action' is restricted to key elements of specific performances. Typical motives

Table 3.1 Framework for qualitative interpretive science research

LEVEL 1: COMMON SENSE CONCEPTS

1. Interpretive scientist gains access to everyday life site of actual social interaction of relevance to research and observes interaction as it naturally occurs in real life contexts.
2. Researcher uses field research and ethnographic methods including ethnographic interviews to develop thick and detailed written descriptions of actual interactions in real life context and records detailed descriptions of settings and conversations that occurred therein.
3. Researcher analyses data to discover members' concepts including key words, constructs and theories that explain the subjective meaning of everyday life settings and actions and develops first order descriptions of interactions and settings from actors' point(s) of view.

LEVEL 2: CONCEPTS OF CONCEPTS OF SOCIAL ACTORS: SCIENTIFIC KNOWLEDGE

4. Researcher reviews and analyses (interprets) concepts and theories in members' accounts from a distant or disinterested (scientific) perspective to induce via abstraction second order concepts, i.e. concepts of concepts of social actors that show patterns in first order descriptions of actors.
 - a. Researcher constructs ideal type models of social roles or positions of people participating in interaction in focal settings to analytically describe the interaction
 - b. Ideal type models are refined to include course-of-action models and motives ascribing typical notions, purposes and goals to ideal type models of actors in specified but general social positions
 - c. Constructed second order models are refined to insure they 1) capture and preserve (make recoverable) subjective meanings of members, 2) are logically consistent and 3) present human action in a manner understandable to everyday actors
 5. Researcher varies features of models to understand how variations in models lead (hypothetically) to variations in outputs or outcomes of interaction.
 6. Researcher examines data (prior data or new data) to ascertain if patterns of meaning and interaction provided in adduced theory are consistent with actual behaviours and interactions in real life settings that represent key aspects of ideal type models.
 7. Researcher relates or compares actors' and social scientific descriptions of behaviour and interaction to existing and newly created (inductively and abductively constructed) second order concepts and theories to refine or contest prior and new theories and concepts.
 8. Researcher formulates narratives, logically consistent and testable propositions or hypotheses that summarize via empirical generalization the findings and insights from first order and second order analyses.
-

are ascribed to the actor who is placed in the situation of interest. The analyst begins the second level analysis by creating constructs or models of actors in the form of ‘homunculi’ with prescribed in-order-to and because motives. The construction of these models is a central practice in interpretive social science and can be done using one or more of the commonly used qualitative analysis methods presented in Table 3.2. Table 3.2 highlights the uses of the methods for organizational science, cites empirical research using the methods and provides basic methodological references on how to undertake the methods.

The table presents commonly used strategies for interpretive social science research including ethnography and grounded theorizing. These well-developed strategies describe and then interpret members’ actual behaviours and first order meanings, the strategies are based on interpretive science ideas and the strategies offer congenial approaches to doing interpretive social science. But they are not necessarily the ‘best’ or only ways to do interpretive social science.

Once first and second order models are developed, the researcher confirms that the models are not arbitrary (step 4c). They must be constructed so that a human act performed in the real world by an actor, as indicated by the typical construct, would be understandable

in commonsense terms to that actor and others (Schutz, 1973b, p. 64). This insures compatibility with the constructs of everyday life. Models of social action must also be clear, distinct and fully compatible with principles of formal logic to make the models objectively valid (Schutz, 1973b, p. 64). The researcher also needs to ensure consistency between commonsense and scientific concepts.

Thereafter, one can vary the circumstances within which the model operates. For example, one can compare a model of a producer acting under unregulated competition with one acting under cartel restrictions and assess the output of each model. This allows the researcher to understand the different factors that explain empirical regularities (p. 65) and can be used to produce interpretive social science theory (steps 5–8).

This scientific analysis process was later labelled ‘abduction’: ‘the process used to produce social scientific accounts of social life by drawing on the concepts and meanings used by social actors, and the activities in which they engage’ (Blaikie, 1993, p. 176). Abduction is the analytical process that moves from lay descriptions of social life to technical descriptions of social life. Schutz never used the term abduction. But his extension of Weber’s (1978) ideal type methodology was important to the development of the

Table 3.2 Qualitative research strategies and methods of analysis for interpretive social science

<i>Application</i>	<i>Description</i>	<i>Interpretive Science Uses</i>	<i>Examples</i>	<i>Reference Sources</i>
Case Study Strategy	Detailed description of phenomenon and how it changed over time	Describe first order meanings Develop second order concepts Validate, elaborate or test theory	Orlikowski (1996) study of situated change at a software firm	Mills, Duerpos & Wiebe (2009)
Ethnographic Strategy	Insider description of a culture or micro-culture developed through participation in the culture	Produce rich and meaningful descriptions of actual organizational behaviour and first order meanings	Weeks (2004) study of the culture of complaints at a British bank.	Agar, M. 1980
Grounded Theory Strategy And Methods of Analysis	Inductive construction of theory from systematically obtained and analysed data	Identification of members' first order meanings using <i>in vivo</i> coding	Perlow (1997) study of work practices and time management of software engineers	Glaser & Strauss (1967) Locke (2002)
		Constant comparative analysis of theoretically sampled categories of data to develop second order concepts		Walsh, Holton, Bailyn, Fernandez, Levina & Glaser (2015)
Expansion Analysis Method	Line by line, data-driven interpretation of a text or transcript	Shows how background knowledge, sensemaking practices and first and second order concepts operate in text	Gephart, Topal & Zhang (2010) study of temporal sensemaking in a public hearing	Cicourel, 1980
Ethno-semantic Analysis Method	Structured approach to inductive discovery of folk terms and categories in ethnographic interviews and data	Identification and verification of first order concepts and their cultural meaning to members Construction of folk taxonomies	Boehlke (2005) ethnography of how tattoo parlour recruited customers	Spradley (1979) McCurdy, Spradley & Shandy (2005)
Interpretive Textual Analysis Method	Strategy for undertaking computer supported textual analysis	Identify first order meanings Develop second order concepts Statistically test and verify patterns identified through qualitative data analysis	Gephart (1997)	Kelle (1995)

'abductive' research strategy in social science (Blaikie, 1993, pp. 176 and 178). The overview of the abductive research strategy in Figure 3.1 highlights the multiple layers involved (Blaikie, 1993, p. 177).

The abductive strategy connects first level and second level constructs to integrate common sense, scientific knowledge and form theory in interpretive social science. For some interpretive scientists, reporting social actors' accounts is all that can or needs to be done to understand social life (Blaikie, 1993, p. 177). Others turn these accounts into descriptions of social life tied closely to actors' natural language. Still others 'will generate abstract descriptions, or even theories, from the descriptions produced from actors' accounts' (Blaikie, 1993, p. 177). But Schutz's abductive process is central to interpretive social science.

A key task for interpretive social science is to uncover the tacit mutual knowledge, symbolic meanings, intentions and rules that orient actors in the everyday world, and to avoid imposing an outsider view – as is done by positivist methods. This is difficult in many situations because much everyday activity is routine and carried out in an unreflective attitude. But when social life is disrupted or people are challenged to explain their behaviour, actors are forced to undertake sensemaking (Garfinkel, 1964, 1967) to reflectively search for and construct meanings (Blaikie, 1993, p. 177). Ethnomethodologists have developed 'breaching' procedures to force actors to engage in sensemaking, which makes their tacit meanings and theories explicit (see 'Ethnomethodology, sensemaking and interpretive practices' below). These 'breaching' procedures add a new methodological tool that allows interpretive social science to test and validate hypotheses about the nature of interpretive practices.

Ethnomethodology, Sensemaking and Interpretive Practices

Ethnomethodology is 'the science of sense-making' (Heap, 1976) that investigates

members' (ethno) methods for constructing and sustaining a sense of shared social meaning and order (Garfinkel, 1967). It does this by analysing the everyday methods people use to accomplish practical tasks (Coulon, 1995, p. 2). Ethnomethodology is not 'an "alternative" methodology' or theory (Turner, 1974, pp. 7 and 11). It is a proto-science (Lynch, 1993) concerned with understanding the taken-for-granted foundations of social order and how activity accomplishes a sense of the external world (Mehan & Wood, 1975, p. 5).

Ethnomethodology, originated by Garfinkel, builds on Schutz's phenomenology to specify 'elemental' interpretive processes that inform all attributions of meaning or sensibility (Freeman, 1980, p. 139). Garfinkel went beyond Schutz's focus on 'normal' or 'stable' social interaction: 'Procedurally, it is my preference to start with familiar scenes and ask what can be done to make trouble' (Garfinkel, 1967, p. 37). He thus created 'breaching' experiments that were designed:

to multiply the senseless features of perceived environments; to produce and sustain bewilderment, consternation and confusion; to produce ... anxiety, shame, guilt and indignation; and to produce disorganized interaction (Garfinkel, 1967, p. 38).

These experiments were used to test (and confirm) the necessity of using interpretive practices to produce and sustain normal social interaction. A well-known breaching experiment is Garfinkel's 'pre-medical student' experiment (1967, pp. 57–64), designed to systematically breach all the essential commonsense expectancies Schutz (1973a & b) identified and to create confusion for subjects in an interview situation.

In the experiment, Garfinkel (1967) posed as a 'medical school representative' and ran 28 pre-medical students individually through a three-hour interview to 'learn why the medical student in-take interview was such a stressful situation' (p. 58). After the first hour of the interview, Garfinkel played a recording of an 'actual' interview for each subject. The recording was a faked interview,

'the applicant was a boor, his language was ungrammatical, he was evasive, contradicted the interviewer' and bragged. The subjects were then asked to assess the recorded interview. Each subject was given contrived information from the applicant's (fake) 'official record' (1967, p. 59) that contradicted the principle points in the subject's assessment of the applicant. For example, if the subject said that the applicant was from the lower class, the subject was told that the applicant's father was a senior executive of a major firm. Student subjects were told that the applicant was admitted and doing well; that six psychiatrists had strongly recommended the applicant be admitted based on fitness for medicine; and that most students who had heard the recording agreed as well.

Most of the student subjects (25 of 28) were 'taken in' by the deception. They became anxious and bewildered, then tried to resolve the 'incongruities of performance data with vigorous attempts to make it factually compatible with their original and very derogatory assessments' (Garfinkel, 1967, p. 60). Seven of the 25 subjects were unable to resolve the incongruity of their views: 'their suffering was dramatic and unrelieved' (p. 63). Three students assumed there had been a deception and dismissed the incongruence. Twenty-two of the 28 subjects expressed 'marked relief – ten of them with explosive expressions – when the deception was disclosed' (Garfinkel, 1967, p. 64). Thus Garfinkel (1967) was able to demonstrate the importance that interpretive practices have for shared meaning and social order by systematically breaching the commonsense expectancies fundamental to social order.

Garfinkel used the results to criticize conventional positivist sociologies that treat commonsense interpretive practices as 'epiphenomenal'. Positivists incorrectly conceive of members of society as cultural or psychological 'dopes', who produce stable features of society by acting out pre-established scripts or by acting on the basis of their psychological biography and conditioning. Garfinkel's research (1967, p. 36)

empirically validated Schutz's (1973) insights, confirmed the importance of commonsense interpretive practices as foundations of social interaction, and related commonsense meanings and sensemaking to dimensions of social organization. He also provided strong evidence that social researchers should treat social settings as emergent situations, where social actors necessarily invent rational properties and interpretive procedures to deal with unfolding contingencies of situations.

Egon Bittner, a student of Garfinkel, extended ethnomethodology to address organization theory (Bittner, 1974). He argued (p. 70) that traditional sociology seeks to understand how well the intended formal structures of organization describe what is going on in organizations. The concept of 'informal organization' was developed in sociology to account for situations where formal structures did not provide for certain aspects of organization; for example, workers who routinely ignore a no smoking policy. Philip Selznik (1948) had pointed out that informal features of organization are needed to adapt to the impact of functional imperatives, but he failed to consider what the formal structures mean to lay actors and how they are used by them on a day-to-day basis (Bittner, 1974, p. 71). Bittner (1974) thus argued for the re-specification of the concept of organization, from the outsider conception of positivists to an interpretive conception of insiders' meanings. This could be done by using the postulate of subjective meaning to study how actors' terms and meanings are assigned to real objects and events in real scenes of interaction (Bittner, 1974, p. 75). This re-specification has been started (Gephart, 1978, 1993), but is an important and incomplete task for the future of interpretive social science.

CONTEMPORARY EXAMPLES OF INTERPRETIVE SOCIAL SCIENCE

The ideas above provide foundations for an interpretive social science of organizations.

And Garfinkel's (1967) breaching experiments show how ethnomethodology has developed a means to create and verify objective concepts of subjective meanings in ways that are 'intendedly replicable and the frameworks can be extended through empirical research' (Turner, 1974, p. 11). This section describes four examples of organizational research undertaken in a manner consistent with interpretive social science methods. I selected these studies to illustrate the methods, practices and findings of interpretive social science. Each study displays only parts of the interpretive social science model, but collectively they display all of the features.

Organizational Socialization

Van Maanen (1973) undertook an ethnographic study of police in their naturally occurring occupational settings to explore the relatively unexamined process of socialization into a police organization. Most previous information on police socialization came from questionnaire-survey research that addressed police attitudes. Van Maanen used a dramaturgical approach (Van Maanen, 1973, p. 408; Goffman, 1959) to conceptualize police and recruits as actors performing both 'on stage' and 'back stage'. He focused on the individual recruit's entry into the police organization, a point when the organization 'may be thought to be most persuasive, for the person has few guidelines to direct his behavior ... and is more readily influenced' than later in their organizational career (Van Maanen, 1973, pp. 408–9).

Van Maanen's entry to the field required a lengthy search for a police department that would permit him to complete police training and do police work as an ethnographer (Van Maanen, 1981). The study lasted for nine months. Three months were spent as 'a fully participating member of one Union City Police Academy recruit class', followed by four months as a back-seat observer in patrol units (Van Maanen, 1973,

p. 409). Van Maanen took extensive field notes, collected tales, and sought to learn the local culture of police from the inside: 'Only by entering into the webs of local associations does a fieldworker begin to glimpse the distinctive nature of what lies within and without these webs' (Van Maanen, 1981, p. 14). Most of his time was spent with a few squad members who became his key informants (p. 15). After training, he learned the symbols of membership in police culture: 'on my body, I still carried a badge and a gun', and 'dressed for the street as I thought a plainclothes officer might' (p. 15). He also learned informal police practices, including how to please the station sergeant to get favourable job assignments and the folk theories police have regarding police work. During his time with the police, 'They allowed me to watch what they did and I let them do it' (p. 17). He thus gained an insider's view of the subjective meanings of police work and yet kept a disinterested perspective on police and himself: 'I have tried to come as close to police as possible without being one of them and to stand as far away from the police as I could without leaving the planet' (1981, p. 17).

Van Maanen (1981) faced the tasks of writing ethnography and producing scientific knowledge once the fieldwork ended. To end fieldwork 'is to distance one's self from the people studied' (1981, p. 18). 'At the point of their departure, I suspect most fieldworkers begin to seriously question their data base and express some grave reservations as to both its quantity and quality' (Van Maanen, 1981, p. 18). Faced with the challenge of 'putting together and writing up what I have discovered in the field' (p. 21) he developed two analytic goals to order his materials: (1) 'presenting the linguistic and conceptual categories used by the police to think about and express themselves' (p. 21); and (2) attempting to 'present the patterns of action relevant to given cognitive categories' (p. 21) to describe the social organization of police activities.

Using data at hand and the first order concepts and theories of police, Van Maanen developed a second order, ideal type model of four 'analytically distinct' stages in police recruit initiation: choice, introduction, encounter and metamorphosis (Van Maanen, 1973, p. 409). These stages describe the experiences and interactions of members, but extend beyond first order meanings to include typical motives and goals of common member statuses and analytical goals, including construction of a model of police socialization as it unfolds over time. The model is constructed to capture members' subjective meanings and Van Maanen (1973, 1981) keeps his 'theory' close to the everyday contexts and constructs studied. This study is an excellent example of interpretive social science research using abduction to transform actors' first level accounts into higher-order descriptions of social life tied closely to actors' natural language (Blaikie, 1993, p. 177).

Organizations and Status Transformation

Gephart (1978) undertook an auto-ethnographic study of how a researcher, in the role of organization leader, created and operated a university graduate students' centre (GSC). The research process involved participation in GSC activities, recording field notes on conversations and activities during one year of participant observation research, and analysis of organizational documents. The research eventually focused on the unexpected occurrence of a 'status degradation' ceremony: a meeting where 'the public identity of an actor is transformed into something lower in the scheme of social types' (Garfinkel, 1956, p. 420). In this case, the leader was removed from the role of manager of the centre and his status was transformed in a downward manner.

The research used second order ethnomethodological constructs concerning the concept

of organization (Bittner, 1974) and the process of status transformation and degradation (Garfinkel, 1956) to specify ideal type models of status degradation and the ideal type organizational schemes used to verbally construct organizations. The degradation case was then analysed using grounded theory practices (Glaser and Strauss, 1967) to describe, code and interpret patterns in the data. Analysis focused primarily on how members' constructions of the organization emerged, changed over time and were used in the degradation process. The core focus in the paper is a detailed transcript of the 'degradation work' that occurred at a committee meeting where the degradation process unfolded. A line-by-line interpretation of the discourse was prepared in order to understand how the interpretive concepts (Bittner, 1974; Garfinkel, 1956; Schutz, 1973a & b) explained the sensemaking that produced the degradation, including the practices involved in constructing enforceable schemes of organization warranting the degradation.

The research described the schemes of organization constructed by different groups at the meeting – degradation facilitators and resisters – and how these were developed and employed over time to interpret the leader's behaviour. Through this process, prior ideal type models of degradation and organization were validated by comparing the models to the observations. Then the model was refined into more elaborate second order concepts to reflect the insights from the specific study. In addition, a grounded theory model of the life history of a degradation process was developed from the data, using theoretical sampling and constant comparative analysis of different groups and second level organizational constructs.

The research confirmed the accuracy of prior conceptualizations of how meaning construction creates organization. It also provided insights into the higher-level construct of status degradation as one form of succession. This was done by connecting first order meanings to second order scientific concepts

and then generalizing to address the more abstract construct of incumbent succession in organizations. The research also provided testable propositions, models and a grounded theory of organizational succession built from the concepts of the concepts of social actors that could be evaluated (confirmed, disconfirmed or refined) in future research on other instances and forms of organizational succession.

The research was designed with Schutz's (1973a) framework in mind and reflects many features of the interpretive social science method. In particular, the data were coded and interpreted to discover members' concepts and theories and were used to develop a narrative of the development of the organization. Bittner's (1974) second order conceptualizations of models of organization and Garfinkel's (1956) ideal type process model of status degradation were compared to the data describing the observed processes. The research also used first order data to produce: (1) a grounded ideal type scheme of 'components of an organizational status degradation ceremony' (p. 569), (2) a schematic process model of the degradation process and (3) ideal type models of members' first order models of organizational reality.

For example, denouncers constructed the organization as a model of compliance (Bittner, 1974) by claiming that all rules demanded compliance, whereas defenders' construction was that rules were incomplete and could be disregarded or elaborated to meet contingencies. The models were shown to reflect the postulate of subjective meaning and the postulates of logical consistency and adequacy. Variations in the model emerged at different stages of the unfolding degradation – i.e. a series of prior, unsuccessful degradation attempts – that led to different outcomes for interaction. Previous sociological conceptions of organizational status degradation were shown to be useful in describing many features of the current degradation. The study findings showed the limits of past research on organizational succession and provided

additional new frameworks for understanding leader succession.

Technological Change

Barley (2015) supervised an ethnographic study to explore how technological change influences how work is done. Barley sought to describe and explain how sales encounters in the 'work system' of auto sales changed when the traditional face-to-face showroom sales approach was supplemented by the new 'online' (or Internet) approach, where customers used websites to research autos, select a dealer and negotiate pricing (pp. 37–8). Role theory and dramaturgical analysis, two interpretive frameworks, were used to understand 'how new technologies become entangled with the social', such that they reconfigured what Goffman (1983) called an 'interaction order: the situated, patterned and recurrent ways of interacting associated with a particular context' (Barley, 2015, p. 34). The argument is that technologies trigger change by altering the tasks workers perform and how they perform them (p. 32). The concept of roles is both a commonsense concept of actors and a second order, social science concept that connects subjective meanings of individuals with shared, commonsense meanings conceived collectively as 'ways of working together' (Barley, 2015, p. 34). Changes to roles change meanings and behaviour and thus change work systems.

Barley (2015, p. 35) also used a dramaturgical approach termed 'frame analysis' (Goffman, 1959, 1974) to highlight sense-making based on a 'definition of the situation'. A frame is defined as a general scheme of meaning that carries shared social meaning. Once people frame the situation, they can invoke the frame to interpret behaviour and can construct a 'line of action' to guide their behaviour. For example, framing certain places as auto show rooms both guides and limits the roles and appropriate behaviours in each setting. Participants use

their background knowledge to assemble a tacit 'script' – the plot of a recurrent activity that defines essential features of the parts or roles people play and establishes loosely prescribed expectations for behaviour in actors concerning how an interaction should go. When an encounter's dramaturgical elements change, scripts may change and if scripts change, the interaction order has, by definition, changed (Barley, 2015, p. 35). This approach to technological change shifts attention from technology to the system of actors, actions and interaction in which the technology is embedded.

Participant observation was undertaken in two California auto dealerships: a Chevrolet dealer and a Toyota dealer. The dealerships had separate sales staff for floor and Internet sales. The initial study focus was a comparison of different manufacturer-based sales cultures (Barley, 2015, p. 38). But initial data analysis found no important differences in dealerships. The researchers had also documented several Internet sales encounters that provided strong evidence of differences between floor and Internet sales that were consistent across the dealerships. For example, Internet sales encounters 'evinced little of the tension and animosity that often marked floor encounters' (p. 38) and the 'price seemed to be the first topic of conversation in Internet sales while it was usually the last topic of conversation during a floor encounter' (p. 38). The researchers then collected additional data comparing floor versus Internet sales encounters. Encounters were tape-recorded, transcribed and integrated with field notes.

A second analysis was then done to determine whether the presence of a technology had reconfigured the scripts, stage, props and moves the actors made in ways that sustained a different line of action (p. 36). The comparative analysis used Goffman's ideas as a guide to code (1) lines of action and (2) the major steps in the flow of the encounter, e.g. greeting a customer, taking a test drive. This produced a conception of the typical stages

of a floor versus an Internet sales encounter and constituted the encounter's script (p. 39). The researchers also noted two action types – 'sales moves' and 'customer moves' – that involved any talk or action the role players made to influence their role-others or shape how an encounter would unfold. 'Awkward moments', defined as interactions that disrupted turn taking or involved disrespectful behaviours, were also coded. A grounded theory analysis was done, based on actors' commonsense terms and interactions. This produced an ideal type second order model of the life history of each type of encounter (pp. 40–8) and general models of each action schema – sales moves, customer moves and awkward moments. Frequencies of occurrences of different types of moves and awkward moments were compared.

The analysis revealed that the floor sales encounter cast salesmen and customers as antagonistic negotiators (Barley, 2015, p. 48). Salesmen showed vehicles to customers and took them for a test drive before negotiating a price. Floor salesmen were prone to employing moves designed to pressure customers. In contrast, Internet salespersons assumed the role of price and information providers and customers assumed the role of price takers: the sales encounter resembled a common retail sales encounter (p. 48). Thus, the scripts of floor and Internet sales were inversely structured and the tenor of the floor sales was more tense and disputatious. Floor sales were considered by floor customers to be more stressful, contentious and threatening than were Internet sales encounters.

Internet sales customers found a more favourable experience than expected and felt more in control and less intimidated than expected (p. 50). Thus the Internet sales encounter 'transformed the work system in which cars are sold' (p. 51). It removed the encounter from face-to-face interaction, since it was only at the point of purchase that the customer and salesperson met. This re-scripted the sales encounter by removing the showroom stage from sales and substituting

telephone conversation for floor encounters. This re-configuration of the sales encounter 'changed the definition of the situation in ways that required salesmen and allowed customers to play their roles differently' (p. 51). The Internet sales encounter was no longer a negotiation, since the customer's information was gleaned outside the encounter and both salesmen and customers had similar and accurate information. Salesmen offered reasonable and competitive prices and had no need to pressure customers who arrived committed to buying a vehicle at the price quoted on the phone.

Barley's (2015) paper displays key features of the interpretive social science approach. Data collection involved observations of actual discourse between sales people and customers in these settings. Members' concepts and theories, as well as subjective meanings, were documented and a richly detailed first order description of auto sales was prepared. The study evolved when the initial hypothesis was not supported and a new hypothesis about technologically different sales methods was tested.

Ideal type models of the scripts and stages of the two types of sales encounter (floor and Internet) were constructed from first order coded data (pp. 40–8). The tenor of the encounters was confirmed by the talk and other behaviours constituting the actual 'moves' and 'awkward moments' of salespeople and customers. Analysis of these interaction segments provided insights into the different meanings the encounters had for participants in each encounter type. The detailed and repeated coding (p. 39) ensured members' meanings were captured and preserved. The concepts used to code data at the analytic level were comprehensible in commonsense terms and referred back to the first order constructs. The two models show how the varied scripts lead to different interactions and outcomes. Further, the data on moves and awkward moments reveal the 'in-order-to' and 'because' motives of salespersons and customers. Barley (2015, p. 49)

also provides data on the frequency of occurrences of moves and moments for each role that substantiates the inferences made about the differing social meanings of the encounters (Barley, 2015, p. 39, fn 13). Barley addresses the relevance of his approach to past and future research on technological change and confirms that Goffman's dramaturgical approach can be usefully applied to the study of the social meaning and implications of technology.

New Product Development

Dunne & Dougherty (2016) explore 'how innovators use abductive reasoning to create new products in the context of complexity' (p. 143). They define abduction as the 'the process of reasoning in which explanations are formed and evaluated' (Dunne & Dougherty, 2016, p. 135) and a 'style of research based on discovery and understanding, not prediction and testing' that is used to make sense of puzzling facts (p. 135). Abduction involves creating hypotheses based on mental models, making predictions and adjusting models to accommodate deviations from predictions then reframing problems.

The researchers conducted 85 interviews with scientists, technologists and managers doing scientific work developing new drugs. The goal was to understand how pharmaceutical and biotechnology company scientists formulated tentative hypotheses or models of the innovation process, evaluated them and reframed them. The interviews elicited accounts of how the scientists and co-workers conceived their work activities and provided 'people's stories of how they do their work of drug discovery' (p. 138). These accounts were used to discover the first order and intermediary models (p. 137) that development workers used to build better models of new drug development (Dunne & Dougherty, 2016). The researchers also describe their own 'cycles of abductive reasoning that

we used to figure out the role of abductive reasoning in complex innovation' (p. 137). Although Dunne & Dougherty's (2016) formal conception of abduction varies from Schutz's depiction (Schutz, 1973a & b; Blaikie, 1993), their research approach is similar to Schutz's description of the abductive process, where social scientists develop second order concepts and theories based on descriptions of first order everyday knowledge among lay actors.

The interview data provided the 'rationales and understandings of why things unfold as they do, rather than "objective" depictions of what they actually do' (Dunne & Dougherty, 2016, p. 139). The approach is suitable for interpretive social science because interviews can elicit members' conceptions and 'inside information' that guides their actions and can convey members' subjective meanings more directly than inferring these from observations where the researchers need to figure out what informants are doing and may impose their own interpretations on what is observed (McCurdy et al., 2005, p. 11). Also, 'the interviews comprise people's rationales for how they work and reflect their reasoning processes, which is what we build theory about' (Dunne & Dougherty, 2016, p. 139).

The analysis involved grounded theory (Glaser & Strauss, 1967), itself 'a process of abductive reasoning' (Dunne & Dougherty, 2016, p. 137). Grounded theory is not necessarily interpretive, since its concepts do not need to be derived from lay language (Blaikie, 1993), but it can be used to create scientific concepts from members' concepts as Dunne & Dougherty (2016) did in building their theory from everyday language use.

The researchers sought first order categories that captured facts of data on new product development. One category was the use of clues to imaginatively conceive of a configuration of interactions 'between a drug possibility, a disease, and the human body' (p. 142). A second category was the content of what innovators were looking for – a plausible pattern of interactions among

product elements that might produce a new drug. The third category was a dynamic of 'elaborating' and 'narrowing' of options by focusing on one category of compounds rather than looking at diverse structures (Dunne & Dougherty, 2016, p. 139). The researchers used abductive reasoning as a label because it seemed to describe the processes they had observed (p. 142) better than other theories.

The final model involved three second order social mechanisms that enabled the use of abductive reasoning to create new products: (1) using clues, (2) elaborating and narrowing, and (3) iterating across disciplinary boundaries to reframe the configuration of interactions (p. 143). For example, the use of clues led members to construct first order models of hypothetical drug development processes that their natural science background suggested might work. Elaborating and narrowing were driven by clues that made some hypothetical configurations more plausible than others. For example, a biology team leader described a breakthrough in developing a drug to treat a serious side effect of kidney disease. The team imagined a plausible configuration in which a smaller molecule could bind with a very large molecule and succeeded in 'imagining a new kind of drug' (p. 145). Finally, reiterating and reframing the imagined configurations occurred when disciplinary boundaries were crossed and information was provided from different perspectives: 'it is a reiterative process where the biologists will not only provide the data but can also tell us a lot about our molecules that we could not foresee' (p. 149).

Dunne & Dougherty (2016) display key features of the interpretive social science framework. They collected data on the workplace practices, first order constructs and theories of new drug development processes of their informants. They undertook interviews and analysed their data with grounded theory methods to uncover members' theories of how to successfully develop new drugs. They

developed second order concepts to integrate and explain the concepts and working theories of their informants. Members' theories tended to involve imagining hypothetical configurations of drug development-related features that provided plausible paths to success. The second order framework involved 'mechanisms' that propelled abductive reasoning forward and that both members and researchers came to see as promising bases for successful drug creation. Repeated and extensive comparisons of first order data with second order emergent concepts were undertaken to ensure the second order constructs captured and preserved members' first order concepts and meanings and were logically consistent in relation to one another.

The researchers substantiated their analyses through presentation of extensive data that reveal the patterns of meaning and action in their second order concepts that were consistent with first order data. The researchers also extended their framework beyond the current data to hypothesize 'barriers to abductive reasoning that, if removed, might enhance implementation' (p. 153). They described an ideal type drug creation process and conceived of hypothetical configurations that differed from those observed in the study to suggest alternative variations that might influence the outcomes of the innovation process. They also discussed how their emergent framework differed from many frameworks previously developed in the innovation literature.

CONCLUSION: THE FUTURE OF INTERPRETIVE SOCIAL SCIENCE

This chapter describes the interpretive social science method that originated in early sociology and that has been refined in recent years. Features of the method have been used in a wide range of important organizational research, although its use has often been more implicit than explicit.

There are several issues that qualitative interpretive social science needs to address to become more influential in organizational research. One issue is that the foundations of interpretive social science are based in phenomenological philosophy and sociology, areas that are difficult to comprehend for scholars who are not familiar with them. It is important for organizational scholars to become familiar with the foundations of social science research methods and to be trained to use this knowledge to further develop existing methodological approaches as an alternative to using an 'anything goes' approach to developing new methods for qualitative research. Also, the methodology of ideal types has a problematic label, since these models are not 'ideal' as in perfect, but are ideal by being abstract, parsimonious schemata that capture key features of actor and action types. Thus, a better understanding of the methodology of ideal types would be helpful for developing more explicit and systematic model building processes that are effective for descriptive and theorizing purposes. A further opportunity is to improve, clarify and refine features of the interpretive social science process and to better understand and explain how one moves from commonsense reasoning to scientific theory and then back again.

Also, it is important to adapt research methods to problems at hand rather than using rigid templates (Langley & Abdullah, 2011) and to be transparent in describing what was really done, rather than offering stylized depictions of methods that omit information about actual research practices. As Malterud (2001, p. 486) notes in the context of interpretive medical science, 'A thorough, well-prepared and well-documented analysis is what distinguishes [the] scientific approach from superficial conjecture'. Silverman (2006, p. 276) and Malterud (2001, p. 485) offer criteria for assessing scientific aspects of interpretive research and constructing transparent accounts of qualitative research methods that can help interpretive social

science scholars articulate the details of their methods. These methods are the foundations of social science practices and knowledge.

Finally, it is important to note that the interpretive social science conception of first and second order concepts differs from other conceptions of these terms. The 'Gioia method' (Gioia et al., 2012) exemplifies this difference. The 'Gioia method' focuses on concept development, not construct development (p. 16). The proponents see concepts as precursors to constructs and 'believe that focusing too much on refining our existing constructs amounts to sharpening the wrong tools' (p. 16). The Gioia method creates distance between first order concepts and second order themes and separates the commonsense view from the scientific view by labelling one view 'informant centric' and the other 'researcher centric' (p. 18). Themes trace a unidirectional path from data (first order) to theory (second order) (Gioia, et al., 2012). This contrasts with interpretive social science, which develops second order constructs from members' first order concepts and ensures that second order concepts preserve members' meanings and are understandable to them. The Gioia method also focuses on description, explanation and prescription (p. 16), whereas the interpretive social science method includes description, understanding, prediction and verification, and de-emphasizes prescription.

Further, the Gioia method uses traditional grounded theory coding, hence coding categories are not necessarily developed from members' terms and meanings (p. 20). And the Gioia method is portrayed as an inductive approach to concept development, in contrast to interpretive social science which uses formal logic, induction, deduction, retroduction and abduction to develop concepts and constructs. Another difference is the emphasis the Gioia method places on 'data structure' as the basis for theory building versus the interpretive social science emphasis on using the subjective meanings

of members and second order constructs for theory building. Further, the Gioia method uses 'box and arrow' representations of theory (p. 22) and prefers to avoid formal propositions and hypotheses. In contrast, the interpretive science approach uses ideal type models presented in narratives and tables, as well as formal propositions, to portray theory. Finally, the Gioia method focuses on the convincingness of research to readers as a foundation for rigor in contrast to the interpretive social science focus on the logic and integrity of research methods. These are not all the differences, but this discussion should encourage readers to examine how terms such as first and second order concepts are used in different methods.

To conclude, the debate concerning the appropriate methods for a social science of organizations has led many scholars to remain relatively silent about the prospects of developing an interpretive social science, although many scholars have quietly used features of the interpretive social science method to do innovative research. Many organizational scholars view quantitative and qualitative positivism as better choices to ensure publications in major journals and hence positivist perspectives remain dominant approaches to research. This belief leads to the privileging of positivist logics, quantitative data and natural science-like methods over interpretive logics, qualitative data and phenomenology-informed social science methods.

To offer a counterpoint to current beliefs, this chapter endorses Schutz's view of the primacy of interpretive methods over positivist methods and views qualitative data and analyses as foundational for – not subservient to – quantitative data and analyses (Gephart, 1988). Put simply, one cannot measure something without first knowing about the qualities of the measured entity, hence quantitative research cannot be undertaken without prior qualitative knowledge of phenomena. More broadly, Schutz notes that the methodological problem of how

knowledge is possible through natural science is a special case of the broader qualitative question of how scientific knowledge itself is possible. He argues that phenomenology has prepared the grounds for an essentially qualitative investigation of the principles that govern all human knowledge, including quantitative, positivistic knowledge. Further, he asserts that the qualitative, methodological devices of interpretive social sciences – the abductive method and method of ideal types – ‘might [be] better suited than those [quantitative methods] of natural science to lead to the discovery of general principles which govern all human knowledge’ (Schutz, 1973b, p. 66). Qualitative knowledge is thus foundational to understanding any form of knowledge and is privileged in interpretive social science.

The interpretive science of organizations can provide qualitative foundations for qualitative and quantitative research (Gephart, 1988) that contribute to answering the fundamental questions of how human knowledge is possible and how it is used. Interpretive studies in the sociology of science (e.g. Knorr-Cetina, 1981, 1999; Lynch, 1985, 1993) and technological innovation (Barley, 1986; Dunne & Dougherty, 2016) support Schutz’s argument by demonstrating how commonsense reasoning and situated meanings in organizational contexts are intertwined with and foundational for the production of scientific knowledge.

An interpretive social science approach could help shape organizational inquiry into an important field that links commonsense meanings, scientific theory and social practice in ways that provide well-substantiated knowledge. Interpretive science methods can discover and address important scholarly and societal challenges that positivist research and many other forms of organizational scholarship cannot resolve, much less grasp, due to their lack of consideration of the actual meanings social actors have and use in everyday life.

ACKNOWLEDGEMENTS

Special thanks to Anne Smith for very helpful comments and feedback that greatly improved the manuscript. Thanks also to Gina Grandy for her patience, helpful comments and encouragement.

Pragmatism: A Philosophy of Practice

Barbara Simpson

The word ‘pragmatism’ is commonly used in the English language to denote the practicalities of just getting on and doing what the situation demands. It seems to invite easy compromise, short-term expediency and taking the path of least resistance without the encumbrance of theoretical principles or values. In the context of research, it has often been used to imply an anodyne alternative that might be adopted when there appears to be no clear paradigmatic preference to guide the process of inquiry; in effect, it is presented as philosophically neutral, a ‘non-philosophy’ that skims over the surface rather than trying to resolve ambiguities in any of the assumptions underpinning different research questions and approaches. This is a vulgar conception of pragmatism that offers little reason for confidence in any knowledge claims that it may produce. By comparison, Classical Pragmatism, which is the subject of this chapter, is a thoroughly elaborated philosophy that accounts for the social experience of living and working together.

Henceforth, I will signify this specifically philosophical meaning with an initial capital letter, Pragmatism. As philosophies go though, it is unusual because it rejects formalisms and abstractions in favour of a genuine concern for how our worlds continuously unfold through our collective efforts to cope with the day-to-day exigencies of modern life. Pragmatism thus has considerable potential to inform those aspects of business and management research that are concerned with the dynamics of human and social practice.

The beginnings of Pragmatism can be traced to intellectual movements that were emerging globally in the mid-nineteenth century (Bernstein, 1972). These were exciting times when new developments in science, such as Darwin’s (1859) theory of evolution and Maxwell’s (1865) theory of electrodynamics, were firing the imaginations of scholars across all disciplines, opening up new ways of thinking about the ‘blossoming, buzzing confusion’ (James, 1890 [1952], p. 318) of our world. It was a time of great

flourishing, not only in philosophy and science, but also in the arts and literature. Pragmatism arose in the specific context of the post-Civil War United States of America. It proposed radically different ways of thinking about the future, the lives that citizens would live, how they should be educated, how they could give voice to their views and how they might engage in political processes. Democracy, education, liberty and justice were the central planks of the original Pragmatist movement, and arguably they still remain at the heart of contemporary culture in the USA (Menand, 2001). However, it is also fair to say that the reach of Pragmatism now extends far beyond its geographic origins, as a living philosophy that addresses human practice in any situation, regardless of its cultural or historical context.

As with any movement of thought, the precise origins of Pragmatism are buried in the myriad conversations amongst intellectuals of the day. However, four key contributors are generally recognised: Charles Sanders Peirce, William James, John Dewey and George Herbert Mead. They most certainly knew each other and discussed each other's work, but it was never their intention to form a 'school of thought' called Pragmatism. The differences between them were considerable, leading to a certain amount of ridicule amongst the philosophers of their day. For instance, Lovejoy (1908) claimed to have identified 13 distinct interpretations of Pragmatism from his own limited reading of Peirce, James and Dewey, while Chesterton (1908, p. 62) complained that if pragmatism 'is a matter of human needs ... [then] one of the first of human needs is to be something more than a [P]ragmatist'. On closer examination though, there are numerous threads that tie these Pragmatist philosophers together as a coherent group (see the list of classic Pragmatist readings provided at the end of this chapter). They were all concerned with the effectiveness of thinking/doing, where in their view, thinking and doing are as inseparable as two sides of the

same coin. They developed a future-oriented instrumentalism that starts from doubt, and proceeds through an experimental attitude of inquiry to construct emergent futures. At the same time, they were reformist intellectuals committed to the improvement of society. Both Dewey and Mead worked with Jane Addams, another recognised Pragmatist from this period, on the Hull House project. This exemplary model of the settlement-house movement was directed towards improving the lives of workers in the rapidly industrialising city of Chicago by promoting activism at the local level. To support this agenda, they developed a method of participatory democracy, which they described as a community of inquiry (Shields, 2003).

Commentaries on Pragmatism often map out a 'rise, fall, and rise again' pattern that saw these ideas relegated to dusty bookshelves by the mid-twentieth century, but then re-emerging in the neo-pragmatism of Richard Rorty (1980) and his student, Robert Brandom (1994). Whilst this narrative undoubtedly reflects the rise of analytic philosophy and the subsequent linguistic turn in social theory, it neglects developments in Pragmatist thinking that were ongoing throughout the twentieth century, as evidenced in works as diverse as those by Blumer, Cooley, Follett, Lewis, Miller, Rescher, Schiller, Sellars and Thayer, to name just a few. Today, Classical Pragmatism, which is distinguished from Rorty's linguistic neo-pragmatism by its attention to the situated doings, rather than just the sayings, of practice, continues to develop as a living philosophy (see for instance Aboulafia, 2001; Bernstein, 2010; Joas, 1993; Rosenthal, Hausman et al., 1999; Talisse & Aikin, 2008) that is continuously on the move. It is futile, therefore, to try to pin down a definitive definition of exactly what Pragmatism is; it is perhaps better understood as a celebration of pluralism that offers a multiplicity of enticing options for researchers who are seeking more dynamic and more processual ways of engaging with their research contexts and questions.

Doing full justice to all this rich diversity is an impossibility, especially within the constraints of a book chapter such as this, so in what follows I will attend specifically to those elements of Pragmatism that I have found most useful in my own research in the business and management domain. This is very much a personal perspective that is in no way intended to preclude alternative takes on what Pragmatism has to offer; indeed, I would encourage others to mine their own interpretations from this philosophically rich vein. I begin in the next section with an analysis of where Pragmatism ‘fits’ in relation to other philosophical positions that commonly appear in the social sciences. I then go on to tease out a set of six inter-related theoretical concepts that have potential to directly inform the study of organisational and management practice as thinking/doing. The chapter concludes with a brief survey of how Pragmatism has already been used in some of the disciplines of business research.

THE PHILOSOPHICAL DIMENSIONS OF PRAGMATISM

The underpinning assumptions that characterise Pragmatism may be summed up as a radical commitment to a non-reductive naturalism, which is anti-foundationalist, anti-dualistic and emergent. From this perspective, we are always already active in the natural world, so the meanings that we attach to life are never independent of our own actions and collective histories, and neither can they be reduced to entities that have any independent ontological reality. William James (1912 [2006]) argued that empirical engagement with a world that is in continuous motion entails direct experience gained through immersion in the situation of concern, unmediated by theoretical constructs or abstractions. It is continuity in the flow of experience that, in his view, defines the reality of nature. He contrasted this with

the rationalist tendency to partition experience into discrete and unconnected things, which produces a static snapshot of the world in an instant of time. For James, a radical empiricist attitude

must neither admit into its constructions any element that is not directly experienced, nor exclude from them any element that is directly experienced. For such a philosophy, *the relations that connect experiences must themselves be experienced relations, and any kind of relation experienced must be accounted as ‘real’ as anything else in the system.* (1912 [2006], p. 20, italics in original)

This emphasis on continuity and process is a unifying theme in Pragmatist thinking, albeit that individual writers express and explore it in their own unique ways. Pragmatism may thus be subsumed under the umbrella of process philosophy, which is an area of growing scholarly interest in organisation studies (Helin et al., 2014).

An immediate corollary to this naturalistic view of a world-in-process is the rejection of foundationalist assumptions about knowledge as ultimately founded on justified beliefs and immutable laws of nature. For researchers working from a reductive perspective, these laws are understood as essential building blocks that permit truths to be revealed about the complexities of nature. However, if nature is perpetually evolving, not only can there be no enduring laws, entities, nor indeed any other pre-determined stabilities, but also there can be no beginning nor end point to the process. Nature is then understood in terms of the dynamic inter-plays between its co-evolving aspects, where both the whole and the parts are in continuous, co-constructive engagement. The particular insight that the Pragmatists bring to this evolutionary dynamic is to understand the continuity of nature not only as a mere product of history, but also as a function of what we anticipate may happen next. In other words, we make bets on how the world will be tomorrow, and it is these bets that shape our actions today (Menand, 2001).

This idea was first articulated by Peirce in what has come to be accepted as the original Pragmatist maxim:

Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object. (1878, p. 293)

In an ever-changing, probabilistic world then, far from being the immutable facts proposed by Descartes, the beliefs that guide our actions are our best guesses, or bets, about how things will turn out if we act this way or that. Whereas rationalists assume a strong teleological view in which outcomes are largely pre-determined, Pragmatists adopt a more fallible, short-term, non-intentional teleology that blends outcomes and actions as co-evolving aspects of a world-in-process (Simpson, 2009). By rejecting the philosophical claim that knowledge must have foundations, Pragmatism challenges the epistemic principles that are commonly used to describe how knowledge may be objectively grasped and represented (Talisie & Aikin, 2008). It offers instead a view of knowing as a social and situated accomplishment that both shapes, and is shaped by, the lived experience of knowers; in other words, epistemology and ontology cease to be distinct philosophical categories.

Dualisms distinguish between two epistemological categories of nature that are seen as mutually excluding opposites. For instance, Descartes' distinction between mind and body and Aristotle's separation of practical action (praxis) from scientific reasoning (theoria) are examples of dualisms that have profoundly influenced Western philosophy. Also in the social sciences, dualisms such as micro and macro, individual and collective, change and stability, art and science, are all well established. The making of such distinctions is, of course, an essential function of language, but when a linguistic clarification becomes fixed as a habit of thinking, the world is reduced to a set of bounded

entities, which at best offer a greatly simplified representation of the objects and ideas, the 'things', that constitute meaning. The anti-dualistic stance in Pragmatism is a critical response to this 'thingification' of lived experience in a world-in-process. Dewey, in particular, took up this cause, reworking and refining his arguments throughout his long working career. For instance, in his early critique of the reflex arc, Dewey (1896) challenged the familiar stimulus and response dualism in psychology. Using as an example a child reaching out to a burning flame, Dewey protested that an analysis which starts with the sensation of light as a stimulus, which then elicits the response of grasping the flame, which in turn results in a burning sensation that stimulates the response of withdrawing the hand, and so on, provides nothing more than 'a patchwork of disjointed parts, a mechanical conjunction of unallied processes' (1896, p. 358). In his view, the stimulus/response dualism slices across the dynamic unfolding of the situation, reducing it to a contrived series of discrete and static instants in time. He offered an alternative perspective in which the movements of sensory-motor coordinations are taken to be ontologically prior to both stimulus and response, so it is these movements that reveal the empirical qualities of experience. In order to capture unfractured continuity then, rather than defining 'things' in dualistic terms, Dewey conceived them as unfolding and interweaving histories, or trajectories, that are made manifest within the possibilities afforded by any given situation (Dewey & Bentley, 1949[1960]). 'Things' may then be re-conceptualised as performative adjustments within the ongoing flow of practice.

Pragmatism's commitment to continuity calls for ways of theorising practice as a never-ending process of transformation that weaves stability and change together into some sort of unified but ephemeral fabric. Stability and change are not conceived here as alternative or competing 'pictures' of the world, but rather as complementary tools that

work together to facilitate action. It is in their interplay that novelty emerges and situations are transformed, and without emergence there can be no possibility of emancipation or social improvement. This notion of emergence as fundamental to the Pragmatist project is most clearly evidenced in Mead's thinking about the function of creativity in evolutionary processes (see Joas, 1996). Mead set out firstly to counter classical foundationalist assumptions that for emergents to appear in an evolutionary process, they must have been immanent from the outset, and secondly to challenge vitalist assumptions that emergence implies mysterious forces at play. For him, creativity emerges in the social dynamics of practice. It is when we figuratively stand in the shoes of someone else, 'taking the role of the other' (Mead, 1934, p. 254), that we reflexively realise alternatives for further cooperative action; and equally it is when different past and future trajectories interact in the present that new directions emerge as turning points, or qualitative changes in the flow of action (Simpson, 2014). Practice is thus conceived as a social and improvisational process that is accomplished within the spatial and temporal dimensions of living contexts. Mead's unique contribution to the Pragmatist understanding of emergence lies in his radical departure from classical ideas of time in order to develop a social temporality in which trajectories of movement are works in progress, continuously re-constructed in the activities of social engagement (Garud et al., 2015).

The picture I have painted here of the philosophical underpinnings of Pragmatism, although resonating comfortably with the lived experience of practice, is nevertheless quite distinct from more familiar 'paradigms' of research. What then is 'real' from a Pragmatist perspective, and how can we know this reality? Putnam (1990) argued that Pragmatism's ontological commitment is constructed within conceptual frameworks, the continuing relevance of which is dependent upon their pragmatic value in guiding our best bets on what will happen next. Thus,

although no description of the world can be inherent in nature, it can still matter to the extent that it serves human interests and purposes. It is inevitable that what serves as real will emerge over time and as situations vary, which in turn challenges conventional notions of causality. Putnam coined the term 'pragmatic realism' to capture the non-reductive pluralism of this mild form of realism, and its capacity to accommodate the continuity of emergence. He was at pains to emphasise, though, that pragmatic realism does have explanatory significance in the day-to-day unfolding of practice, so it must not be dismissed as unfettered relativism.

To appreciate the philosophical differences implied by a Pragmatist approach to research, it is helpful to compare it to other approaches commonly used in the business and management domain. Burrell & Morgan (1979) mapped out what they saw as the range of possible paradigms available to organisational analysts. They used a 2x2 matrix that differentiates between Functionalist, Interpretive, Radical Humanist and Radical Structuralist paradigms, each of which is defined in terms of its own unique combination of ontology, epistemology, assumptions about human nature and methodologies. In the intervening years, this matrix has been widely used by researchers as a philosophical positioning tool, but it is also increasingly criticised as an over-wrought and incomplete image of the world – one that privileges modernist assumptions about the nature of reality at the expense of more postmodern sensibilities in research. Although Burrell and Morgan did locate a number of different theoretical approaches on their paradigm map (see 1979, pp. 29–30), they did not include Pragmatism in their original analysis. Given, however, that their framework is based on two dualistic distinctions (between Objective and Subjective, and between Regulation and Radical change) and a representational rather than a performative logic of inquiry, it is difficult to see any possibility of a fit for Pragmatism, with its anti-foundationalist and anti-dualistic orientation.

This lack of fit invites researchers to liberate themselves from the constraints of Burrell and Morgan's framework in order to appreciate other philosophical perspectives that may be more sensitive to the postmodern problematics of continuity and flow (Chia, 1995).

SOME KEY CONCEPTS IN PRAGMATISM

In the preceding section, I have laid out the distinctive philosophical features of the Classical Pragmatist project. I now turn to examine six theoretical concepts in Pragmatism that I have found useful in the empirical study of practice in business and management – abduction, inquiry, habit, social selves, gestural conversation and trans-action. The presentation of each of these as a discrete concept must, however, be understood as a purely heuristic device; in practice, they are better understood as interweaving and co-constructing dynamics.

Abduction

Much of Peirce's writing on Pragmatism was concerned with eliminating ideas that are doubtful or unclear, and clarifying ideas that may be difficult to apprehend (Peirce, 1965: Volume 5, para. 206). As part of this process, he proposed abduction (sometimes also known as retroduction) as an inferential logic

that complements and extends deduction and induction. It is, he argued, the process of forming an hypothesis to explain a given situation; abduction is a creative leap, 'an act of insight' that 'comes to us like a flash' (1965: Volume 5, para. 181). It is the only conceivable source of novelty in thinking/doing as it suggests the possibility 'that something *may be*', while 'Deduction proves that something *must* be [and] Induction shows that something *actually is* operative' (1965: Volume 5, para. 171, italics in original). Peirce illustrated the syllogistic differences between these three logics using the example of a bag of beans (1965: Volume 2, para. 623):

Here, the logic of deduction proceeds from a general rule (all the beans in this bag are white) to the prediction of a particular outcome (these beans are white), while inductive logic works in the opposite direction, drawing a general rule from particular observations. By contrast, abductive logic lacks the certainty of deduction or induction; rather, it brings new insight by suggesting a possible explanation for observed events (these beans are [may be] from this bag). Whilst deduction and induction are adequate inferential tools for a world that already exists, the emergence of a world-in-process cannot be accounted for without the logic of abduction. Returning to Peirce's original Pragmatist maxim, the practical effects that any object may have are anticipated abductively as hunches, or bets that we place on the future. '[I]f we are ever to learn

Table 4.1 Three logics of inference

Deduction	Rule	All the beans from this bag are white
	Case	These beans are from this bag
	∴ Result	These beans are white
Induction	Case	These beans are from this bag
	Result	These beans are white
	∴ Rule	All the beans from this bag are white
Abduction	Rule	All the beans from this bag are white
	Result	These beans are white
	∴ Case	These beans are from this bag

anything or to understand phenomena at all, it must be by abduction ... every single item of scientific theory which stands established today has been due to Abduction' (Peirce, 1965: Volume 5, paras 171–2).

Peirce likened abduction to detective work, which depends not only on observing the fine details of the situation, but also on formulating plausible explanations for these details.

I perform an abduction when I so much as express in a sentence anything I see. The truth is that the whole fabric of our knowledge is one matted felt of pure hypothesis confirmed and refined by induction. Not the smallest advance can be made in knowledge beyond the stage of vacant staring, without making an abduction at every step. (Peirce, quoted by Sebeok & Umiker-Sebeok, 1988, p. 16)

The skill of the detective, as exemplified for instance by Sherlock Holmes, is to gather many small observations and to abductively infer their possible consequences within this ever-changing fabric of knowledge. By testing each of the logical components of an hypothesis one at a time, the detective meticulously reduces the uncertainty of the situation. It is precisely this reduction of doubt that Peirce saw as necessary if we are to 'make our ideas clear' (1878). Within the domain of business and management research, the importance of abductive logic has been recognised in generating new theory (Locke et al., 2008) and indeed, as a critical element in all scientific reasoning (Mantere & Ketokivi, 2013). Whilst it is not a research methodology in its own right, abductive logic is always required when researchers seek explanations for the unexpected and surprising events in their experience (Agar, 2010). To the extent that practice is understood as emergent then, the inherently creative concept of abduction is what links practice to theory (Joas, 1996).

Inquiry

For Peirce, 'inquiry' is a process that is initiated when there is doubt, and completed when

this doubt is resolved. It is a learning process in which meanings are reconstructed in the continuously evolving relationship between practice and context. Doubt signals some sort of deficiency in the continuity of practice/context, which in turn invites the generative action of inquiry. Whereas Peirce saw it primarily as a logical process for clarifying ideas, Dewey took the concept of inquiry much further, developing it as an existential, rather than merely cognitive, process that transforms what he called 'the situation', which is the whole set of conditions out of which actions emerge, into something new. 'Inquiry is the controlled or directed transformation of an indeterminate situation into one that is so determinate in its constituent distinctions and relations as to convert the elements of the original situation into a unified whole' (Dewey, 1938 [1986], p. 108). He maintained that inquiry is pervasive in all human experience. 'In everyday living, men examine; they turn things over intellectually; they infer and judge as "naturally" as they reap and sow, produce and exchange commodities' (1938 [1986], p. 106). The difference between common-sense inquiry and scientific inquiry is, in Dewey's view, simply a matter of their respective subject matters; both, he argued, share the same basic structure of inquiry. It is valuable then, for us as researchers to delve deeper into what this structure is.

Inquiry begins with doubt, which is experienced as an existential unease, or a felt sense, that arises when our bets on what will happen next prove to be inadequate. The first phase of inquiry involves finding an explanation for this sense of unease by structuring it as a problem of some sort. In this sense, inquiry precedes more familiar 'problem-solving' processes or techniques, for which the problem is given at the outset. Using abductive logic, explanatory hypotheses are inferred; their veracity is then tested using deductive logic; and, finally, inductive logic confirms that the hypothesised relations are indeed at work. Thus, from beginning to end, inquiry is grounded in the temporal unfolding of

practice. All three of the inferential logics, abduction, deduction and induction, are here involved in a continuous interplay that produces what Dewey called ‘warranted assertions’, a term that acknowledges the tentative nature of all knowledge as it is continually challenged in emerging situations. This understanding of the provisional nature of knowledge is a clear rejection of ‘spectator’ epistemologies that seek certainty by locating the observer in a fixed position outside the flow of action. Rather, the researcher is invited to plunge in as a participant in the emerging inquiry. In contrast to much of the contemporary advice on research methods, which advocates either an exclusively deductive, or inductive, or sometimes even a purely abductive approach, inquiry offers a more comprehensive understanding of human experience and practice in which all three logics of reasoning are engaged. It is the interplay between these logics that gives inquiry the dynamic potential that has been recognised and valued by business and management scholars working in organisational learning (Elkjaer, 2004), experiential learning (Miettinen, 2000), and routines theory (Cohen, 2007; Winter, 2013).

Habit

Every inquiry involves habits of action that function as both a resource and an outcome of the process. It is habits that allow us to anticipate what will happen next, and they guide us in taking actions appropriate to the current situation. The ‘what next of chief importance is the one nearest the present state of the one acting. ... Now the thing which is closest to us, the means within our power, is a habit’ (Dewey, 1922/1957, pp. 36–7). In theoretical terms, habits are commonly thought of as automatic reflexes that require no conscious thought; they are seen as mechanical, recurrent and predictable patterns of behaviour that are idiosyncratically individualistic; and once established, they remain as permanently

fixed features of an individual’s conduct. Defined in this way, it is difficult to integrate the notion of habit into the dynamic continuity of inquiry as an emergent process. The Pragmatists, and once again particularly Dewey, set about re-defining habit as altogether more fluid, more lively and more social than the commonly held understandings. For them, habit is not a mechanical response to a given stimulus, but rather it is an acquired and mutable predisposition to act in certain ways in certain situations; it is ‘an attitude of response’ (Mead, 1938, p. 3), not a rigid prescription for action. As such, habits are only ever loosely teleological, never fully determining how practice will unfold. In addition, they are themselves continuously modified as they are re-assessed in the moment-by-moment situational contexts of inquiry.

Although this is a very different interpretation of ‘habit’, Dewey preferred to continue using this term, arguing that

we need a word that expresses that kind of human activity which is influenced by prior activity and in that sense acquired; which contains within itself a certain ordering or systematization of minor elements of action; which is projective, dynamic in quality, ready for overt manifestation; and which is operative in some subdued subordinate form even when not obviously dominating activity. (1922/1957, p. 31).

A crucial feature of the Pragmatist view is that habit is an inherently social concept. Habits are not immaculately conceived; they are acquired as we engage with other actors in a variety of situations that influence both our own and others’ choices about what to do next. Dewey argued that the customs and institutions of society exist not as agglomerations of ‘individuals’ habits’; they arise because our predispositions to act are both formed and exercised in situations that are always already social. This active quality of habit provides a basis for moral society, where the values embedded in habits are always open to reflexive revision and cultivation. From a Pragmatist perspective, the values we live

by are warranted not by pure reason, nor by external fiat, and neither are they intrinsic to nature, but rather they arise in human conduct and the choices we make about what to do next. For Dewey then, if society is to thrive, it needs an education system that develops an experimental habit of mind to foster the critical intelligence required to respond in ever-changing circumstances.

Social Selves

It should, by now, be apparent that the Pragmatists were not seeking to theorise at either individual or collective levels of analysis. Indeed, they rejected this dualistic form of thinking in favour of a more holistic and dynamic approach that sees individual selves and their social situations as inseparable in the continuity of just getting on with living. In his social psychological theorising, Mead (1934) developed this idea of selves as ineluctably social by considering the self not as a discrete identity nor even a suite of interchangeable identities, but as a social process in which the conscious mind progressively unfolds and becomes manifest.

It is absurd to look at the mind simply from the standpoint of the individual human organism; for, although it has its focus there, it is essentially a social phenomenon; even its biological functions are primarily social. ... We must regard mind, then, as arising and developing within the social process, within the empirical matrix of social interactions. (1934, p. 133).

He argued that it is only through the social dimensions of living that we can become conscious of the self, because it is only by participating in social situations that we are able to stand back and see the self through the eyes of others as an object located within the social process.

Mead further elaborated this notion of 'the self as social process' by invoking two different aspects of the self, which he called the 'I' and the 'me'. Here he does not construct the

'I' and the 'me' as dualistic opposites on a common dimension of 'selfness'; rather they should be understood as a duality; that is, two completely different ways of experiencing the self. This distinction between dualism and duality is crucial to the Pragmatist project; whereas dualisms are epistemological phenomena that arrest the continuity of process, a duality identifies two ontologically different orientations that are incommensurable (Dewey, 1917). For instance, a common duality in the business and management literature is the distinction between ostensive and performative (or structure and agency) perspectives, where the ostensive view seeks to represent reality, while the performative view enacts reality in practice (Latour, 1986). This same distinction is evident in Mead's presentation of the 'I' and the 'me' as different aspects of the self (1934, pp. 173–8). He described the 'me' as the embodied habits of conduct that have been accumulated through social engagement, where habit is understood in the predispositional Pragmatist sense as mutable and acquired through experience. This is the objective, ostensive aspect of self, which is accessible as an object of deliberate, reflexive examination. The 'I', on the other hand, is the spontaneous, performative response of the self to the present moment. It is an anticipatory gesture that may either reinforce the habits of the 'me', or introduce novel alternatives. Whatever the consequences generated by the 'I', these ultimately may become embedded in the habits of the 'me'. In the process of inquiry both the 'I' and the 'me' are involved, with the 'I' introducing the abductive logic of what might be, and the 'me' reflecting the inductive logic of what is. 'The self is essentially a social process going on with these two distinguishable phases. If it did not have these two phases there could not be conscious responsibility, and there would be nothing novel in experience' (Mead, 1934, p. 178). It is in the interplay between the 'I' and 'me', then, that both selves and situations emerge.

Gestural Conversation

The vehicle for this interplay, Mead argued, is ordinary everyday conversation, in which signs and symbols including spoken and written language are used as communicative gestures in the ongoing construction of social meaning. Every such gesture anticipates a response by in some way participating in the other, by taking the other's role or by standing in the other's shoes; the response that is then called out is itself another anticipatory gesture. It is in the to-and-fro of gesture and response that we not only come to a clearer idea of the world-in-process, but we also develop the capacity for collaborative action.

[T]aking the rôle of the other, an expression I have so often used, is not simply of passing importance. It is not something that just happens as an incidental result of the gesture, but it is important in the development of co-operative activity. The immediate effect of such rôle-taking lies in the control which the individual is able to exercise over his own response. (Mead, 1934, p. 254; see also Mead, 1925)

The consequences of this control thus ripple out across social situations, whilst at the same time diffracting the rippling effects of other conversations. In Mead's view, community can take on 'an institutional form' (1934, p. 167) by means of 'the generalized other' (1934, p. 154), which is the attitude of a whole social group. This is what allows an individual to participate in the attitudes held in common in a community or organisation. For instance, Mead gives the example of players in a baseball game, for whom it is not sufficient to anticipate the moves of individual players; they must also be able to assume the attitudes of the whole team in order to improvise together in a coordinated way as the play proceeds. Without the generalised other, there is also no possibility for internalised conversations of gestures to occur, and thus no opportunity for abstract thinking. 'And only through the taking by individuals of the attitude or attitudes of the generalized other

toward themselves is the existence of a universe of discourse, as that system of common or social meanings which thinking presupposes at its context, rendered possible' (1934, p. 156). It is clear, then, that for Mead the gestural conversation must not be reduced to a purely inter-subjective, micro-phenomenon; rather, it is the motive force in the processes of building communities, institutions and societies.

Taking the role of another, whether this be a specific other or a generalised other, admits the possibility of at least temporarily standing in different shoes and experiencing the current situation differently. It is in perceiving differences between self and other that doubt arises, and this in turn may trigger a process of inquiry. For Mead, the experience of simultaneously occupying two different roles, or frames of reference, is a necessary requirement for any event to be considered social. He coined the term 'sociality' to describe 'the capacity for being several things at once' (1932, p. 75). This capacity appears not only as an ability to simultaneously occupy different standpoints, but also it has a temporal dimension, which Mead described as being 'betwixt and between the old system and the new' (1932, p. 73). Thus, doubt may also be triggered when we are confronted with changing situations where the old and the new are not in sync. By weaving temporality into the conversational dynamics of sociality, Mead has constructed a comprehensive theory of practice that focusses on relational movements across time and space.

Trans-action

In this final phase of my selective review of the complex jigsaw of Pragmatist thinking, I turn to the 1949 book that John Dewey co-authored with Arthur Bentley, late in the careers of both of them. They were interested in exploring differences between the various ways in which action may be theorised. In

particular, they recognised trans-actions as philosophically distinct from inter-actions (see also Emirbayer, 1997; Simpson, 2016). For them, 'inter-action' refers to a dyadic mode of engagement that is characteristic of the modern, rational, Western world. It describes movements in terms of 'particles or other objects organized as operating upon one another' (Dewey & Bentley, 1949[1960], p. 73) in a controlled environment that is independent of any wider context of space and time. This is a mechanistic image of action in which outcomes are produced by forces that act between objects, but which also leave the objects themselves unchanged. The game of billiards is the classic image of this form of action, where balls can influence each other's movements but remain unchanged in their own essential nature. By contrast, Dewey and Bentley's notion of 'trans-action' engages with the world-in-process by privileging flow ahead of 'objects' or 'things', which are always necessarily provisional and tentative. They sought a holistic account of lived experience such that "thing" is in action, and "action" is observable as thing' (1949[1960], p. 123). For them, trans-action is 'unfractured observation – just as it stands, at this era of the world's history, with respect to the observer, the observing, and the observed' (1949[1960], p. 104). Here the actor is continuously emergent within the flow of the integrated whole, which is itself emerging. Some interpreters of Mead's 'conversations of gestures' have treated this dynamic in inter-actional terms (e.g. Blumer, 1969), but his thinking is actually better accommodated by a trans-actional understanding of the relational and processual movements of meaning-making. Trans-action suggests a post-modern sensibility (Chia, 1995) that demands new ways of thinking and talking about experience and practice. In Dewey and Bentley's view, any effort invested in developing these new ways will be worth it, because it will open up the types of questions that are increasingly central to researchers today.

For example, although Pragmatism has often been criticised for its neglect of issues of power and authority, a central concern of business and management scholars, the inter-action/trans-action distinction, does invite some new ways of thinking about this perennial problem. The inter-action model represents the commonly accepted view that the force to act resides within specific individual entities, whether these be billiard balls, CEOs, political leaders, top-performing companies or dominant nations. This force to act is expressed as 'power over' (Follett, 1996, p. 103); that is, more powerful entities exert power over others. Power, then, is an attribute of individuals that may be acquired and possessed. By contrast, the trans-actional view is always already saturated in power, which is then manifest in the changing movements of flow as socially coordinated actions emerge. Here, power is in the situation rather than in individuals, and is itself constantly morphing as an expression of coactive 'power with' (Follett, 1996, p. 103).

Our task is not to learn where to place power; it is how to develop power. ... Genuine power can only be grown, it will slip from every arbitrary hand that grasps it; for genuine power is not coercive control, but coactive control. Coercive power is the curse of the universe; coactive power, the enrichment and advancement of every human soul. (Follett, 1996, p. 119)

The function of management development, then, is less to develop specific attributes in specific managers, and more about building the habit of working together as situations evolve.

PRAGMATISM IN BUSINESS AND MANAGEMENT STUDIES

In the preceding section I have mapped out just a few of the theoretical concepts that are encompassed within the scope of Pragmatist thinking. This breadth of vision has been taken up and continues to be developed in numerous disciplines including philosophy,

education, jurisprudence, public administration, social theory and political science, but surprisingly its impact in business and management studies remains muted. It does appear occasionally as a source of conceptual inspiration in sub-disciplines such as strategy (Powell, 2001, 2002), operations research (Ormerod, 2006), innovation (Nooteboom, 2012), creativity (Adler & Obstfeld, 2007; Arjaliès et al., 2013), new product development (Carlile, 2002), ethics (Martela, 2015; Wicks & Freeman, 1998), gender studies (Rumens & Kelemen, 2010), routines (Cohen, 2007; Dionysiou & Tsoukas, 2013; Winter, 2013), human resource management (Watson, 2010), and also in the philosophical underpinnings of sensemaking and organisational learning (Elkjaer & Simpson, 2011). At the same time, scholars are increasingly seeking better ways to engage process- and practice-based views in areas such as strategy-as-practice (Jarzabkowski & Spee, 2009), organisational knowing (Nicolini et al., 2003), leadership-as-practice (Raelin, 2016) and entrepreneuring (Steyaert, 2007), all of which call for more performative ways of working that can better engage with the flexibility and creativity of living organisational experience (James, 1912 [2006]; Latour, 1986; Lorimer, 2005). Whilst Pragmatism clearly offers an appropriate and useful way of approaching the dynamics of human conduct in social situations, there are still questions to answer about how to develop more relevant theories of organising, and how to conduct empirical work that engages more fully with the performative dimensions of social practice.

Recent theoretical developments include an article by Farjoun et al. (2015), which outlines an approach to new theory development that focusses specifically on Dewey's (1922[1957]) book, 'Human nature and conduct'. In so doing, the authors have acknowledged there is a task of translation to be undertaken in bringing Dewey's ideas alive in the domain of organisational theorising. Their argument is that through its recursive logic

and commitment to the emergent ephemerality of 'things', Pragmatism offers a fresh perspective on the dynamics of change and complexity in organisations, which is both richer and more realistic than alternative accounts drawn from rationalist and structuralist theories. To illustrate this point, they demonstrated how Pragmatist concepts may be used to address specific challenges in the organisation studies literature such as the agency/structure problem, and the boundary problems associated with defining conceptual categories. However, they also acknowledged that Pragmatism has even greater depths that, as yet, remain unplumbed by those organisational scholars questing for more dynamically informed theoretical ideas.

Whereas theoretical concepts offer ways of framing inquiries into the thinking/doing of situations, Pragmatism goes beyond this to seek a synthesis of theory with the radical empiricist possibilities of practice. It is in engaged practice that performative meanings are brought to life, shaping the ongoing continuity of social action. Empirical work in this performative tradition requires a close re-examination of all the usual methodological assumptions that we bring to bear in doing qualitative research, and in particular, it urges us to go beyond the static classifications and foundational assumptions of representationalism. In my own work, I have approached this problem by exploring the specific concepts that I have developed earlier in this chapter, but as sensitisations that influence my inquirer's gaze rather than as reductive theoretical constructs for elaboration. So for instance, Philippe Lorino and I have investigated the performance and implications of routines in the practical context of a manufacturing business that had recently introduced a computer-integrated manufacturing system (Simpson & Lorino, 2016). We accounted for an unfolding series of events by tracing the emergence and transformation of habits in a socially and temporally extensive process of inquiry. We identified the abductive turning points in this inquiry, probed the conversational dynamics

of thinking/doing and revealed the transactional engagements amongst the various actors, both human and material. Taking this approach allowed us to expand our thinking beyond the well-known surface features of Pragmatist philosophy to demonstrate how it works in practice, in particular developing more performative understandings of the particular situation of our inquiry. These understandings are, of course, embedded in the wider domain of Pragmatist thinking/doing, but they are given greater clarity by a sensitisation to key Pragmatist concepts.

Pragmatism's value to business and management studies is its particular resonance with questions relating to practice and process, where the field is still wide open to new inquiries and fresh insights. In my view, however, the potential for Pragmatism to inform practice research and management education is likely to remain fragmented and indistinct unless researchers are willing to engage a fresh methodological orientation that genuinely invites a theory/practice synthesis. In writing this chapter, I hope to invite adventurous inquirers to dive in and explore more of what Pragmatism may have to offer.

Critical Management Studies

Wharerata Writing Group¹

Li Min is a Chinese national studying in New Zealand.² To make ends meet she has held numerous part-time jobs in the hospitality and retail sectors where she has been sexually harassed, bullied, unpaid, poorly paid and illegally paid by various employers. Her experiences have led her to work voluntarily for the 'unite' union and lately she has been picketing Burger King Restaurants over their zero hours contracts (Treen, 2015).

Li is considering applying for a scholarship to study for a PhD in management. She is keen to see her studies contribute to addressing the problems she has encountered in her part-time work experiences. Her contact at the university's school of management has suggested she look for inspiration for her research project in some of the influential traditions that inform the critical study of management.

INTRODUCTION

The *critical* study of management begins with questions about the purpose of inquiry

and, particularly, whom research is in aid of. In some instances, critical study also attempts to change the conditions of organized life that are in question. Marx's popular aphorism that the job of 'philosophers' – whom we take to be all those deeply concerned with *the conditions* by which we live – is to change as well as understand the world, offers important historical steerage. In the spirit of Marx's words, our contribution to this volume maps the influential qualitative research traditions in the critical study of organizations and management *and* sets out how these traditions attempt to challenge and change the conditions they study. We do this from the perspective of a student, Li Min, who, as the brief narrative above notes, is about to set out on PhD studies.

In what follows, we discuss how Li Min's research work would be located in contemporary forms of five key traditions of critical study of management. We offer brief methodological and axiological guidance in each case. Our format borrows from Marta

Calás and Linda Smircich's influential chapter on feminist analysis in *The SAGE Handbook of Organization Studies* (2006) and from Prichard et al.'s presentation of the methodological choices available to those undertaking organizational discourse analysis (2009). Where our chapter differs is that as well as discussing the *mode of inquiry* that Li Min might adopt if she were to embrace each of the traditions, we also discuss the *mode of influence* that that tradition might suggest.

There are many potential research trajectories in each tradition. Given the space constraints, we have attempted to locate Li Min's work in *contemporary examples* of each of our five traditions, which are: Marxism, postcolonialism, discourse theory, psychodynamics and feminism. Each section begins with a short paragraph that adds a few extra details surrounding Li Min's PhD project and introduces the broad priorities and commitments of each tradition's mode of inquiry before locating the work alongside a key contemporary example. We conclude the chapter with a discussion of the various subjects positions the critical 'philosopher' of management and organizations might occupy when in search of both illumination and the reconstruction of the object of critical study.

FROM DIVERSE ECONOMIES TO ALTERNATIVE FORMS OF ORGANIZING: LI MIN GOES TO THE FREE FOOD STORE

Researcher's Location

Li Min's part-time work exposed her, in intimate detail, to the insecure working conditions and exploitative class relations of the food and retail sector. This led Li Min on a search for alternative forms of exchange relations, economic processes and organizing forms. A friend recommended she visit a

free food store in the Manawatu. Significantly different to a food bank and normal food shops or retailers, the free store is a charity organization that gives away surplus food donated by retailers and cafes to everyone who comes to the shop. The free store seemed to Li Min a very interesting example of an alternative form of organizing based around food (re)distribution. She wondered about the organizational and social dynamics of this example of alternative economic organizing as well as its transformative impact. She decided to volunteer as a worker for the free store and the organization agreed to let her study it as a research topic for her PhD.

Considering the deadlocks and unsustainability of dominant forms of organizing in neoliberal capitalist economies, there is an ongoing but growing interest among critical scholars in alternative forms, such as cooperatives, social movement organizations and even communes (Parker et al., 2014). Within this field, Li's study needed to question the nature and formation of exchange relations, and (re)distribution processes, and to understand how alternatives can co-exist in a capitalist economy alongside its tensions and contradictions. In what follows, we assume that Li Min took the diverse economies framework as the entry point for her PhD and decided to do a *critical ethnography* of this free store. Her purpose was to understand and contribute to the development of non-capitalist economies and we now set out the priorities and commitments she took from this approach.

Diverse Economies Framework

Capitalism is an economic system based on private accumulation to capital of the surpluses realized through commodity-based production and market exchange. As is rather obvious, capitalism is global and directly and indirectly shapes much of our lives and the planet upon which we depend. It

underwrites childhood and child rearing (Langer, 2002), shapes how we experience time (Smith, 2015), orchestrates the nature of our learning (Olsen, 2006) and organizes how we come to earn a living (Willis, 1977). It's easy to think of capitalism as a totally inclusive economic system; a system where lives involve a series of movements from one opportunity for capitalist exploitation to another. However, the more we assume that our economic relations are fully maintained by capitalist dynamics, the more we are stuck with the assumption of the unity, singularity and totality of capitalist hegemony (Gibson-Graham, 1996).

One consequence of such an assumption is that only 'way out', if imagined at all, is through some dramatic overthrowing of capitalism, in some hoped-for class war. Most activists and social scientists regard this as utopian fantasy (Graeber, 2012). Prominent among the group are the post-structuralist economic geographer Gibson-Graham. In their 1996 book, *The End of Capitalism (as we knew it)*, they argue that the job of the social scientist (PhD students like Li Min, for example) is to challenge *the discourse of capitalism*. Such work involves revealing the signifiers (meaning systems that structure our assumptions) that the discourse of capitalism needs to function, but which are carefully forgotten. The discourse of capitalism, for example, requires, and often forgets, family labour, public services and the long history of cooperative organizing, where *people's lives* are the purpose of economic relations rather than simply the source of surplus for capital. For Gibson-Graham, it is this capital-o-centricism that has the effect of making non-capitalist economic processes (cooperatives, family work, public goods, etc.) marginal and peripheral (Gibson-Graham, 1996, pp. 253–9).

This approach is significantly different from other Marxian-inspired theoretical positions in the critical study of organizations and management. The labour process tradition (Braverman, 1974; Cushen and Thompson,

2016), for example, is mostly concerned with the political processes within capitalist corporations.

Gibson-Graham followed up their deconstructive analysis of the discourse of capitalism with their work *A postcapitalist politics* (Gibson-Graham, 2006), where they set researchers and activists the challenge of demonstrating how non-capitalist activities co-exist alongside capitalist activities in order to (re)think, (re)imagine and (re)create performative alternatives that serve the needs of communities.

So, what kind of critique of capitalism is this and what kind of research practice does it suggest? The authors argue that a diverse economies framework is simply a technology that 'reconstitutes the ground upon which we can perform a different economy' (Gibson-Graham, 2008, p. 619). It is unashamedly an example of 'weak theory' that 'contains minimal critical content'. But what Gibson-Graham suggest is a *politics of possibility* for searching and enacting alternatives rather than simply negating and resisting what is given to us as 'Capitalism'. For instance, by analysing the free labour of academics and subscription fees in the capitalist industry of publishing journal articles, as communities of scholars we can search or enact non-capitalist alternatives based on open access articles, online journals, cooperative models or open review policies to perform our scholarship as examples of non-capitalist labour, enterprise, transaction and property.

Transformative Effects

The purpose of this critical theoretical framework is quite simply to challenge and change the hegemonic presumptions about the economic system that surrounds us. In Gibson-Graham's own words, this 'involves making credible those diverse practices that satisfy needs, regulate consumption, generate surplus, and maintain and expand the commons, so that community economies in which

interdependence between people and environments is ethically negotiated can be recognized now and constructed in the future' (Gibson-Graham, 2008, p. 623).

Gibson-Graham's projects often involve participatory action research (see Gibson-Graham, 2006, Chapters 6 and 7). In Li Min's case, a critical ethnographic approach might be used (see Ybema et al., 2009), where the aim is to challenge the taken-for-granted assumptions shaping social relations, meanings and identities in the given organizational context and, if possible, to transform organizational and social relations by acknowledging the central role of actors and asking 'what could be rather than what is' (Jordan & Yeomans, 1995; Nyberg & Delaney, 2014).

In the case of the free food store, it may be neither an ideal/model organization, nor a pure non-capitalist organization. While the store is an example of non-capitalist communal charity enterprise, it relies on the donations from retailers of over-produced food. While analysis of the free store highlights the over-production and waste at the core of capitalist consumerist society, and the development of responsible business practice by some retailers, the free gifting of surplus food through volunteer labour also helps us to rethink capitalist labour and exchange relations. Normal relations involve wages for labour and money for commodities. The free food store shows how differences can develop in opposition to common assumptions and practices. Thus, as a part of diverse economy, studying a free store may have various outcomes for transformative potential, such as reconsidering and experimenting with the roots and terms of the capitalist economic processes including marginal cost, economies of scale, waste, profit, consumption, surplus and distribution. In the process, such research might help to contribute to changing exchange relations in the capitalist economy that fit the needs of the community and support alternative political and ethical agendas (See Gibson-Graham et al., 2013; Cameron & Healy, 2013).

LI MIN AND POSTCOLONIAL THEORY

If the above strand of contemporary Marxism sends Li Min on a search for alternatives to capitalist organizations, then Postcolonial theory sends Li Min on a search for a new form of *global subjectivity*. For this tradition, capitalism is one part of a world constituted under colonialism, initially at least in the name of a 'civilising mission' through ideological hegemony and violence. Much of this tradition remains. Many argue that since the Second World War, with its world policies of development and modernization, our subjectivity has been shaped by the discourses of globalization and the project of multiculturalism (Said, 1978; Spivak, 1988; Escobar, 1995).

Such discourses could be said to govern Li Min's life. They make her relocate from China to New Zealand, to pursue education under the authentic English curriculum, almost essential for the career she is hoping to secure. They make her subject to the detailed immigration rules imposed on a student visa and, consequently, she fears becoming 'illegal'; she is unwilling to report exploitative employers and more readily accepts work on a cash basis. But this does not necessarily mean that Li Min is being *defined* by this subjection. Her work on the Burger King protest brought her into contact with other students, and together they formed a group aiming to support international students involved in employment disputes.³ But the question for her was how to develop a research topic around such concerns?

Li Min's PhD research is inspired by postcolonial theory. It problematizes our relations to *specific spaces* and locates *our-selves in historical, social and cultural conditions*. In other words, postcolonialism problematizes identity, subjectivity and agency. Particularly, it works with those who – through the discursive practices of the West (Said, 1978; Spivak, 1988) – were once homogenized as 'Others'

(non-Western) and categorized as fixed and incomplete, but who are now ‘speaking back’ (Calás & Smircich, 2006, p. 317).

This is not to assume that colonial conditions have ended. Colonial hegemonies continue in real-life politics, in economic relations with the surpluses of far-flung global value chains accumulated by the West – rather than the rest – and around the politics of knowledge (cf. Ahmad, 1995; Awatere, 1984; Foly, 2011).

Subaltern Postcolonial Studies

So, what kind of speaking back is possible and what kind of research practice does this involve? Some scholars (Bhabha, 1994) point to the hybrid responses to neo-colonial economic and epistemological domination; others are less certain and point to ambivalence and mimicry as expressions of the mind-set of the colonized. Celebrated post-colonial scholar Gayatri Chakravorty Spivak argues that for the colonized, the ‘subalterns’, their political agency needs to be associated with dominant groups; therefore, homogenizing factors of identifications become essential for them. She concludes that subalterns cannot represent themselves (1988; cf. Mir & Mir, 2014).

According to subaltern studies, cultural differences and institutionally produced divisions such as ‘citizen’, ‘immigrant’ and ‘refugee’, are inherent features of social relations of postcolonial states. Therefore, the collective identity of subalterns (colonized workers, for example) emerges as a category or community in response to everyday cosmopolitan politics of life (Chakrabarty, 1989; Guha, 1989). This line of inquiry is concerned with theorizing communities’ actions and alternative discourse. Drawing from this perspective, the researcher is drawn to work on how solidarity and political action by the colonized is constituted – such as with the Unite Burger King protest mentioned above – and other areas where deviations from conventional

subordination are located. This work thus challenges Spivak’s assertion and shows that the subaltern, the colonized, can (actually) speak.⁴

Transnational Postcolonialism

Alternatively, Li Min might turn to Transnational postcolonial theory. This locates the colonized subject as a series of factions, such as: indigenous communities, immigrants, refugees, undocumented people living in border areas and precariat workers. Li Min and other international students fall into this category. As temporary immigrants, they work and pay taxes, which implies they are in active relations with the state and business (Mir & Mir, 2014). Such a ‘factions’ approach would explore the politics of multiculturalism of neoliberalism, with its politics of multiplicities of locations and entities – local, national, regional, and global, as well as state and stateless condition – and how both interact with class, gender, race, ethnicity and sex – social sub categories – within the axis of a single global economic regime. Such an approach would investigate the interplay of neoliberal regimes and how they impose gradations on individuals’ status. Such work might address the differentials in the agency and vulnerability of particular groups; for example, women as contingent workers (Brah, 1993; Calás & Smircich, 2006; Chio 2005; Holvino, 2010; Ong 1987). Transnationalism claims that an international division of labour is entangled with the issues of gradation of citizenship rights and flexible citizenship. Evidence of this is found in the conditions of workers employed in the Special Economic Zone in the case of the South, or, for example, employees recruited from Asia in the USA’s Silicon Valley (Ong, 2006). Workers employed in a global fast-food chain, for example, are in a similar situation.

In that sense, Li Min might connect her work situation with that of the suicides among workers at Foxconn iPhone factories

located in the Special Economic Zone of Shenzhen province in China. But Li Min's actions in forming an International Students Committee, and thus taking part in political society, allow some redefinition of active relations with the state and business, both locally and globally, and theorize such work as forms of multiple location resistance (Escobar, 2011).

Research Strategies and Transformational Effects

Such traditions of theorization suggest research strategies and tactics that involve close investigation and political action *with* subordinated groups. Inevitably, they suggest ethnographic and action research strategies with the purpose of creating transformational effects for those involved. In other words, the purpose of such research is to support the agency of the subaltern/colonized with a primary focus on interrogating and challenging ideological constructions and highlighting and expressing resistance. While such performative research might not, in and of itself, redefine the cultural logic of global capitalism, it may bear productively on individuals' mobility and on their scope for making legitimate claims. Moreover, it might, perhaps, help to create conditions for the emergence of new legal norms of global citizenship. But more immediate effects are also possible. Li Min's demonstration as a casual worker exposed her to union politics, and through this to the strength of collective organization. The formation of the aspiring Committee for International Students might highlight for her that fragmented individuals can be coordinated, globally linked and able to translate their individual agendas into a collective one. Zapatista movements and the actions of South Korean farmers during the WTO (World Trade Organization) summit in Hong Kong are examples. These movements are now globally connected; their organization strategy is understood to involve translocal

groups (Banerjee, 2011) and highlights the process of defining globalization from below. But even more local effects are possible. Postcolonial theory and its research strategies offer insights into how we are subjects of political and economic systems within the contextual realities of neo-global order; how our labour is exploited and how our voices become repressed by such order. This exploration of the individual's formation as a subject of subordinating orders is at the core of our next, and linked, critical perspective.

LI MIN AS SUBJECT AND AGENT OF DISCOURSE

Li Min is an Asian woman. She is a migrant retail worker who has been bullied, harassed and exploited. Turning to the work of French social theorist Michel Foucault can help Li Min understand that her experiences are not merely bad luck but, rather, a 'logical' consequence of her placement in the categories 'Asian', 'woman', 'migrant' and 'retail worker' – a cluster of categories which, as presently constructed, demand of her a mode of being in which subservience to others is routinely expected and through which she is readily positioned as an 'easy' target of abusive treatment. Foucault offers Li Min methods and concepts for interrogating this process of categorization and its effects, from which opportunities for change can be identified.

A Foucauldian approach enables us to question whatever is claimed to be true, right and proper about the world. Knowledge itself is the object of Foucauldian analysis and this is understood as being imbued with power such that to interrogate (or claim) knowledge is, simultaneously, to interrogate (or claim) power (Foucault, 1980). Deploying this approach, claims to speak the truth can be examined for their assumptions, processes of formation, underpinning rules and for the effects that discourses of truth generate for our sense of self, how we are to relate to

others and how society is to be arranged (see Foucault, 1977, 1978, 1985). Viewed through a Foucauldian lens, then, we may understand Li Min to be subjected to those particular discourses that claim to speak the truth about what it is to be 'Asian', 'woman', 'migrant' and 'retail worker' and, rather than treating these categories as self-evident truths, they become the focus of our inquiry.

Deploying Foucault, whenever we encounter something which is said to be 'true', 'right' or 'proper', we shall understand this as a social construction. We cannot assume that there exists some objective, certain connection between what we encounter in the world and the knowledge/truth that exists in relation to that. Rather, it is the discourses that we call on to account for our experiences which continuously bring reality into being, through and in the very accounts we give of it, a process which simultaneously has the effect of denying or limiting other possible realities (Foucault, 1972, 1977).

Consequently, what is routinely claimed as being true in respect to the category of persons defined as (i.e. constructed as) 'Asian', for example, forms a discursive regime which constructs reality. This regime has a history that can be examined, exposing how it has been shaped and developed over time, and identifying whose and what interests are served during the formulation of this category of being at any given point in time. In a New Zealand context, this could involve Li Min investigating official documents about immigration policy and procedure, and looking for change and continuity in the criteria governing entry – how 'Asian' is defined, what social function the policy serves and what demands are made of those subjected to it.

Discourses also rely on assumptions and underpinning rules which govern what they regard as appropriate and relevant, and these can be interrogated. They deploy a grammar of terms and definitions that can be unpicked to expose gaps, contradictions, requirements and expectations. The discourse of 'Asian', in the New Zealand context, makes claims

about what it is to be 'Asian', the habits of mind, of demeanour, of self-hood and of relating to others which it expects of those it speaks of. These are also matters which can be interrogated, thereby drawing attention to what possibilities for being are afforded and prescribed by this discourse. To explore these dimensions of discourse, Li Min could go beyond official documents and explore everyday talk about or by 'Asians' and draw out from this talk its underpinning assumptions, rules and requirements for being.

Importantly, for Foucault, discourse is not simply talk and text. It also includes social practices which both give effect to and inform what is being accounted for in talk and text, and can therefore be found in institutional routines and bodily practices (1972, 1977). As a retail worker, then, Li Min is expected to adopt prescribed ways of talking to customers and preparing their food; techniques likely written into training manuals and which a trainer has then used to verbally instruct Li Min on those dimensions of what it is 'to be' a 'good employee'. As she goes about her work, she enacts and embodies that very discourse, she has that discourse inscribed upon her bodily movements (Foucault, 1977). Discourses are, thus, highly productive in the sense that they have many effects: Li Min is simultaneously the subject of, is subjectivated by, is subject to and disciplined by the discourse of what it is to be a 'good employee'. What Foucault proposes is that by analysing discourses and their processes of development, we can come to understand how it is that we have been constructed into being who and what we are. From this analysis we can begin to make choices for ourselves as to who and what we wish to become (e.g. Foucault, 1985).

Discourses, then, construct social reality and our sense of self; what is said and what is intelligibly sayable provides the ways in which we categorize, explain and seek to act in the world and form our very selves (e.g. Foucault, 1985). This can be read to imply that discourses are determinative of

what we can think, say and be (Alvesson & Kärreman, 2000). Contra this, however, Foucauldian analyses also demonstrate that whatever is constituted by a given discourse as 'reality' or 'my self' remains open to change through exposing the very process of reality construction as one which is social, and hence neither natural nor inevitable (e.g. Foucault, 1977, 1978). Moreover, wherever power is found, so too is resistance (Foucault, 1980). Foucault's efforts show us, then, that through understanding the discourses which inform our experiences we become empowered to craft alternative frames of action, sense-making and subjectivity, an ethical process which Foucault understood as 'care of the self' (e.g. Foucault, 1985, 1986, 2008). In Li Min's case, through examining the discourses which generate expectations for her as 'Asian', 'woman', 'migrant' and 'retail worker', she can identify opportunities to craft a self that is shaped by those elements of these discourses which she sees as productive, setting aside those which she sees as problematic. Other discourses of 'care', 'equality' and 'respect' can also be called on in this process of crafting a self that is not merely an object of discourse.

Foucault developed two methods of inquiry for examining discourse. The first, 'archaeology', comprises two components. First, it analyses what has been claimed to be 'the truth' of a topic, paying particular attention to the assumptions and effects of those claims for our sense of self and for relations between persons (e.g. Foucault, 1970, 1972). Second, it postulates the underlying 'structure of thought', or episteme, which make it possible for those 'truths' to be considered intelligible and plausible at the time they arose, even if they later came to seem nonsensical (Foucault, 1972, p. 191). Archaeology thus seeks to identify and analyse the form of a set of claims to know the truth, a form which has two levels: that of particular truths about a specific topic, and that of the general truth, which underpins and governs all truths in a given period.

Foucault's second (and complementary) method, genealogy, ranges more widely, looking to the social context in which discourses develop, identifying connections between what was seen as problematic at a given point in time and how discourses which claim to speak the truth form in response to these perceived problems (Cummings & Bridgman, 2011; Dreyfus & Rabinow, 1983). Genealogy involves examining the networks of relationships, strategies and tactics that have facilitated certain ideas and practices coming to the fore (e.g. Foucault, 1977, 1978). Power is central to such an analysis (Alvesson & Deetz, 2000; Dreyfus & Rabinow, 1983). Attention is paid to how social practices emerge and develop to shape who we are, and how power relations influence the ways people use and experience their selves and their bodies (e.g. Foucault, 1977, 1978, 1980). Whatever effects or ways of being are created, constrained or disciplined in some way in a given discourse, and whatever is held up in that discourse as laudable or abominable, are matters of particular interest in a genealogical analysis. It examines both the effects of a given discourse on persons and interpersonal relationships and how this situation developed (e.g. Foucault, 1977, 1978).

Foucauldian discourse analysis can examine a wide variety of talk/text/practices and the focus of analytic effort can attend to whatever is the subject of a given discourse. Combining archaeology and genealogy, attention can contribute to understanding what the categories and terms of a given discourse routinely imply; the assumptions embedded in such categorizations; how these categories are called on to justify certain actions and practices; their effects for our sense of self; and how those categories have emerged and developed over time.

Examining the everyday language use of individuals to identify patterns and themes in how the issues under examination are framed and justified could be another approach. The analysis could consider how claims about

what is 'right', 'true' and 'proper' are presented and justified, seeking to identify the unwritten, unstated, implicit 'rules' that govern what is said. Any subject positions generated in such talk could be examined for their claimed characteristics, rights, duties, powers and limitations.

The Foucauldian discourse analyst can also turn to official texts, accounts given by experts and institutional sources, tracing developments in the discourse over time. From this, the analyst may identify not only the form of a given discourse but also how it came to be instituted and regularized into rules, procedures, laws, practices, norms and routines, enabling measurement, training and enforcement, all of which function to create disciplined ways of being.

Foucauldian discourse analysis, then, offers multiple routes for a critical examination of what is routinely taken for granted about what is real, true, right and proper. Foucault's methods of inquiry, and his conceptual apparatus, offer a fertile means of interrogating what are otherwise commonly accepted and sanctioned ways of talking and acting, revealing how what we take as 'reality' and our 'self' has been socially constructed and is thus open to change. In Li Min's case, this kind of analysis offers insight into the systemic forces shaping her experience and will aid in the development of ideas for how to challenge these. And one of the ways in which we might challenge these forces is to change the academic discourse in which we become located as researchers and the researched.

LI MIN ENGAGES THE PSYCHOANALYTIC TRADITION

Dear Li, please excuse us. In this segment we speak to you in the first person. Our reasons for this will become clear, but suffice to say we switch here from the familiar third person academic voice, the voice and

position of the university (as we will discuss below), to the first person to simulate, at least, the critical psychoanalytic tradition's commitment to engagement and empowerment of the other.

We imagine that you are thinking that psychoanalysis might seem an odd place to look for a critical approach to organizations and management. It is most often understood in our society as being 'useful' only in the clinical setting. So how can something that happens between a therapist and a patient help us dig into the underside of organizational life? One way to answer this question is to first put aside, for a moment, 'the organization' as institution, and replace it with 'the relationship', or rather what we would call the 'social bond'. So, instead of organizing/organization, we have the social bond between, for example, the therapist and patient, the teacher and the student, the manager and the workers; between the master and the resistant slave. We have the bond between any two people and between the self and the other. These are the places where a 'social bond' resides (Malone, 2008).

In this critical organizational analysis of social bonds, psychoanalysis is an important theoretical resource. It is a resource that has been appropriated in the study of organizations and management since at least the mid-twentieth century – famously with the classical tradition of the Tavistock Institute (Jones & Spicer, 2005, p. 228) – and most recently, and perhaps this is now the dominant form of *critical* organizational analysis, from the Lacanian psychoanalytic tradition (cf. Arnaud, 2002; Contu & Driver et al., 2010; Costas & Taheri, 2012). So, rather than survey all the various critical psychoanalytic traditions, we focus here on this now very prominent Lacanian tradition. In particular, we focus on what we regard as the summation of Jacques Lacan's work on the social bond found in his presentation of 'the four discourses'.

Lacan introduced the 'four discourses' during a seminar series he gave in 1969 and

1970 – the series was entitled *The other side of psychoanalysis* (Lacan, 2007) – where he sought to theorize the dominant organizing social bonds of the current epoch through his lens as a psychoanalyst. Lacan proposed four discourses, and thus four social bonds: the master, university, hysteric and analyst.

In what follows I am going to position you, Li, as ‘the hysteric’ and myself as, in sequence, the master, university, analyst. Through this, hopefully, we will have a chance to talk about some of the other influential traditions but also, and more importantly perhaps, to practice the technique of psychoanalytic inquiry – to demonstrate the practicability of its questioning nature – and to explore its mode of influence. But to understand Lacan’s critical form of organizational psychoanalysis, we need to go back to Freud.

Le maître (*The Master*)

Freud is the master of psychoanalysis; this is an indisputable fact. His discovery, the unconscious, revolutionized our understanding of individual human suffering and the malaise of civilization (Freud, 1976; Freud & Strachey, 1962). It is impossible to understand human relationships without recognizing the role of the unconscious, in his view, and if you try, you are only tinkering on the conscious surface. But Freud had his problems, the biggest being his structural biological determinism (think penis envy and infantile sexuality). But this was resolved through the ‘turn to language’ that swept the social sciences in the 1960s and 1970s (Parker, 1989). Jacques Lacan picked up Freud and re-birthed his theory through a post-structural lens. So, the first step into Lacan’s critical psychoanalysis of organization/bonds, is through his seventeenth seminar, *The other side of psychoanalysis*. Lacan’s ability to trace the (post-)structural foundations of the social bonds that hold us

relationally together gives us a structure for critical analysis. The four discourses, which might be your chapters entitled the master, the university, the hysteric and the analyst, may well offer up some ‘Truth’ that resides on, if you like, the ‘Other Side’ of your research question.

Li: Professor, what am I to you? Am I just a recruit? Someone to discipline with your truth? This Lacan doesn’t sound like he knows me, does he understand what I need? What I demand? What I desire? Do you? What am I to you? (Note: Li, being quick to grasp the nuance of the engagement, has effortlessly adopted the position of the hysteric).

L’Université (author as the university):

Perhaps I didn’t adequately cover your options. To be fair, seminar 17 is only one of more than 20 seminars, and then there is the *Ecrits* (Lacan, 1977) and many other vitally important texts. You should read widely throughout the oeuvre of Lacan and his interpreters, and particularly become intimate with the registers RSI (Real, Symbolic, Imaginary), desire, jouissance and of course the *objet a* (see Copjec, 1994; Grigg, 2008; and Žizek, 1990 for a range of positions on these devices) and the intricate twists and turns of the psychoanalytic process and how it has become something of note for the field of management and organization studies. How it enables us to reveal the emptiness of certain signifiers (Jones & Spicer, 2005); how organizations operate at a symbolic level (Arnaud, 2002); how the imaginary register creates disciplining regimes (Roberts, 2005); how Lacan can help us understand burnout (Vanheule et al., 2003); how choice is an elaborate and dangerous fantasy (Fotaki, 2007); and, importantly, how the Lacanian lack is implicated in identity formation (Driver, 2009). But this is just scratching the surface; there is also all the important work building on Lacan’s later work, including his famous twentieth seminar, *Encore*. Here you can delve into the theory of sexualization, discover the difference between phallic and feminine *jouissance* (Dickson, 2011; Fotaki & Harding, 2012) and consider the dark side of passion (Kenny, 2010).

But I haven’t even begun to introduce your other psychoanalytic options – what some might call the ‘Freudians’ – those who remain close to Freud’s original work, or follow Melanie Klein’s interpretations of Freud. Of particular note here is Manfred Kets de Vries and colleagues’ work on

the psyche of the entrepreneur and executive (1985, 1993, 1991), Michael Diamond's excellent book *The unconscious life of organizations* (1993) and Yiannis Gabriel's works – including on happy families (1999) and his book with colleagues *Organizations in depth: the psychoanalysis of organizations* (Gabriel et al. 1999). Contrasting Lacan's rather oblique style is Melanie Klein's object relations theory. To gauge the importance of this, I would suggest Stephen Frosh's excellent text *The politics of psychoanalysis* (1987).

That should provide you with a better grounding – your next stop is the library. I believe you have (at least) 11 books and many more journal articles to read.

Li: *Thank you Professor! That's an enormous amount of reading. But, really, how close does this bring me to formulating a research question? Do you really think that the psychoanalyst has it all figured out? Do you really think that if I learn the details of the theory and its method I will be able to theorize my suffering in a helpful (maybe even cathartic) way? Or are your motivations less pure than they seem? Will I write for you, sir? What am I to you?*

L'analyste (The Analyst)

The job of the critical student is the job of the hysteric. To be a relentless 'pain in the backside' for the various hierarchical structures they encounter; to never stop challenging the doctrine; and to refuse the assimilation of the university. This is what psychoanalysis offers. It is heaving with theoretical density, and encumbered with impregnable terminology and obscure concepts. It erects playgrounds in the dark space between the material and the philosophical. It asks the questions others repress. But all this only works if the hysteric is in charge – in other words it only works if the student never fails to ask the question of the university: what am I to you? The danger, of course, is that when the student approaches the psychoanalytically minded university researcher, the researcher attempts to enrol the student into 'their' symbolic register – how can the academy be analytical? Perhaps

it does all start with hysteria (Alakavuklar et al., 2016)?

Li: *[we do not get to see how Li responded to this section as the analyst would never directly intervene with the signifiers of their symbolic. The analyst must suppress their supposed 'knowledge' of Li's symptom and instead make room for Li to position them as the object of desire].*

Final Note from the Author

Above, we have attempted to apply one of the critical Freudian traditions (Lacanian psychoanalysis and particularly the four discourses) as a research framework. The key point is that it problematizes the very process of research, the form of critical knowledge and the agent of that knowledge. Within this tradition, the various questions of 'research strategies' and 'modes of influence', as always, are set with the four discourses. In other words, Li Min's research strategies, from the position of the hysteric at least, will be those that resist, challenge and pour sand into the gears of the dominant (masterly/fatherly?) research traditions of the university (e.g. positivism, constructivism, interpretivism). If, however, we locate Li Min's work in the discourse of the analyst, her research and its 'transformational effects' involve up-ending the subject's (whomever that might be) unconscious chains of signifiers, and replacing them with a revised (and one would hope more bearable and emancipatory) set of signifiers; a new, unspoken code that organizes the subject's desire. This is not to say that the other traditions (Freudian and Kleinian particularly) are not equally (or more!) useful in this regard. Remember: resist the doctrine!

LI MIN (FEMINISM)

The bullying, harassment, underpayment, poor payment and in some cases no payment

that Li Min confronted in a string of seemingly disastrous casual retail and hospitality jobs led her, inevitably, to two questions. First, was there a more lucrative and reliable way for a young Chinese woman to support her studies? Second, did she have these experiences because she signified as a 'woman' and 'foreign'? Did the combination of these two inevitably position her as subordinate and exploitable? She pondered these points, sipping tea and watching a group of her well-heeled male contemporaries at the next table tease each other over the relative size and power rating of their cars and computers. They, it seemed, did not have the same problems. But her academic advisers, who had been priming her to do a feminist critique of foreign women workers in New Zealand, were themselves rather split on the question of inevitability. Citing Marianna Fotaki (2011), an exponent of psychoanalytic feminism, one had proclaimed that 'phallogocentric discourse' was the enemy of women and men.

We are dealing with a deep *cultural unconscious* organized around the phallus, the symbolic penis, Fotaki claims. What women confront is not men as a class – who systematically and explicitly orchestrate a regime of oppression, a patriarchy – but rather a symbolic and unconscious structure that organizes and confirms the power of 'the Boss', 'the team leader', the 'father', and hierarchical management relations more generally. Power, in this sense, is not built on the threat of violence or the removal of rewards, but on the unconscious *significance* given to various linked terms and concepts that link back to a core signifier (the phallus). It is the universality and strength of this 'phallogocentric order', as Li Min had become aware, that gives men permission to enact what seemed to her a kind of sexualized domination of women in workplaces.

But how would it be possible to 'turn off' or re-route such a symbolic structure or 'turn on' a symbolic structure that exposes and affirms femino-centric relations between *both men*

and women workers? Li Min could hardly imagine such a place. Discovering this structure sounded like a worthy target for her PhD studies. But was there a more direct answer to the question of women's subordination – one that didn't rely on an elaborate archaeological dig into the social unconscious? Perhaps Li Min was looking in the wrong direction.

Across the now-crowded student café, Li Min's gaze fell on a woman attending to two preschool children who were busy eating their lunches of fruit, sandwiches and yoghurt. The woman fed one child with a spoon, calmed the other, organized more food for both and went on talking to both the children and her companion across the table. The man, dressed in the smart casual attire of a university lecturer, was busy looking at his phone and nodding as she talked. He then gathered up his papers, stood rather stiffly, touched her hand softly, and left. The woman then turned her attention to the children and, as she did, ate the sandwiches the children and her partner had left behind.

Signification is all very well, thought Li Min. But isn't the core of women's subordination found in the work done, in the actual labour of women; labour that includes caring, feeding, cleaning up and supporting others. Was this subordination more 'objective', material and 'in plain sight' than Fotaki and the theorists of deep structures were prepared to recognise? One of her advisers had been saying as much. Women's positioning was a function of the grip that the feudal patriarchal family had on their labour (Fraad et al., 2009). The problem lay in the intimate, individualized and personal relations of marriage and family life that deliberately obscured from both men and women *her* relative positioning as feudal labourer – a positioning where the woman's practical, sexual and emotional labour is appropriated by her partner ('lord?'), her children and others (Fraad, 2003). The argument is that what works in one sphere, the home, has a tendency to also work in others. The upshot of this would seem to be that unless a woman can find a man to act as a 'woman', as a feudal serf and as a source of

surplus family labour, then she will struggle with this feudal positioning in the workplace.

But isn't this changing? Li Min thought of her friends on similar paths to her, moving away from a traditional roles in the patriarchal feudal families which now seemed to her to be in crisis.

'You look thoughtful!' It was her friend Gemma. 'Yes, trying to think my way out of a couple of PhD questions.' 'What are they?' Gemma asked. 'The easiest one is what should be the target of my PhD. The tough one is how to make a reasonable living and not get screwed by some greedy boss or corporation.'

Gemma had just completed a master's degree in religious studies. They met a year before, serving beer to rugby fans while working for a temping agency. They shared a few drinks after work and Lin Min thought their relationship might be headed for intimacy. But Gemma stopped working for the temping agency and neither of them had followed up. Li Min saw Gemma occasionally around campus and noted her transformation. The traditional student garb of tired jeans and tee shirts had become light, wafer-thin silk shirts; expensive, elegant boots; and heavily pleated cotton trousers and skirts. She looked incredible and invincible, Li Min thought, as Gemma swept into the seat beside her.

'How do *you* do it?' Li asked. Gemma paused, weighing her answer carefully. She looked at Li Min thoughtfully and then spat out: 'I screw them back.'

Li Min gasped! It was one thing to resist or reject traditional marriage, and partnerships with men, and to speak the discourse of feminism around campus, but quite another to regard prostitution as a chance to exploit men by way of return.

Gender is a performance, right? I'm quoting Butler here (1990). Do we have to perform as a victim, as slave, as the subordinate of men? Do we have to put men on a pedestal and work for them? Or can we perform differently? Can we perform our gender, our sexuality and the things we like about being a woman and make a living out of that? Is that OK?

Li Min gasped again. Gemma explained that working at an exclusive and expensive hotel with a group of likeminded and supportive women had helped liberate her emotionally, politically and financially. After Gemma left, Li Min quickly sketched out a further PhD Topic and labelled it: 'Prostitution as feminist performance; a critical organizational ethnography' (Kessler, 2002; Scoular, 2004). She could hardly breathe at the thought of it. She imagined her supervisors' nervous support for the topic, while steering her firmly clear of a participatory research strategy. But perhaps her performance might be in finding a way to work for and with Chinese immigrant prostitutes (Coy, 2009; Liu and Finckenaue, 2010; Spanger, 2011), and perhaps she would find a way to support through her research other students (Roberts et al., 2007) who were working 'under the covers'?

CONCLUSION

Critical forms of organization and management inquiry begin with the aim of changing as well as investigating the conditions that are the topic of study. Of course, each of the major research traditions makes different objects the target of such inquiries. The Marxist aims at redirecting the flows of value, the postcolonialist seeks to reconstruct colonial subjectivity, the Foucauldian is engaged in shifting discourses, the psychoanalyst is re-ordering signifiers, and the feminist is upending existing structures. The challenge for researchers is developing research strategies that fit these dual aims. Drawing selectively on particular strands of work in these five traditions, we have sketched out how critical, qualitative, but change-focused work might be done. From a critical ethnography of the free store, to the feminist participatory action research with immigrant prostitutes, we have identified a set of strategies that in various ways necessarily reshape the participants, the

researchers and the wider conditions *as part of* the research studies. The implication, and main conclusion, one might draw from such research is that for the most part it is not concerned with the extractive production of commodified knowledge, but rather it regards making changes to the lives of the people involved in the inquiry as the main ‘output’.

Notes

- 1 The *Wharerata Writing Group* is a collective author that includes (in alphabetical order): Ozan Alakavuklar, Fahreen Almagir, Andrew Dickson, Craig Pritchard and Suze Wilson, all of the School of Management, Massey University, Palmerston North, New Zealand.
- 2 Li Min is a composite character developed from our engagement with a series of women working and studying in New Zealand.
- 3 Li Min is aware of Improving Dream Equality Access and Success (IDEAS) – a support group formed in 2003 by the undocumented students of the University of California of Los Angeles. IDEAS played a vital role in organizing a campaign on the Development, Relief, and Education for Alien Minor (DREAM) Act in 2010. She and her new friends are planning to form a group linked to IDEAS and all such Committees around the globe.
- 4 Despite Li Min’s identity as a privileged migrant student in relation to China, she has experience of living in the margin; hence Nkomo’s (2011) arguments may help Li Min in theorizing her lived experience, and political views, and thus to challenge the assumption of whether representation is possible. Subsequently, she can draw from Imas and Weston’s (2012) analyses, which illustrate the experience of the organization of people who lack civil stance and their contested and chaotic reality.

Poststructuralism

Angelo Benozzo

INTRODUCTION

The term *qualitative research* denotes a movement developing in academia at the beginning of the 1970s which brought together various approaches from differing ontological, epistemological, methodological, political and ethical origins, all of which were critical of the traditional ways of doing research: the strategies of the survey, and of the experimental and quasi-experimental study. This movement then also fed into managerial and organizational studies. In 1979, a turning point came when a special issue of the prestigious academic journal *Administrative Science Quarterly* appeared, entitled ‘Qualitative methodologies’, which gave scholarly legitimacy to qualitative research in the field of management studies.

Qualitative research has been described as a comprehensive site or arena in which scholars share a mutual rejection ‘of the blend

of scientism, foundationalist epistemology, instrumental reasoning, and the philosophical anthropology of disengagement that has marked “mainstream” social sciences’ (Schwandt, 2000, p. 190). Scholars who gravitate to this arena may have very different perspectives and interests, but each one, be it consciously or unconsciously, grounds her/his research in some branch of philosophy, such as phenomenology, hermeneutics, critical theory or social constructionism, or, perhaps, postmodernism and poststructuralism. *Science* and *research*, after all, are concepts subject to different views and conflicting interpretations, and their meaning may vary according to the philosophical approach adopted and the political, as well as historical, moment.

Poststructuralism, then, is just one of the numerous philosophical movements that has influenced social research and management studies, and my task here is to present the reader with an outline of this movement,

dwelling on a few key philosophical concepts so as to make clear how these are reconceived in poststructuralism. I offer just one of many possible ways to ‘settle’ things: no easy task, given the complexity of the topic and the number of studies which have been inspired by poststructuralism, both in the social sciences and in organizational studies. I apologize in advance if the reader is left with the impression that my chapter fails to do justice to such a rich and complex philosophical field.

I begin by attempting to outline poststructuralism by placing it within the broader movements of ‘posts’. I then explore some of the key issues that characterize poststructuralism: structure and difference; the subject and power; language and deconstruction. In the final pages, I reflect upon the implications of these key issues for those doing qualitative research and make a connection with the ongoing debate on post-qualitative research, which appears to be one of the most promising frontiers in the field of qualitative inquiry. Despite being aware of how useful it can be to provide cases to illustrate a point, I have chosen not to give too much space to examples of post-structuralist pieces of research. To do this would mean, on the one hand, reinforcing the idea that there is a ‘proper’ way to do qualitative research, and, on the other, going against the very spirit of poststructuralism, a spirit (as we shall see) that questions any normative, prescriptive model.

It is my firm conviction, however, that, in order for qualitative research to interact creatively with data (Benozzo et al., 2013), it needs to be rooted in philosophical theory. To ‘produce different knowledge and to produce knowledge differently’ (St. Pierre, 1997, p. 175), we need to read hard and ground our work in a theoretical perspective, whether this be phenomenology, social constructionism, critical theory, feminist theory, poststructuralism, new materialism, posthumanism or even something new and still to be ‘discovered’.

‘POSTS’ – INCLUDING POSTMODERNISM AND POSTSTRUCTURALISM

Although the Latin word *post*, meaning ‘after’, is often used in the purely chronological sense, this is not its sole meaning in the words ‘poststructuralism’ and ‘postmodernism’. The prefix ‘post’ highlights a different logic or the overcoming of an obstacle, and should not simply be taken to mean something coming after modernism and structuralism chronologically: in fact, the emergence of postmodernism and poststructuralism was not the consequence of the *end* of modernism and structuralism, because the latter did not disappear. Instead, poststructuralism and postmodernism take certain key themes of structuralism and modernism and rework them in the light of new theories and insights.

Postmodernism and poststructuralism are part of a whole series of ‘posts’ (such as postcolonialism, postcritical, posthumanist, postFordist, postpositivist¹, postfeminist, postfoundational, postemancipatory, postmemory, postrevolutionary, posteverything ...) which, together with a plethora of ‘turns’ (the linguistic turn, the interpretive turn, the narrative turn, the critical turn, the reflexive turn, the turn to affect ...) have come to inhabit the landscape of the social sciences over the last forty years. Every ‘post’ rejects the idea of the ‘stable structure’, and takes as its starting point a break with the assumptions typical of Western Enlightenment (Crotty, 1998). Some scholars argue that it is impossible to clearly distinguish postmodernism from poststructuralism (Sarup, 1993). Indeed, they do have many points in common, but there are also differences (Alvesson & Sköldbberg, 2009). Lather (1993), for example, distinguishes between the two terms by arguing that postmodernism ‘raises issues of chronology, economics (e.g. Post-Fordism) and aesthetics, whereas poststructural[ism] is used,

more often in relation to academic theorizing after structuralism' (p. 688).

Some scholars consider poststructuralism to be a specific way of thinking belonging to the broader movement that goes by the name of postmodernism. According to them, the latter is a geographical and conceptual movement, which appeared after and in opposition to modernism. First coined with regard to an architectural movement rebelling against what was seen as a-historic, super-rational functionalism, it was applied in the 1960s to a group of American literary critics and spread to other areas, for example economics and the arts. Postmodernism owes its fame to Lyotard's book entitled *The postmodern condition* (1979), in which the author distances himself from the following: the values and practices of the Enlightenment; an unconditional faith in Reason, Freedom, Progress, History and Man; metatheories that aspire to build totalitarian theories of physics and science; and the notion that there are 'some rational, global solutions and explanations, some general principles which guarantee progress in the development of knowledge' (Alvesson & Sköldbberg, 2009, p. 180). Lyotard calls these totalizing theories 'metanarratives' and describes the postmodern condition as an 'incredulity towards metanarratives' (Lyotard, 1979, p. xxiv).

Crotty (1998) describes postmodernism as a response to the cultural transformations taking place in the present age. These changes, which involved many spheres of human activity – including literature, philosophy, the social sciences, art and architecture – basically produced a need for new ways of thinking and understanding and new forms of representation and communication, all of which resulted in postmodernism. In the 1980s, when the works of the French poststructuralists finally became available in English, postmodernism found its philosophical support in poststructuralism. In line with Wolin (1992), Crotty sees postmodernism as

the cultural movement of the unmaking, of the collapse of the antithesis, of the elimination of distinctions, and it is this idea of unmaking which brings postmodernism and poststructuralism closer together.

As said above, it is over-simplistic to state that poststructuralism is what comes after structuralism. In fact, poststructuralism is a French term used primarily to describe a philosophical movement emerging in the 1960s which not only influenced philosophy, but also literature and the arts, and politics, sociology and psychology. Poststructuralism brings together a set of French philosophers (principally Derrida, Deleuze, Foucault, Lyotard and Kristeva), who, while expressing very different ideas, were united by a dissenting position with respect to science and established moral values. The works of these authors,

show poststructuralism as a thorough disruption of our secure sense of meaning and reference in language, of our understanding of our senses and of the arts, of our understanding of identity, of our sense of history and of its role in the present, and of our understanding of language as something free of the work of the unconscious. (Williams, 2005, p. 3)

Despite their significant differences, these philosophers' works can be read as a reaction, on the one hand, to the structuralism prevailing in those years, and, on the other, to an idea of the human being deriving from humanism, which endured until French existentialism. The humanist idea of the subject had proved mistaken, and this led those French philosophers to question any acquired certainty and explore how philosophical and scientific practices had produced that subject of Western culture that had caused such massive destruction during the two World Wars. Later, I will be taking a close look at their critique of the humanist subject; I shall now examine their critique of one of the cornerstones of structuralism: the idea of structure. But before continuing, it is useful to explain the connections between poststructuralism

and management and organization studies. Since the mid-1980s, the works of Foucault have played a central role in that area of studies grouped together under the term Critical Management Studies (CMS) (Alvesson et al., 2009).

A first wave of CMS was inspired by the concept of power – see later in this chapter – Foucault proposed (Knights, 2009) and, in particular, many scholars of CMS have been influenced by Foucault's book (1977) *Discipline and punish*, where work organizations, institutions, schools and military apparatus are seen as something akin to prisons 'insofar as they involve hierarchical observation, normalizing judgment and the examination as technologies of correct training, discipline, and surveillance' (Knights, 2009, p. 157).

The first wave of poststructuralism in CMS was followed by a second, more recent wave, which developed poststructuralism in different directions (Jones, 2009). For example, Contu (2008) and Vidaillet (2007) have drawn on Jacques Lacan in their work, while other authors (Willmott, 2005; De Cock and Böhm, 2007) have turned to thinkers like Ernesto Laclau and Slavoj Žižek, who were in turn inspired by and revisited some of the key concepts of poststructuralism.

STRUCTURE AND DIFFERENCE

The dissenting position towards structuralism starts by subverting the traditional hierarchical relationship between *structure* (a model or pattern which is both descriptive and prescriptive) and *difference* (or limit), as well as rejecting any possibility of arriving at 'the Truth' (true knowledge). For structuralism, a structure is what is regularly repeated. For example, the normal 'life cycle' in human resource management describes a repeated pattern made up of different stages (recruiting,

selection, performance evaluation, reward and/or training and development), as well as the relations between each stage in the model. However, there may be limits (differences and variations) to the normal model (the sequence and content may change and may look like this: recruitment, selection, selection, performance evaluation, selection). The existence of a normal, regulatory model implies that any exception is conceived as a deviation from the norm, and once we have defined what is normal, the limit (difference and variation) can also be measured and corrected if necessary. Normalization produces the objects of knowledge by creating hierarchies, by comparing and homogenizing, by differentiating and excluding.

Poststructuralism rejects this framework and restores dignity to the limit (the exception from the norm, the difference, the variation). In essence, the starting point for an understanding of poststructuralism would seem to be this: the differences and limits of a model/structure have an important creative role to play. They are not to be devalued or considered as something to be negated or avoided. For poststructuralists, the limit (or difference) is no longer constantly compared to the model, but becomes the centre, the core; something good in its own right. 'The limit is the core' writes Williams (2005, p. 2), which means that any form of stable knowledge is defined by its limits and cannot be conceived of without them. While structuralism privileges a model that is repeated identically over time, thereby becoming the norm, poststructuralism overturns this hierarchical relationship between pattern and difference, making the exception more important.

These philosophers ask what happens when what is important is not what is repeated, but what is different – the difference, the differentiation? What might happen if we upset the hierarchical order of structure and limit and if a model is disempowered of its descriptive

and prescriptive force, so as to make room for what always changes? Within the field of management and organization studies, for example, poststructuralism has led some scholars to rethink the historical oppositions between organization and change, order and disorder, organization and disorganization (Chia, 1999; Cooper, 1986). Cooper (1986) views organization as being in conversation with disorder and disorganization. Following Deleuze's philosophy of difference, Linstead and Thanem (2007) reconceptualize the relationship between change and organization as not being 'opposed in any straightforward way ... [they] are imbricated in each other in a continuously responsive conversation between organization and the "objects" it tries to organize, i.e. between organization and non-organization' (p. 1485).

With this focus on difference instead of normality, what takes centre stage is not the recurring structure (the model that always repeats itself) but whatever varies and changes. If we shift our attention from centre to periphery, from the structure to the limit, from the model to the difference, then we realize to what extent the notion of normality (or what structuralists call a structure) draws a demarcation line, positioning differences or deviation as far away as possible from the centre. Difference should not be understood as diverging or departing from a model: for poststructuralists, limits or the *differences resist identification*, because otherwise they themselves would become the norm. In itself, a limit is elusive, but we can try to look at its effects, and above all we can problematize normality (the centre) and challenge its claim to 'natural' truth. The new questions become: what would happen if life took on different forms than those described and prescribed by the model? What would happen if fixed, stable truths became unstable? Consequently, how we can create new things, unexpected forms of life, different situations? What the poststructuralist French philosophers share is this 'description' of limit as something

indetermined and *elusive*, almost impossible to understand using modernist conceptual categories. They all investigate the effects of differences in different areas, and follow the traces of these differences.

Poststructuralism challenges our certainties; it introduces movement and disorder into a world that seeks stability, and since these thinkers are focused on removing the categories and metanarratives of science, it follows that poststructuralism has been, and still is, influential in fighting discrimination based on sex, gender and sexual identity; it has enhanced awareness of those forms of inclusion or exclusion related to social class and race. It is a form of resistance to the implicit or explicit forms of violence exercised through science and research and through values and morals, not to mention artistic canons and the law.

The starting point, therefore, is to begin to dismantle these oppositions, categories and meanings, and uses, habits and beliefs, making room for those differences that have been removed from history and showing that there is no obligation to enact these forms of behaviour even if they are stratified and consolidated in human affairs. For example, the categories of identity (race, class, ethnicity, sexual orientation, age, gender, etc.), with their hierarchical relationship between two extremes, are the result of a process; they were a way of solving certain problems that humanity was facing. These arrangements have been repeated and stratified over time, but they are not binding in character. The way we relate to each other, and the categories we use to describe ourselves, or our organizational practices, are the result of mere historical circumstance, where the pressing need was to solve certain problems that humanity (or Western culture, or its institutions) was facing. This way of thinking has two consequences: (1) structures are discontinuous and entirely contingent; (2) structures consolidate and congeal over time, to the point that they are deemed necessary and natural.

THE SUBJECT AND POWER

In philosophy, a 'subject' is a generic word used to indicate a human being or person, what psychologists call 'the individual'. Together with words such as *subjectivity* and *subjectification*, the concept of *subject* stands at the centre of poststructuralist philosophy. Because of their French origin, when these concepts migrated to the English-speaking world, translating them was no easy feat (Gherardi, 2016; Henriques et al., 1984). For example, because the French verb *assujettir* means both 'to produce subjectivity' and 'to make subject to', and the English language has no single word which conveys both meanings, scholars had to use two words to translate the French *assujettissement*: subjectivity and subjectification.

By dethroning the subject once and for all, poststructuralism disempowered one of the most influential concepts of the modern age, together with the notions of power, constitutive subjectivity and agency. Of course, the subject had already been partially decentred by Marx's description of the human being as a product of society, by Freud's theory of the unconscious, by Nietzsche declaring that God was dead, and by Gramsci, who provided the basis for understanding how subjectivity comes into being with his concept of hegemony. The poststructuralists worked through these positions, distancing themselves from some of them at the same time, especially from Marxism.

Criticism of the humanist subject is bound up with the criticism of the notion of the 'author' found in two short essays by Barthes and Foucault. In 1968, Barthes declares the death of the author and states that the author's identity is a construction of French rationalism, empiricism and the Reformation. He concludes that 'the author is never more than the instance saying I' (p. 145), whose identity is a particular configuration within all the possibilities offered by language. While the absence of the author might seem to make the reader

more important, because 'a text's unity lies not in its origin but in its destination' (p. 148), the author's demise means the reader's identity disappears as well: '... the reader is without history, biography, psychology' (Barthes, 1968, p. 148). Foucault too (1969a) returns to the same idea when he asks: 'What is an author?' and, recalling Beckett, 'What does it matter who's speaking?' Naming the author, for Foucault, characterizes the text's presence and marks the edges of the text. The author is 'a certain functional principle by which, in our culture, one limits, excludes, and chooses' (Foucault, 1969a, p. 119). The notion of the author is a product of discourse: 'The author function therefore is characteristic of the mode of existence, circulation, and functioning of certain discourses within a society' (p. 108). This movement, aimed at destabilizing the notion of the author (Benozzo et al., 2016), runs parallel to the one declaring the death of the subject constructed by humanism.

The humanist subject is a unified, self-founded, rational individual – stable, coherent, self-conscious, knowing and outside of history. The subject of the modern era is Cartesian man who, having uttered the 'magic' sentence *Cogito, ergo sum*, became the source of truth and knowledge. By defining as 'object' everything that is not 'subject', Descartes established a series of binarisms (self/other, subject/object and identity/difference) which have come to underpin Western epistemology. Once what is external has been defined as an object, then the outside can be studied, measured and controlled. 'Real' knowledge about the outside can be produced: the subject can make predictions and carry out changes. This subject appeared on the scene of Western culture in the seventeenth century, and coincides with the notion of the human being used in bureaucracies, in organizations and in the narratives of the social sciences. There are traces of this subject in the legal system, granting rights, obligations and responsibilities, and he is also the citizen subjected to forms of normalization, discipline and punishment.

Foucault's famous announcement of the 'death of man' (1966) must be interpreted as a rejection of the notion of constitutive subjectivity that found its final expression in German Idealism (Mascaretti, 2013). This notion refers to the subject who dictates the conditions of experience, who is the motivating force behind civilization, the protagonist of history; he is the source of the moral values that guide action. His symbolic representation is to be found in the Vitruvian man who is the measure of all things: an adult white male, reared in Western culture, positioned at the centre of the Universe. He is the subject who creates the object of knowledge (nature, society, organizations, the Other) in his own image and stubbornly projects his own categories onto the objects that he has constructed. His being in the world is guided by a sense of purpose, which is the emancipation and liberation of humanity. The humanist subject is free and has agency; he can escape oppression to pursue his ambitions and intentions. Through reason and self-control, this man can free humanity from its errors and archaic beliefs. Whoever is truly able to overcome unexpected difficulties becomes a model for the rest of humanity.

This rejection of the notion of constitutive subjectivity found an echo in the work of Althusser (1971), for whom the subject is interpellated – hailed and positioned – through ideological systems, which operate silently, in ways of which we are unaware. Through interpellation, the ideological apparatuses of the state (such as schools, the Church and the family, and the legal and political systems and trade unions) govern people in the interest of the ruling class and with the assistance of law enforcement (the police and armed forces). Althusser uses the example of when a policeman hails a particular person: 'Hey, you there!' and the latter responds (or turns towards the source of the shout). The policeman creates the subject, who may in turn feel like a scoundrel, or an upright citizen. The consequence of this view

is that the subject has the illusion of being the author of its subjectivity, when it is actually ideology, which interpellates the subject through language and constitutes its subjectivity. For Althusser, the subject is 'always-already' made subject to in language.

Foucault focused much of his work on this theme of how the human being is made subject, and one of his important contributions was to help us understand that what we call *subject* is a concept that has changed over time. His work can be seen as a continuous study into the compulsory and coercive forms that constitute the subject, and his main interest consisted of creating 'a history of the different modes by which, in our culture, human beings are made subject. My work has dealt with three modes of objectification that transform human beings into subjects' (Foucault, 1983, p. 208). The first line of inquiry was related to the ways in which the subject becomes the object of science. For example, the subject is constituted as a speaking subject – in general grammar, philology and linguistics – or as a subject who labours in wealth and economics. The second line of research investigated how the subject is objectified through dividing practices that set up binarisms such as self/other, sane/insane, criminal and 'good boy', and the third line of research consisted of the ways of objectification through which men 'have learned to recognize themselves as subjects of "sexuality"' (Foucault, 1983, p. 208).

In poststructuralism, then, the modern notion of the subject is replaced by that of an emerging or fragmented one, constantly 'becoming' in relation to the positions occupied simultaneously within discourses. Discourses circulate in written or oral form: they exist in social practices and in the layout of institutions (school, family, organizations, homes, churches) and require the agency of the subject to be enacted. Discourses are also beyond-text – in so far as they are also comprised of non-textual elements (e.g. the visual, the spoken, etc.) (Parker & The

Bolton Discourse Network, 1999) – and they ‘... authorize what can and cannot be said; they produce relations of power and communities of consent and dissent, and thus discursive boundaries are always being redrawn around what constitutes the desirable and undesirable and around what it is that makes possible particular structures of intelligibility and unintelligibility’ (Britzman, 2000, p. 36). This means that discourses make the subject intelligible and legitimate; they offer him different and, at times, contradictory positions that he may take up in social contexts, organizations, the family and so on. Positioning confers rights and duties, defining the obligations that an individual has towards other individuals as well as those of the latter toward the former (Harré & Moghaddam, 2013).

Together with this reconceptualization of the subject, poststructuralism (and in particular Foucault) involves a reworking of the notion of power. In humanism, power is something a person owns. Man is born with agency, and therefore with power, which he may use as he likes. Power is a prerogative of the individual who can exercise his will over others by forcing those less powerful to do things they do not want to do. Foucault criticizes this view and instead of the word ‘power’, writes of ‘power relations’, for example, in the family, in society, in organizations and institutions. This means, first, that power is a system of relations prevalent in society (not a relationship between oppressor and oppressed) and, second, that individuals are not the recipients of power, but the space where power is enacted or resisted. Weedon reminds us that ‘Power is a relation. It inheres in difference and is a dynamic of control, compliance and lack of control between discourses and the subjects constituted by discourses, who are their agents. Power is exercised within discourses in the way in which they constitute and govern individual subjects’ (1997, p. 110). We must not have an over-deterministic view of discourses, because the subject is never

completely subject to them². The positions available clearly represent a limitation of agency, but at the same time make available certain kinds of knowledge and actions that would not be possible if the subject took on different positionings.

In other words, in poststructuralism there is a twofold (dual) movement in the construction of subjectivity³. The subject exhibits agency by taking up certain discourses and *simultaneously*, those same discourses force him to take up a certain kind of subjectivity. Subjectification has a dual nature, and should not be understood solely as a coercive force operating *on* the subject – and it is this position that distances poststructuralism from Althusser. The subject is ‘subjected to the regime of meaning of a particular discourse and enabled to act accordingly’, but is at the same time ‘a site for possible forms of subjectivity’ (Weedon, 1997, p. 34). The subject may also resist the power that determines him and counteract discourses to which he is made subject, but at the same time and necessarily, he depends on being subjected to be intelligible and recognizable. The subject is simultaneously forged by external forces, but it is precisely within these forces that agency finds space. Agency is always taken up within a given framework.

In the field of management and organization studies, some researchers have investigated the multiplicity of subjectivity as well as its contradictions, ambiguities and discontinuities. Scholars have theorized and analysed how organizations (mainly through regulatory discourses) can forge the subjectivity of individuals or how different subjectivities emerge from surveillance-based organizations (Ahonen et al., 2014; Baack & Prasch, 1997; Benozzo, Pizzorno et al., 2015; Boje et al., 1996; Calás & Smircich, 1999; Collinson, 2003; Cooper & Burrell, 1988; Fleming, 2007; Ford, 2006; Harding et al., 2011; Hassard & Parker, 1993; Linstead, 2004; Pizzorno et al., 2015; Prasad, 2012).

LANGUAGE AND DECONSTRUCTION

Basically, humanism and structuralism can be read as an attempt to define the essence of things, the factor that can identify something or someone and group them together with others of the same type, so as to create an order, a system of classification, within an existence dominated by chaos and disorder. In the *Archaeology of knowledge* (1969b), Foucault reconstructed how human sciences used language to build binarism, categories, classification schemes and tables/grids that reflect an 'innate' order of things. These deep structures were supposed to provide the framework within which to control the untidiness of life. Poststructural theories, feminist poststructural theories and queer theory (Butler, 1999, 2004; Halperin, 1995) have troubled those structures, and it was precisely the poststructuralist critique of language and, in particular, deconstruction, which brought to light how language functions by producing structures which we believe to be real, but are actually very primitive, and which create forms of privilege.

Poststructuralism rejects those humanist theories of language, which generally posit the *correspondence* between a word and something out there in the world – words correspond to things existing in the world, and language therefore mirrors what we encounter. These are significant issues, because the huge variety of things that happen in the world makes it impossible to find a correspondence for everything in language; in other words, it is difficult to invent the words which might match everything that exists in the world. For that reason, using the humanist idea of language leads us to group together into categories, classes and so on, certain things and behaviours, ideas and people, which may seem similar, but are in fact very different. A good example is the category *homosexual*. In an attempt to create order and coherence, some people are included in this category, but this obscures their differences in relation to

other identity categories such as class, ethnicity, gender or age. Moreover, since the homosexual category is weak, we are forced to fix, or define the essence both of the thing itself (the homosexual category), and of the real, live homosexuals inhabiting the world, so that the category and the individuals can be matched. This activity, consisting of a search for sameness (not for difference), which combines entities only apparently similar, is carried out through language.

For poststructuralists, language does not mirror the world. A significant starting point for their critique is Derrida's revision (1967) of the linguistic theories of Ferdinand de Saussure (1916). Humanist theories of language conceived words as signs representing a *presence* that exists somewhere else in the world, and there are traces of this idea also when we wonder about the meaning hidden behind words in ordinary language, as if the meaning existed somewhere else. Saussure changes this framework, because he claims that the meaning resides in the sign and nowhere else. To arrive at this point, he makes a distinction in the sign between the signified and the signifier. The first is the meaning and the second is the sound or image of the written sign. The point that Saussure clarified is that the relationship between the two elements of the sign is arbitrary; the signifier does not express the signified and the signified does not reflect a sound or form. The meaning of a sign 'is not intrinsic but relational. Each sign derives its meaning from its difference from all the other signs in the language' (Weedon, 1997, p. 23). For example, there is nothing intrinsic in the signifier *homosexual* that gives it its meaning; what gives meaning to *homosexual* is its difference from other signifiers referring to sexual identity, such as heterosexual or transsexual.

Poststructuralism agrees with, but at the same time distances itself from, Saussurean theories. The poststructuralists accept the idea that there is no correspondence between words and things, that signs have no intrinsic

meaning, and find meaning instead in the differences from other signs in the linguistic chain: meaning is thus generated through differences rather than through similarities. However, poststructuralists distance themselves from Saussure because his theory does not explain the presence of different meanings for the same signified; Saussure's theory is logocentric in the sense that 'signs have an already fixed meaning recognized by the self-conscious rational speaking subject' (Weedon, 1997, p. 25). Poststructuralism operates a radical change in Saussure's theory by arguing that the meaning is never fixed forever but is constantly deferred. Jacques Derrida invented the neologism *différance* (with an 'a') to explain that meaning is never stable, but changes constantly, so that the meaning can always be questioned. The word *différance* contains the combined meanings of the words difference and deferral. Therefore, if meaning is always changing and ephemeral, then representation can only be a temporary retrospective that unfortunately fixes the meaning, but we can never know exactly what something means; we can never get to the root of things. The point is that poststructuralism is not interested in 'meaning'; this can never be pinned down and must always be deferred, being always incomplete and lacking an origin.

One of the most influential poststructuralist critiques of language is to be found in Derrida's book *Of grammatology* (1967), which attacks logocentrism as the defining mode of Western thought, based on what he calls a 'metaphysics of presence'. The logic of *presence* refers to a transcendental order which exists in itself and is manifested by ideas such as essence, consciousness, rationality, unified subject, *logos* and so on. Western thought is rooted in this idea of presence: 'a relatively unexamined set of philosophical assumptions underpinning much of the natural and social sciences, in which it is implicitly believed that things and events are unproblematically given to us as fully

present and self-identical in the immediacy of our experiences' (Chia & King, 2001, p. 318). However, things and events are not fully present and it is not true that we can understand them through unmediated experience. The yearning for the 'thing in itself', writes Spivak (1974), is the desire for a *centre* that is transcendent and timeless, which 'spawns hierarchized oppositions. The superior term belongs to presence and the *logos*; the inferior serves its status and marks a fall' (p. lxix).

In *On grammatology*, Derrida elucidates brilliantly how language works because of difference, and not because sign and thing are identical (not because of presence). Again, Spivak explains that '[t]he structure of the sign is determined by the trace or track of that other which is forever absent' (1974, p. xvii) and in this way, Derrida builds the foundations for the undoing of structures (centred on sameness and presence), in short, for *deconstruction*, an approach that has enjoyed great success in poststructuralism and beyond. It should be made abundantly clear that deconstruction is not demolition: it is not a nihilistic or annihilating practice. It should rather be described as a practice of reconstruction in order to understand how a structure, an essence, a centre were built and, above all, what they produce. Deconstruction 'is to dismantle our preconceived notions and expose the absent presence. The absent presence is that which has been ignored in an attempt to preserve the illusion of truth as a perfectly self-contained and self-sufficient present' (Jackson & Mazzei, 2012, p. 18).

Deconstruction makes us more aware of how language traps us in binary forms of thought, in categories and in grids of intelligibility, highlighting what we normally pay little attention to, not only in what we read on a page, but also in the text of the 'self' and in organizational and social practices; deconstruction, then, should not be understood in the restrictive sense, as merely a tool for textual analysis or literary criticism. Derrida's

famous saying, 'There is nothing outside of the text' (Derrida, 1967, p. 158), could be taken to mean that the only thing that we should pay attention to is language, but it could also be understood, perhaps more correctly, as meaning that everything is text, or that outside there is another text, other structures and assumptions – we are inseparable from the text through which we constitute ourselves and things.

Derrida stressed that 'deconstruction is not a method' and cannot 'be reduced to some methodological instrumentality or a set of rules and transposable procedures' (Derrida, 1988, p. 4). He later wrote that deconstruction 'is neither a theory nor a philosophy. It is neither a school nor a method. It is not even a discourse, not an act, nor a practice. It is what happens, what is happening today in what they call society, politics, diplomacy, economics, historical reality, and so on' (Malabou & Derrida, 2004, p. 225). A poststructuralist question does not ask what deconstruction means, but what deconstruction does: it puts a structure 'under erasure' (*sous rature*), meaning 'to write a word, cross it out, and then print both word and deletion' (Spivack, 1974, p. xiv). In this sense, we continue to use categories that allow us to describe the world (and organizations), because they seem necessary, but at the same we cross them out because we think they are inadequate. For example, we would write ~~management~~ and ~~organization~~ to make it clear that we are questioning a structure but at the same time not rejecting it. We are working both within and against it.

Deconstruction not only works within and against a structure, but displaces the structure so that something different can be thought and done. If we look at some of the classic (and injurious) categories of Western culture (self/other, man/woman, white/black, Western/Eastern, heterosexual/homosexual), deconstruction begins by reversing the order of the binary, so that in the binary man/woman, for example, women take the privileged position and men feel the discomfort of

being labelled sentimental, weak, irrational and so on. Then the privileged term (man) needs to be displaced and a new one created which can no longer be understood using the original binary (man/woman). In this way, we support a way of thinking in favour of something different happening. This kind of research would be *différance*, not repetition.

One of the main consequences of deconstruction is that it allows us to look at how language does not indicate pre-existing things; it constructs the world we know, meaning that we assign words to the world and there is nothing natural about what we produce, and if the world is constructed through language and cultural practices, then it can be deconstructed and reconstructed. Structures, models and regularities are not necessary and do not pre-exist our capacity to give them a name: they are contingent and open to change. It follows too that we have a great responsibility towards the structures we have constructed. This responsibility cannot be assigned to a presence outside of ourselves which makes us state 'That's how things are', because that would actually be shirking our responsibilities, along with the intellectual and political challenges involved in embracing the ambiguous, contingent nature of human existence. Deconstruction also has ethical aspects, offering new opportunities to rewrite ourselves and our cultural practices, our organizations and the way of life that *we ourselves* have produced, in a never-ending process.

Poststructural theories of language have migrated and influenced management studies and produced subversive analyses of organizations. Jones (2004) has identified three possibilities in the adventure of deconstruction in organization studies: (1) the possibility that deconstruction might be a 'method'; (2) the possibility that deconstruction might be negative or some form of 'critique' and (3) the possibility that deconstruction might result in relativism or 'the indeterminacy of meaning' (p. 36).

POST-QUALITATIVE RESEARCH AND METHODOLOGIES

Qualitative inquiry in general, and in management and organization studies in particular, is greatly indebted to humanism. For this reason, once the classical humanist structures were undone by poststructural theories, the difficulty for researchers was how to ‘work the ruins’ of qualitative research: ‘Once those philosophical categories have shifted, methodology will shift as well. If humanism’s inscription of reality, knowledge, truth, rationality, and the subject are dangerous fictions, then its “science” also becomes problematic. If this is the case, what might a different science look like?’ (St. Pierre & Pillow, 2000, p. 10).

In recent years, a movement inspired by poststructural theories has entered the arena of qualitative inquiry, seeking to trouble humanistic research assumptions and go beyond *conventional humanistic qualitative research* (St. Pierre, 2011). This disruptive action is aimed at the kind of qualitative research that has become all too predictable in book after book, article after article, conference after conference: it is a reliable and stable structure, and it is also dangerously regulatory. Indeed, qualitative research has become so regulated and standardized that it risks losing the critical mass that characterized its origins. The disruptive movement originated in education studies, in poststructural feminism and in the methodological and epistemological debates surrounding qualitative research, but the field of management and organization studies still seems untouched by these developments.

Scholars have started to deconstruct some of the classic categories of qualitative research, such as *interview* (Scheurich, 1995), *validity* (Lather, 1993) and *data* (St. Pierre, 1997), and more recently, to trouble other keystone concepts: *reflexivity* (Pillow, 2003) and *voice* (Jackson and Mazzei, 2009). Subsequently, post-qualitative

research attracted more interest from scholars working in the qualitative field, because it offered a creative launch-pad for new methodological journeys. Numerous specialist journals have dedicated whole issues specifically to post-qualitative research: (1) *Qualitative Inquiry – Qualitative Data Analysis after Coding* (2014/6); (2) *Cultural Studies ↔ Critical Methodologies – Data* (2013/4); (3) *The International Journal of Qualitative Studies in Education – Post Qualitative Research* (2013/6); and (4) *Qualitative Inquiry – Concept as Method* (2017/9). In addition, approaches like new materialism and posthumanism (Barad, 2007; Braidotti, 2013; Koro-Ljungberg, 2015; Lather, 2013; MacLure, 2013; Massumi, 2002) have made some unexpected words available to research (such as assemblage, entanglement, movement, apparatus, intra-action, diffraction, rhizoanalysis, line of flight, nomadic, affect, event, space-time-matter, onto-epistemology, etc.) which resist attempts to construct yet another clear, consensual regulatory alternative.

The ‘post’ in post-qualitative research can be understood, then, not only as what comes after neopositivism, interpretivism and linguistic turn, but also as the ongoing process of deconstruction, and many of the key concepts of the neopositivist and interpretative frameworks (such as sameness, voice, experience, ‘I’, analysis, coding, data, field, interview, narrative, research design, reflexivity and many more) have been put under erasure using this process. Indeed, they have sometimes been completely abandoned because they tend towards fixity.

Post-qualitative inquiry and methodology cannot be described in precise terms, and much of the methodological rule-following used in conventional qualitative research cannot be used in the post-qualitative field or may seem inadequate. For example, terms such as qualitative, methodology, ethics and so on are labels with no stable identity for post-qualitative scholars and are therefore always, at least in part, becoming. Research

and the work of the researcher thus become something ‘not-yet-thought’, something different. As outlined above, structuralism thinks of difference as difference from something, while Deleuze (1994) urges us to think of difference-in-itself, intent on freeing difference from the dominance of identity by making difference primary, and identity only secondary. This might also be read as meaning that it is *difference* that creates something, rather than *commonality* or *sameness*, or that *difference* is in constant dynamic tension with *commonality* or *sameness*. In this perspective, what a thing *is* fluctuates constantly, so that there is really no *being*, but only *becoming* (Koro-Ljungberg et al., 2016).

Post-qualitative theories and the accompanying methodological moves can also be seen as political moves (Lather, 2007) against normative science, especially by scholars interested in experimental ontologies and surprising methodologies. Similarly, when a methodology is seen as changing and ‘becoming’ (Deleuze and Guattari, 1994) – when it is endowed with elements of the unknown and unanticipated – it seems to offer scholars greater opportunities of openness and creativity.

The task of rethinking qualitative research in general (and research in management studies in particular) is challenging because we are continually pushed back into the past; a past which is also our present. We are all (managers, leaders, followers, researchers, consultants, participants, workers, employers, etc.) the subjects of humanism: it is where we were born and grew up, the land we still inhabit with our bodies, and the language we still speak. The work is arduous, but at least Foucault (1981) has given some advice:

We have to dig deeply to show how things have been historically contingent, for such and such reason intelligible but not necessary. We must make the intelligible appear against a background of emptiness and deny its necessity. We must think that what exists is far from filling all possible spaces. To make a truly unavoidable challenge of the question: What can be played? (pp. 139–40)

Notes

- 1 Lather and St. Pierre (2007) use the term postpositivism to indicate that group of theories that rejects the assumptions of positivism and which may be hereinafter referred to as: neopositivism, interpretivism, critical theory and poststructuralism. Within organization and management studies, we find the use of two terms: postpositivism (Prasad, 2005) and *post-positivism* (Miller, 2000). In the first case, postpositivism is used in its most popular sense, that is, in line with Lather and St. Pierre. In the second case, *post-positivism* is suggested by Miller (2000) to describe a meta-theoretical position, which derives from functionalism (Burrell and Morgan, 1979) or by modernism (Deetz, 1996), that ‘does not require a rejection of realism, objectivity, and the scientific goal of value-free inquiry. However, these scholars do reject the notion of absolute truth, the unassailable foundation of observation, and the assumption of an always steady and upward accumulation of knowledge’ (Miller, 2000, p. 58).
- 2 Poststructuralism implies a rethinking of agency. Once the subject is decentred, he is no longer the free spirit of humanism.
- 3 Weedon describes subjectivity as follows: ‘subjectivity [in poststructuralism] is used to refer to the conscious and unconscious thoughts and emotions of the individual, her[his] sense of herself[himself] and her[his] ways of understanding her[his] relation to the world’ (Weedon, 1997, p. 32). Subjectivity refers to self-awareness and individuality, and not to an intrinsically human feature present in our personal narratives.

Mixed Methods

Jose F. Molina-Azorin

INTRODUCTION

The choice between quantitative or qualitative methods has been the subject of controversy in business and management research. Although business and management researchers employ both qualitative and quantitative approaches, the use of large sample, quantitatively operationalized research designs dominates (Phelan et al., 2002; Molina-Azorin, 2011). There are some differences between the European, more pluralistic, tradition, and its acceptance of qualitative research, and that of North America. For example, in the field of entrepreneurship research, Molina-Azorin et al. (2012) found that in the *Journal of Business Venturing* and *Entrepreneurship Theory and Practice*, two leading US-based entrepreneurship journals, 12 per cent and 8 per cent were qualitative papers, respectively. However, in *Entrepreneurship and Regional Development*, a leading European journal in this field, 36 per cent

were qualitative studies. In any case, for these three journals, and for most other business and management journals, quantitative designs dominate.

Although the use of qualitative methods has lagged behind the use of quantitative approaches, significant contributions to management theory and practice have also come from qualitative studies (Barr, 2004; Cassell & Symon, 2006). Moreover, an important methodological trend is to integrate qualitative and quantitative research methods in the same study; that is, to employ a mixed methods approach (Molina-Azorin, 2007). The issue need not be quantitative versus qualitative methods, but rather how to combine the strengths of each in a mixed methods approach.

Although researchers have combined qualitative and quantitative data for many years, current conceptualizations of mixed methods research did not emerge until the 1980s (Bryman, 1988; Greene et al., 1989). Mixed methods research has developed rapidly in

these last few years, emerging as a research methodology with a recognized name and distinct identity ((Denscombe, 2008), especially in some fields such as education, health sciences, psychology and sociology. In these fields, this methodological approach is becoming increasingly articulated and recognized as the third methodological movement, along with qualitative research and quantitative research (Tashakkori & Teddlie, 2003). Scholars from these fields have published specific books on mixed methods research (Tashakkori & Teddlie, 2003; Niglas, 2004; Mertens, 2005; Creswell & Plano Clark, 2007; Greene, 2007; Andrew & Halcomb, 2009; Morse & Niehaus, 2009; Teddlie & Tashakkori, 2009; Tashakkori & Teddlie, 2010; Creswell & Plano Clark, 2011; Creswell, 2015; Curry & Nunez-Smith, 2015; Plano Clark & Ivankova, 2016).

However, the attention devoted to mixed methods in our business and management field has been relatively low in comparison to the disciplines from within the social and behavioural sciences identified previously as championing the mixed methods movement. For example, at the moment, there is not any specific book on mixed methods research published in our field. In addition, although there are articles that have used a mixed methods approach, the expression 'mixed methods' is not usually used in the title of these mixed methods studies. Furthermore, the literature base of this methodological approach is rarely included in the references sections of mixed methods articles published in business and management journals (Molina-Azorin, 2011). On this evidence, it seems likely that the terminology, advantages, purposes and designs of mixed methods research may be unknown to business and management researchers, and consequently our field may not exploit the full potential for mixing methods. Therefore, we have much to learn about this methodological approach from other fields.

The use of mixed methods research in business and management may play an important

role in the development of our field because results obtained from different methods have the potential to enrich our understanding of business and management problems and questions. In fact, there are calls for using mixed methods in business and management research (Jick, 1979; Hitt et al., 1998; Lee, 1999; Currall & Towler, 2003; Armstrong & Shimizu, 2007; Edmondson & McManus, 2007; Molina-Azorin, 2007, 2011, 2012; Molina-Azorin & Cameron, 2015; Molina-Azorin & Lopez-Gamero, 2016), but more knowledge about this methodological approach is needed in our field.

The aim of this chapter is to examine the main characteristics of mixed methods research. An important objective of this paper is to help business and management scholars to become more familiar with mixed methods research, studying why and how to use this approach. This chapter may be relevant for researchers who want models of how other scholars effectively apply this approach. Thus, several examples of mixed methods studies published in our field in three important journals (*Academy of Management Journal*, *Strategic Management Journal* and *Journal of Organizational Behavior*) are examined. In addition, recommendations regarding the adequate application of mixed methods research are indicated.

This chapter is organized as follows. First, the foundations and main characteristics of mixed methods research are indicated, emphasizing why and how to conduct a mixed methods study. Next, several examples in the business and management field that use a mixed methods approach are examined. Finally, the last sections offer some implications and recommendations, and a summary of the main conclusions.

MIXED METHODS RESEARCH

In this section, several important aspects, characteristics and methodological advances in mixed methods research that have been

made by other fields are examined. Specifically, definition, barriers to conducting this type of research, purposes, types of designs and philosophical positions are described.

Definition of Mixed Methods Research

Greene et al. (1989) defined mixed methods designs as those that include at least one quantitative method (designed to collect numbers) and one qualitative method (designed to collect non-numeric data). Tashakkori & Teddlie (1998) pointed out that mixed methods studies are those that combine the qualitative and quantitative approaches into the research methodology of a single study. Johnson & Onwuegbuzie (2004) indicated that mixed methods research is the class of research where the researcher mixes or combines quantitative and qualitative research techniques, methods, approaches, concepts or language into a single study. Plano Clark (2005) stated that mixed methods research combines qualitative and quantitative data collection and data analysis within a single study.

Johnson et al. (2007) asked 21 researchers to define mixed methods and obtained 19 definitions. These definitions differed in terms of what was being mixed (methods or methodologies), the stage of the research process in which mixing occurred (data collection, data analysis, inferences) and the purpose for mixing (breadth, corroboration). As a result of their review, these authors offered a composite and broad definition (Johnson et al., p. 123): mixed methods research is the type of research in which a researcher or team of researchers combines elements of qualitative and quantitative research approaches (e.g. the use of qualitative and quantitative viewpoints, data collection, analysis, inference techniques) for the purposes of breadth and depth of understanding and corroboration. These authors indicated a continuum of several types of mixed methods studies, with

the identification of pure mixed, qualitative dominant and quantitative dominant as the three types that fall into their mixed methods definition.

Barriers to Conducting Mixed Methods Research

There are several barriers to carrying out mixed methods studies (Plano Clark, 2005; Bryman, 2007; Creswell & Plano Clark, 2007). Mixed methods studies require extensive time, resources and effort, and researchers must develop a broader set of skills. Creswell & Plano Clark (2007) pointed out that conducting mixed methods research is not easy. Mixed methods studies are a challenge because they are perceived as requiring more work and financial resources, and they take more time. Increased time demands arise from the time it takes to implement the quantitative and qualitative parts of the study (Niglas, 2004).

In addition, mixed methods research also requires that researchers develop a broader set of skills that span both the quantitative and the qualitative. Many scholars have specialized in their research training in either a predominantly quantitative or qualitative tradition, and this issue may militate against the application of mixed methods studies. One way to overcoming this limitation in trained capacities of researchers that might hinder their ability or inclination to conduct mixed methods research is to develop teams than can bring together specialists in both kinds of methods. However, the presence of skill specialisms may lead to compartmentalization of roles and responsibilities that can hinder the integration of findings (Bryman, 2007).

Another barrier is related to the challenges of publishing mixed methods studies. In this case, researchers face two kinds of problems (Plano Clark, 2005; Bryman, 2007). One is the tendency for some journals to be known to have a methodological bias toward either quantitative or qualitative research and,

consequently, researchers may believe that the presence of such a bias limits their ability to publish mixed methods studies. The other is that the need to describe and discuss two sets of data collection, data analysis and findings may make it difficult to publish mixed methods studies due to the word and page restrictions that journals impose on authors.

Benefits and Purposes of Mixed Methods Research

Taking into account previous barriers to conducting mixed methods research, is it worth our time and effort to carry out mixed methods studies? Some benefits and advantages of mixed methods research can be indicated. The overall purpose and central premise of mixed methods studies is that the use of quantitative and qualitative approaches in combination provides a better understanding of research problems and complex phenomena than either approach alone (Creswell & Plano Clark, 2007). Better understanding can be obtained, for example, by triangulating one set of results with another and thereby enhancing the validity of inferences. In fact, the concept of the triangulation of methods was the intellectual wedge that eventually broke the methodological hegemony of the monomethod purists (Tashakkori & Teddlie, 1998). Jick (1979) discussed triangulation in terms of the weaknesses of one method being offset by the strengths of another. It is often stressed that different methods have different weaknesses and strengths, and therefore the main effect triangulation can offer is to overcome the weaknesses of any single method. Thus, if we use several different methods for investigating the phenomenon of our interest, and the results provide mutual confirmation, we can be more sure that our results are valid (Niglas, 2004).

Other purposes, reasons or rationales for combining qualitative and quantitative methods can be pointed out. Greene et al. (1989) highlight other additional purposes along

with triangulation: complementarity (elaboration or clarification of the results from one method with the findings from the other method), development (when the researcher uses the results from one method to help develop the use of the other method) and expansion (seeking to extend the breadth and range of inquiry by using different methods for different inquiry components).

Bryman & Bell (2015) also present a wide variety of purposes for mixed methods research: triangulation (the findings from one method are cross-checked against the results deriving from the other type); qualitative research facilitates quantitative research (providing hypotheses or informing the design of survey questions); quantitative research facilitates qualitative research (preparing the ground for qualitative research through the selection of people to be interviewed, or companies to be selected as case studies); static and procedural features (quantitative research can study the static features and regularities of a phenomenon and qualitative research can focus on more procedural characteristics); qualitative research may facilitate the interpretation of the relationship between variables (a qualitative study can be used to help explain the factors underlying the broad relationships that are established in the quantitative part); and analysis of different aspects of a phenomenon (for example, the relationship between macro and micro levels, or different stages of a longitudinal study).

Saunders et al. (2016) also indicate other reasons for using a mixed methods design: generalizability (use of mixed methods may help to establish the generalizability of a study, its relative importance or its credibility); diversity (use of mixed methods may allow for a greater diversity of views to inform and be reflected in the study); problem solving (use of an alternative method may help when the initial method reveals unexplainable results or insufficient data); and confidence (as findings may be affected by the method used, use of a single method

may make it impossible to ascertain the nature of an effect).

Mixed Methods Designs

A key aspect related to the use of mixed methods research is the type of design; that is, how to conduct a mixed methods study. There are two main factors that help researchers to determine the type of mixed methods design that is best suited to their study: priority and implementation of data collection (Morse, 1991; Morgan, 1998; Tashakkori & Teddlie, 1998; Creswell, 2003).

Regarding priority, the mixed methods researcher can give equal priority to both quantitative and qualitative parts, emphasize qualitative more, or emphasize quantitative more. This emphasis may result from the research question, from practical constraints on data collection, from the need to understand one form of data before proceeding to the next, or from the presumed preference of the intended audience. Mixed methods designs can therefore be divided into equivalent status designs (the researcher conducts the study using both the quantitative and the qualitative approaches, roughly equally, to understand the phenomenon under study) and dominant–less dominant studies (the researcher conducts the study with a dominant method and a small component of the other method).

Implementation of data collection refers to the sequence the researcher uses to collect both quantitative and qualitative data. The options consist of gathering the information at the same time (concurrent, simultaneous or parallel design) or introducing the information in phases (sequential or two-phase design). In gathering both forms of data concurrently, the researcher may seek to compare them to search for congruent findings. When the data are introduced in phases, either the qualitative or the quantitative approach may be gathered first, but the sequence relates to the objectives of the researcher. Thus, when

qualitative data collection precedes quantitative data collection, the intention may be to first explore the problem being studied and then to follow up on this exploration with quantitative data that are amenable to being studied as a large sample, so that the results can be applied to a population. Alternatively, when quantitative data precede qualitative data, the intention may be to test variables with a large sample and then to explore in more depth with a few cases during the qualitative phase.

These two dimensions and their possible combinations can lead to the establishment of several designs which are represented using the notation proposed by Morse (1991). In her system, the main or dominant method appears in capital letters (QUAN, QUAL) while the complementary method is in lower case letters (quan, qual). The notation ‘+’ is used to indicate a simultaneous design, and the arrow ‘→’ stands for sequential design. Thus, the following four groups of mixed methods designs and nine types of design can exist using these two dimensions (Johnson & Onwuegbuzie, 2004):

- 1 Equivalent status/simultaneous design: QUAL+QUAN.
- 2 Equivalent status/sequential designs: QUAL→QUAN; QUAN→QUAL.
- 3 Dominant/simultaneous designs: QUAL+quan; QUAN+qual.
- 4 Dominant/sequential designs: qual→QUAN; QUAL→quan; quan→QUAL; QUAN→qual.

There are other classifications of mixed methods designs. Thus, three main types of mixed methods designs are triangulation, exploratory and explanatory designs (Creswell & Plano Clark, 2007). The purpose of a triangulation mixed methods design is to simultaneously collect both quantitative and qualitative data, merge the data, and use the results to understand a research problem. The researcher gathers both quantitative and qualitative data, compares results from the analysis of both types of data, and makes an interpretation as to whether the results from

both support or contradict each other. The triangulation design is usually a one-phase design in which researchers implement the quantitative and qualitative methods during the same time frame and with equal weight. It generally involves the concurrent, but separate, collection and analysis of quantitative and qualitative data so that the researcher may best understand the research problem.

The purpose of an exploratory mixed methods design is the procedure of first gathering qualitative data to explore a phenomenon, and then collecting quantitative data to explain relationships found in the qualitative data. Therefore, this design is a two-phase (sequential) mixed methods design. In this case, the results of the first method (qualitative) can help develop or inform the second method (quantitative). This design is based on the premise that an exploration is needed for one of several reasons: measures or instruments are not available, the variables are unknown, or there is no guiding framework or theory. Therefore, researchers use this design when existing instruments, variables and measures may not be known or available for the population or context under study. It is also appropriate when a researcher wants to generalize results to different groups, to test aspects of an emergent theory or to explore a phenomenon in depth and then measure its prevalence.

The explanatory design is also a two-phase, mixed methods design and it consists of first collecting quantitative data and then collecting qualitative data to help explain or elaborate on the quantitative results. This design starts with the collection and analysis of quantitative data. The second, qualitative phase of the study is designed so that it follows from the results of the first quantitative phase. The rationale of this approach is that the quantitative data and results provide a general picture of the research problem, but more analysis through qualitative data collection is needed to refine, extend or explain the general picture. For example, this design is well-suited to a study in which a researcher

needs qualitative data to explain significant (or non-significant) results, outlier results, or surprising findings. This design can also be used when a researcher wants to form groups based on quantitative results and follow up with the groups through subsequent qualitative research or to use quantitative participant characteristics to guide purposeful sampling for a qualitative phase. In sum, there are two main variants of the explanatory design: the follow-up explanations design and the participant selection design. Although both models have an initial quantitative phase followed by a qualitative phase, they differ in the connection of the two phases, with one focusing on results to be examined in more detail and the other on the appropriate participants to be selected.

Mixed Methods Research and Philosophical Positions

The advocates of pure quantitative and pure qualitative approaches have engaged in ardent dispute (Johnson & Onwuegbuzie, 2004). Several debates, or paradigm 'wars', (Datta, 1994) have raged in the social sciences regarding the superiority of one or the other of the two major social science paradigms: the positivist approach and the constructivist (interpretivist or naturalistic) orientation (Tashakkori and Teddlie, 1998). Another important aspect examined in those debates has been the idea of incommensurability and incompatibility, which means that qualitative and quantitative approaches could/should not be used in the context of the same study. This idea is based on the fact that there are quite different epistemological and ontological assumptions that underpin different paradigms and methods.

However, 'pacifists' have appeared who state that qualitative and quantitative methods are compatible. Reichardt & Cook (1979) countered the incompatibility thesis based on the paradigm-method fit by suggesting that different philosophical paradigms and

methods are compatible. Moreover, these authors argued that paradigms and methods are not inherently linked. Therefore, qualitative and quantitative methods can be combined within the philosophical paradigms. Moreover, the increasing use and application of mixed methods in several fields reflects this possibility of the combination of quantitative and qualitative methods.

As indicated by Saunders et al. (2016), there are two philosophical positions that often lead to mixed methods research designs: critical realism (Maxwell & Mittapalli, 2010) and pragmatism (Morgan, 2007; Biesta, 2010). Critical realists believe that while there is an external, objective reality to the world in which we live (realist ontology), the way in which each of us interprets and understands it will be affected by our social conditioning (interpretivist epistemology). Thus, for example, a researcher may use quantitative analysis of officially published data followed by qualitative research methods to explore perceptions. For pragmatists, the nature of the research question, the research context and likely research consequences are driving forces determining the most appropriate methodological choice. Both quantitative and qualitative research are valued by pragmatists and the exact choice will be contingent on the nature of the research.

Together with critical realism and pragmatism, Shannon-Baker (2016) also analyses two additional paradigmatic perspectives discussed in mixed methods literature: transformative-emancipation and dialectics. Mertens (2007, 2010) argues for adopting specific goals for research, which can be done by utilizing the transformative-emancipatory perspective. This perspective is characterized by the intentional collaboration with minority and marginalized groups or those whose voice is not typically heard on particular issues. Regarding dialectics (Greene & Hall, 2010; Johnson, 2017), this approach argues for using two or more paradigms together. Thus, a dialectic perspective brings together two or more paradigms in respectful dialogue

with one another throughout the research process. The emphasis is not in joining the two, but instead focuses on the tensions and new understandings that arise.

EXAMPLES OF MIXED METHODS STUDIES

To analyse the application of mixed methods in business and management research, a reading of articles published in the *Academy of Management Journal* (AMJ), *Strategic Management Journal* (SMJ) and *Journal of Organizational Behavior* (JOB) has been carried out in order to identify some mixed methods articles. AMJ is one of the most important empirical journals in our field that publishes studies in several management areas. SMJ also enjoys a reputation as a leader among management journals and focuses mainly on a macro management topic (strategy). Finally, JOB is one of the most important journals about a micro topic (organizational behaviour). The intention was to identify papers of broad interest to business and management scholars in a variety of speciality areas in the management field that can serve as examples of why and how mixed methods research is used. Therefore, several mixed methods studies are described, emphasizing the methodological characteristics regarding the mixed methods approach used (purposes, design, combination of methods, main aspects of the quantitative and qualitative methods) rather than the specific findings of each study.

In the *Academy of Management Journal*, Grant et al. (2014) used a QUAL→QUAN exploratory design to analyse the psychological implications of self-reflective job titles. The authors combined inductive qualitative and deductive experimental methods. Specifically, in the first phase, the purpose was to build theory through a qualitative study. The authors gathered three different sources of qualitative data. First, using a

semistructured interview protocol, they conducted 22 interviews with Midwest staff members, as well as the president and CEO, board chair and several affiliated outsiders. Second, they conducted 23 hours of observation, which included attending staff meetings and events as well as observing employees carrying out daily tasks. Third, they also obtained over 100 archival documents, including mission statements, chapter newsletters, event invitations, weblogs, and meeting announcements and agendas. Regarding data analysis in this qualitative stage, the authors used an inductive analytic approach that involved taking iterative steps between the data, existing literature and a developing set of theoretical ideas. They developed a general conceptual model and a set of theoretical propositions to explain patterns gleaned from the data. In the second phase (the quantitative part), the aim was to close the loop in full-cycle research by moving from theory building to theory testing. They designed a quasi-experiment to examine and test the propositions in the context of a health care system. Therefore, the mixed methods purpose was development, as the qualitative part developed the theoretical propositions (finding of this qualitative part) that then were tested in the quantitative part.

Grant et al. (2008) used this QUAL→QUAN exploratory design with the purpose of development to examine the relationship between employee support programmes and affective organizational commitment. The qualitative part, through 40 semistructured interviews, helped to construct and elaborate theory. Thus, the authors developed hypotheses in this first qualitative part that then were tested with the second, quantitative stage. In a similar way, Zellmer-Bruhn & Gibson (2006), in their study about the implications of a multinational organization context for team learning and performance, also used a design with a first qualitative part and a second quantitative part with the purpose of development. As they noted, to develop the surveys used for this study and to understand the contexts of the firms, they first interviewed a sample of

107 individuals, and then they carried out the quantitative part.

Anand & Watson (2004) used a QUAL+quan mixed methods design with the main purpose of triangulation to study how award ceremony rituals influence organizational field evolution through critical processes. As they indicated, while the approach was primarily qualitative, relying on content analysis of texts in trade periodicals, they also used quantitative data and statistical methods to underscore the significance of their findings, trying to confirm the qualitative results. However, in the study by Lavie et al. (2007) the main part is the quantitative one, as they employed a QUAN→qual mixed methods explanatory design, with the purpose of complementarity, in their analysis of the performance implications of timing on entry and involvement in multipartner alliances. As the authors emphasized, they elaborated their main quantitative research design via 12 personal interviews. The qualitative analysis of interview transcripts enabled them to gain insights into the causal mechanisms that drove their quantitative empirical results and assisted in the interpretation of these quantitative findings.

In the field of strategy, several articles published in the *Strategic Management Journal* that use and advocate a mixed methods approach have also been found. For example, an example of a QUAL→QUAN design (sequential exploratory, equivalent status) with a mixed methods purpose of development is the article by Sharma & Vredenburg (1998) about the relationship between environmental strategy and the development of competitive organizational capabilities. These authors carried out a study conducted in two phases within a single industry context (the oil and gas industry). The first phase (exploratory) involved comparative case studies through in-depth interviews in seven firms in the Canadian oil and gas industry to ground the resource-based view of the firm within the domain of corporate environmental responsiveness. Interview

data were triangulated through a qualitative content analysis of corporate public documents such as annual reports, environmental reports, company newsletters and newspaper reports. This exploratory study was intended to examine linkages between environmental strategies and the development of capabilities, and understand the nature of any emergent capabilities and their competitive outcomes. The first phase ended with two hypotheses based on previous literature and this qualitative study. The second phase (confirmatory) involved testing the emergent linkages through a mail survey-based study of the Canadian oil and gas industry. The final written report was structured in two main parts: the exploratory study included several sections (qualitative data collection, qualitative data analysis and results with the proposed hypotheses) and then the confirmatory study was carried out (with a quantitative data collection, quantitative analysis section and results). The qualitative phase assisted in understanding the industry, and in developing the theory, hypotheses and measurement instrument. Therefore, this study used a sequential exploratory mixed methods design. Regarding the issue of integration, in this study the authors integrated the qualitative and quantitative parts by connecting the findings of the first qualitative part to the beginning of the quantitative phase. Therefore, the quantitative part was built on the qualitative phase.

Yeoh & Roth (1999) is an illustrative example of a qual→QUAN design, and they tested a model of the relationships among firm resources, firm capabilities and sustained competitive advantage in the US pharmaceutical industry. They carried out a quantitative analysis, though they explained that the variables and their measurements used in the quantitative analysis were determined through a qualitative, two-stage process. First, the secondary literature was reviewed to determine the resources and capabilities that are important for competition in this industry. The second stage involved interviews with product

and marketing managers at several pharmaceutical companies, as well as with industry experts. In these interviews, informants were requested to identify the types of capabilities they felt were critical for future success in the industry. Thus, this qualitative phase helped to carry out the quantitative study, which is the dominant part of the article. Additionally, and contrary to what was done by Sharma & Vredenburg (1998), the qualitative part does not appear in such a deep, systematic and methodical way, without constructing any sets of in-depth cases.

Dyer & Hatch (2006) is an example of the QUAN→QUAL design. Their study examined the role of network knowledge resources in influencing firm performance, using a sample of US automotive suppliers selling to both Toyota and US car makers. From a point of view of mixed methods research, the authors indicated the dual nature of the research investigation. The first objective was to empirically examine the relationship between customer-to-supplier, knowledge-sharing activities and the rate of improvement in supplier network performance. Thus, this quantitative part tested the hypothesis that a buyer that provides greater knowledge transfers to its supplier network will develop the suppliers' production capabilities such that the suppliers' operations for that buyer will be more productive. Through a survey, the findings confirmed that Toyota's supplier network does produce components of higher quality and at lower cost for Toyota than for their largest US customers.

The second objective (qualitative) was to explore why the supplier performs better as a member of one network (i.e. Toyota's) than another network (i.e. GM, Ford or Chrysler). Interviews were done at 13 suppliers to explore quantitative results and analyse this second objective. In this study, the authors used different methods to assess different facets of a phenomenon, yielding an enriched, elaborated understanding of that phenomenon. The second, qualitative part helps explain and clarify the findings of the

first, quantitative phase. Therefore, this study uses one of the two variants of the mixed methods explanatory design, namely, the follow-up explanations design.

The other variant of the explanatory design is the participant selection design. Rouse & Daellenbach (1999) advocate a QUAN→QUAL design (sequential explanatory, equivalent status), through this variant of participant selection design, to determine the most valuable resources in a specific industry. These authors emphasize the importance of qualitative research to stimulate and guide future studies of resource-based competitive advantage. Their framework begins with a quantitative four-step firm selection process: (1) selection of a single industry; (2) clustering firms by strategic type or group within this industry; (3) comparing performance indices within strategic groups and (4) identifying those firms within each strategic group that are the high and low performers. Then, in a second qualitative phase, these firms would be selected as research subjects and would be analysed using in-depth fieldwork or ethnographic study methods; that is, a qualitative approach. Given the contention that sustainable competitive advantages are organizational in origin, tacit, highly inimitable, socially complex, embedded in process and often driven by culture, there can be no other way to obtain the data of interest than using a qualitative orientation. Fieldwork which takes the researcher into the organization is essential to gain an in-depth knowledge and understanding of the organization and its processes. Therefore, in this mixed methods explanatory design through the variant of participation selection design, the researchers would form groups based on quantitative aspects, using these quantitative participant characteristics to guide purposeful sampling for a next qualitative phase.

In the field of organizational behaviour, some mixed methods studies have also been identified in the *Journal of Organizational Behavior*. For example, Challiol & Mignonac (2005), using a QUAN+QUAL design,

presented the results of two empirical studies related to the geographical mobility of employees. Specifically, this paper focuses on the relocation decision-making processes of dual-earner couples. The objective is to gain a better understanding of the complex process of this relocation decision-making, and for this reason the authors indicate that two empirical studies, one quantitative and one qualitative, with two independent samples, were carried out. The first study is a quantitative survey of 155 management-level employees and focuses on the variables likely to moderate the influence of the spouse (partner) on the probability of accepting or turning down geographical mobility. This quantitative part attempts to establish whether the spouse's attitude toward mobility unconditionally influences the employee's likelihood of accepting a relocation opportunity or whether it varies in function as a result of various factors. Specifically, willingness to relocate is the dependent variable, and other variables are used as moderators and independent measures, such as marital quality, perceived job alternatives for the spouse, the spouse's career priority, the spouse's willingness to relocate and the employee's relative contribution to household income. Hypotheses are tested using a moderated hierarchical multiple regression procedure. The second study is qualitative, consisting of 11 in-depth interviews of dual-earner couples within which one of the partners had been required to decide whether to accept relocation or not. It complements the first study by providing a perspective on the initial results and attempting to identify and isolate the dynamics within the couple when making relocation decisions. The authors indicated that this second study constituted both triangulation across methods (reconciling qualitative and quantitative data) and complementarity by examining overlapping and different facets of a phenomenon.

Lilius et al. (2008) carried out a QUAN→QUAL study about the contours and consequences of compassion at work. In the first quantitative stage, the authors conducted a pilot survey that captures the nature

of compassion at work and its relationship to positive emotion and affective commitment. The qualitative part is a narrative study that reveals a wide range of compassion triggers and it illuminates ways that work colleagues respond to suffering. This narrative analysis demonstrates that experienced compassion provides important sense-making occasions where employees who receive, witness or participate in the delivery of compassion reshape understandings of their co-workers, themselves and their organizations. As indicated by the authors, these combined methods portray a deepened image of the kinds of suffering experienced, and responses offered, in the workplace. Therefore, the authors take advantage of the mixed methods purposes of complementarity and expansion.

Some mixed methods studies include more than two phases. For example, Jones & Martens (2009) published a mixed methods article with three phases. Specifically, these authors used a QUAN→QUAN→QUAL design to examine the mediating role of overall fairness and the moderating role of trust certainty in justice-criteria relationships. The first two phases were quantitative, and here the authors derived hypotheses from fairness heuristic theory, which proposes that perceptions of overall fairness are influenced by different types of justice and are used to infer trust when trust certainty is low. The first quantitative part showed that employees' perceptions of overall fairness in relation to a senior management team mediated the relationships between specific types of justice and employee outcomes. In the second quantitative part, these mediated effects were replicated and trust certainty moderated the effect of overall fairness on trust. Finally, the last qualitative part, through a content analysis, explored how the organizational context may have influenced the quantitative findings of the second quantitative study. Therefore, a purpose of complementarity was achieved through this last qualitative part.

IMPLICATIONS AND RECOMMENDATIONS

As stated above, other social science fields have more of a tradition of using and analysing the application of mixed methods research, and therefore it is important to consider what organizational scholars could learn from their experience. Knowledge of the literature base of mixed methods research and analysis of empirical papers that use a mixed methods approach will help business and management scholars to design and conduct this type of study. Next, some recommendations and implications regarding the application of mixed methods research are examined.

An important challenge for mixed methods studies in management research is the explicit clarification of several relevant aspects in the written report (Creswell et al., 2003). Thus, in relation to data collection, the implementation decision calls for clearly identifying the core reasons for collecting both forms of data (quantitative and qualitative), and understanding the important interrelationship between the quantitative and qualitative phases in data collection. Moreover, the choice of implementation strategy has consequences for the form of the final report. Thus, when two phases of data collection exist, the researcher can report the data collection process in two phases. The report may also include an analysis of each phase separately and the integration of information in the discussion or conclusion section of a study. In relation to priority, researchers need to make informed decisions about the weight or attention given to quantitative and qualitative research during all phases of their research. In the final written report, a project might be seen as providing more depth for one method than for the other through the length of discussions.

Some authors provide guidelines and recommendations about how to carry out a mixed methods research. Creswell (1999)

offers nine steps in conducting a mixed methods study: (1) determine if a mixed methods study is needed to study the problem; (2) consider whether a mixed methods study is feasible; (3) write both qualitative and quantitative research questions; (4) review and decide on the types of data collection; (5) assess the relative weight and implementation strategy for each method; (6) present a visual model; (7) determine how the data will be analysed; (8) assess the criteria for evaluating the study and (9) develop a plan for the study.

Similarly, Teddlie & Tashakkori (2006) provide a seven-step process for researchers selecting the best design for their projects: (1) the researcher must first determine if his/her research question requires a mono-method or mixed methods design; (2) the researcher should be aware that there are a number of different typologies of mixed methods research designs and should know how to access details regarding them; (3) the researcher should select the best mixed methods design for his/her particular study and assume that one of the published typologies includes the right design for the project; (4) typologies may be differentiated by the criteria that are used to distinguish among the research designs within them, and the researcher needs to know those criteria; (5) these criteria should be listed by the researcher, who may then select the criteria that are most important for the particular study he/she is designing; (6) the researcher then applies the selected criteria to potential designs, ultimately selecting the best research design; and (7) in some cases, the researcher may have to develop a new mixed methods design, because no one best design exists for his/her research project.

Regarding the last step, Teddlie and Tashakkori (2006) point out that mixed methods designs have an opportunistic nature. Thus, in many cases, a mixed methods research study may have a predetermined research design, but new components of the design may evolve as researchers follow up on leads that develop as data are collected

and analysed. These opportunistic designs may be different from those contained in previously published typologies. The point is for the researcher to be creative and not limited by the existing designs. A design may emerge during a study in new ways, depending on the conditions and information that is obtained. Thus, a tenet of mixed methods research is that researchers should mindfully create designs that effectively answer their research questions (Johnson & Onwuegbuzie, 2004).

Hanson et al. (2005) also offer some recommendations for designing, implementing and reporting a mixed methods study. Thus, they recommend that researchers attend closely to design and implementation issues, particularly to how and when data are collected (e.g. concurrently or sequentially). The study's purpose plays an important role here. They also recommend that researchers familiarize themselves with the analysis and integration strategies used in the published mixed methods studies. Moreover, because mixed methods studies require a working knowledge and understanding of both quantitative and qualitative methods, and because they involve multiple stages of data collection and analysis that frequently extend over long periods of time, they recommend that researchers work in teams. Moreover, in preparing a mixed methods manuscript, they recommend that researchers use the phrase 'mixed methods' in the titles of their studies, and that, early on, researchers foreshadow the logic and progression of their studies by stating the study's purpose and research questions in the Introduction. Clear, well-written purpose statements and research questions that specify the quantitative and qualitative aspects of the study help focus the manuscript. Additionally, these authors recommend that, in the Introduction, researchers explicitly state a rationale for mixing quantitative and qualitative methods and data (e.g. to triangulate results, to develop or improve one method with the other, to extend the study's results). Another recommendation is that, in the Methods, researchers specify the

type of mixed methods research design used. By doing this, the field will be able to build a common vocabulary and shared understanding of the different types of designs available.

A mixed methods study must be competently designed and conducted, and, as a consequence, management scholars must have the skills and training to carry out both quantitative and qualitative methods and take advantage of this type of research (Creswell et al., 2003). Coupled with traditional statistics coursework, in-depth training concerning the discovery process (e.g. qualitative observational techniques or case studies) has the advantage of enabling researchers to think fully about what types of research questions are innovative, interesting and practically relevant (Currall et al., 1999). But the key point here is that along with quantitative and qualitative courses, it may be necessary to design a specific mixed methods research course. Students should be taught about purposes, designs and the use of mixed methods research, and they should also be encouraged to carry out mixed methods research as part of their training. Academic institutions should take this important issue into account.

An important challenge in mixed methods studies is the quality of this type of research. Methodologists in the field of mixed methods debate the role of quality and validity in this approach (Bryman, 2006; Dellinger and Leech, 2007; Bryman et al., 2008; O'Cathain et al., 2008; Pluye et al., 2009). Their recommendations will be useful for researchers and journals.

In addition, there are challenges in publishing mixed methods studies that generally arise from existing constraints such as page limits. One of the biggest challenges related to publishing mixed methods research is describing the complexity of mixed methods studies within the page limits. While such limits pose a challenge to all researchers, they are particularly problematic for mixed methods research due to the quantity of information that must be conveyed for a study combining two different methods.

Moreover, there is a risk of diluting or diffusing one of the methods (the less important one or the one less accepted by academia) by trying to do too much within the page limit. In summary, by limiting space, journals may discourage the publication of mixed methods research.

CONCLUSION

This chapter provides several ideas about the application of mixed methods designs in business and management. First, several aspects of mixed methods have been examined to make clear what the literature already tells us about this type of research. Second, I have carried out a description of several mixed methods articles published in three top management journals, describing the main characteristics of the mixed methods studies identified. Finally, implications and recommendations for an adequate application of mixed methods research have been provided based on previous experiences in other fields.

An important characteristic of mixed methods is integration (Fetters & Freshwater, 2015). Business and management researchers that use mixed methods must integrate the quantitative and qualitative parts and should consider this question: what synergy can be gained by the additional work of using both qualitative and quantitative methods? This aspect urges researchers to carefully plan their works with intentional choices that can leverage integration. The key point here is to produce a whole through integration that is greater than the sum of the individual qualitative and quantitative parts.

Finally, I would like to indicate that I agree with the 'paradigm of choices' emphasized by Patton (1990). A paradigm of choices rejects methodological orthodoxy in favour of methodological appropriateness as the primary criterion for judging methodological quality. Thus, this paradigm of choices recognizes that

different methods are appropriate for different situations and questions (Molina-Azorin, 2007). The predominance of more quantitative-based methodological tools in business and management does not mean that these tools are applicable to all research questions. The research question and context should dictate the choice of the appropriate research methods. In any case, we must also take into account the fact that knowledge about qualitative and mixed methods research can stimulate a researcher to better define and analyse innovative problems and research questions in business and management research.

Resisting Colonization in Business and Management Studies: From Postcolonialism to Decolonization

Alia Weston and J. Miguel Imas

INTRODUCTION

Official history has it that Vasco Núñez de Balboa was the first man to see, from a summit in Panama, two oceans at once. Were the natives blind?

Who first gave names to corn and potatoes and tomatoes and chocolate and the mountains and rivers of America? Hernán Cortés? Francisco Pizarro? Were the natives mute?

The Pilgrims on the Mayflower heard Him: God said America was the Promised Land. Were the natives deaf?

Later on, the grandchildren of the Pilgrims seized the name and everything else. Now they are the Americans. And those of us who live in the other Americas, who are we? (Galeano, 2008, p. 122)

The opening quote alerts us to the key, historical concerns of colonialism and imperialism. It does so by illustrating the ways in which Europeans physically and ideologically conquered and exploited the land of Indigenous populations, in this case the

'Americas', in the sixteenth and seventeenth centuries. It was not only the Americas, but also Africa and the entire global south that suffered the ignominious effects of colonial, imperialist rule. These historical impacts of colonization continue to influence contemporary society, and have led to tremendous consequences for the way in which we conceptualize the *other* in research. This is most evident in the way we frame *marginalized subjects* from a Western point of view. In business and management studies, colonial epistemology has prevailed for decades and still continues to influence how we describe and engage with the *other* (Mohanty, 1988), imposing a sense of superior knowledge in the development of methodologies with which to 'study' *them*. In this chapter, we challenge this colonial tradition by exploring a range of perspectives that resist these injustices and offer alternative ways of constructing knowledge with the marginalized *other*, and bring forward a more encompassing and grounded understanding of people who have

suffered from colonial rule. This is our contribution to this volume, because we believe it is essential for any scholar to be alert to the vicissitudes of conducting research in the global south and the fourth world (Restrepo & Escobar, 2005).

Before we begin, we wish to clarify our position on ‘postcolonialism’ and acknowledge the inherent challenges of using this term. For the purposes of this chapter, we use the term postcolonial to encompass an evolving tradition of ideas and practices that work to resist colonization. We do so with full recognition that postcolonial is not an umbrella term, but an idea that sits alongside a range of congruent traditions including: anticolonial thinking (e.g. Grosfoguel, 2011), subaltern studies (e.g. Chakrabarty, 2005), Indigenous perspectives (e.g. Stewart-Harawira, 2013) and decolonial practices (e.g. Mignolo, 2009). All these traditions are similar in that they have cumulatively sought to advance an ongoing resistance to colonization; however, each is distinct with its own inherent opportunities and limitations. It is, therefore, through an ongoing critical dialogue that these traditions continue to evolve. Despite the inherent limitations (which we will highlight in this chapter), we have chosen to employ the term postcolonialism because it is a seminal perspective which, we believe, is still enduring and relevant today.

We position this chapter as an invitation to whoever is interested in gaining a broad understanding of postcolonialism and associated ideas, how these ideas have developed across business and management, and what constitutes appropriate and inappropriate research methods in this area of study. The chapter is structured as follows. We start by explaining the historical origins of postcolonial theory and highlighting associated perspectives. We then note how the concept has evolved in business and management studies. Following this, we focus on the main objective of this chapter, and conduct a critical review of business and management research methods. We employ an analytical

framework derived from postcolonial theory to highlight both appropriate and inappropriate use of methods in research that resist (neo-)colonialism. We highlight the ongoing debate and give examples of empirical research to illustrate how methods have been applied in the field. By empirical, we mean research that engages with the world and goes beyond purely theoretical analysis. After our analysis, we explore pertinent issues in the field. In particular, we comment on key silences and omissions, as well as practical issues of undertaking research in local contexts. We end by pointing to the future of research in this area, acknowledging the inherent challenges and highlighting the opportunities for researchers moving forward.

RESISTING COLONIALISM

There is no unified theory of postcolonialism, but it is predominantly taken to be a set of ideas that are critical of the historical and contemporary inequities in power that are created as a result of colonialism and imperialism (e.g. Loomba, 1998). These ideas are conceived as a way of reclaiming power following colonial expansion (e.g. Banerjee & Prasad, 2008; Prasad, 2003a; Said, 1978; Young, 2008). Although the anti-imperialist movement began much earlier, postcolonialism as a field of study originated in the late 1970s through literary and cultural studies, following Edward Said’s work on Orientalism. Through his work, Said emphasized the exaggerated distinctions made between Eastern and Western cultures and the ways in which colonially positioned Western (i.e. European) perspectives were categorized as superior to non-Western perspectives. Key concepts related to postcolonialism include ‘neo-colonialism’, ‘hybridity’, ‘liminality’ and ‘mimicry’. Neo-colonialism recognizes that colonization has not ended, and explains the ongoing forms of

colonization present in contemporary society (Spivak, 1999; Young, 2003), while hybridity, liminality and mimicry articulate the subversive amalgamation of colonial and local ideologies which produce a space of resistance in colonized contexts (Bhabha, 1994, 1996; Özkazanç-Pan, 2008; Sambajee, 2015).

Despite its valuable contribution to challenging the power inequities inherent in (neo-)colonization, postcolonialism as a field is not without criticism. We wish to highlight three key issues. First, it is seen to be too obscure and theoretical, and thus lacking in practical, applied relevance to contemporary society (Abrahamsen, 2003). The second issue is the ongoing debate about the meaning of the term 'post' in postcolonial, and whether it is conceivable to talk about moving beyond the colonial period (Mbembe, 2001). Following this line of debate, it has been argued that the term is limited since it only applies to contexts in which Indigenous persons have gained independence from colonial rule, for example only in African, Asian and Latin American countries (Perera and Pugliese, 1998). But even in these latter contexts, critique is still prevalent. This is illustrated by Latin American scholars being critical of postcolonial theorizing for constituting a Eurocentric critique of Eurocentrism (Maldonado-Torres, 2011). Finally, a central drawback of postcolonial scholarship in the business and management field is the over-emphasis on theoretical critique (primarily focused on the work of Said, Bhabha and Spivak), with scant focus on methods. As such, there is a lack of insight about how to conduct first-hand research in this field.

In recognizing the wider limitations of postcolonial theory, we take the opportunity to acknowledge the congruent areas of study that are situated alongside postcolonialism. Here, we briefly comment on anticolonialism, subaltern studies and decolonial practices. By including the term anticolonialism, we acknowledge the history and revolutionary work of activists who resisted

colonialism. An example is Frantz Fanon's seminal work from the 1960s, which situates an anticolonial struggle for liberation (1967/2008; 1963). This history has developed from the work of black and African American writers who wrote against different forms of oppression, and championed the civil rights and women's rights movements (Smith, 1999/2005). Subaltern studies originated through work in South Asia, and typically refers to the engagements of 'subaltern' groups of people, or marginal populations, who fall outside of colonial domination. Work in this area is aligned with postcolonial studies because it critiques colonial domination by exploring spaces of poverty and forms of popular agency (Chakrabarty, 2005; Roy, 2011; Spivak, 1998/2006, 1999, 2005). Like anticolonial thinking and subaltern studies, decolonial practices also encompass forms of active resistance to colonialism.

Although it is not yet a term common to the business and management literature, it is also essential to highlight the work that has taken place in the field of decolonization studies (e.g. Lugones, 2010; Smith, 2012; Zavala, 2013). In doing so we recognize this as an area of study that has deep synergy with postcolonial studies, particularly because it has emerged through the critique of postcolonial theory. Here, we wish to acknowledge the valuable work taking place which we believe is useful for advancing colonial resistance in business and management studies. There is no single decolonial perspective, but it can be defined as a process of actively dismantling the colonialist power dimensions that still exist in contemporary (twenty-first-century) society (Ashcroft et al., 2013). It resists neo-colonization by incorporating activist and performative methodologies and resisting colonization in all aspects of life (Denzin et al., 2008). Research responds to a number of issues. For example, it disrupts contemporary issues of racism and patriarchy, through critical feminism (Cannella & Manuelito, 2008) and critical race theory (Kincheloe & Steinberg, 2008; Ladson-Billing & Donnor,

2008). In addition, it resists oppressive forms of pedagogy, by actively replacing these with critical pedagogy that emphasizes emancipation (Giroux & Giroux, 2008), and by highlighting local Indigenous pedagogies (McLaren & Jaramillo, 2008).

Decolonization also responds to the critique that postcolonialism only applies to post-independence contexts. For example, it accounts for the struggles of Indigenous communities by highlighting ongoing ‘settler–colonizer’ power dynamics in Australia, Canada and the USA (Perera & Pugliese, 1998; Tuck & Yang, 2012). Another stream of decolonial thought, which has emerged from Latin America, is critical of postcolonial research about the *other* that privileges the Eurocentric ideal of ‘emancipation’. The focus has shifted to the decolonial ‘liberation’ of the *other* – following for instance Enrique Dussel (Maldonado-Torres, 2011). Although the concept of decolonization addresses certain limitations inherent in postcolonial theory, it is not without criticism. For example, Tuck & Yang (2012) warn of the easy adoption of the discourse of decolonization wherein it is used as a method or metaphor to generally improve things in society. For instance, terms such ‘decolonize student thinking’ have been used. They argue that using this kind of terminology debases the essence of decolonization, since it is a misuse of the term. Despite this critique, the value of engaging with the concept of decolonization to account for neo-colonial dynamics is well recognized.

Stepping aside from critical debates of terminology, our position is that all these concepts are important to acknowledge because they question the ways in which colonially derived (Western/imperial) perspectives are categorized as superior; and Indigenous, local (non-Western) dimensions are excluded on the grounds of inferiority (Calás & Smircich, 1999; Frenkel and Shenhav, 2006; Prasad, 2003a; Said, 1978; Westwood, 2001). Whether working through a postcolonial, decolonizing, or other associated lens, researchers actively subvert colonially inspired research approaches,

and instead reflexively theorize and incorporate methods which resist colonization and prioritize peoples’ lived experiences. The aim is to first unearth explicit and hidden power dimensions in research (see e.g. Imas, 2005). The next step is to critically question how research is conducted from philosophical, theoretical and empirical standpoints. Researchers then overcome power imbalances by undertaking research which is culturally appropriate in the context of study. They do so by re-emphasizing local, cultural and Indigenous forms of engagement (Tsui, 2004), engaging with performative methodologies to redistribute power (Denzin and Lincoln, 2008) and giving voice to the silenced (Muecke, 1992).

Before we progress further, it is essential to highlight our reflexive personal critique as authors of this chapter (see, for example, Giraldo, 2016). Alia is mixed heritage and navigates the liminal space of hybrid cultures. She is South African (Cape-Malay) and British, was born and raised in Zimbabwe and currently resides in Canada. Miguel is of European heritage, was born and raised in Chile and currently resides in the UK. We both actively engage in field research about business and management in the postcolonial contexts of Africa and Latin America (respectively). In these contexts, we work critically with postcolonial theory and research methods. We reflexively recognize the unearned privileges that our backgrounds and positions afford, as well as the inherent limitations of our work. The limitations include the problematics of writing in the English language as well as working remotely in contexts which embody the ongoing histories of (neo-)colonization.

POSTCOLONIAL RESEARCH IN BUSINESS AND MANAGEMENT STUDIES

In the business and management field, postcolonial research has a more recent history, and

is still gaining recognition, when compared to related areas such as colonial resistance or postcolonial literary and cultural studies (e.g. Ibarra-Colado, 2006). Research in the field primarily employs the term ‘postcolonial’, and it first appeared in English publications in the mid-1990s. In business and management studies, postcolonial thinking is percussed by two streams of critique which both sought to advance new critical knowledge and emancipation in the field. These were the critique of parochialism and ethnocentrism; as well as critique from post-structuralist and postmodern frameworks, which were positioned in the Critical Management Studies (CMS) movement (Jack et al., 2011). The reason for the slow development of the field – emerging nearly 20 years after Said’s work – is due to the fact that managerial practices and organizational forms are argued to be based on (neo-)colonial ideologies (see, for example, Bush and Maltby, 2004; Cooke, 2003; Frenkel and Shenhav, 2003; Neu, 2000; Spivak, 1998/2006; Tyson et al., 2004; Westwood, 2006). As a result, postcolonial and related perspectives occupied a marginal position in the extended business and management field (Prasad, 2012), and there are limited frameworks available to account for the (neo-)colonial impact of management theories and practices on Indigenous communities (Banerjee, 2000).

Postcolonial critique of business and management research alerts us to the problem that theories which are developed through (neo-)colonial frameworks create value for only certain types of people and institutions and marginalize other peoples and institutions, particularly those that are Indigenous (Banerjee, 2000). From this perspective, researchers work to question the appropriateness of business and management practices, and incorporate more appropriate and reflexive approaches to research (Prasad, 2003a). Research has focused on radically reconfiguring philosophical, methodological and ethical dimensions in business and management studies (Westwood, 2006).

Despite the slow development, postcolonial research has continued to gain prominence in business and management studies. There are now prominent English-language journals which welcome this critical approach to business and management research. For example, the journal *Critical Perspectives on International Business* has provided a space for critique for over 10 years (Alcadipani & Faria, 2014). It is committed to providing voice to marginalized groups (i.e. peripheral regions) and excluded perspectives (i.e. Indigenous communities), as well as to embracing postcolonial critique (Cairns & Roberts, 2011). Commitment to the latter is demonstrated by this being the first journal to publish a special issue focused on critical postcolonial reflections of management and organization (see Banerjee and Prasad, 2008). The journal *Organization* has demonstrated a parallel commitment to critical research in organization studies, by similarly publishing a special issue dedicated to postcolonial studies in 2011 (see Jack et al., 2011). These are not the only journals to publish work on postcolonial issues in the business and management field. Other prominent English-language journals include *Organization Studies*, *Human Relations* and *Management Learning*. The advancement of the field is commendable, but we also recognize the inherent limitations of the field being advanced, and dominated, by a colonial language (i.e. English).

Given the complexity of this field of study, in that it encompasses a range of traditions and accompanying limitations, we reflected extensively on the ‘best’ way to provide an overview of research methods which are appropriate for undertaking research in postcolonial contexts and that work to resist (neo-)colonialism. We admit that this was not a simple undertaking, especially in a limited number of pages. Our approach, which you will see in the following sections, has been to conduct a critical review of empirical research in business and management studies, through a postcolonial lens.

A POSTCOLONIAL CRITIQUE OF RESEARCH METHODS IN BUSINESS AND MANAGEMENT STUDIES

In this section, we conduct our postcolonial analysis of research methods in business and management studies. Our objective in this review is to highlight examples of a range of research methods in the field, in order to evaluate the appropriateness, as well as inappropriateness, of methods employed in (post) colonial contexts. To do so, we have used a framework based on postcolonial critique (Weston, 2012) which integrates key tenets derived from early postcolonial theory and practice. The framework incorporates two main dimensions and is visualized in Figure 8.1. The first dimension (on the vertical axis) acknowledges that postcolonial thinking critiques the positioning of colonially derived concepts above local concepts (Prasad, 2003a;

Said, 1978). The second dimension (on the horizontal axis) acknowledges postcolonial scholarship that works to reflexively re-emphasize Indigenous or local forms of engagement (Muecke, 1992; Tsui, 2004). When the two dimensions are superimposed, this results in four categories that we have used to position research methods that resist (neo-) colonialism, in contrast to methods that reproduce colonial power imbalances.

Using the framework, we review business and management research methods through the four categories. We have labelled these: A: Indigenous methods; B: Hybrid-Liminal methods; C: Appropriation or neglect of methods; D: (Neo-)colonial methods. In our view, the former two categories A and B (on the left) depict research that resists (neo-)colonialism, since research in these categories reflexively re-emphasizes Indigenous or local forms of engagement. However, the categories C and

Perspective of method	Indigenous/Local	A: Indigenous Methods are incorporated within a frame of postcolonial critique. Researchers reflexively work <i>with</i> Indigenous or local forms of engagement.	C: Appropriation or Neglect Non-reflexive appropriation of Indigenous forms of engagement by researchers for research purposes, or unreflexive neglect of appropriate methods. Imbalanced power dimensions are ignored.
	Colonially Derived	B: Hybrid-Liminal Methods are incorporated within a postcolonial frame. Researchers reflexively construct a hybrid-liminal space wherein historically colonial methods are subverted and usefully combined with local forms of engagement.	D: (Neo)colonial Methods are either derived from historically colonial relationships, or methods form new relationships of colonization. Imbalanced power dimensions are ignored.
		Reflexive	Non-Reflexive
		Emphasis of local engagement in research methods	

Figure 8.1 Typology of approaches categorizing postcolonial vs colonial research

D (on the right) account for research methods which are not appropriate because they continue to integrate colonially derived concepts in a non-reflexive manner. In the remainder of this section, we explore each category. We discuss these in reverse order of importance (i.e. D to A) in order that we may first critique and dismiss the areas that are not appropriate, and then end by highlighting research methods and approaches that are relevant to the ongoing resistance of (neo-)colonialism. In our review, we highlight critical debate on the use of these methods, or give examples of empirical research to illustrate.

D: (Neo-)colonial Methods

In this category, we emphasize (neo-)colonial research methods in the business and management field. The category includes methods which are either derived from historically colonial relationships, or methods which form new relationships of colonization (e.g. Spivak, 1999; Young, 2003). In all cases, the literature that falls in to this category ignores the imbalanced power dimensions that result from colonization. Rather than reviewing specific examples of the literature, here we highlight the critical commentary and ongoing debate that has arisen surrounding this focus on research methods.

In the business and management field, postcolonial scholars have critiqued traditional international business (IB) and cross-cultural management (CCM) research for having restricted views of what constitutes knowledge about business, management and organization. In particular, IB and CCM are criticized for being (neo-)colonial because they employ Western-derived or Eurocentric constructs and assume that these constitute behaviour in any cultural context (Alcadipani & Faria, 2014; Mourdoukoutas, 1999; Prasad, 2003b; Westwood, 2006; Westwood & Jack, 2007). For instance, this critique applies to the way that multinational corporations privilege the culture of the home country above

the culture of any other country the corporation does business in (Fougère & Moulettes, 2012). The issue is that approaches such as these perpetuate colonial practices in the workplace because they fail to acknowledge that many different worlds and knowledges coexist simultaneously (Alcadipani & Faria, 2014; Mourdoukoutas, 1999). This has resulted in the local knowledge from subaltern groups being marginalized or homogenized (Escobar, 2007; Westwood, 2006).

Following this critique, when research is conducted in IB and CCM contexts, methods are considered to be highly problematic from a postcolonial lens. Examples of problematic methods include the over-reliance on positivist quantitative methods as well as naïve interpretivist qualitative methods. For example, quantitative methods objectify knowledge and exclude views which highlight multiplicities of diverse knowledge (Muecke, 1992). Chen (2004), for example, points to the disregard for diversity in Asia management approaches and the over-reliance on questionnaire data in CCM research, which homogenizes local knowledge. Coronado (2012) raises a similar critique of CCM and points to the disregard for cultural diversity, specifically highlighting the (neo-)colonial perpetuation of stereotypes in Latin America. As well as this, naïve interpretivism presupposes that qualitative methods and insights can be applied and generalized across all contexts (Jack & Westwood, 2006; Westwood, 2006). For instance, European ethnography, a colonially derived research method, has historically excluded Indigenous peoples from negotiating or disrupting knowledge that was produced about them (Said, 1986). European ethnography is still used in contemporary research contexts and the same critiques apply.

C: Appropriation or Neglect of Methods

In this category, we highlight two streams of literature. The first includes the non-reflexive appropriation of Indigenous forms of

engagement by researchers for research purposes. In these forms of engagement, imbalanced power dimensions are either disregarded or ignored altogether. The second stream of literature attempts to include postcolonial theoretical critique, but unreflexively fails to apply the same level of critique when incorporating research methods.

Appropriation is used to describe the ways that knowledge is adapted or taken without benefit for the original 'owner'. For example, the way that Western anthropologists have historically 'stolen' Indigenous knowledge (Banerjee & Linstead, 2001). Banerjee and Linstead (2004) critique Whiteman & Cooper's (2000) work in which they apply Western models of management to explain the organizational engagement of an Indigenous beaver trapper of the Cree Nation in Canada. The authors argue that although this is an original piece of ethnographic work, the theorizing perpetuates (neo-)colonial thought. They point out that the article unreflexively ignores histories of colonization in Canada, appropriates knowledge of an Indigenous community without permission, and shows a lack of awareness of the problematic nature of ethnography. Although they draw attention to this study as an example, they highlight issues which apply to anthropological studies more widely. Another example of appropriation is highlighted by Xu's (2008) critique of comparative management literature. Xu performs a critical reading of Redding's (1990) work on Chinese business and management practices, arguing that it privileges Western intellectual and cultural ideas over local ideas. Redding's work is argued to be appropriative because it propagates a naïve Eurocentric view of Chinese business practice, since the voice and capacity for dialogue of the Chinese subject is denied. As these examples demonstrate, an issue with appropriative research is that the findings perpetuate unexamined assumptions and do not correctly account for the worldview of peoples in the research context. In this way, Indigenous or local knowledges are either adapted for the benefit of others, or they are

viewed as less important and marginalized in comparison to Western ideologies. There is, however, still debate over what are considered as the boundaries of appropriation. For example, Mangaliso's (2001) view is that in South Africa, it is encouraging to see non-Indigenous persons learning Indigenous languages so that they can better understand (organizational) engagement in other cultures.

The second stream of literature in this category has been identified as problematic because it attempts to include pertinent postcolonial theoretical critique, but unreflexively fails to apply the same level of critique when incorporating research methods. Adanhounme (2011), for example, performs an excellent postcolonial analysis of corporate social responsibility (CSR) in Ghana by arguing that CSR reproduces (neo-)colonial dimensions when it incorporates organizational dimensions that meet foreign expectations, and excludes local communities. The analysis is excellent, but the methods lack the same level of consideration from a postcolonial lens. The research employs a qualitative case study design to understand the CSR dimensions in a mining plant, and the resultant interview data (including interviews, field observations and consultation of documentation) was analysed via emergent themes related to the theoretical perspectives in the study. There is an attempt to modify some of the interviews to incorporate a life storytelling approach with local mine workers and community members. However, the details are limited and there is a lack of explicit reflexive critique about the appropriateness of the chosen research methods for postcolonial research. Similarly, Chio's (2008) research in Malaysia focuses on issues related to epistemic coloniality which are inherent in globalization and knowledge transfer in developing countries. The author performs a valuable postcolonial critique of the modernist construction of knowledge in Malaysia, in particular questioning the power dynamics of quality management. Following the theoretical analysis, it is stated that the

insights are supported by primary and secondary data, of which the primary data were obtained from interviews. Again, this is an important examination of postcolonial analysis from a theoretical standpoint. However, the methodological approach is limited since it is skimmed over and is not explained in sufficient depth. Specifically, there is no mention made of how postcolonial theorizing has impacted on the choice of methods.

B: Hybrid-Liminal Methods

In the following section, we draw attention to what we call hybrid-liminal research methods. The term hybridity denotes the way in which those who were colonized adopted and reshaped the cultures and philosophies of the colonizers. We note the criticisms of hybridity as a vehicle for the loss of traditional culture and identity (see Abrahamsen, 2003); however, we define hybridity following Bhabha (1994), who argues that those who were colonized were not passive victims of colonial domination but employed hybrid culture as a form of agency to resist domination. In this way, hybridity is the 'liminal' in-between space that collapses the divide between colonizers and colonized, enabling subversion and resistance. It signifies the creative transformation of Western culture and practices (Ashcroft, 2001). From this perspective, a hybrid-liminal space is reflexively constructed, and colonially derived methods are subverted and productively combined with local forms of engagement. This can be achieved in two ways, either by combining colonially derived and local methods in a reflexive manner in postcolonial research, *or* by drawing on historically Western concepts or methods and reflexively incorporating them into research in a context-sensitive manner which resonates with a postcolonial perspective.

The following are examples of hybrid-liminal research which reflexively combines colonially derived and local methods

in postcolonial contexts. For example, Imas et al. (2012) challenge the conception of who is an entrepreneur through their concept of barefoot entrepreneur[ing]. Their conceptualization builds on Max-Neef's (1992) critical notion of barefoot economics, which redistributes power and makes visible the organizationally invisible. The authors employed a 'microstoria' methodology (Ginsburg, 1993; González y González, 1997; Molho, 2004) to subvert the hegemonic power of grand theories and narratives (i.e. economic theory) in mainstream research and emphasize the lived experience of those who are not heard (see Boje, 2001). Narrative interpretations were published to highlight the experiences of barefoot entrepreneurs who dwell at the margins of organizational society. Similarly, Imas & Weston (2012) employed an 'improvised ethnography' in the streets of two postcolonial countries, Brazil and Zimbabwe, to subvert the Eurocentric management/organization discourse that labels marginalized urban outcasts as organization-less. Their methodological approach reflexively drew on Knoblauch's (2005) focused ethnography, which was critically re-imagined via a postcolonial lens to enable spontaneous conversations to arise *with* those who are organizationally marginalized. Narrative interpretations were shared in the published work to counteract the dominant Eurocentric discourse and emphasize a co-constructed discourse of the south, which is re-written to reflect the organizational solidarity, resilience and resistance of the speakers. Similarly, Sambajee (2015) employed a focused ethnography to understand non-traditional forms of diasporic resistance in the Mauritian hotel industry. The methodology reflexively supported a postcolonial analysis which was directed through Bhabha's theories on mimicry, ambivalence and hybridity.

A further example is Chandrasekara's (2009) research, in which she incorporates Spivak's (1988/2006) postcolonial critique in her feminist analysis of accounting and finance practices in a Sinhalese community.

She draws on critical feminist ethnography using participant observation and interviews, in a synergistic manner, to support the cultural critique in the local context. In this way, she reflexively incorporates a contextually sensitive methodology to give voice to local business practices which have been marginalized in comparison to mainstream European practices. Finally, Weston (2012) explores creative work practices in the post-colonial context of Zimbabwe by reflexively adopting a 'critical interpretivist' perspective (Alvesson & Deetz, 2000; Frenkel, 2008; Jack & Westwood, 2006) that drew on interpretivist and critical postcolonial philosophies. The research employed a 'critical narrative-ethnography' which incorporated Western and local Zimbabwean research methods. In particular, the research incorporated Zimbabwean narrative tradition (see Vambe, 2001, 2004) in order to subversively highlight local voice and the experience of creative work practices.

The following are examples of the second approach to constructing hybrid-liminal methods. As already highlighted, the literature here includes historically Western methods which are reflexively incorporated in a context-sensitive manner that resonates with a postcolonial perspective. Cairns (2007), for example, provokes discussion about the issues of applying hegemonic 'developed' worldviews to explain morality. He highlights the example of the ship-breaking industry in Cittagong, Bangladesh, and presents multi-storied readings with a range of secondary data (i.e. visual images and texts) to highlight the multiple interpretations and realities. This article is not positioned as a piece of post-colonial scholarship, but the author clearly accounts for the historical dimensions of colonization that have impacted on the country, and reflexively acknowledges the differences and implications of multiple interpretations. Tedmanson (2008) similarly performs an analysis of (post)colonial politics, supported by secondary data. In particular, she highlights the death of the Palm Island man,

Mulrunji, by drawing on a variety of publicly recorded textual documents (i.e. media commentaries, historical accounts, government inquiry records and legislation). She incorporates these to empirically support her theoretical analysis with narratives that are grounded in lived experiences.

A: Indigenous Methods

In this section, we explore the final category in Figure 8.1. This category highlights research which reflexively works *with* Indigenous or local forms of engagement. Indigenous is a term used to describe peoples who are born in a specific place or region (Ashcroft et al., 2013). It includes multidimensional forms of lived knowledge and reason that inform peoples' lives in the locality (Kincheloe & Steinberg, 2008). In particular, Indigenous peoples have their own situated philosophical and knowledge base that is tied to the particular locality, and grounded in the history, politics and culture of the locality (Denzin & Lincoln, 2008). This is distinct from the 'local' knowledge of people who have lived in, and gained social experience from, a place over time (Dei, 2012). For example, *Ubuntu* is a (South) African Indigenous term philosophically based on collective solidarity and communal care, whereby a person is a person only through other people (Mbigi, 1997). Meanwhile, the *Sumak Kawsay* movement, which originates from Andean Indigenous communities in Latin America, is based on an ancestral philosophy that relates to the notion of harmonic good life *bien vivir* (Misoczky, 2011).

From a postcolonial perspective, Indigenous knowledge has historically been viewed as inferior or primitive in comparison to European or Western knowledge (Denzin & Lincoln, 2008). Prominent examples of problematic research are the use of quantitative survey questionnaires and qualitative European ethnography. These colonially derived research methods have historically

not accounted for Indigenous knowledge and excluded Indigenous peoples from shaping the knowledge produced about them. As a result, localized knowledge has been marginalized, silenced and stereotyped, and does not reflect the worldviews of the people in the locality (Escobar, 2007; Westwood, 2006). In response to this, Indigenous issues have actively gained momentum through the work of decolonization. For instance, Smith's (1999/2005) work on Indigenous Māori research is considered as seminal work in the area of critical, resistive indigeneity. In comparison, critical Indigenous research has a shorter history in the business and management field, and it is only more recently that researchers have actively emphasized the importance of advancing Indigenous research in the field (Jack & Westwood, 2009; Jack et al., 2011; Jackson, 2013).

Indigenous scholars are working to critically address inequalities, and re-position Indigenous perspectives and methods in contextually appropriate ways that incorporate philosophies and knowledge bases that are tied to their localities. Resistive indigeneity advocates for the use of critical, participatory methodologies (Denzin et al., 2008). This includes leading the research agenda and deciding which methods should be used without direction from non-Indigenous researchers (Porsanger, 2004), as well as developing codes of conduct based on cultural ethics for researchers working on Indigenous issues (Smith, 1999/2005). In an early example, Henry & Pene (2001) highlight *Kaupapa* Māori research and methodology, as a set of methods and procedures, which are actively shaped by situated Māori views of what is 'true' and 'real'. This approach does not exclude the use of mainstream *Paheka* (Anglo) research categories, but instead decisions are made depending on the type of research and whether it aligns with Māori cultural values. These perspectives are mirrored by authors who emphasize the value of *Kaupapa* Māori research as a transformational methodology which empowers Indigenous Māori research, whilst

at the same time pragmatically accounting for the complex intersection between Indigenous and Western research in organizational contexts (Ruwhiu & Cathro, 2014; Ruwhiu & Cone, 2010).

Although there has been limited work undertaken from business and management contexts, more recent work is being conducted which is advancing the field. For instance, Schneider and Kayseas make an important contribution on Indigenous qualitative research in Chapter 10 of this volume. In addition, in their edited compilation, Spiller & Wolfgramm (2015) have given space for a range of authors to highlight the application of a diverse range of Indigenous spiritualities in the workplace. The works in the collection highlight a range of perspectives, including: Indian Adivasis; Native American; Canadian First Nations; Māori; Aboriginal Australian; Chinese Taoist; Japanese Zen, Shinto Confucian and Bhuddist; Andean Sumak Kawsay; and South African Ubuntu spiritual traditions. Although not all the works directly explicate Indigenous research methodologies, they are important because they present situated spiritual and cultural traditions, through the authentic voices of the authors. This work is crucial in enabling the reader to gain an enriched and enlightened understanding of Indigenous spiritual traditions from across the globe. It is an important and timely addition to the literature.

CRITICAL ISSUES

In this section, we reflect further on critical issues in the field. In particular, we comment on key silences and omissions, as well as practical issues of undertaking research in local contexts. We do so to point to the opportunities and limitations of engaging in research in this area, and contribute to the ongoing debate about the practical challenges of undertaking empirical research.

Challenges, Silences and Omissions of Knowledge

Some key challenges have been highlighted following our review of methods. The main challenges for research in this area are linked to the broader discipline. The first challenge concerns the concept of business and management research being fundamentally (neo-)colonial in nature. We argue this for two reasons: first, because the field stems from the colonial legacy of the division of labour, and second because methods used in vast areas of research such as IB and CCM perpetuate (neo-)colonial patterns that continue to marginalize the multiplicities of knowledge in Indigenous communities and localized contexts.

The second challenge that the review highlights is that most of the business and management research that does specifically incorporate postcolonial perspectives is theoretical. As well as this, the theoretical analysis is narrow since it primarily refers to the term postcolonial, and predominantly builds on the work of only certain postcolonial theorists. There is a clear need to widen the research agenda. The large focus on theoretical output leads to the third challenge. It exposes the limited focus on methods and the lack of field research which has incorporated postcolonial research methods. It also explains why some research includes sophisticated postcolonial analysis but at the same time the incorporation of methods does not involve the same level of critical, reflexive analysis. The practicalities of undertaking postcolonial research may be challenging, but it is essential that when methods are employed they are used in a manner that is appropriate to the context.

Practicalities of Undertaking Research

Employing methods in research that resists (neo-)colonialism is not straightforward. If it

were, more scholars would be doing so. Rather than employing taken-for-granted methods, researchers critically recognize the multiplicity of worldviews. In response, they work to reflexively design and implement specific methods which are applicable to the particular kinds of research *and* contexts. Postcolonial theory and related concepts have been a valuable force in shifting the way that research is conducted because it necessitates a radically different type of sensibility. Researchers are required to be transparent about the ethical and political dimensions of research, and remain faithful to these throughout the process (Westwood, 2006). This leads us to comment on the practicalities of engaging in these kinds of research. We do so by commenting on reflexivity and ethics, as well as the emotional tensions that may be faced in the field.

In research that recognizes the multiplicity of worldviews, the concept of validity is not applicable for evaluating the quality of research (Finlay, 2006). Reflexivity is an alternative approach used to critically evaluate whether the research has been carried out in an appropriate way (Angen, 2000; Pyett, 2003) and involves the ongoing evaluation of the relationships and methods of knowledge production (Calás & Smircich, 1992). Critical reflexivity involves a deeper questioning of the researchers' involvement in the research (Cunliffe, 2002). It encompasses a range of issues, including the evaluation of ethics, as well as the position of the researcher(s). Perera & Pugliese (1998) maintain that in order to be transformative and demonstrate a commitment to local struggle, a discipline should be open to (re)examination. Reflexive critique is therefore essential for the research that is undertaken in postcolonial and related research contexts because it is vital that the power dimensions of theory and practice are continually examined and evaluated.

Jack and Westwood (2006) suggest an approach to reflexivity in postcolonial research that consists of five key forms of evaluation to enhance the quality of

the research. These are: (1) evaluating the researcher(s) location(s) from a plural perspective, including reflecting not only on geographical location but also historical, cultural and institutional location(s); (2) evaluating the location(s) of the research participants; (3) evaluating researcher(s) motivations for the study; (4) evaluating the inclusion of local forms of self-representation and inclusive research practices; and (5) evaluating the implications inherent in writing and disseminating the research. They specify that these issues should be addressed in an ongoing way throughout the research process, but especially before, during and after data collection.

The acceptance of multiple worldviews also means that a universal code of ethics cannot exist. It is therefore inappropriate to assume that Western-Eurocentric views of ethical engagement apply in all research contexts. Indigenous scholars have retaliated against the colonial views of ethical engagement. As already pointed out, Smith (1999/2005) explains how Indigenous Māori communities have developed codes of conduct based on cultural ethics for researchers who are working on Indigenous issues in New Zealand. Indigenous codes such as these are essential for safeguarding cultural practices. Continuing this line of debate, Fine et al. (2008) draw our attention to the issue of safeguarding certain types of knowledge of Indigenous communities – such as sacred knowledge – that should not be reported to those outside a community. Finally, Onyango-Ouma's (2006) view is that ethics are tied to the locality; issues cannot always be predetermined and are often based on situated morals in the context of study. These views have implications for the appropriateness of rigid ethical codes that are enforced by research institutions.

Our final comment about the practicalities of engaging in research that resists (neo-)colonization is that it is not easy and can be emotionally taxing and compromising (Imas & Weston, 2012). It is a continual and demanding battle to resist and research

against the flow of (neo-)colonial research practices. Undertaking research in the field will therefore take much longer, especially when methods are tailor-made to fit the context. Fieldwork may also involve traveling to remote locations, or locations which suffer from repression and stigmatization. In addition, the continual engagement with reflexivity can be emotionally challenging, as researchers may find it difficult to sustain continual engagement (Finlay, 2002).

CONCLUSION

In this final section we point to the future of research in this area. We acknowledge the inherent challenges and highlight the opportunities for researchers moving forward. As we have stated in this chapter, conducting postcolonial and related types of research is not a straightforward endeavour. This explains why this area of research is still marginal in the business and management field, and why most authors resort to discussing postcolonial, decolonising or Indigenous perspectives in theoretical terms. Theoretical focus is not wrong, but it certainly draws attention to the overemphasis on theoretical critique and the related challenges that are inherent in styles of research presentation. Business and management research is typically required to fit a prescribed academic style and encompass well-established sets of constructs. It is therefore difficult to go against the grain, and these expectations pose limitations for researchers who wish to express their resistance to (neo-)colonialism. In this way, researchers working on postcolonial and related issues are pushed to conform to patterns of 'writing' and delivering research. This is perhaps inevitable as most postcolonial researchers in the business and management field have conducted their PhDs in Anglo-American academic settings, and are therefore influenced by the prevalent academic trends. Since researchers learn to

express themselves within customs and norms appropriate to the Anglo-American setting, so their ideas become a reflection of the Eurocentre. We note here that this is also self-critique, since both of us writing here are extremely aware that our style of writing in English is linked to our privileged backgrounds and the contexts in which we exercise our trade.

The two of us have come to realize that although this is not an impediment for conducting our postcolonial research, we equally know that it has been a big and risky challenge to move away from accepted theoretical traditions to engage in research on different terms, and engage with communities that are essentially invisible in the field of business, management or organization. So, the question is, what can we do? Is it possible to establish a research agenda that invites dialogue, reciprocity, understanding, participation and immersion in localities which are traditionally at the margins of our society? The answer is not only yes, but, equally, we must. The message of this chapter is that there is a space created for developing original methodologies that reflect alternative epistemologies and ontologies. These offer opportunities for us to challenge well-rehearsed Western theories and attitudes that impose or prescribe organizational behaviours which do not represent 'subaltern' lives and experiences. Methodologically, we must recognize that by engaging from a distance, we learn nothing and remain inconsequential in our fight for supporting ideas and philosophies which remain unknown and marginal.

There is growing acceptance of multiple worldviews and methods, so we stress the importance of harnessing this acceptance to unleash new ways of thinking and doing. In this vein, we equally stress the importance of engaging in the field and developing knowledge which reflects the worldviews and cosmologies of localized and Indigenous communities. This is essential to fully debate what it means to engage in business and

management, and to truly reflect plurivocal practices beyond the confines of the margins. To do so requires an engagement with communities in a manner that reflects a sensibility of co-collaboration, co-participation, co-voice. Doing so is a step to redirecting power to invisible communities. We need alternative ways of cooperating to tackle the deeply rooted issues that affect our economies, environments and social lives. We end this chapter by leaving you with a thought in the spirit of decolonizing the postcolonial:

As Nelson Rolihlahla Mandela said: It always seems impossible until it's done.

Feminist Methodologies

Nancy Harding

INTRODUCTION

It is difficult to under-estimate the influence of feminist theory on contemporary qualitative research methods. A brief outline of the history of qualitative methods illuminates this, and provides a necessary context for understanding why there is a need for separate and distinct 'feminist' research methods.

Arguments about the quantitative/qualitative divide dominated debates about research in the 1970s. Strong epistemological distinctions were made (Alastalo, 2008) and scientism's positivist, objectivist approach dominated understanding of qualitative methods (Packer, 2011). The researcher (presumptively male) was required to be 'cool, distant and rational' (Fontana & Frey, 2000, quoted in Packer, 2011, p. 47), and unbiased and non-evaluative. He was powerful, authoritative, distanced, impartial and above all objective, his objectivity ensuring the

credibility of his research (Oakley, 1981). The topics he studied were those of the public space. 'Women's interests' were regarded as emotional or personal issues, and were deemed to be so unworthy of study they did not even make it into the realm of potential research topics. Research participants were overwhelmingly male, and when women were included their voices were silenced. For example, Karp's (1987) exploration of job satisfaction 'beyond midlife' seemed to seek a balance between the sexes (39 male and 33 female participants), but the interview quotes he uses are predominantly from male informants, with women quoted largely when discussing physical appearance.

That is, before feminism's influence, research was something carried out by men who studied men and male public lives. Men were unmarked and normative, both the ground on which research (and life) rested and the model on which others should base themselves. Such phallogentric discourses,

although much attacked, continue to circulate and are found in the most unexpected of places, including gender itself. For example, there has been little interrogation of the epistemological and methodological assumptions that inform ‘men and masculinities’ (Pini & Pease, 2013).

A BRIEF HISTORY OF FEMINISM

An understanding of history provides insight into the rationale for ongoing debates in feminist research. Briefly, first-wave feminism, as it has come to be called, emerged in the nineteenth and early twentieth centuries and is perhaps best remembered for its struggles for women’s rights, notably the rights to vote and own property. Change was slow, even after the right to vote was won in the UK a century ago. Women took over ‘men’s’ jobs during World War II but were summarily returned to the kitchen sink at its end. It is difficult to imagine how different from today were women’s lives (in the UK) just a generation or two ago. The concept of ‘career’ hardly existed for our mothers and grandmothers: paid less than men for doing similar work, they were expected to give up paid work on marriage or childbirth. Our grandmothers had no financial independence and women remained until comparatively recently the property of their husbands, with no rights to a bank account or to own property, no voice and little influence. Second-wave feminism challenged this. The Women’s Movement arose in the 1960s, used consciousness raising as a means of change, fought patriarchy and facilitated the entry of women into academia.

Second-wave feminists were subsequently accused of propounding one model of ‘the woman’ – white, middle class, heterosexual – and of silencing women who do not conform with this narrow ideal. In response third-wave feminism, originating in the 1990s (see Nicholson, 2013, for a

critique of the ‘wave’ metaphor), explores not only gender but also race, class, sexuality, ethnicity and other forms of oppressive influences on women’s lives. Third-wave feminist theory is diverse, fragmented and contested. Influenced by poststructural theories it explores how, in neoliberalist regimes, the self is a project to be worked on, within conditions that both influence and constrain the possibilities of subjectivities and selves. Thus the unified subject or ‘the’ woman has disappeared from feminist debate. This may be the ultimate development of second-wave feminism’s critique of essentialism. However, if there is no such thing as an essentialised woman, “‘the’ woman”, then what or who is the subject of feminist theory and politics (Thomas & Davies, 2005)? One answer is found in ‘strategic essentialism’ (Spivak, 1996). This means that we can call ourselves ‘women’ so as to recognize ourselves as part of a category that remains oppressed and use that recognition to continue the struggle against that oppression. At the same time, strategic essentialism rejects essentialist arguments and argues that there is nothing that marks women out as ‘a woman’. In MOS this argument was developed by Knights & Kerfoot (2004), who argued the need to examine how representations of gender are constituted/constitutive, and challenge the reification of terms that are attached to concepts of ‘men’ and ‘women’. More generally, third-wave feminism challenges the meanings attached to femininity but retains an abiding political project of refusing the denigration of those who occupy the subject position of ‘woman’ (Budgeon, 2013). Finally, the emergence of the digital age is signalling the emergence of fourth-wave feminism, but also post-feminism, so the picture is again changing quickly.

In this light, feminist research methods are part of an evolving and developing political project that is not only anti-patriarchal but against all forms of abjection and abuse.

WHAT ARE 'FEMINIST RESEARCH METHODS'?

Feminist research methods are *not* concerned merely with ensuring that women are included in research – that does little to address inequalities. They also do not seek to have only women studying women – that would mimic male research models. However, the study of women by women is an important aspect of feminist research. To understand what is meant by feminist research methods we must start with second-wave feminist scholars' epistemic project of challenging how knowledge itself was (and is) understood (Stanley & Wise, 1983). This is inter-linked with feminism's political intent, its focus on egalitarianism and its aim to challenge discrimination and disadvantage through undermining the reproduction of power and dominance. Overwhelmingly, feminist research asks political, moral and ethical questions, so we must distinguish between 'method' (techniques for gathering data); methodology (how should research proceed?) and epistemology (theories of knowledge, or how research can be carried out) (Sandra Harding, 1987).

FEMINIST EPISTEMOLOGIES

Epistemology asks who can be knowers, what is 'knowledge' and what kinds of things can be known. Feminists' entry into research shattered prevailing presumptions of the universality and objectivity of the (masculine) physical and social sciences. For example, Donna Haraway's *Primate visions* (1989) destabilised primatology through showing how masculine primatologists projected their own understanding of (human) masculinity onto the great apes. Biology textbooks were rewritten following Emily Martin's (1991) illumination of how they portrayed the meeting of the (tiny) sperm and the (dominant) egg as a stereotypical heterosexual romance (active male/passive female).

However, there is no such thing as a single, unitary feminist epistemological perspective. Feminist thinkers work in all, or nearly all, academic disciplines, where they cover the gamut from positivist to poststructuralist, positivism to idealism, and empiricism to poststructuralism. What they have in common is a focus on oppressed identities, and a sharing of basic epistemological principles of: a focus on the subjective and personal, a reflexive understanding of gender asymmetry, the research's ethical impact, and its ability to empower and bring about change (Cook & Fonow, 1990). All these can be seen in Womersley et al.'s (2011) study of how affect (in this case shame) is co-constructed within the interview setting. Their feminist frame necessitated 'a commitment to understanding the ways in which gender is a social production, formed, reproduced, and modified within the intersubjective' (p. 879), plus 'a critical attention to positionality, reflexivity, the production of knowledge, and the power relationships that are inherent in research processes' (op. cit). Data analysis required tracking how affect influenced the interviews through understanding the form of the conversation, the content of the dialogue and the researcher's own emotional memory of the event.

There are thus guidelines for carrying out feminist research, but these cut across the numerous philosophical, theoretical and epistemological positions within which feminist theories are developed. A discipline that features such major thinkers as Judith Butler, Nancy Fraser, Donna Haraway, Sandra Harding, Luce Irigaray, Julie Kristeva, Karen Barad and numerous others, covering a spectrum of disciplines across the physical and social sciences, arts and humanities, has a rich heritage for researchers seeking to locate their work within a feminist epistemology.

In what follows, I will introduce standpoint theory, poststructural approaches and refer briefly to intersectionality. There is no space in which to explore transnational and postcolonial epistemologies, capitalist production,

new materialism, new organisational forms, transnational feminist networks, radical or liberal approaches, or other emergent approaches. However, these and other epistemologies are discussed in feminist literature in MOS, so a treasure-trove of ideas awaits the researcher keen to go beyond this introductory chapter (see Calás & Smircich, 1999, for an excellent discussion). I am devoting space to feminist standpoint theory, which some now regard as somewhat dated, because it is one of the few epistemological positions unique to feminist theory, and the debates that crystallised in standpoint approaches provide the context for contemporary approaches.

Standpoint Theory

This is perhaps one of the most influential of feminist epistemologies to emerge from second-wave feminism. Standpoint theories aim to advance a feminist epistemology, or theory of knowledge, that involves development of effective knowledge from the standpoint of women's experiences. Its roots are in Marxist feminist theory (see Nancy Hartsock, 1998). Its various protagonists argue, first, that subordinated groups see the world from their own location, which powerful groups are unaware of. Second, their very survival requires that they understand the cultures of the powerful, so they also see the world within the perspective of the dominant culture (see especially Patricia Hill Collins, 2000). This is the 'double vision' of the 'outsider within'.

Standpoint perspectives, by definition, refuse the concept of the homogeneous 'woman'. They recognise differences between women on account of race, class, ethnicity and sexuality, with researchers exploring women's location at standpoints of class, race, etc. The focus is not on the individual but the group (see, for example, Reynolds, 2010). Core to all standpoint perspectives is the need to understand relationships between power, knowledge, material experiences and epistemology.

Standpoint theories have been subjected to much internal and external critique and development (see Sandra Harding's edited book (2004)). Although 30 years old, the concept remains active, debated and informative. For example, a special edition of the journal *Hypatia* in 2009 updated the debates (see also Kristen Intemann's (2010) analysis of 25 years of standpoint feminism). Its continuing relevance in MOS is suggested by Martin's (2001) use of women's standpoints to understand men's mobilisation of masculinities in organisations, as 'not primarily directed towards women, but enacted in the presence of women, that men see as natural and harmless, but women often experience as harmful' and exclusionary (p. 589).

Poststructural Feminist Epistemologies

A very different approach is found in post-structuralist gender theories that challenge the stability, biological or constructed, of masculinity and femininity. Poststructural theory argues they are fluid and historically mutable. Foucault (1979, 1986, 1992) facilitates the argument that male and female, the hetero- and homosexual, even the body, are conceptions of the Western industrialised era. There could be 'literally hundreds of possible sexes that humans can inhabit' (Hester, 2004, p. 218), but these are compressed into two cultural codes (Foucault, 1994) used when making sense of gender (Ely & Meyerson, 2000; Barry et al., 2006). One of the most influential theorists in this body of work is Judith Butler, whose early work in *Gender trouble* (1990) and *Bodies that matter* (1993) proposed that gender is not determined by biology but 'is a fantasy instituted and inscribed on the surface of bodies' (1990, p. 136). Bodies and genders are performatively constituted, that is, through constant repetition of micro-movements of the body occurring within a set of meanings that limit possibilities of what/who we can become.

These meanings pre-exist us: we are born into them and learn how to move within them to ‘constitute the illusion of an abiding gendered self’ (1990, p. 140). That is, there is no female, male or other gender identity that pre-exists the ‘expressions’ of gender; rather, the female and the male are constituted through the acts that performatively achieve gendered bodies.

Poststructural MOS researchers explore how organisations constitute subjects as masculine or feminine. For example, Brewis et al. (1997) argued that ‘Gender divides humanity into “masculine” or “feminine”’ (p. 1275) but it is ‘the discourse of gender difference’ that constitutes the differences, such that ‘The concepts of masculine and feminine have no a priori grounding in material reality – they are labels arbitrarily imposed on particular ways of behaving’ (p. 1277). Linstead & Pullen (2006) warn that the binary of male/female continues to inform poststructural organisational thought (p. 1289) and indeed the binary creeps back in even where it is least welcome. For example, Bowring’s (2004) study of *Star Trek*’s Captain Janeway, and Muhr’s (2011) study of a cyborgian leader, papers that use film, television and other media as the sources of ‘data’, are forward-looking in exploring gender fluidity, but the fluidity they write of moves between masculine and feminine characteristics and thus remains within the traditional binary of male/female (see also Linstead & Thomas, 2002; Linstead & Brewis, 2004). Others explore the means through which the binary is constituted and sustained. Linstead and Brewis (2004), for example, suggest ‘a binary is not simply constituted by its poles, but by the media between those poles’ (p. 361), while Borgerson and Rehn (2004) define fluidity of gender identity as ‘the space between’ (p. 461) the two poles of a dualism, such as male/female. They argue that ‘the quality of fluidity does not apply at the level of gender, but at the level of traits said to constitute gender’ (p. 469).

Feminist poststructural epistemologies are influential not only in exploring the constitution of sex, gender and sexualities, but

organisational identities more generally (For excellent case examples, see Kondo, 1990; and Trethewey, 1997).

Intersectional Feminist Epistemologies

Chapter 26 of this book discusses intersectionality in some depth, but its discussion cannot be omitted from a chapter headed ‘Feminist research methods’ because some academics argue that feminist theory today *is* intersectionality theory. That is, gender or sex cannot be understood in isolation from other socio-cultural categories such as age, ethnicity, class, sexuality, disability, etc., because women (and men) are not just their sex/gender, but are also marked by and constitute their identities within and through these other categories. Thus, gender/sex is understood to intersect with these other categories, becoming mutually intertwined with them. Intersectionalities emerged out of postcolonial and anti-racist feminists’ critiques of the hegemonic tendencies of white, middle-class Western feminism to posit themselves as a ‘we’ to an unspecified ‘they’ (see Chandra T. Mohanty’s influential paper, ‘Under Western eyes’, 1988, and Kimberley Crenshaw (1989)).

In the US, much intersectionality theory work has been undertaken by women of colour, leading to the charge (Puar, 2012) that white women have been let off the hook of their complicity in participating in practices of abjection and humiliation of others. It follows that intersectionality theorists emphasise the importance not only of studying those who are subordinated or excluded, but also of analysing the normative ‘we’ that constructs, reproduces and benefits from relations of dominance (Walby et al., 2012, p. 230). An analysis of power relations is vitally important in this approach, as is exploration of how the categories and their intersections are themselves constructed, and how the intersections are ‘done’ (Lykke, 2010).

The analysis of intersectionality in MOS is in its infancy, despite the pioneering work of

Joan Acker (2006) and her understanding of organisations as the sites of emergence and perpetuation of inequalities. But important work for MOS academics planning to incorporate intersectionality into their feminist research methods includes Holvino (2010), who argues the need to understand the linkages between everyday organisational practices and external, societal influences. Bell & Nkomo (2001) have illuminated how white female staff display gender blindness while black female staff arm themselves psychologically against the consequences of racism, and Boogaard & Roggeband's (2010) study of the Dutch police force shows the complexities of intersectional identities, in that individuals both openly challenge inequalities and actively reproduce them. This study should be read alongside Healy et al.'s (2011) research, which shows how inequality regimes are sustained in the face of sophisticated anti-discrimination policies and legal duties. Finally, Woodhams et al. (2013) demonstrate that penalties associated with multiple disadvantage exponentially increase as disadvantages seem to interact to the detriment of people at 'intersections'.

These studies suggest that Thomas and Davies's (2005) lovely paper, 'What have the feminists done for us?', which explored the value of feminist theory for understanding resistance, needs updating, because contemporary feminist thinkers offer further insightful, impact-full ways of carrying out research in MOS.

I turn now to feminist methodologies. I will suggest that feminism shares methodologies with qualitative research more generally, but can bring new insights into how those methodologies can be mobilised in researching organisations.

FEMINIST METHODOLOGIES

A major point to note when discussing feminist methodologies is the quantitative/qualitative divide. Oakley (2000, p. 3) wrote: 'in

the methodological literature today, the "quantitative"/ "qualitative" dichotomy functions chiefly as a gendered ideological representation' and that 'within this gendering of methodology, experimental methods are seen as the most "quantitative" and "hard", with qualitative methods "soft" and thus feminine'. In 1993, Stanley and Wise had argued that this bifurcation is associated with Cartesian dualism and the mind/body split. Cartesian dualism's ontology is one that proposes two opposing principles, masculinity and femininity, that it disseminates through the sociocultural, so that 'the very grounds of reality are presupposed in binary and gendered terms' (p. 194).

Quantitative research is presumed therefore to support the masculine status quo, and despite Oakley's (2000) advocacy of quantitative methods, there is a 'disinclination of those most fully engaged with feminism to use quantitative methods' (Cohen et al., 2011, p. 573). That is, only 16 per cent of articles in which authors take an avowedly feminist position include quantitative analysis, whether mixed methods or solely quantitative. In contrast, non-feminist research into women is dominated by quantitative methods. There is a sharp distinction between the US (preference for quantitative research) and the UK (preference for qualitative research), with US journals offering publishing spaces that take women as the object, not subject, of research. In MOS's most highly ranked journals, women are over-represented and men are under-represented in published qualitative studies as compared to non-qualitative authors (Plowman & Smith, 2011). However, note how these authors continue a functionalist approach that draws a sharp distinction between men and women, looking for the differences between them, and that they do not distinguish between feminist, gender and woman-oriented research as Cohen et al.'s (2011) study does.

But apart from the preference for qualitative approaches, feminists draw upon the range of methodological research approaches available within the social sciences. The

best feminist research adapts each methodology to ensure that women (and other participants) are incorporated into every stage of the research process, from design of the research to its dissemination. This is because, as the above discussion of theoretical perspectives makes clear, researchers using a feminist approach believe research should begin from everyday experiences and that the voices of research participants should be heard. We will find something similar when we explore the methods feminist researchers use to gather empirical materials.

THE CHOICE OF RESEARCH TOPIC

Again, there are no limitations or rules, but feminist researchers often write movingly of how aspects of their own lives, for which they may have no definite labels, inform the choice of their research topic. Others write of exploring topics that, once the research is under way, illuminate differences between male and female participants that cast light on the whole experience being explored. For Paget (1981, in DeVault, 1999), women, but not male, artists experienced ‘ontological anguish’ about the appropriateness of their working as artists. That is, feminist researchers identify aspects of women’s lives that are so taken-for-granted they are hardly available to conscious thought.

FEMINIST RESEARCH METHODS: TECHNIQUES FOR GATHERING EMPIRICAL MATERIALS

As noted above, feminist research approaches evolved in response to an understanding that epistemologies of research privileged men (not only as knowers and as subjects of research, but also as dictators of what shall be legitimised as ‘knowledge’) while silencing and/or excluding women and the issues

that may be pertinent to women. Feminist research methods sought to make redress through researching issues pertinent to women and legitimising women’s knowledge, including women as both researchers and participants in research. But the means by which empirical materials are acquired (methods) are generally those found in non-feminist research methods texts: interviews, focus groups, documentary analysis, ethnography, etc. However, they differ in practice.

Feminists have always been highly critical of the demand for objectivity and detachment: they argue the need to do just the opposite. Oakley (1981) argued, influentially, that the traditional research interview obscured the hierarchical and exploitative character of the encounter, and that far from being ‘dangerous bias’, personal involvement ‘is the condition under which people come to know each other and to admit others into their lives’ (1981, p. 58). Feminist methods therefore aim to ‘subvert [...] the established procedures of disciplinary practice tied to the agendas of the powerful’ (DeVault, 1999, p. 59). Researchers who do not explore how their personal, professional and social histories influence how they frame their research will ‘inevitably reproduce dominant gender, race, and class biases’ (Naples, 2003, p. 3). Interviews should therefore be conversations in which researcher and participant collaborate as partners in the research, with the researcher actively involved in the interview. This approach, somewhat revolutionary 30 years ago, has now become a signifier of good research skills.

However, feminist research methods offer one intriguing addition to our repertoire of qualitative research skills: they explore silences and the half-said. There is a strong body of feminist theory that argues women have no language of their own, so they (we) have to use a masculine language that does not encompass female experience. (For a discussion of Cixous’s perspective on the silencing of women and its application in MOS, see Phillips et al., 2014, and for an analysis of

Irigaray's arguments and its implications for feminist research in MOS, see Fotaki et al., 2014.) It follows that 'the unspoken, the inaudible, the ignored' give insights that cannot be made through concentrating on the spoken word alone (Mazzei, 2003). Such a recognition of lack of language and/or voice has several implications for research.

First, if masculine discourses position women such that they lack a language with which to speak about their experiences, then researchers need to be able to explore aspects of women's lives that may be incompletely articulated. This requires moving beyond terms that frame activities, such as 'housework', to explore what is hidden behind words that reduce complex activities to something that appears easy and straightforward – and thus hardly worthy of study. We therefore have to listen actively for what appears so familiar and taken-for-granted that we hardly notice it, or things we think we understand so well that we need not explore them in any depth. Careful probing skills are necessary to elicit understanding of these things.

Second, if the language available to women cannot encapsulate so much of their experiences, then the feminist researcher should become adept not only at listening to silences and the not-said, but also to translating the stumbling half-said. This requires using our own experiences – filling the silences with our own understanding helps understand what is 'incompletely said' (DeVault, 1999, p. 67). Researching work–life, balance, say, would require probing a mention of 'housework' to find out what it involves, how it is done, the politics and affect around its doing, the implications for not doing it, etc.

Feminists often understand silence in terms of an oppressed otherness. For example, Tsalach's (2013) auto-ethnographic account explores how and why she could not speak when she was herself the subject of oppression. This has a political intent: 'Focusing directly on oppressive experiences often means saying what cannot be said and attempting to learn what is not

knowable' (Tsalach, 2013, p. 77), so as to fight subjugation and subordination. Indeed, much feminist research is devoted to exploring how oppression is articulated within and through the lives and bodies of women. Care is needed: researchers may not share class, race, ethnicity or (lack of) agency with research participants, so may unknowingly influence them or lack insights vital for interpreting the empirical materials. However, researchers cognizant of power and class differentials between themselves and participants can explore interviews as a microcosm of the wider social world where privileged and oppressed meet.

However, in MOS wordlessness may signify silence rather than a lack of language. There may be impositions (such as fear of retaliation from management) that prevent speech (Glenn, 2004). As Milliken & Wolfe Morrison (2003) suggest, in organisations silence is 'a choice that is made when there is a fear of the consequences of speaking, or when normative and social pressures inhibit what can be said'.

Incorporating one's personal involvement in the research is thus core to much feminist research methodology, in ways that exceed forms of reflexivity regarding how researchers influence their research. That is, we acknowledge traditions of 'woman talk', where female participants in conversation engage in helping each other to develop ideas. The feminist interview is thus one in which two people participate in a conversation, sharing understanding and attempting to minimise power disparities between the two, and drawing on their own biographies and interests in doing so. There is value and legitimacy in understanding researchers' own experiences of the fieldwork (Letherby, 2003; Gilmore & Kenny, 2015). This includes studies involving male participants: gendered power play may be insightful, reflecting the wider sociality, but also difficult and painful. However, we may be too certain about our own empathic abilities and self-knowledge, and mistakenly feel we 'know' research participants when we don't.

Other Methods

Feminist researchers bring a feminist sensitivity and understanding to other types of research method, offering useful insights for all qualitative researchers, feminist or not. For example, Haynes (2011) offers valuable insights into auto-ethnographical research. One of her first points could be written by any insightful researcher using auto-ethnography: 'What is important ... is not the truth or falsity of my autoethnographical account, but the way in which our perceptions of reality are part of an interpretive process of understanding our experiences within the social world' (p. 137). But her feminist stance leads, in a moving account, to the necessity of protecting the 'I' who emerges from the auto-ethnographical research. Haynes's motivation was to 'explore the self in relation to wider socio-cultural and political phenomena, in the fundamental autoethnographical sense'. The required first person narrative 'invokes a degree of vulnerability necessary to scrutinise the self and reveal it to others in order to understand the social context' (p. 144). Haynes advocates an ethic of care in relation to the researcher self, to protect that self from emotional harm.

A research method long popular in MOS is shadowing. Gill's (2011) feminist understanding of ethnography suggests a need to question rules and guidelines about shadowing. It is impossible for the ethnographer to fade into the background, she argues, and both participants and researcher will be engaged in identity work as one is shadowed by the other, because, as Cunliffe (2010, p. 11) writes, the researcher and researched 'are always selves-in-relation-to-others'. Further, negotiations between researcher and researched are always layered in differences such as gender, age, class, education, sexuality, etc. Gill recounts her different experiences of shadowing three entrepreneurs. The entrepreneurial labour and tasks performed across the cases were relatively the same, but it was in the gendered portrayal

of entrepreneurship that the entrepreneurial experience seemed to matter (pp. 122–23). Thus, Gill's feminist insights lead her to conclude that the researcher who is shadowing participants is involved in constructing the very thing she is studying (p. 128).

But feminist methods do not exist, as such – feminists undertake interviews, organise focus groups, analyse documents, engage in ethnography, etc. These become feminist when carried out within and through feminist epistemologies and ontologies. In other words, it is theory-led research that characterises feminist research, not the methods *per se*. Overall, the feminist research interview is one where solidarity and empathy, rather than critical distance, is the guiding approach, alongside recognition of how gendering influences interactions between participants. This introduces new ways of thinking about qualitative research more generally.

DATA ANALYSIS

Feminist research draws on the familiar range of data analysis methods, but they are adapted to conform to the feminist principles outlined above, such that we may talk about 'feminist discourse analysis', 'feminist narrative analysis', 'feminist deconstruction', 'feminist textual analysis', etc. However, while these share a heritage with their non-feminist counterparts, I will highlight two areas that emerge specifically out of feminist theories.

The first is the analysis of silences and hesitations (discussed above). Some might see this as a form of feminist discourse analysis, but I distinguish it from discourse analysis more generally because (1) it is located in feminist theoretical perspectives that argue women lack voice or language, while (2) the sorts of hesitations and silences recognised by feminist researchers seem to include little that can be identified as 'codes', so they get lost during data reduction. DeVault's

(1999) guidelines on this are comprehensive. She recommends looking for difficulties of expression, such as 'I don't quite know how to put it', or 'you know' – these signify the failure of language to encapsulate experiences inadequately coded in standard vocabulary. There are instead inarticulate, content-free mumbling and hesitations that are discarded during data reduction because they appear to contain little relevant information. 'Often', writes DeVault (1999, p. 69), 'this halting, hesitant, tentative talk signals the realm of not-quite-articulated experience, where standard vocabulary is inadequate, and where a respondent tries to speak from experience and finds language wanting'. Further, phrases such as 'you know' are consequential for the joint production of talk in the interview (DeVault, 1999, p. 67). A participant saying 'you know' signifies far more than the mere words suggest. It encapsulates an understanding, DeVault writes (1999, p. 68), that 'OK, this next bit is going to be a little tricky. I can't say it quite right, but help me out a little; meet me halfway and you'll understand what I mean'. If we have honoured such requests on a woman-to-woman level, as we do when we nod and murmur 'um hmm', we are 'doing with ... respondents what we women have done for generations – understanding each other' (De Vault, 1999, p. 69). That is, researchers' own resources as women serve as resources for analysing empirical materials. We should therefore draw on our own responses to interview participants or to the experience of the interview to analyse the 'unnoticed matrix of social organization that constructs both the interview talk and [the] emotional reaction to it' (DeVault, 1999, p. 72). Analysis may actually start with our own emotional response.

In sum, through drawing on our own experiences as women when analysing empirical materials, the researcher's own experience of gendering becomes a kind of method (DeVault, 1999, p. 71), requiring that 'feminist researchers need a more disciplined use of the personal' (ibid.).

The second specifically feminist approach to data analysis I will discuss here relates to the feminist new materialism theory of Karen Barad (2007). Feminist researchers working with Barad's theory of performativity focus on data 'hot spots' (MacLure, 2013, in Ringrose and Renold, 2014) that 'glow' for the researcher, whether encountered during the fieldwork, analysis or later. This approach takes feminist reflexivity to a new level. Hot spots are analysed through a diffractive analysis that makes 'new mappings, onto-epistemological mappings' that allow 'something new to emerge' (Davies, 2014, p. 734). Diffraction, in Barad's words (2007, p. 30), involves not fixing 'what is the object and what is the subject in advance ... diffraction involves reading insights through one another in ways that help illuminate differences as they emerge: how different differences get made, what gets excluded, and how these exclusions matter'. The focus is on the moment of the encounter between researcher and researched (Davies, 2014), and on all the texts that inform that encounter, and the texts that inform those texts. They 'intra-act' (Barad, 2007); that is, they are mutually constituted, entangled agencies that do not precede but emerge within and through their intra-action. Multiple theoretical insights are read through each other (Mazzei, 2014, p. 742). Harding, Ford and Lee (2017) argue that this negates the concept of the solo researcher immersed in her data. Instead, data analysis becomes a group task involving debate, discussion, close questioning of each participant, and multiple readings of each theme through all the other themes, and through the reviewers' comments.

WRITING UP

Feminist researchers in MOS tend to adopt the academic style of writing favoured by qualitative researchers in general. The violence of this 'masculinist' style of writing is

increasingly critiqued by feminist authors in MOS and other disciplines. Most notably, Phillips et al. (2014) have shown how the influence of scientific writing constitutes the discipline of MOS as masculine. The emphasis on rigorous method and rationality requires that writing be exact, hard and have a 'penetrating conclusiveness' (Phillips et al., 2014, p. 316). Such requirements are 'genealogically entangled with the meaning of masculinity' (ibid.); the scholar is a 'man of reason', even if the scholar would identify as female. The orthodoxy is that the only gender that can be done legitimately in research (by men or women) is a masculinity from which the feminine is purged (Phillips et al., 2014). This, Fotaki et al. (2014) argue, is a form of unintended violence – the discriminatory exclusionary practices embedded in organisational language perpetuates the continued marginalisation and silencing of women. We thus need a 'language and means of symbolization ... with which to speak differently about organizations and organizing' (Fotaki et al., 2014, p. 1244). We need a feminine writing that is 'unruly, unbounded and polluting of the very concept of organization' (Phillips et al., 2014, p. 314).

The aim is not to replace masculinist writing: rather, the masculine/feminine dualism itself should be disrupted through destabilisation and confusion (Phillips et al., 2014), and through a writing from the body that seeks not to inseminate the reader with the brilliance of its ideas (Fotaki et al., 2014) but to offer its writing as a gift to the other that '*enables the other* rather than appropriating the other's difference in order to construct and glorify the self through rigorous and masterful knowledge' (Phillips et al., 2014, p. 324). Rather than insemination there should be birth and nurturing – of ideas, thoughts, political movements, inspiration, feelings and the becoming-human (Fotaki et al., 2014). Feminists should therefore aim to write from bodies that create a relational space for production, writing and sharing, a space in which to give birth to understanding.

Phillips et al. (2014, p. 322) advocate bisexual writing, by which is meant a mode of escaping from boundaries, of being 'illusive, playful, seductive and fluid' (p. 324), thus challenging the 'truths' that dominate MOS. This means working with *difference*, invention, daring not to know and dismantling the authorial 'I' into its numerous, shifting pieces. It does not do away with the masculine but works outside and through it, seducing it through the fluidity of the feminine to weave new ethical relations.

But how may we write in such ways? Feminists are experimenting with new forms of academic writing. I will first outline the work of four authors from other disciplines whose books (rather than papers) offer potential models for MOS researchers to adapt. I will then briefly explore how Jenny Helin is taking forward this work of 'writing differently' in MOS.

Denise Riley (2005) writes like a philosopher-poet, or poet-philosopher. Her writing drips with metaphor. It is often difficult to understand intellectually but can be felt viscerally. Riley thus points towards a haptic mode of writing, which engages readers through the flesh and the nervous system, rather than the brain. For example, where Butler (1997: 3–4) writes of hate speech:

To be injured by speech is to suffer a loss of context, that is, not to know where you are. Indeed, it may be that what is unanticipated about the injurious speech act is what constitutes its injury, the sense of putting an addressee out of control. ... Exposed at the moment of such a shattering is precisely the volatility of one's 'place' within the community of speakers; one can be 'put in one's place' by such speech, but such a place may be no place.

Denise Riley writes of the same experience:

The worst words revivify themselves within us, vampirically. Injurious speech echoes relentlessly, years after the occasion of its utterance, in the mind of the one at whom it was aimed: the bad word, splinterlike, pierces to lodge. In its violently emotional materiality, the word is indeed made flesh and dwells amongst us – often long

outstaying its welcome. Old word-scars embody a 'knowing it by heart' as if phrases had been hurled like darts into that thickly pulsating organ. But their resonances are not amorous. Where amnesia would help us, we can't forget. (Riley, 2005, p. 1)

Film theorist Annette Kuhn's (2002) approach is very different. Family photographs are the 'data' that, interpreted, offer a history of the second half of the twentieth century. Kuhn's rationale for using personal memories is that the psychic and the social are so intertwined that the analysis of the self is an analysis of the social. Analysing the 'I', she argues, makes it immanent rather than transcendental, but requires greater demands of our analytical procedures. This facilitates study of moment-to-moment experiences of the self – writing from the embodied 'me' – and thus fights against 'methodolatry'. For instance, she writes of class:

Class is something beneath your clothes, under your skin, in your reflexes, in your psyche, at the very core of your being. In the all-encompassing English class system, if you know that you are in the 'wrong' class, you know that therefore you are a valueless person (p. 116). That is, there is 'something shameful and wrong about you, that you are inarticulate and stupid, have nothing to say of any value or importance, that no-one will listen to you in any case, that you are undeserving, unentitled, cannot think properly, are incapable of 'getting it right'. ...And you learn that these feelings may return to haunt you for the rest of your life' (ibid.). Those of us who are working class learn not to speak, we learn to be silent 'through shame' and 'the hardest thing of all is to find a voice: not the voice of the monstrous singular ego, but one that, summoning the resources of the place we come from, can speak with eloquence of, and for, that place' (p. 123).

Kuhn explores the viscerally stored memories evoked through photographs, while anthropologist Kathleen Stewart analyses affect. She explores the ordinary of the everyday, interweaving accounts from her own life with those from her anthropological studies, describing Stewart the anthropologist as 'she'. In *Ordinary affects* (2007) she explores:

the varied, surging capacities to affect and to be affected that give everyday life the quality of a continual motion of relations, scenes, contingencies, and emergences. They're things that happen. They happen in impulses, sensations, expectations, daydream, encounters, and habits of relating, in strategies and their failures, in forms of persuasion, contagion, and compulsion, in modes of attention, attachment, and agency and in publics and social worlds of all kinds that catch people up in something that feels like something (p. 1–2).

She writes in short, seemingly disconnected passages of pure description, and then introduces a short analysis that builds iteratively to a deeply insightful understanding of contemporary life in the USA. For instance, she writes of 'disappearing acts':

Ecstatic little forms of disappearance have budded up. We dream the dream of a finished life. The dream job or the dream body settles into a perfect form.

Or we dream of the kind of magic that comes in a flash. The sweepstakes cameras appear at your door when you are still in your housedress, and big bunches of balloons in primary colors are released into the air. Or UFOs come in the night and lift you up in an out-of-this-world levitation trick.

Disappearance has always been the genius of the so-called masses. We are gifted dreamers of getting away from it all, giving capture the slip, if only by slipping into the cocoon of a blank surface.

Blankness has blanketed the country, spreading smoothly through the comfortable uniformity of theme parks and gated communities, and the sprawling new shopping meccas of big-box stores for every corner of life – home, pets, coffee, books, garden, bed and bath, pizza, tacos, hamburgers, toys, babies, office.

Banality is the vitality of the times. You can slip into any of the places where it's on display and check out for a while without ever feeling disconnected for a second (pp. 48–9).

Finally, Kathleen Angel's *'Unmastered: A book on desire, most difficult to tell'* (2012) is where pornographic novel and philosophical text meet. She provides a penetratingly subjective account of a love affair in which her intense desire for the man (not The Man) illuminates

embodiment, passion, feminist theory, and understanding of how romance undoes the woman, rendering her docile and tamed. The book's pages are often blank, or contain only a few lines – we are invited into white space. For me, her complex intertwining of personal and theoretical illuminates Lacan's (1998) Seminar XX, on 'The Woman'. For example, she writes of how a woman's desires make her feel guilty if she espouses them. But (p. 200) whose desires are they? 'these desires rioting noisily through me – whose are they? They are mine, and yours, and anyone else's. They have found their way inside me, and taken up residence. They have folded their arms, and said, Ha. Ha' (p. 200). In the 'sanitised hyperreal' (p. 220), women are governed by 'unruly, lustful' bodies whose 'unbridled, guilty febrility', a desire they may not have chosen, ties them to a 'personal Magus' and in so doing requires that the (heterosexual) woman 'take[s] a scythe' to herself and 'hack[s] at her roots' so that she does not surpass the man in achievement. Woman has learned to rein in her desire and herself to become something a man promises to fulfil, so that 'In order for the woman to live, her love for the man has to die'.

These indications of how to write outside the straitjacket of Introduction, Literature Review, Methodology, Data Analysis, Discussion and Conclusion involve far more than writing first-person accounts of one's own experiences (Vickers, 2015). In MOS, Helin (2015) is reaching towards such a goal. Her inspiration is Bakhtin, who allows writing about the 'messiness' experienced when doing fieldwork. The honest researcher does not tame that mess and corral it within the prison walls of scientific writing. Helin wishes to write about 'relationality and flow' rather than realism and monologic writing; she finds a model in Bakhtin's notion of the polyphonic novel, in which dialogue between the voices of reader, writer and those written about is created (p. 176.) Helin wishes to avoid the 'god position', where one looks down from on high onto one's empirical materials and imposes

structure on them. This requires positioning the writing-self within the empirical materials, where research participants are speaking. One immerses one's self in audio recordings rather than decontextualised transcripts, and then lets the writing take the author where it will. Rather than focusing on words and sentences, the researcher is attuned to utterances and how these proceed from earlier utterances and are the precedent for those that follow. Transcripts lose 'sensed, fleeting data' (p. 182), and embodied experiences. Reduction to themes, to 'one-voiced accounts', does a disservice to the people who participate in our studies. Instead, she concludes, as writers we should stay in the text, in the writing, trying out different ways of writing and letting the work unfold itself.

CONCLUSION

Feminist research in MOS is lively and well established, but the espoused use of feminist research methods remains uncommon, despite the potential of feminist research to 're-invent rather than merely recycl[e] management theory' (Limerick & O'Leary, 2006, p. 98). Feminist research shares many interests with critical approaches to management studies. Both are concerned with power, control and resistance, politics and liberation, and fighting against tyranny. The rich history of feminist research, with decades of debate and exploration of how to give voice to the marginalised, could have much to offer management researchers. Feminist epistemologies offer transformational, political potential, and assist in the discovery of secrets of oppression and resistance (Roets and Goedgeluck, 2007). As Deutssch (2004, p. 887) writes, feminist qualitative research is rooted in an understanding that the personal is not only political; it is intellectual, theoretical and part of the process of research itself. When political change fails, it can explore why alternatives have stopped being

alternatives (op. cit., p. 93). Rather than power *over*, its focus is on 'power within', 'power to create' and 'power as ability', in both the inquiry process itself and the wider world of organisations.

Indigenous Qualitative Research

Bettina Schneider and Bob Kayseas

INTRODUCTION

Former Canadian Prime Minister Paul Martin responded to a question about the future of Aboriginal business for the Canadian Council for Aboriginal Business by stating,

First of all, more and more Canadian businesses are beginning to understand that if you want to do business with Indigenous Canadians, you have to understand their worldview. If a Canadian business wants to do business in Korea, in China, or any other part of the world, they understand that they have to understand the people they're dealing with. They have to understand their worldview, they have to understand their concepts. ...For far too long, Canadian businesses have not understood this in terms of dealing with Indigenous Canada, and yet Indigenous Canada has a very deep and profound worldview (Gladu, 2016, p. 18).

This statement introduces a complex topic and it does so in a way that captures the core of what this chapter is about, which is Indigenous qualitative research as it pertains

to business. It is important to note that the authors believe many methods exist that work well with research involving Indigenous people, and we note some of these methods in the appropriate sections below. However, we also believe that this chapter should focus on 'why' there are distinct Indigenous research methods as well as 'how' those methods are to be implemented. This is an important discussion. Its importance can be highlighted with reference to the following quote from the *Canadian Tri-Council Policy Statement: Ethical Conduct for Research Involving Humans* (TCPS):¹

Research involving Aboriginal peoples in Canada has been defined and carried out primarily by non-Aboriginal researchers. The approaches used have not generally reflected Aboriginal worldviews, and the research has not necessarily benefited Aboriginal peoples or communities. As a result, Aboriginal peoples continue to regard research, particularly research originating outside their communities, with a certain apprehension or mistrust. (Government of Canada, 2014, p. 105)

Researchers must understand the rationale for Indigenous research methods and must delve into their research with greater detail than simply acknowledging past injustices – their understanding needs to be at the level contemplated by the Former Canadian Prime Minister Paul Martin. Martin believes that researchers need to understand the ‘world-view’ of their Indigenous research partners. The most challenging aspect of engaging in a process leading to active research involving Indigenous peoples is the self-awareness that is required. Stokes and Hall (2014) ask the following question in their book *Research Methods*: ‘to which particular philosophical and methodological approaches do you subscribe when you are in the process of developing new knowledge?’ (p. 96). Every researcher needs to ask him or herself this question before beginning their research project.

The core research questions we explore in this chapter are: (1) how can Indigenous business research be conducted without using only ‘Western academic constructs, methodologies and terminologies?’ (Mertens et al., 2012, p. 19); (2) how can Indigenous business research accurately communicate Indigenous peoples’ experiences and build on their conceptual and theoretical frameworks? and (3) how can Indigenous business research truly improve the quality of life of Indigenous people throughout the world? (Mertens et al., 2012). Our research on Indigenous qualitative research methodologies in business intends to seek out ‘locally relevant constructs, methods and theories derived from local experiences and Indigenous knowledge’ (Mertens et al., 2012, p. 19) that can contribute to an alternative to the Euro-Western paradigm within business, management, and other disciplinary areas.

This topic is particularly relevant at this moment in time, given the growing demand for the indigenization of teaching and research throughout Canadian higher education. This push to indigenize is partly driven by certain segments of society that

wish to address the gross inequities that exist amongst Indigenous and non-Indigenous peoples in Canada. As Willie Ermine states, ‘the conditions that Indigenous peoples find themselves in are a reflection of the governance and legal structures imposed by the dominant society. Indeed, what the mirror can teach is that it is not really about the situation of Indigenous peoples in this country, but it is about the character and honor of a nation to have created such conditions of inequity’ (Ermine, 2007, p. 200). It is in fact this ‘Indigenous gaze’ now upon the West, which Ermine speaks of, that demands a profound change in the interactions between Indigenous and non-Indigenous peoples. Ermine suggests that there is an ethical space, produced by contrasting worldviews, within which Indigenous and non-Indigenous peoples can and must engage in dialogue if any form of reconciliation is to be achieved. This change must be achieved not only through the dialogue Ermine speaks of, but also through a more self-critical conversation amongst non-Indigenous peoples. In her critique of Len Findlay’s (2000) call to always indigenize, Elina Hill believes that non-Indigenous people need to engage in more self-critical work to decolonize and achieve better relationships with Indigenous peoples. Hill believes that Canadian universities’ call to ‘Indigenize’ might actually ‘help to avoid self-critical work toward decolonization on the part of the university’ (Hill, 2012). Hill references Linda Tuhiwai Smith’s groundbreaking book, *Decolonizing Methodologies: Research and Indigenous Peoples* (2012), in her critique. Smith, a Māori scholar and educator from New Zealand, not only provides a critique of ‘research’ in relation to Indigenous communities, but also creates an Indigenous research agenda that offers an alternative to the dominant paradigm. Hill’s understanding of Smith’s perspective on indigenization is that it is not only one of the many paths one can take toward decolonization (with decolonization being Smith’s main objective), but it also involves the immersion

of oneself in Indigenous knowledge systems, traditions, methodologies, and priorities. Hill further points out that:

while non-Indigenous people ought to take Indigenous thought seriously, they cannot easily take up Indigenous traditions or positions in order to forward their own projects. There needs to be keen awareness of how such a move might risk further exploiting Indigenous peoples and their knowledge. Because interactions between settlers and Indigenous peoples have long been fraught with imbalances of power, ethical non-Indigenous researchers engaging with Indigenous thought must do so in partnership with Indigenous peoples, and with recognition for Indigenous goals. (Hill, 2012)

This chapter attempts to explore how we as researchers in business, management, and other relevant disciplinary areas may respectfully engage with Indigenous methodologies in an effort to decolonize, indigenize, and meaningfully contribute to eradicating the inequities that exist between Indigenous and non-Indigenous peoples. The Truth and Reconciliation Commission of Canada states that apologies and reparations are not enough when it comes to reconciliation; real social, political, and economic change is needed (Truth and Reconciliation Commission of Canada, 2015). It is our hope that this chapter contributes to real change in Indigenous communities through the research that is undertaken by all who meaningfully engage with the ideas we share.

In the following chapter, we will first begin by exploring the role that decolonization plays in the undertaking of Indigenous research methodologies. We then review the four main elements of an Indigenous research paradigm: Indigenous ontology, Indigenous epistemology, Indigenous axiology, and Indigenous research methodology. We provide examples of Indigenous ontology, epistemology, axiology, and research methodology in practice. We explore distinct Indigenous qualitative research methods as well as qualitative research methods that work well with research involving Indigenous people.

We conclude with a discussion of the many opportunities and challenges that indigenization presents for researchers and universities.

DECOLONIZATION

Before we can begin to further complicate the call by academia to indigenize research, we must begin with a working understanding of what decolonization is, the role it plays in the formation of an Indigenous research paradigm, what an Indigenous research paradigm consists of, and the epistemological foundations upon which such a paradigm has been built. In *Decolonizing Methodologies*, Smith states ‘the term “research” is inextricably linked to European imperialism and colonialism. The word itself, “research”, is probably one of the dirtiest words in the indigenous world’s vocabulary’ (Smith, 2012, p. 1). Smith goes on to reference Edward Said (1978) and his Western discourse about the Other as she describes the ways knowledge about Indigenous peoples has been collected, categorized, and represented back to the West, and then represented back to the colonized through the Western ways of knowing and research (2012, p. 1). Smith goes on to say that Indigenous peoples have their own story to tell, ‘the history of Western research through the eyes of the colonized’ (1999, p. 2). One of the many significant contributions of Smith’s book is that it identifies research as not only a site of struggle between the West and Indigenous peoples, but also as a site of resistance. Smith’s book goes beyond deconstructing Western scholarship, i.e. a retelling of Western scholarship through Indigenous eyes, but it also attempts to resist and improve the current political and social conditions of Indigenous peoples through the exploration of research approaches and methodologies that ‘can be more respectful, ethical, sympathetic and useful’ (2012, p. 9). As Smith states, ‘To resist is to retrench in the margins,

retrieve “what we were and remake ourselves.” The past, our stories local and global, the present, our communities, cultures, languages and social practices – all may be spaces of marginalization, but they have also become spaces of resistance and hope’ (2012, p. 4). The purpose of this chapter is to examine how we, as business researchers, can not only decolonize and deconstruct our research methodologies, but also identify those spaces of resistance that will help to truly improve the conditions of Indigenous peoples. Wilson states that, ‘If research doesn’t change you as a person, then you haven’t done it right’ (2008, p. 135). Building on Wilson and Smith’s work, research shouldn’t only change you as a person, it should also always positively contribute to the communities with which you work. If research doesn’t meaningfully impact the research participants and contribute to the improvement of their current conditions, then you haven’t done it right.

According to Chilisa, decolonization is ‘a process of conducting research in such a way that the worldviews of those who have suffered a long history of oppression and marginalization are given space to communicate from their frames of reference’ (2012, p. 14). The process of decolonization is multifaceted. It requires researchers to ‘research back’ in an effort to examine how various disciplines have ‘described and theorized about the colonized Other’ and how such disciplines have silenced their voices and ‘refused to let the colonized Other name and know from their frame of reference’ (Chilisa, 2012, p. 14). Chilisa goes on to emphasize that the decolonization process must critically analyze dominant literatures in an effort to expose ‘the problematic influences of the Western eyes and how they legitimize “the positional superiority of Western knowledge”’ (Chilisa, 2012, p. 14). As Smith (2012) states, ‘decolonization, however, does not mean and has not meant a total rejection of all theory or research or Western knowledge. Rather, it is about centering our concerns and world views

and then coming to know and understand theory and research from our own perspective’ (p. 41). More than anything, decolonization ‘must offer a language of possibility, a way out of colonialism’ (Smith 2012, p. 204), and provide Indigenous peoples with the opportunity to make plans, make strategic choices, and theorize solutions.

AN INDIGENOUS RESEARCH PARADIGM

It is important to explore the concept of ownership with regard to knowledge when discussing an Indigenous research paradigm. According to Wilson (2008), Hart (2010), and Chilisa (2012), within an Indigenous research paradigm, knowledge is not something achieved in isolation. Smith (2000) is critical of the commodification of knowledge and believes Maori cultural values and thinking see knowledge ‘as belonging to the whole group’, and that ‘individuals do not hold knowledge for themselves; they hold it for the benefit of the whole group’ (p. 218). An individual should not pursue knowledge for the sake of claiming that knowledge; it should be pursued and shared for all of creation. While we individually arrive at knowledge, knowledge is developed through the self in relation to other humans, other ideas, other environments (living and nonliving).

Wilson believes that four elements combine to make up a research paradigm: ontology, epistemology, methodology, and axiology. He encourages us to think of these four entities as interconnected and inseparable. From his perspective, an Indigenous research paradigm is about relationality – ‘ontology and epistemology are based on a process of relationships that form a mutual reality. The axiology and methodology are based upon maintaining accountability to these relationships. ...An Indigenous research paradigm is relational and maintains relational accountability’ (2008, p. 71). Wilson further explains

that an Indigenous research paradigm is founded on the belief that knowledge is relational; knowledge is shared with all of creation, i.e. research subjects, animals, plants, and the cosmos, and that we are accountable to the relations that we form through our research.

Wilson (2008), Chilisa (2012), and Hart (2010) all speak about the challenge of adapting the dominant system's research paradigms and tools because of the Western epistemological foundations upon which these paradigms have been built. However, each one of these authors successfully differentiates Indigenous ontology, Indigenous epistemology, Indigenous axiology, and Indigenous research methodologies from their Western counterparts. Wilson believes it is the uniqueness of these four elements that sets an Indigenous research paradigm apart from other research paradigms (2008). In order to truly understand what makes an Indigenous research paradigm unique, we will explore each of the above-mentioned elements in the following pages.

INDIGENOUS ONTOLOGY

Chilisa (2012) defines ontology as a body of knowledge that explores what it means to exist, and Wilson (2008) defines it as the nature of existence or reality. According to Wilson (2008), if 'reality is the relationship that one has with the truth' (p. 73), then an Indigenous ontology might have multiple realities. While Wilson (2008) acknowledges that the notion of multiple realities is similar to a constructivist paradigm, he points out that the difference between a constructivist ontology and an Indigenous ontology is that the truth is not external to an individual, but rather located in the relationships that one has. The concept of a *relational ontology* emphasizes that the relationships that one has with an object or idea are what is important and not the object or idea itself. Wilson

further expands on this idea 'to say that reality *is* relationships or sets of relationships. Thus, there is no one definite reality, but rather different sets of relationships that make up an Indigenous ontology. Therefore, reality is not an object, but a process of relationships, and an Indigenous ontology is actually the equivalent of an Indigenous epistemology' (2008, p. 73). Chilisa (2012) explains relational ontology as one's social reality in relation to the connections that human beings have with the living and non-living world. She refers to the *ubuntu* philosophy of the Bantu people of southern Africa as a way of explaining relational ontology. Chilisa (2012) discusses the translation of the *ubuntu* philosophy into English: 'I am we; I am because we are; we are because I am', or 'a person is because of others', which she asserts not only implies 'Communality, collectivity, social justice, human unity, and pluralism', but also a relational ontology (p. 21).

According to Hart (2010), spirituality and reciprocity are two key elements of an Indigenous ontology and are key in his Indigenous research paradigm. Hart cites Cajete (2000), Meyer (2008), and Rice (2005) as he explains the interconnectedness of the spiritual and physical worlds. Wilson (2008) defines spirituality as 'one's internal sense of connection to the universe' (p. 91), which Chilisa (2012) further explains may include 'one's personal connection to a higher being, or humanity, or the environment' (p. 114). Chilisa also acknowledges Indigenous peoples' connection to the environment/land when discussing spirituality. As Chilisa (2012) notes, 'construction of knowledge has to be done in a manner that builds and sustains relationships with the land/environment and is respectful of the environment. In this context, knowledge is held in connection with the land and the environment' (p. 114). Hart (2010) defines reciprocity as the belief 'that as we receive from others, we must also offer to others', and explains that 'reciprocity reflects the relational worldview and the

understanding that we must honor our relationships with other life' (p. 7).

Kayseas has explored the value of equal exchange and the principle of reciprocity through his research. Unlike the traditional Western model that views knowledge as an acquirable commodity, Indigenous traditions view information and knowledge transfer as a value of equal exchange or, as articulated by Greely (1996) and Michell (1999), 'as an entity that has spirit to which certain behaviors and protocols are accorded' (as cited in Cardamone & Rentschler, 2006, p. 32). Indigenous-focused research and knowledge transfer must value the principle of equal exchange and benefit the population as a whole if it is to be considered ethical and guided by what Gower (2003) refers to as the 'principle of reciprocity' (as cited in Cardamone & Rentschler, 2006, p. 11).

The principles of valued equal exchange and reciprocity encompass a number of vital research criteria: an emphasis on traditional social and cultural obligations for knowledge transfer which draw upon standards and customs under Indigenous law; a focus on 'deeper' research outcomes than merely reporting findings; the importance of Indigenous concepts of *community* before the *individual* with respect to research project negotiations and community participation; and the importance of a collective or community notion of consent and confidentiality (Ermine et al., 2004).

In accordance with Ermine et al. (2004) and Cardamone and Rentschler (2006), Kayseas and Moroz's (2014) research project, Natural Resource Partnerships and New Venture Creation in a First Nations Context, utilizes the above-mentioned principles to ensure that the outcomes have mutual and tangible benefits to Indigenous communities, that Indigenous communities retain authority over their knowledge, and that all obtained Indigenous knowledge is recognized and repaid through equal exchange and reciprocity. For example, case study communities are offered the services of the researchers/

business professors to assist them in capacity development initiatives that are mutually agreed upon. Project researchers, the co-PIs, collaborators, and research assistants may assist the community with research for a business plan, community-planning initiatives, or a market research study for a particular development project.

We will further address examples of Indigenous ontology in the section on Indigenous Research Methodology. While the above-mentioned section explains many aspects of an Indigenous ontology, we must begin to more deeply explore Indigenous epistemology in order to truly understand what it means to exist from an Indigenous frame of reference.

INDIGENOUS EPISTEMOLOGY

Indigenous knowledge cannot be easily categorized or defined. According to Battiste and Henderson (2000), Indigenous knowledge represents the 'cumulative body of knowledge and beliefs, handed down through generations of cultural transmission, about the relationship of living beings (including humans) with one another and with their environment' (p. 42). In his article, Indigenous Worldview, Knowledge and Research (2010), Hart references Maurial (1999) as he attempts to define Indigenous Knowledge (IK). Hart (2010) states that Indigenous Knowledge, according to Maurial, is 'the peoples' cognitive and wise legacy as a result of their interaction with nature in a common territory' and 'identifies three characteristics of Indigenous knowledge: local, holistic, and oral' (p. 62). Hart goes on to also reference De La Torre's (2004) definition of Indigenous knowledge, which Hart (2010) states is 'the established knowledge of Indigenous nations, their worldviews, and the customs and traditions that direct them' (p. 63).

In *Aboriginal Knowledge for Economic Development*, Newhouse (2013) asserts that Elders are the most ‘visible representation’ of Indigenous Knowledge in daily life because they ‘serve as sources of knowledge as well as reminders of a set of values and way of life and being’. IK is not just a set of knowledges, but a way of doing things, a way of living in the world and a way of being in the world (Newhouse, 2013, p. xxii). Newhouse looks to Cajete and Little Bear (1995), Castellano (2000), Battiste (2000), and Ermine (2005) as he identifies the following commonly accepted characteristics of IK:

- 1 a long, intimate relationship with a particular environment, based on long-term observations and testing of hypotheses through use and practice,
- 2 both reason and passion are intertwined and valued in decision-making,
- 3 practice, ceremony and instruction are how IK is transmitted,
- 4 IK has a spiritual foundation that emphasizes interconnectedness and (w)holism,²
- 5 an extended apprenticeship with Elders is generally how IK is acquired; learners are taught and tested through their observed behaviour,
- 6 IK is multidisciplinary in nature,
- 7 IK is both practical and ethical; it guides people how to live well within a particular landscape. (Newhouse, 2013, p. xxii–iii)

Newhouse (2013) examines the re-emergence of Indigenous Knowledge in the following reflections on his past work:

contemporary Aboriginal people in Canada desire to develop a modern Aboriginal society that is based in ideas both from the West and from their own cultural and intellectual traditions. This central desire has led to the necessary foregrounding of what we have come to call Indigenous knowledge (IK) or traditional knowledge (TK) or traditional environmental knowledge (TEK). It is expected that IK will serve as a foundational knowledge for the structures and processes of everyday life: governance, education, family, economy, health and culture. IK is seen as a way to recover from a more than century long attempt to replace every aspect of Aboriginal life with European-based thinking and values. Modern Aboriginal society did not reject knowledge from

the West, but brought it to the IK reconstruction effort with skepticism and a healthy dose of critical reflection. (p. xx)

According to Wilson (2008), knowledge is relational, meaning that it arises through the ways the human world, the spirit, and the environment (living and nonliving) interact with one another. Wilson (2008) states,

knowledge is shared with all of creation. It is not just interpersonal relationships, not just with the research subjects I may be working with, but it is a relationship with all of creation. It is with the cosmos, it is with the animals, with the plants, with the earth that we share this knowledge. It goes beyond this idea of individual knowledge to the concept of relational knowledge. It's not the realities in and of themselves that are important; it is the relationship that I share with reality. (p. 74)

Chilisa (2012) describes relational epistemologies as socially constructed by people who have a relationship and connection with one another as well as the living and nonliving environment (p. 116). Chilisa (2012) and Wilson (2008) describe how knowledge comes from many different sources: people's languages, histories, stories, observation of the environment, prayer, ceremony, song, dance, visions, and spiritual insights. Chilisa (2012) discusses the role Indigenous languages play in the advancement of ‘new knowledge, new concepts, new theories, and new rules, methods, and techniques in research’ (p. 57) as well as the important role language plays in the research process.

Wilson (2008) further points out the importance of understanding that ‘research and thinking need to be (and are) culturally based. Of course, all philosophy is based upon a culture, a time, a place. It is impossible for knowledge to be acultural’ (p. 91). Therefore, it is important to recognize the multiplicity of epistemologies and ontologies that contribute toward the creation of knowledge. It is critical to recognize the cultural origins of one's research epistemology and ontology. When discussing an Indigenous research paradigm, in addition to many of

the above-mentioned Indigenous values that inform it, Wilson emphasizes that the cultural values of egalitarianism and inclusiveness must be a part of the epistemological foundation of such a paradigm. The circle has been recognized as a common structure amongst many Indigenous communities because it supports inclusiveness, wholeness, egalitarianism (Wilson, 2008). When using an Indigenous research paradigm, the researcher cannot place himself or herself above anyone in his or her research circle. Research participants should be included every step of the way.

Elders, relationships, Indigenous languages, cultural values, stories, prayer, and ceremony are all sources of Indigenous Knowledge that we mention in the Indigenous research methodologies we share throughout this chapter. These sources of knowledge are examples of what makes an Indigenous epistemology unique and distinct from other epistemological foundations.

INDIGENOUS AXIOLOGY

Chilisa (2012) notes that ‘axiology refers to the analysis of values to better understand their meanings, characteristics, their origins, their purpose, their acceptance as true knowledge, and their influence on people’s daily experiences’ (p. 21). Wilson (2008) explains that Indigenous methodology demands that research is guided by respect, reciprocity, and responsibility, and that the researcher abides by these three Rs of Indigenous research and learning in order to help build relationships that have been established through the research process. Some of the questions pertinent to axiology and methodology that Wilson (2008, pp. 77–8) urges researchers to consider when working within an Indigenous research paradigm are:

- How do my methods help to build respectful relationships between the topic that I am studying and myself as a researcher (on multiple levels)?

- How do my methods help to build respectful relationships between myself of the other research participants?
- How can I relate respectfully to the other participants involved in this research so that together we can form a stronger relationship with the idea that we will share?
- What is my role as a researcher in this relationship, and what are my responsibilities?
- Am I being responsible in fulfilling my role and obligations to the other participants, to the topic and to all of my relations?
- What am I contributing or giving back to the relationship? Is the sharing, growth and learning that is taking place reciprocal?

Chilisa (2012) discusses relational axiology as one of the four elements of an Indigenous research paradigm; relational axiology is research that is guided by the four Rs: principles of relational accountability, respectful representation, reciprocal appropriation, and rights and regulations. We have already explored relational accountability above. Respectful representation refers to the researcher’s ability to listen, acknowledge, and ‘create a space for the voices and knowledge systems of the Other’ (Chilisa, 2012, p. 22). Reciprocal appropriation refers to the notion that all research is appropriation and should benefit both the researcher as well as the communities researched. Rights and regulations are ethical protocols that provide the research participants with ‘ownership of the research process and the knowledge produced’ (Chilisa, 2012, p. 22). While Wilson (2008) and Chilisa’s descriptions of Indigenous and relational axiology are similar to certain feminist and ethnographic research methodologies, the point of differentiation has everything to do with *context*. What we mean by this is that researchers need to take into consideration the history of research in Indigenous communities and the communities themselves. How do the above-mentioned questions posed by Wilson relate specifically to Indigenous communities and support the notion of relational accountability? One of the most important issues

regarding context is that the experiences of Indigenous research participants have been historically very negative. Researchers must understand this history and the lack of ownership Indigenous communities have had over the research process and knowledge produced before they can begin to fairly apply Wilson (2008) and Chilisa's (2012) interpretation of axiology to their research.

Within an Indigenous axiology, the principle of relational accountability promotes community-driven research. From this perspective, research must go beyond being community based; it must be driven by the needs and wants of the community. The Urban Aboriginal Knowledge Network (UAKN) requires that community-driven and research embodies and promotes relational accountability in the following ways:

- a. Research is grounded in community priorities, and constructed or designed collaboratively between communities and researchers;
- b. Research conducted is respectful of Aboriginal people's languages, cultural protocols, values, lifecycles and gender(s);
- c. Research conducted is respectful of Aboriginal people's research approaches and protocols;
- d. Aboriginal peoples and organizations will be an active participant in the research process at the level of their choosing;
- e. Principles of USAI (Utility, Self-Voicing, Access and Inter-relationality), (OFIFC), and OCAPTM (Ownership, Control, Access and Possession), (FNIGC) will be looked to as useful and guiding references informing community driven research. (UAKN, 2015)

An example of community-driven research is the work by Schneider and Wenger (2014), which was conducted with the Newo Yotina Friendship Centre (NYFC) in 2013/14. The NYFC is an incorporated, non-profit, and broad-based collaborative community organization in Regina, Saskatchewan. The NYFC assists Aboriginal people within the Regina community to empower themselves and to pursue education, employment training, and advocacy in a comfortable environment

which allows them to heal, to grow, and to adjust to life in an urban setting, along with the challenges that this represents. The research project with the NYFC was funded by the Urban Aboriginal Knowledge Network's Prairie Research Centre.³ As mentioned above, the UAKN requires that research is community-driven. When Schneider approached the NYFC in 2013, there was no pre-defined research topic. The research project that was eventually chosen was based on the NYFC's priorities and was designed collaboratively between the NYFC and Schneider. The objective of the NYFC's research project was to adapt the life skills and financial literacy curriculum in order to make it more relevant to the urban Aboriginal clientele at the Newo Yotina Friendship Centre (NYFC) and to determine the overall impact of this curriculum on NYFC's clientele. Prior to this research project, the NYFC had experience in delivering financial literacy curriculum. According to the NYFC, during the review of the original financial literacy curriculum, while participants showed tremendous growth in their understanding of various topics that were reviewed, many barriers that interfered with attendance, consistency, and the overall attainment and application of information were identified, indicating the need for a different approach to delivering this type of curriculum. The NYFC noted that many of the concepts in the curriculum were designed from a mainstream perspective and asserted the need to develop a curriculum that incorporated an Aboriginal worldview and a culturally sensitive approach, as well as the inclusion of a relevant life skills curriculum, in order to eliminate barriers and to provide a greater opportunity for a holistic, multi-pronged, sustainable program for urban Aboriginal peoples. An Indigenous axiology ensures that the values of Indigenous communities guide the research process and methodologies undertaken.

INDIGENOUS RESEARCH METHODOLOGY

Stokes and Wall (2014) ask a fundamental question that needs to be addressed before any of us embark on our research projects: ‘to which particular philosophical and methodological approaches do you subscribe when you are in the process of developing new knowledge?’ (p. 96). The methodological approaches we choose are, of course, guided by our epistemological and ontological foundations. Epistemology reflects the various ways knowledge is made or developed. The epistemology one adheres to reveals the assumptions and values that the researcher holds about the world. Before we can choose a specific methodological path, each one of us needs to discover ‘our own approach, attitudes, beliefs and assumptions in relation to how much of the wider world operates and functions particularly in relation to ideas such as subjectivity versus objectivity and realism versus relativism’ (Stokes and Wall, 2014, p. 96). The choice of research philosophy and methodology very much reflects one’s perspective on life. The research philosophy we choose reflects the values and beliefs that guide our philosophical thinking, while the research methodology ‘will operate in a given system of philosophical thinking’ (Stokes and Wall, 2014, p. 88).

While certain qualitative research methodologies align well with Indigenous research methodologies, many do not. Chilisa (2012) provides an overview of some of the limitations of dominant research methodologies:

- 1 The tendency to ignore the role of imperialism, colonization, and globalization in the construction of knowledge
- 2 Academic imperialism – the tendency to denigrate, dismiss, and attempt to quash alternative theories, perspectives, or methodologies
- 3 Methodological imperialism – a tendency to build a collection of methods, techniques, and rules that valorize the dominant culture

- 4 The dominance of Euro-Western languages in the construction of knowledge
- 5 The archives of literature that disseminate theories and knowledge that are unfavorable to former colonized societies and historically oppressed groups. (p. 117)

An Indigenous research methodology ensures that researched knowledge ‘will be kept “in context” with cultural protocols’ (University of Calgary, 2015), as well as being meaningful and taking into consideration the well-being (present and future) of the communities studied. Another key characteristic of an Indigenous research methodology is the collective. As explained by Maggie Kovach (2009), there is a sense of commitment to the people in many Indigenous societies. Inherent in this commitment to the people is the understanding of the reciprocity of life and accountability to one another. Wilson (2008) points out that as researchers, ‘you are recognized by your deeds within the Indigenous world. Not by what you say on paper: what you have done’ (p. 91). Therefore, an Indigenous research methodology emphasizes actions over words as well as practicality, which assumes that the knowledge one gains through research will be utilized in practical ways – ways that benefit the research participants. Hart (2010) emphasizes this practicality of research by quoting Kovach’s statement, ‘one seeks knowledge because one is prepared to use it’ (p. 9).

We asked First Nations University of Canada’s business professor, Richard Missens, to share the Indigenous research methodology he has been using throughout his dissertation. Reflecting on his dissertation experience, Missens states,

First Nations’ people have always had a veneration of age and the accumulated wisdom that the elders have learned throughout a lifetime. These cultures view the elders as the knowledge keepers and the teachers within their societies. When we are seeking understanding, their teachings are available to us in the time of our lives when we need them with as much as a simple request. However, there are a set of principles and doctrines

that guide learners of First Nations' knowledge. Here are some examples:

- Knowledge is collectively owned, shared and held (multi-agent system)
- Knowledge is cumulative (learnt through increasing or enlarging by successive addition)
- Knowledge requires a commitment from the learner
- Humility is vital to understanding
- Knowledge must be sought (i.e., you have to seek it, it is not forced on you)
- All knowledge is sacred and spiritual and must be treated as such. (Richard Missens, personal communication, May 25, 2016)

Missens' first step in his dissertation research was to identify elders. Missens states, 'In First Nation societies, as with any other, there are individuals who have expertise and experience in specific areas. In societies that believe in multi-intelligence, where individuals are blessed with "gifts", including knowledge, learners must seek out those knowledge keepers who hold the type of knowledge that you are seeking' (Richard Missens, personal communication, May 25, 2016). Missens asked the Saskatchewan Indigenous Cultural Center (SICC)⁴ for assistance. As he points out, this cultural institution has a deep commitment to the promotion and preservation of IK and has developed extensive relationships with the First Nations elders across Saskatchewan.

Missens' second step in his dissertation research involved protocol. As he states, 'In order to respect the First Nation doctrine of learning, I had to present tobacco to the elders and ask them for their understanding and guidance. They were invited to a focus group meeting where we would ask them to share their knowledge. There were two primary focus groups and three individual follow-up meetings after that' (Missens, personal communication, May 25, 2016).

Missens' third step involved ceremony. Missens states, 'Before the focus groups, the elders had asked that a smudge ceremony and prayer be conducted prior to starting. The

smudge is a purifying ceremony that cleanses our minds and spirits in preparation for the acceptance of new knowledge – it opens our minds. The prayers asked the Creator and our ancestors to help us. The prayers asked 1) that the learner (Missens) is successful in attaining the understanding that he is seeking, 2) that what he learns will be used for the good of the people, 3) the elders prayed that what they share is truthful and accurate, and 4) giving thanks for this opportunity to work together' (Missens, personal communication, May 25, 2016).

Missens' research methodology certainly captures the key elements of Indigenous ontology as described above by Hart: spirituality and reciprocity. Spirituality is described by Missens in the third step of his dissertation research on ceremony. Missens has also demonstrated reciprocity by giving back to First Nations communities through his dissertation research. Like Kayseas, Missens also offers his services to assist the communities he works with in capacity development initiatives that are mutually agreed upon. He has delivered numerous workshops to First Nations communities on business planning and entrepreneurship as part of his dissertation work. Many First Nations communities and individuals have benefitted from these workshops, which was part of the guidance Missens received from the Elders – to give back to the individuals and communities he sought guidance from.

INDIGENOUS QUALITATIVE RESEARCH METHODS

Kovach (2009) believes that 'Indigenous methodologies and qualitative research at best form an insider/outsider relationship' (p. 31). What is meant by this insider/outsider relationship is that while Indigenous methodologies share interrelated characteristics with certain qualitative approaches,

there are two fundamental areas that are unique to Indigenous research methodologies. According to Kovach (2009), 'Indigenous knowledges have a fluidity and motion that is manifested in the distinctive structure of tribal languages. They resist the culturally imbued constructs of the English language, and from this perspective alone Western research and Indigenous inquiry can walk together only so far' (p. 30). Indigenous epistemologies represent the other area that exists outside of Western research methodologies; they are very different from Western epistemologies, as we explored in the beginning of this chapter. The importance of these insights by Kovach is that qualitative research methodologies and Indigenous methodologies can occupy a similar methodological space, and within this space, both comparable and different methods can be applied. However, as mentioned by Kovach above, when it comes to language and worldview, non-Indigenous researchers *can only walk so far*. This certainly does not mean that non-Indigenous researchers cannot meaningfully participate in Indigenous research. However, such research must be done *with Indigenous peoples* in order to truly understand the importance of Indigenous languages, worldview, ontology, epistemology, axiology, and research methodology in the research process. For example, with regard to language, Wilson (2008) notes that Aboriginal Australians will refer to other Indigenous people as 'cousin', 'brother', or 'auntie', demonstrating 'the relationship with something (a person, object or idea) is more important than the thing itself' (p. 73). In Cree, Wilson (2008) points out that '*Nookoom*' means 'my grandmother' and '*Kookoom*' means 'your grandmother'; however, 'there is no word for "grandmother" in Cree. ... "You can't be a grandmother without being attached to something"' (p. 73). In both examples, understanding the language deepens one's understanding of Indigenous worldview, epistemology, and relationships. Without this understanding,

non-Indigenous researchers can only walk so far. Additionally, there are a myriad of issues that will impact the authenticity and value of the research and the ability of non-Indigenous researchers to undertake projects with Indigenous populations as the focus. One such issue is related to the questions being asked by the researcher and thus the depth of understanding required. For example, a researcher examining strategic alliances between Indigenous communities and industry partners may not delve into social and, especially, cultural variables within the community and thus the depth of understanding could conceivably be rather shallow. However, if a researcher is studying why Indigenous people choose to pursue collective interests over individual pursuits when engaging in entrepreneurship, he or she may need to explore the Indigenous groups' worldview, values, and even the language. This second example illustrates the potential range of understanding required of non-Indigenous researchers. This is not to say that a non-Indigenous researcher cannot be successful at such research; however, a certain depth of understanding is required. Furthermore, non-Indigenous researchers must always be working to decolonize themselves and their disciplines in order to genuinely participate in Indigenous research. In the following section, we will explore Indigenous research methods that exist both 'inside' and 'outside' of traditional qualitative research methodologies.

As Brayboy states, 'Stories are not separate from theory; they make up theory and are, therefore, real and legitimate sources of data and ways of being' (Brayboy, 2006). When it comes to story-gathering methods, such as the case method, narrative research, and certain ethnographic approaches, it is important that the researcher is a good listener and is comfortable with how the story is being shared; the researcher should not interrupt or else he or she risks not only disrespecting the research participant, but also impeding information from being shared

that could be quite relevant to the research. Those trained in Western research methodologies must look beyond written stories and texts as the only legitimate ways of knowing. Indigenous methodologies value the oral tradition as well as other storytelling methods such as song, dance, proverbs, and metaphors that have often been dismissed by academia as legitimate ways of knowing. As Chilisa (2012) notes, language, oral literature, and storytelling 'can provide new insights into other ways of theorizing about methodologies in social science research' (p. 156) as well as provide an avenue of dialogue with research participants about issues of concern. Indigenous case studies are examples of research methodologies that share inter-related characteristics with the case method. While the case method approach is used in constructing the case, the Indigenous worldview and research methods are incorporated into the development of the case and the methodology used. There are an increasing number of Indigenous case studies being developed. Cape Breton University, located in Sydney, Nova Scotia, created the Purdy Crawford Chair in Aboriginal Business Studies in order to promote interest among Canada's Aboriginal people in business and to undertake research that will create post-secondary resources, such as case studies, that can be used to indigenize the business curriculum in universities across Canada. The Purdy Crawford Chair has developed 48 case studies available in their Case Studies in Aboriginal Business Series. The First Nations University of Canada's School of Business and Public Administration has developed a number of Indigenous case studies and hopes to generate many more in the future.

With regard to the interview method, Kovach (2009) states, 'Highly structured interviews are not congruent with accessing knowledges that imbue both the fluidity and regulation of the storyteller's role within oral tradition, or that respond to the relational nature of Indigenous research' (p. 123). Indigenous methodologies do not

promote placing restrictions on a research participant's narrative, but rather encourage an open-ended structure. If we refer to certain Indigenous axiologies that were mentioned earlier in the chapter, respect, reciprocity, and egalitarianism are critical to incorporate into the interview process. Research participants must be treated with the utmost respect, must not feel as though a power differential is present between themselves and the researcher(s), and should also benefit from the research process. Too often, 'researchers conduct interviews as privileged elites and knowers who are operating with Western models of thought and conducting interviews within frameworks of Othering ideologies supported by deficit theories and literature that construct the researched as the problem' (Chilisa, 2012, p. 223). Furthermore, the language used is also guided by Western academic disciplinary vocabulary, terms, concepts, and categories of analysis that could certainly limit relational ways of knowing that are meant to 'communicate equality among participants' (Chilisa, 2012, p. 220). Indigenous interview methods demand that the researcher uses IK 'to guide interview question structures, types of questions asked, and data analysis procedures' (Chilisa, 2012, p. 223).

One of the disadvantages of some Western-based focus groups is that they do not always allow all members to be equally heard. Dominant voices within the groups can often restrict others from freely participating. While Nominal Group Technique and the Delphi Method are Western-based methods that strive to provide all participants with a voice when it comes to identifying problems, generating solutions, and making decisions, these approaches are still quite different from the talking circle and/or research-sharing circle approach within Indigenous groups. The talking circle and/or research-sharing circle approach allows everyone a chance to speak uninterrupted. It is common practice to have each speaker hold a sacred object – e.g. a stone, a feather – while

he or she is speaking and to pass it along to the next speaker when he or she is done (Chilisa, 2012). Kovach (2009) notes that there is a general set of protocols that guide research-sharing circles in Indigenous settings, such as the expectation that they are led by an Elder or cultural leader, that food is provided to the group and that all participants are properly acknowledged for their contributions. There is very much a spiritual element incorporated into the talking circle and/or research-sharing circle. As Kovach (2009) states, the 'research-sharing circle is a method to engender story. It is meant to provide space, time, and an environment for participants to share their story in a manner that they can direct' (p. 124).

With regard to open-ended questionnaires, researchers must incorporate IK systems into their design and make them reflective of the needs and experiences of the research participants and their communities. For example, are the questions and terminologies used throughout questionnaires constructed in a way that makes the questions fully relevant to the research participants given their knowledge systems, languages, and experiences? Are the questions seeking out knowledge that the research participants and communities deem as useful and beneficial? Do the questionnaires legitimize the knowledge and theory of the research participants and their communities or that of the researcher(s) (Chilisa, 2012)? Chilisa (2012, p. 230) provides the following questions to consider when Indigenous research participants are actually involved as co-researchers, questions which promote one type of participatory action research approach: the participant as co-researcher:

- 1 How are the research questions produced?
- 2 Whose research questions are they?
- 3 Do the research questions energize the researched to engage in a dialogue about their material world?
- 4 What methods and theory are used to accurately generate and record marginalized voices, as well as indigenous and local knowledge pre-

dominantly excluded through Euro-Western conventional methodologies?

- 5 With what and with whose theories are research questions and analysis of data conceptualized?

Participatory action research aligns well with Indigenous research methodologies. According to Bergold and Thomas (2012), participatory research methods fully engage research participants in the research process *since it is their* 'life-world and meaningful actions' under examination. Participatory research methods also emphasize treating research participants and communities not as 'objects of research, but rather as co-researchers and knowing subjects with the same rights as the professional researchers' (Bergold and Thomas, 2012). Transformative participatory action research methods must also be considered when discussing Indigenous research methods, since there are some important commonalities. Essentially, transformative participatory action research emphasizes 'active engagement and political action' (Chilisa, 2012, p. 235) by both researcher and researched in the pursuit of personal and social transformation. Examples of participatory action research approaches that align well with Indigenous research methodologies and maximize community involvement are outlined by Chilisa (2012):

- 1 Selecting a shared community problem and planning for the action research
- 2 Culturally sensitive and context-relevant gathering of information guided by group reflection
- 3 Continuous collection of data through field-work
- 4 Community-informed analyzing and interpretation of data
- 5 Participatory monitoring and evaluation. (p. 255)

Furthermore, participatory action research methods often employ appreciative-inquiry approaches that encourage both the researcher and research participants to look at participants' strengths and the strengths of their

communities instead of approaching the research process from a problem-based, deficit position that reinforces hopelessness and a lack of agency amongst research participants (Chilisa, 2012). Participatory action research certainly represents the insider space Kovach refers to when discussing qualitative research methodologies that overlap with Indigenous methodologies in an effort to empower and socially transform research participants and their communities.

INDIGENIZING THE ACADEMY

Indigenization is a process that involves a critique and resistance to Euro-Western methodological imperialism and hegemony as well as a call for the adapting of conventional methodologies by including perspectives and methods that draw from Indigenous knowledges, languages, metaphors, worldviews, experiences, and philosophies of former colonized, historically oppressed, and marginalized social groups (Chilisa, 2012, p. 101).

There are many opportunities and challenges regarding indigenization in the academic sphere. On October 15, 2015, Dr. Lynn Wells, First Nation University's Vice-President Academic, at the time attended Marie Battiste's presentation, 'Indigenization and the Academy's Responses and Responsibilities', at the National Vice-President's Academic Council (NATVAC) at Dalhousie University, located in Halifax, Nova Scotia. Dr. Wells shared her notes on the presentation with many of us at First Nation University. According to Wells, Battiste shared that indigenization has become an increasingly competitive area amongst universities in Canada; many universities are competing over funds and the number of Aboriginal people they can bring into their institutions. However, during the conference, Battiste encouraged institutions to learn from and share with one another when it come to indigenization. She noted that more students do not necessarily lead to fundamental changes

in how the university is structured, how knowledge and values are prioritized, how teaching is approached, and how research is conducted (L. Wells, personal communication, October 15, 2015). With regard to research, indigenization requires far more from us as researchers than simply choosing to work with Indigenous partners, research respondents, and communities. It requires us to decolonize ourselves and our disciplines as well as to immerse ourselves in Indigenous epistemologies, ontologies, axiologies, and research methodologies if we are going to make fundamental changes to the way research is conducted. This is certainly one of the opportunities that indigenization offers researchers and academia.

One of the key challenges indigenization must contend with is the intellectual imperialism and overall dismissiveness amongst many Western academic institutions and academics when it comes to IK. Chilisa (2012) expands on this notion in the following: 'For colonized, historically oppressed, and marginalized groups, intellectual imperialism speaks to the tendency to exclude and dismiss as irrelevant knowledge embedded in the cultural experiences of the people and the tendency to appropriate Indigenous knowledge systems in these societies without acknowledging copyrights of the producers of this knowledge' (p. 55). One of the fundamental challenges of the Western academy is how to restructure itself so that it is truly a multiplicity of epistemologies in relation to one another and not simply built upon Eurocentric knowledge systems at its core, whilst non-European epistemologies exist and exert limited influence at the margins. IK and research methodologies often challenge dominant paradigms that locate Eurocentric ways of knowing as the norm. As Hill states,

To continue to ignore the effects of research, or to pretend that they are someone else's concern, is to continue colonizing from the site of the university. Indeed, the absence or obfuscation of Indigenous perspectives from Canadian knowledge systems over the last few centuries has distorted realities

for all, and has led to increasingly complex ethical, legal, and practical dilemmas. (Hill, 2012)

While indigenization provides the opportunity for researchers and universities to decolonize and to meaningfully contribute to eradicating the inequities that exist between Indigenous and non-Indigenous peoples, the structure of the academy and the intellectual imperialism that very much still exists represent significant barriers.

CONCLUSION

The system within academic structures throughout the world regarding research, academic performance, and professional advancement has the potential to negatively impact the quality and value of research within and for Indigenous communities. The standards that could be codified from all the works referenced above regarding Indigenous research are substantial and far-reaching. For example, decolonizing research, as described by Chilisa (2012), suggests that researchers need to create the opportunity for Indigenous research participants to ‘communicate from their frames of reference’ (p. 14). As mentioned earlier, Chilisa (2012) offers a number of suggested approaches to accomplishing this challenging task: ‘selecting a shared community problem and planning for the action research; culturally sensitive and context-relevant gathering of information guided by group reflection; continuous collection of data through fieldwork; community-informed analyzing and interpretation of data; participatory monitoring and evaluation’ (p. 255). The processes to engage the community are complex and involve a respectful, close relationship between the researcher and the research participants.

Additionally, we note concerns about ownership of knowledge created through the research process. We state earlier in the chapter that knowledge is often seen

as something to be obtained, individually owned, and commodified. It is argued that one of the essential components of an Indigenous research paradigm is that knowledge cannot be owned. Furthermore, Indigenous peoples should benefit from the knowledge they are sharing through the research process and in fact it should be recognized that the knowledge so shared does not transfer ownership. Newhouse (2013) offers a list of important research processes that should be present within projects involving Indigenous peoples. He suggests that research must be grounded in community priorities and constructed or designed collaboratively between communities and researchers. Kovach (2009) describes the sense of commitment to the people that exists within many Indigenous societies. This shared sense of mutual commitment manifests itself through such life principles as reciprocity of life and accountability to one another. Therefore, when one seeks to engage within such communities, they are assuming responsibilities of giving back and being accountable for the participation they seek. Researchers must agree that the knowledge one gains through research will be utilized in practical ways – ways that benefit the research participants.

The question thus arises, how does the Euro-Western research paradigm, operationalized within the framework of the Canadian and global academic system, reconcile with the substantial and far-reaching requirements of the Indigenous research paradigm? A number of suggestions were made within the context of Indigenizing qualitative research methods noted above. However, one of the challenges that remains is that these suggested approaches must yet occur within a system that is guided by the globally accepted tenet, ‘publish or perish’. Publish or perish. Those words are heard throughout university campuses throughout the world. Kilonzo and Magak (2013) describe the impact of the:

relentless pressure to publish, quickly and continually, [that] dictates the sustenance of one's academic career. Scholars who do not meet the demands of this rigorous central rule in academia, regardless of the importance of whatever else they are doing in the field, are routinely marginalized by both peers and institutions. It is arguable that a significant percentage of the substandard work submitted for academic publishing is attributable to this professional pressure. This pressure is a global phenomenon.... (p. 28)

The publish or perish phenomenon, along with the new push amongst universities and colleges throughout Canada to indigenize, has led many researchers to pursue research projects that have an Indigenous component. However, if the intention of these research projects is more for individual gain than for the benefit of Indigenous communities, then this is in opposition to everything we have discussed in this chapter.

Many people are involved in research projects involving Indigenous populations and there are likely many great examples of success. However, as noted previously, research within many Indigenous communities still carries negative connotations. The highest order of codified research ethics in Canada recognizes this in the *Tri-Council Policy Statement: Ethical Conduct for Research Involving Humans*, which is highly consistent with other national and international ethics policies. The challenges that exist for business researchers seeking to engage in knowledge development within Indigenous communities are considerable. However, doing it right will lead to the creation of new relationships and potentially new, positive outcomes for communities and people that deserve so much more than the academic community has traditionally provided. If research is approached as ceremony, then stronger relationships, a raised level of consciousness, and new insights about the world around us are only some of the many benefits both researchers and research participants will receive (Wilson, 2008).

Notes

- 1 The Tri-Council Policy Statement: Ethical Conduct for Research Involving Humans (TCPS or the Policy) is a joint policy by the Canadian Institutes of Health Research (CIHR), the Natural Sciences and Engineering Research Council of Canada (NSERC), and the Social Sciences and Humanities Research Council of Canada (SSHRC), Canada's three federal research agencies. It expresses the agencies' commitment to ethical research involving humans and is also 'a framework that harmonizes with other national and international ethics policies' (Government of Canada, 2014, p. 11).
- 2 'Interconnectedness is the idea that all things are connected in some fashion and that these connections can be made clear and examined. Holism is the idea that individual parts cannot be discussed without seeing how they fit together in a coherent manner' (Newhouse, 2013, p. xxiii).
- 3 <http://uakn.org/research-centre/prairie-research-centre/>
- 4 The Saskatchewan Indigenous Cultural Centre's mission statement is to 'Protect, preserve and promote cultures and languages of the First Nations Peoples of Saskatchewan' (SICC, 2016). The SICC was first established by the Federation of Sovereign Indian Nations (FSIN) in 1972 as the Saskatchewan Indian Cultural Centre and 'was the first First Nations controlled educational institution serving at the provincial level' (SICC, 2016).

An Introduction to Constructionism for Qualitative Researchers in Business and Management¹

Gina Grandy

INTRODUCTION

We are all constructionists if we believe that the mind is active in the construction of knowledge. (Schwandt, 2000, p. 189)

What really exists is not things but things in the making. (James, 1909/1996, p. 263, in Tsoukas & Chia, 2002, p. 567)

There are a number of variations and interpretations of constructionism that influence the work of qualitative researchers. As noted by Gubrium & Holstein (2008) in their *Handbook of Constructionist Research*, ‘constructionism now belongs to everyone and to no one – a highly variegated mosaic of itself’ (p. 4). My intent with this chapter is not to present an exhaustive review of constructionism for qualitative researchers in organization studies – there are various sources already available which do this well (see for example, Cunliffe, 2008; Fairhurst & Grant, 2010; Samra-Fredericks, 2008). Rather, my desire here is to offer a particular reading of

constructionism that draws from my own lived experiences – deriving from my own questions, challenges, reflections and development – to assist those relatively new to constructionism. In line with a social constructionist approach, I am writing myself into the chapter and this means what is to follow is both enriched and limited by my own interpretations, experiences and preferences.

It is difficult to speak of the roots of constructionism because the influences and streams of thinking are so diverse. I suggest it might be better to think of it as a web of influences, comprised of interconnected thinkers, theories, perspectives, research strategies and methods. For example, influential thinkers range from Weber, Durkheim, Marx, Gergen, Goffman, Berger and Luckmann, to Shotter, and related theories range from symbolic interactionism and sense-making to postmodernism. Constructionism is suited to a diverse range of research methodologies (e.g. action research, ethnography, grounded theory) and methods (e.g. observation, interviews, narratives). Constructionism

underpins studies in leadership (see Fairhurst & Grant, 2010, for a conceptual overview, or Grandy & Šliwa, 2015, for a qualitative empirical study), identity (Alvesson, 2010; Grandy, 2008; Thomas & Linstead, 2002), gender (Mavin & Grandy, 2016a, 2016b), entrepreneurship (Downing, 2005; Fletcher, 2006; Refai et al., 2015), management learning (e.g. Corlett, 2013; Larsen & Ø Madsen, 2016; Ramsey, 2013) and strategy (Grand et al., 2015; Mir & Watson, 2000), among others. Given that this chapter is in many ways one distinct to my experiences of constructionism, it seems fitting to first provide the reader with an overview of the key aspects of constructionism that inform my work as a qualitative researcher in business and management.

Following Lincoln & Guba (2000), I understand constructionism to be a *perspective* or *research paradigm* whereby individuals continually construct and negotiate meanings to make sense of experiences. Constructionism is *dialectical*; marked by tensions and complexities because of the opposing yet inseparable nature of subjective and objective realities,² static and processual realities, subjective and objective knowing, and self in-relation-to-others. It envelops *relativism* in the sense that local and specific multiple realities exist, but also *realism* in that political, cultural, social and historical contexts through which such realities are constructed reproduce material effects. Meaning making is also *intersubjective* and *processual*; it is both personal and shared, shaped by one's experiences of self and self in-relation-to-others, and it is temporal and fluid. As a constructionist researcher, I *co-construct* the meanings and interpretations that are negotiated and re-told through my research. I am not a bias to the research, although I do bear a *moral responsibility* to be *reflexive* about how my life experiences and engagement with those whom I encounter in the research process become interwoven in the meaning making process that is re-presented as the experiences of others.

As we move through the chapter I will share with the reader how I have grappled with

various questions and challenges that led to such an understanding and how such assumptions emerge through my own qualitative research. In what follows I organize the content around three areas: constructionism under various labels; constructionism as ontology, epistemology and research paradigm; and intersubjectivity, co-construction and reflexivity. Throughout these sections I weave in empirical examples. Towards the end of chapter, I will also include an extended example from my PhD work with the goal to provide the reader with transparent illustrations of how philosophical assumptions of constructionism can transpire in empirical qualitative research in business and management.

AM I A CONSTRUCTIONIST, SOCIAL CONSTRUCTIONIST, RELATIONAL CONSTRUCTIONIST OR CONSTRUCTIVIST?

In her work on opportunity and new business venturing, Fletcher (2006) delineates between social constructivism and social constructionism. Generally speaking, for her, constructionism is more about 'the relationality between people, institutions, material objects, physical entities and language, rather than the private sense-making activity of particular individuals' (p. 422). She links social constructivism to Vygotsky (1981) and Bruner (1990), whereby 'individual, subjective knowing' (p. 431) is privileged but attention is still given to socio-cultural practices. Constructivism is also often traced back to George Kelly's personal construct theory (see Raskin, 2002). Social constructionism, however, draws more closely from Berger and Luckmann's (1966) work and considers more fully the 'examination of the interplay between agency and structure linking individual constructions of sense-making and enactment to the societal level through processes of structuration (Bouchiki, 1993; Zafirovski, 1999; Bruyat and Julien, 2001; Goss, 2005)' (p. 426). Crotty (2003)

makes a similar distinction and emphasizes how constructionism focuses upon the ‘collective generation of meaning’ (Schwandt, 1994, p. 127; as cited in Crotty, 2003). Crotty (2003) also notes that social constructionism embraces the critical spirit and ‘the hold that culture has on us’, while ‘constructivism tends to resist the critical spirit’ (p. 58).

In one of my meetings with my PhD supervisor I recall her asking me if I could differentiate between constructionism and constructivism, and where did ‘social’ fit into my philosophical understanding. Those questions were important in helping me to grapple with my interpretation of constructionism and its ontological and epistemological assumptions. At the time, it led me to the label ‘social constructivism’ to reflect the approach I had adopted.

In my PhD I used social constructivism to describe my understanding and I explained it in this way:

I was particularly interested in the individual’s meaning making; however, I also felt that the embedded nature of social, cultural, political institutions contributed to the individual’s processes of meaning making. For me it was a matter of emphasis and ‘social constructivism’ captured my acknowledgement of the social, historical and cultural significance (and interaction) of meaning making, as well as my focus upon the individual’s processes of sense making. For this research, a social constructivism perspective was not seen to deny the possibility of emancipation; however, emancipation was not a focal point of exploration. (Grandy, 2006, pp. 108/109)

There are historical and socio-cultural dimensions to constructionism (Schwandt, 2000, p. 197; Weinberg, 2014). Meaning making happens ‘against a backdrop of shared understandings, practices and language, and so forth’ (Schwandt, 2000, p. 197). Gubrium & Holstein (2008) suggest that ‘constructionism’ is more useful to describe a framework ‘for appreciating, not critiquing, everyday reality-constructing practices in general’ (p. 6). Yet, as Berger and Luckmann (1966) contend, the social distribution of knowledge varies, ‘possessed differently by different individuals

and types of individuals’ (p. 60). I suggest then, whether explicit or not, that such meaning making efforts are often inseparable from power dynamics embedded in social relations, structures and systems (see also Haslanger, 2012, for a discussion of this).

Others refer to relational constructionism to describe how knowing is relational and dialogic (see Cunliffe, 2008; Fletcher, 2006; Hosking, 2011), whereby ‘the importance of thinking about ways of being and relating to others’ (Cunliffe, 2008, p. 132) is emphasized. Hosking (2011) contends that relational constructionism is a perspective with its own ontological, epistemological and methodological assumptions (see also van der Haar & Hosking’s (2004) conceptual piece on appreciative inquiry and relational constructionism).

These days I am less concerned about the specific label I use to describe my understanding of constructionism.³ I suggest that the labels reflect more a matter of emphasis, rather than fundamental differences. Regardless of the label used, it is more important that the researcher is transparent about key principles underpinning her conceptualization.

CONSTRUCTIONISM AS ONTOLOGY, EPISTEMOLOGY OR RESEARCH PARADIGM?

One of constructionism’s concerns is the sociology of knowledge and thus is epistemological in nature (Berger & Luckmann, 1966; Cunliffe, 2008; Gubrium & Holstein, 2008; Thorpe, 2008; Weinberg, 2014). Knowledge and learning are not ‘out there’ to be captured or discovered; rather, knowledge is socially embedded and constructed (Crotty, 2003; Schwandt, 2000; Thorpe, 2008). To ‘know’ is to be interested in understanding multiple ‘truths’, in contrast to searching for ‘the truth where “the search for The Truth is both divisive and limiting”’ (Wang, 2016, p. 572). To ‘know’ is to construct and negotiate meanings in relation to other

people, structures, systems, cultures and histories, over time (Crotty, 2003). To 'know' is to appreciate experience and to understand context (Thorpe, 2008). 'Whereas rational approaches veer towards distance, clarity and generalizability, constructionist approaches favour closeness, complexity and locality' (Thorpe, 2008, p. 115). Typically, constructionist research is more concerned with the *what* or *how* of phenomena, rather than the *why* (Gubrium & Holstein, 2008).

Admitting that social, historical and cultural aspects have an influence on what we can know and learn is often seen as a lack of rigour and insight. Notwithstanding, constructionists have argued there is no escape from prejudice and that ignoring prejudice is itself a prejudice worthy of study in its own right. So rather than look for a perfect experience it is far better to accept it, warts and all. (Thorpe, 2008, p. 116)

Epistemologically, there are differences in the extent to which constructionists recognize subjective knowing alongside objective knowing. Subjective and objective knowing play out in a dialectical process, which reflects tensions and an inter-play between the meanings we construct through and from our lived experiences within systems of 'values, technologies, beliefs, lived histories and material conditions' (Thorpe, 2008, p. 116). For Schwandt (2000, p. 191), constructionism takes into account 'a desire to emphasize the contribution of human subjectivity (intention) to knowledge without sacrificing the objectivity of knowledge'. Crotty (2003) also takes the 'object' very seriously, arguing, 'meaning (or truth) cannot be described as simply "objective". By the same token, it cannot be described simply as "subjective"...we do not create meaning. We construct meaning. We have something to work with. What we have to work with is the world and the objects in the world' (pp. 43–4).

Berger & Luckmann's work (1966) on the *Social Construction of Reality* has been foundational in paving the way for our understanding of constructionism in business and management studies. For Berger and Luckmann, like many constructionists,

meaning making is primarily an epistemological pursuit: 'the phenomenological analysis of everyday life or rather the subjective experience of everyday life refrains from any casual or generic hypothesis as well as assertions about the ontological status of the phenomena analysed' (Berger & Luckmann, 1966, p. 34). For some, there is a real scepticism of the 'real', and Schwandt (2000) contends that for Gergen, at least in his earlier work (1985, 1994, 1995), Potter (1996) and Denzin (1997), constructionism takes no position on ontology in that 'constructionism neither affirms nor denies the "world out there"' (p. 198). In more recent work, however, others such as Elder-Vass (2013) reconcile realism and social constructionism.

While for some constructionism may very well be primarily an epistemological endeavour, others focus upon its ontological considerations (see Cunliffe, 2011; and Shotter, 2010 for a discussion of ontology and constructionism). In my own research on stigma and work (e.g. dirty work) and how individuals construct and make sense of their identities, I have felt compelled to recognize power and material effects (e.g. lack of job security, low pay, abuse) through which the everyday experiences of, for example, exotic dancers and other sex workers are often marked (e.g. Grandy, 2008; Grandy & Mavin, 2012, 2014; Mavin & Grandy, 2013). Similarly, in my work with Sharon Mavin on the experiences of women leaders and how they come to understand and construct meanings of their relations with other women, we have been motivated to better understand the lack of women's representation in senior leadership, the micro violence women leaders experience and the power dynamics that perpetuate these material effects (e.g. Mavin & Grandy, 2016a, 2016b; Mavin et al., 2014). In doing so, such a constructionism approach surfaces ontological assumptions aligned with realism. Further, I would argue that 'meaning making is an "ongoing accomplishment"' (Crotty, 2003, p. 47) and this implies a processual nature of 'reality' and a becoming ontology.

There are other constructionists who are also explicit about their ontological assumptions. For example, Hosking's (2011) conceptualization of relational constructionism accounts for the ontological and power dynamics inherent in constructionism, with the former tied to what I would consider both relational and processual notions of being. Also, in my work with Martyna Śliwa on contemplative leadership we illustrate how social constructionism with a relational ontology can unfold in empirical qualitative research (see Grandy & Śliwa, 2015).

Working through the dialectics of relativism, realism and processual dynamics of 'reality' can often be tricky for the novice qualitative researcher. I recall vividly from my PhD defence when the external examiner, whose own work was informed by constructionism, asked me about my ontological assumptions. Specifically, he was interested in how my understanding of constructionism aligned with my use of the term 'capture', a term used throughout my thesis. We talked through how 'capture' implies a static state whereby reality is out there for us to discover. A camera 'captures' a particular snapshot in time or truth, but my claims to meaning making as fluid, dynamic and re-negotiated contradicted that such static truths could be discovered. In sum, rather than view constructionism as an epistemological stance, following Lincoln and Guba (2000) I understand it as a research paradigm underpinned by particular ontological, epistemological, theoretical and methodological assumptions.

INTERSUBJECTIVITY, CO-CONSTRUCTION AND REFLEXIVITY

Relational constructionism brings to the forefront interrelationships, the dialogical nature of relationships and the dialectics of self, self-in-relation to others and our surroundings (Cunliffe, 2011). Relational constructionism

does not necessarily mean the research is intersubjective, but I contend that it is through such an interpretation of constructionism that the striking significance of intersubjectivity can play out for some. Social realities are always re-produced in human interaction (Berger & Luckmann, 1966). Intersubjectivity appreciates how meaning is constructed in relation *to* others and in relation *with* others in the cultural, historical and political structures and systems in which we 'interact'. Cunliffe (2011, p. 658) notes, 'intersubjectivity does not just emphasize the "we" but also embedded and embodied interrelated experiences and in situ meanings (Cunliffe, 2003, 2008), which shift as we move through conversations over time and people (durability and meanings)'. For me, intersubjectivity also considers the self as subjective in that the individual's lived, embodied and reflective experiences are integral to meaning making, which occurs in relation to and with others, thereby implying there will never be completely shared meanings.

My understanding (and articulation) of constructionism as it relates to intersubjectivity has evolved over time, partly in response to reviewers' requests to explain how 'relational' could be about more than 'interaction between' individuals. In a recent piece (Mavin & Grandy, 2016a) we propose a theory of abject appearance to explain women leaders' embodied identity work within a context of intra-gender relations. This theory was developed through an iterative process of data collection, analysis and theory stemming from interviews with 81 leaders, as well as reflective notes and conversations with the research assistants involved and between us as co-authors. Part-way through the journal-reviewing process, we were challenged by a reviewer to clarify what we meant by 'in relations with other women', 'women leaders' and 'social relations'. For us, the accounts of women leaders where they talked about their own experiences without making reference to an 'interaction' with another person (e.g. 'projects of the self', p. 8) informed our theorizing about women leaders, women leaders' relations with other women, and women's leadership.

In revising our work, we came to a particular reading of intersubjectivity that allowed us to deliberate on the complexity of intersubjectivity and view the relational as that which entails the subjective self, self-in-relation to others, and self-in-relation to ‘particular historical and social contexts’ (Mavin et al., 2014, p. 444).

Following Cunliffe and Erikson (2011), we take a relational approach, placing emphasis on social constructions of organizing. We draw upon an intersubjective view of the world where meaning is shaped by one’s experiences and is socially mediated (Anderson, 2008). It is ‘a way of thinking about who leaders are in relation to others within the complexity of experience’ (Cunliffe and Erikson, 2011: 1434). An intersubjective approach provides a bridge between the personal and the shared, the self and the Other to interpret meanings of social and cultural life. We understand women’s intra-gender relations as a way of being in-relation-to other women. ... This means that even when talking of projects of the self this involves intersubjective recognition (Harding et al., 2013). For example, participants sometimes construct projects of the self and reflect on their own identities, as well as construct themselves in-relation-to other women, and in-relation-to men. In our analysis, we include diverse accounts to recognize the ‘entwined nature of our relationships with others’ (Cunliffe and Erikson, 2011: 1434): accounts of women leaders’ in-relation-to men; accounts of self-in-relation-to women and to men; and accounts of, and reflections on, their own experiences offered for other women. (Mavin & Grandy, 2016a, p. 8)

The Researcher as Co-constructor

My understanding of constructionism is one where the researcher is also the researched, and where the subjectivity of the researcher is something to be embraced, not controlled for or eliminated. We ‘are not detached from the social worlds’ we ‘seek to understand’ (Weinberg, 2014, p. 19). In this way, ‘intersubjectivity in qualitative research is the co-constructed encounter between interviewer and interviewee during which each negotiates meaning and identity (Rapley, 2001), since “selves” are actualized in relational contexts (Pezalla, Pettigrew & Miller-Day, 2012)’ (Probst, 2016, p. 3).

We each bring to our research our opinions, values, stories and reflections and ‘all that I can really do – like any other social investigator – is to listen to what my “subjects” have to say and attempt to make a “reading” of their words in light of my own theoretical predispositions and concerns’ (Watson, 1998, p. 140). This is not to say that a qualitative researcher’s involvement in meaning making (in the co-construction of meaning) is something that should be taken for granted by qualitative researchers or that qualitative researchers have an open licence to do whatever they want without considering the implications for research design and rigour. Just the opposite, I contend that qualitative researchers adopting a constructionism approach have a responsibility to write themselves into the research in a way that is transparent, thorough and reflexive. In Corlett and Mavin’s chapter on reflexivity for this handbook, they also delve deeper into how such reflexivity plays out in qualitative research.

In some qualitative research, this notion of researcher as co-constructor manifests in ways where dialogics are more fully recognized and the relationship between ‘participant’ and researcher becomes an opportunity for participant-reflexivity. ‘Reflexivity is driven in conversation’ (Holton & Grandy, 2016, p. 375) and the ‘interaction’ between researcher and participant (through observation, interviews, ethnography, videos) is a relational setting where participants can take ‘time out’ from the mundane of their everyday working lives, retrospectively make sense of experiences, self-reflect and possibly unsettle engrained ways of thinking and doing (Holton & Grandy, 2016; McCann et al., 2008). Corlett (2013) offers the notion ‘participant-focused reflexivity’ to explain the process through which a participant, in interaction with someone or something, experiences an arresting, sticky (Riach, 2009) or striking (Cunliffe, 2002) moment. In a research context, the interview itself or any research ‘encounter’ can serve to trigger a questioning of a participant’s thoughts and actions, and everyday workplace experiences. It can lead to new insights for participants and

ways of thinking, being and doing (Corlett, 2013; Cunliffe, 2002; Hibbert et al., 2010; Holton & Grandy, 2016).

In her qualitative study with public sector professionals, Corlett (2013) suggests that management learning is a reflexive and dialogic practice. She suggests that through researcher–participant engagement, the research process can serve as a dialogic process of learning. She adopts a relational social constructionist approach where the researcher is recognized as co-constructor in meaning making. Through interviews with the researcher, there is a ‘telling, re-telling and recalling of experiences’ and ‘participants are struck and engage in critical self-reflexivity’ (Corlett, 2013, p. 454). Corlett (2013) proposes six phases through which research as a dialogic practice might unfold (storying experience, making meaning, creating order, engagement in critical self-reflexivity, become aware of and change use of language, becoming otherwise). In Corlett’s study, the researcher as co-constructor is central to her understanding of constructionism, data analysis and theory development. Another example of the possibilities of participant-focused reflexivity and co-construction in qualitative research can be seen in my work with Judith Holton, where we explored the experiences of middle managers in healthcare to empirically develop the concept of voiced inner dialogue (VID). In that qualitative study, we describe VID as a type of reflection-on-action and that participants’ VID was triggered in dialogic conversation with the researchers (See Holton & Grandy, 2016).

AN ILLUSTRATIVE EXAMPLE. THEORIZING IDENTITY AT WORK: EXOTIC DANCING AS A SITE FOR ORGANIZATIONAL AND OCCUPATIONAL RESEARCH

Journal word restrictions mean that empirical qualitative research publications typically only scratch the surface regarding the philosophical

assumptions of the research. It is therefore particularly difficult for the author to write about, or for the reader to see, the ontological, epistemological, theoretical and methodological assumptions that underpin constructionist qualitative research in business and management studies. To further elaborate on how viewing constructionism as a research paradigm might play out in ontological, epistemological, theoretical and methodological terms, in what follows I provide an illustrative example using my PhD work.

For my doctoral work I was interested in theorizing identity at work and looked to an ‘extreme case’ (Kreiner et al., 2009), namely exotic dancing as dirty work, because I expected the everyday experiences surrounding the complexity of identity construction to be particularly raw. I anticipated that such complexity would offer vivid and novel insights transferable to broader understandings of identity and work. My research question was, how does the subjective individual make sense of her work-based identity? I described my philosophical assumptions in this way:

As described by Burrell and Morgan (1979) and Denzin and Lincoln (2000), social constructivism adopts a relativist ontology through which local and specific, multiple, constructed realities emerge. At the same time, by acknowledging the specific historical, cultural and political contexts through which these realities are constructed I adopted a position that also takes into account the material effects produced by these specificities (e.g., stigma). Who we are is not just ideological, there are also material conditions which envelope our sense of selves (Alvesson and Skoldberg, 2000). In particular, my exploration into sex work / dirty work makes me sensitive to the experiences or outcomes (whatever form they might take) of such work for the participants involved in this study (e.g., job insecurity, withdrawal, violence). Social constructivism is seen to envelope relativism through multiple, negotiated meanings (Lincoln and Guba, 2000), realism through consideration of material effects (Alvesson and Skoldberg, 2000) and movement through ongoing processes of human thoughts, action and interaction. (Chia, 1996). (Grandy, 2006: 107/108)

Undoubtedly, qualitative researchers will also be interested in how ontological and

epistemological considerations, as they relate to constructionism, play out in theoretical and methodological ways. Again, drawing from my PhD work, where I made these connections explicit, theoretically, for that work I fused several streams of literature, including emotion work/management, dirty work and identity. Transparency around how the ontological and epistemological assumptions of one's perspective of constructionism interconnect with theoretical assumptions is important. Below, I offer an example to illustrate the interconnectedness of ontology, epistemology and theory in qualitative research in business and management.

This view of social constructivism also influenced my theoretical approach to this topic. In fusing emotion work and identity, dirty work and identity, and identity regulation as a form of organizational control, and social identity I created space for understanding how the subjective individual makes sense of their identity at work given various historical, social, cultural, and organizational resources that interact and intersect in these processes. So this was constructivism? For example, the conceptualization of identity employed in this research, that is, identity as processual, multiple, contradictory and coupled to our broader lived experiences, is aligned with the relativism, realism and fluidity described above in social constructivism. Moreover, my understanding of emotion as a lived, interactional experience within biological, cultural and social spheres accounts for the interplay between agency and structure similar to the underpinnings of social constructivism. In understanding agency as the struggles in which an individual engages, consciously or otherwise, in choosing to live a particular way (Brewis, 2004), I draw out the subjective individual in emotion work. Furthermore, in exploring exotic dancers' experiences through a dirty work lens and linking it to identity regulation as a form of organization control, I also illuminated the historical and institutional forces that play a role in the co-construction of identity at work for the participants with which I interacted. Overall, the subjective individual was given space to emerge while also considering the interplay with various social, historical and cultural resources in meaning making. (Grandy, 2006, p. 110)

What might such philosophical assumptions mean then for methodology and methods in qualitative research? Constructionism aligns

well with a diverse range of methodologies and methods (see Charreire-Petit & Huault, 2008, for a discussion of the alignment between epistemology and methods as it relates to constructivist research on organizational knowledge). For my PhD research, I adopted what I referred to as the research 'strategies' of ethnography and case study and employed a range of what might be referred to as qualitative methods and 'data', including participant observation, diaries, semi-structured formal and informal interviews, and archival data. The excerpt below highlights how my constructionist assumptions of processual meaning making and meaning making for self in relation-to-others surface through my decision, and approach to, semi-structured interviews.

The intent was to explore if and how individuals engaged in identity work through talking about their work (Watson, 1998). Adopting Watson's (1998:141) view that we come to understand who we are to ourselves and others through interaction and engagement with others, as well as through 'on-going achievement of conversations which go on "in our minds"', I felt interviews conducted in a flexible, informal manner would be a suitable way through which to prompt and re-present how these individuals engage in a simultaneous process of talking and becoming. ...By this, I do not mean that I intended to 'produce' more objective accounts simply that this style of interviewing allowed more room to interpret how meanings were continually being re-constructed throughout the conversations (Mason, 2002). A semi-structured interview guide was used to facilitate this process. (Grandy, 2006, pp. 119–20)

As noted earlier in the chapter, it is important that researchers acknowledge their role in the co-construction of meaning. As an example of the needed transparency around the inseparability between researcher and participants, in my PhD thesis I described my role as co-constructor of meaning. What follows is more a reflective, rather than reflexive, account of this.

As I tell this story, I am not presenting myself as a neutral party presenting 'facts' about work-based identity. As argued by Richardson (2000), I see myself as part of the research process, fully

engaged in constructing, negotiating and struggling with the contradictions and tensions of trying to 'hear' the voices of individuals, while simultaneously co-creating the realities that I present. In effect, I am making sense of how others make sense of their identity construction, or as put by Thomas and Davies (2005:688), my 'interpretations are ... a construction of the construction made by the actors studied. I am not concerned with locating the 'truth' about work-based identity. My concern is in understanding a set of truths that are co-created by those I meet throughout this research and myself. (Grandy, 2006, p. 6)

Through my conversations and engagement with participants I co-constructed and re-presented their identity at work stories as partial, retrospective accounts of their experiences, intertwined with my own lived experiences (e.g., gender, culture, age, education) (Alvesson and Deetz, 2000; Tsoukas and Chia, 2002; Watson, 1998). (Grandy, 2006, p. 109)

My comfort (and at times discomfort) with the fluid and contradictory nature of my own work-based identity construction explains how I interpreted the stories of participants in the way I did. Their struggles and the multiple, contradictory nature of their identity work were particularly salient to me because of my own lived experiences. At the same time, the multiple methods employed in the research does, however, increase the trustworthiness of the discussions offered in the thesis and address criticisms of relativism. (Grandy, 2006, p. 110)

In later work published from the PhD thesis, I further developed my reflexivity, partly in response to reviewers who challenged my co-author and me to engage on a deeper level about our subjectivity and co-construction (see Mavin & Grandy, 2013; Mavin & Grandy, 2016a, 2016b).

CONCLUSION

The many 'versions' of constructionism make it impossible to write a chapter to serve as *the* definitive reference source on it. This chapter delineates *some* of the key considerations relevant for qualitative researchers, particularly those who might be new to constructionism in business and management and perhaps those who come to constructionism with limited experience with research philosophy.

Indeed, there are many other questions that may intrigue readers. For example, for those interested in unpacking differences in how constructionism can be used to answer macro versus micro level questions, the work of Burr (2015) and Cunliffe (2008) will be useful resources. Readers may want to refer to Berger & Luckmann (1966) or Gergen (2015) for a fuller discussion of language and constructionism conceptually, or Samra-Fredericks (2008) for an overview on language and discourse as it relates to constructionism in organizational studies. Other areas in which readers may have an interest relate to recent debates within organization studies on the convergence (or not) of constructionism and critical realism (e.g. Al-Amoudi & Willmott, 2011; Newton et al., 2011).⁴

In preparing to write this chapter, I reflected on the questions that I grappled with during and beyond my PhD research. It has been an interesting writing process to retrospectively reflect on and identify what I think were my most significant struggles more than 10 years ago when I was writing up my thesis. Some of the questions, conversations and reflections that surfaced throughout my writing contemplations were arresting and vibrant memories, while others emerged gradually as I progressed in my writing. This is *my* construction of constructionism for qualitative researchers in business and management, a version that I hope offers valuable insights to constructionist qualitative researchers.

Notes

- 1 I would like to thank Cathy Cassell and Ann Cunliffe for their helpful feedback on an earlier version of this chapter.
- 2 Or perhaps, better put by Berger and Luckmann (1966), seemingly real or objectivized social realities, based on stable interactions.
- 3 See also Harris and Graham (1994) for a discussion of three constructivist paradigms, namely endogenous, exogenous and dialectical.
- 4 Much of the work on critical realism and constructionism is conceptual and not empirical.

Hermeneutics: Interpretation, Understanding and Sense-making

Leah Tomkins and Virginia Eatough

Hermeneutics is concerned with 'the real experience that thinking is'. (Gadamer, 1989: xxxiii)

INTRODUCTION

In general terms, the field of hermeneutics has two main branches: one concerned with the activities of interpretation, the other concerned with the philosophy of understanding (Palmer, 1969). The first of these addresses the practical issue of how to interpret text; the second is more abstract and conceptual, and explores questions such as what we mean by understanding, and how understanding comes about. The first tends to generate rules and standards; the second tries to articulate principles rather than procedures. Therefore, the first exerts a direct influence on methodology; the second exerts a more indirect influence on methodology. Although many discussions of hermeneutics use these two notions of interpretation and understanding interchangeably, we attempt to

maintain a distinction between them to enable the implications of this difference to emerge.

Many of the central motifs of hermeneutics can be traced to classical antiquity, and to ancient Greek philosophy, in particular. For instance, the idea of a hermeneutic circle owes much to Plato's theory of recollection, that is, that we learn about the unknown only by recognising its relationship with something already known. For many readers, however, the origins of hermeneutics are probably more closely associated with biblical exegesis, especially the interpretation of the sacred texts of Judaism and Christianity. For biblical hermeneutics, the challenge is to try to make sense of religious texts despite being distanced from their original meaning, inspiration and reception by hundreds, if not thousands, of years (Jasper, 2004).

The issue of historical distance is worth dwelling on for a moment. Although biblical hermeneutics is concerned with the chronological gap between the reader and the originator of the gospel, this is not the way the concept of 'historical' is normally used in

the hermeneutics of the human and social sciences. Here, the idea of historicity does not mean that something belongs to the past. Instead, it means being part of history, that is, situated in a certain time and place, and having one's way of seeing the world influenced by such grounding in very profound ways. In the sections that follow, history-as-context is woven into the very act of interpretation and the very possibility of understanding.

HERMENEUTIC CIRCLES: THE 'HOW' OF INTERPRETATION AND UNDERSTANDING

One of the most appealing ideas in hermeneutics is that of the hermeneutic circle. The circle is a simple yet powerful symbol, usually taken to signal a move away from linear towards more iterative, integrative thinking. The circle emphasises understanding as relational and referential; we understand something by connecting it with something we already know, whether through comparison, contrast or juxtaposition. There is no single definition of this circle in the hermeneutic corpus; that is, no such thing as *the* hermeneutic circle. Instead, different theorists work with circles to emphasise their own particular interests and concerns.

Whole and Parts

Schleiermacher, the father of modern hermeneutics (Palmer, 1969), uses the notion of the hermeneutic circle to connect whole and parts, making them mutually dependent and co-constitutive. The whole can only be understood as it relates to the parts, and vice versa, the parts can only be understood as they relate to the whole. He explains, for instance, that

the vocabulary and the history of the era of an author relate as the whole from which his writings must be understood as the part, and the whole must, in turn, be understood from the part. Complete knowledge is always in this apparent circle, that each particular can only be understood

via the general, of which it is a part, and vice versa (Schleiermacher, 1998, p. 24).

There are several points of interest in Schleiermacher's words here. Not only is he connecting whole and parts, he is also suggesting that the whole relates to the whole context – culture, customs, discourse, conventions and personal circumstances, etc. – from which the author of the text is writing. Context here is no mere backdrop or scene-setting, it is an integral aspect of hermeneutic understanding. The specific text created by the author – the part – is not just influenced by context, it is constituted by that context. And vice versa, the context is constituted by the production of that text. Hermeneutic experience is therefore inseparable from the cultural and discursive setting in which – and from which – it emerges. Indeed, we need only to consider the common etymology of 'text' and 'context' to see this interweaving.

Moreover, Schleiermacher is also suggesting an important relationship between the general and the particular by relating whole to general and part to particular (there is an obvious etymological connection between 'part' and 'particular'). Schleiermacher elaborates this relationship thus:

the whole is provisionally to be understood as an individual of a genus, and the intuition of the genus, i.e., the formal understanding of the whole, must precede the material understanding of the particular. One can admittedly also only come in the first place to the knowledge of a genus via knowledge of an individual case which belongs under it (Schleiermacher, 1998, p. 232).

This casts an interesting light on the hermeneutic relationship between the specific understanding of an individual case and the broader understanding of the category (genus) into which the case appears to fit. It suggests that, for Schleiermacher, general and particular (or nomothetic and idiographic, as we might think of these things in methodological terms) are not 'either/or' approaches, but instead, they are intimately interrelated; we cannot have one without the other. Relatedly, if inductive approaches are seen as the route from the particular to

the universal, and deductive approaches are the route from the universal to the particular, Schleiermacher's hermeneutic circle encourages us to see these as mutually dependent and co-constitutive. Together, not separately, they fuel hermeneutic interpretation.

So, Schleiermacher's work presents several aspects of hermeneutic circling; interpretation involves a mutually referential and productive relationship between whole and parts, and between the general and the particular. These operate at a number of different levels; for instance, whole can refer to the whole setting of a text's production, to a whole work and to a whole sentence, whilst the concomitant parts refer to a specific work, a specific passage within a work and a specific word within the sentence, respectively. Thus, whenever we consider any particular thing, we should also reflect on the whole – the general thing – to which this particular part belongs. And vice versa, whenever we consider what type of thing we are dealing with, i.e. when we find ourselves putting some sort of label on it, we should also reflect on how our appreciation of that category is brought about by our exposure to specific instances of it. For instance, we know what rain is because of our experiences of actual rainy days; and vice versa, we understand the implications of rainy days because of our more general grasp of what rain is.

Although often seen as conservative, even old-fashioned, Schleiermacher's writings have profound implications for how we see the research endeavour. His hermeneutic circling encourages us away from the confines of the bounded categories to which we have been accustomed – idiographic versus nomothetic and inductive versus deductive. It challenges us to re-think some of our normal conceptions of intellectual inquiry and to question the taken-for-granted assumptions that guide it.

Pre-understanding, Understanding and the Circularity of Being

Moving on to Heidegger (1962), we see the notion of hermeneutic circling used differently

Box 12.1 Hermeneutics in Action

The idea of a co-constitutive relationship between 'text' and 'context' is a core feature of organisational and management research which draws on the hermeneutic tradition, irrespective of whether this is in the Schleiermacher mould or the framing of more recent, critical hermeneuticists such as Ricoeur or Habermas. For instance, Lee's (1994) analysis of email communication examines relationships between the text of individual message fragments and the broader culture and practice of corporate information exchange. Prasad and Mir (2002) present a hermeneutic analysis of CEO correspondence to shareholders as both reflecting and constituting the political and economic context of the global oil industry in the 1970s and 1980s. Genoe McLaren and Helms Mills (2010) examine the problematic relationship between the management textbook as 'text' and the contextual influence of feminism and the civil rights movement on our understandings of management. In these papers, the specific text takes on a particular complexion within the broader institutional and political context; and vice versa, that broader context comes alive through the prism of the specific text.

and more radically. Heidegger shifts the emphasis away from what takes place *within* understanding – and from relatively concrete and practical concerns about whole and parts – towards the question of how any sort of understanding is possible in the first place. Heidegger's philosophy marks a decisive shift in the hermeneutic tradition from the procedural to the existential – from method to ontology.

In Heidegger's view, before we come to understand anything explicitly we already have a pre-conception or pre-supposition of it – a fore-having (*Vorhabe*). This fore-having conditions and is conditioned by any fore-sight (*Vorsicht*) and fore-conception (*Vorgriff*) that we may have in perceptual or cognitive experience. As Heidegger explains,

an interpretation is never a presuppositionless apprehending of something presented to us. If, when one is engaged in a particular concrete kind of interpretation, in the sense of exact textual interpretation, one likes to appeal to what 'stands there', then one finds that what 'stands there' in

the first instance is nothing other than the obvious un-discussed assumption of the person who does the interpreting (Heidegger, 1962, pp. 191–2).

Thus, Heidegger's most procedurally orientated definition of hermeneutic circling involves manoeuvring between pre-understanding and understanding, between our assumptions about, and our actual encounter with, a text. This means surfacing, interrogating and revising one's pre-conceptions and assumptions as one gathers more information about the object or phenomenon of inquiry.

As Gallagher (1992) suggests, there are useful parallels between this version of Heidegger's hermeneutic circle and the concept of schemata from cognitive and developmental psychology, and the work of Piaget in particular. The concept of schemata holds that our knowledge is organised into patterns and structures which we access and use in the acquisition of new knowledge; we draw on processes of assimilation to incorporate new information when it fits easily with our existing schemata, and processes of accommodation to alter these schemata when new information challenges our existing patterns of thinking. A Heideggerian *Vorhabe* is a schema involving a set of predictions – not fully or consciously formalised – about the object or phenomenon of inquiry, which are either confirmed or challenged in the process of interpretation.

Hermeneutic circling appears in several guises in Heidegger's work, perhaps most significantly in his reflections on the circular structure of *Dasein* or the philosophical question of Being. The circularity of *Dasein* illustrates the notion of historicity that we trailed in our introduction. Our nature as historical beings involves three interwoven qualities of engagement with the world, namely *Verstehen* (understanding), *Befindlichkeit* (attunement) and *Verfallen* (absorption), and their corresponding temporal emphases of future, past (having been) and present. Our lives have a forward thrust because our pre-understandings fuel our understandings (*Verstehen*). They are inextricably infused

with the conventions and patterns of thinking that have been handed down to us in tradition (*Befindlichkeit*), and with which we are now concerned in our day-to-day relations with others (*Verfallen*). Our lives have meaning precisely within this triple-aspect temporal context. As human beings, we cannot *but* interpret what it means to exist within our particular setting, with our particular heritage and with our own ongoing possibilities to make sense of our lives.

So, with Heidegger's circles we have a primordial relationship between pre-understanding and understanding, and a view of human existence as inextricably relational, worldly, temporal and historical. Heidegger's circles are less obviously useful from a methodological perspective, perhaps, but then his aim was a philosophical exploration of how understanding is possible, rather than a normative project of what steps to follow to unpack a text. In a sense, the shift from Schleiermacher to Heidegger is a shift from the search for meaning of a text-in-context to the quest for meaning of a life-in-context.

Anticipation and Encounter

Gadamer (1989) develops the theme of temporality to reveal Schleiermacher's and Heidegger's circles as mutually illuminating, rather than contradictory. For Gadamer, hermeneutic circling is a process whereby 'the anticipation of meaning in which the whole is envisaged becomes actual understanding when the parts that are determined by the whole themselves also determine this whole' (Gadamer, 1989: 291). Thus, Schleiermacher's whole and Heidegger's pre-understandings are connected by a temporal sense of anticipation; we anticipate the whole and we encounter the part. In Gadamer's view, the most foundational of hermeneutic elements is the interpreter's pre-understanding (like Heidegger), which comes from being concerned with the same subject or genus (like Schleiermacher). We have an assumption (whether or not it is explicitly articulated) that we know roughly what we are

dealing with when we approach a text, that is, what category of thing it concerns.

This assumption that we basically know what we are dealing with gives us a sort of confidence. Indeed, our anticipation with any textual encounter is that we will be able to make sense of it, and that we can rely on the text being coherent (we will look at what happens when this expectation is dashed in the next section). This anticipation of intelligibility comes from the way in which author and interpreter are connected in a shared tradition, in a community of understanding. As Gadamer (1989: 292) sees it, 'the task of hermeneutics is to clarify this miracle of understanding, which is not a mysterious communion of souls, but sharing in a common meaning'. When we approach a text, we assume that the world of the interpretation of a text (our world) is connected with the world of the production of the text – whether this connection is across the passage of time, as with ancient texts, or across any differences that arise just because author and interpreter are separate human beings with different perspectives, as with contemporaneous texts. The space between author and interpreter is not a gap, but a bridge.

With Gadamer, therefore, we move from the meaning of a text-in-context and a focus on the text's originator (as per Schleiermacher), through the understanding of a life-in-context and a focus on the person living, i.e. interpreting that life (as with Heidegger), to an emphasis on what happens to connect these, that is, to the space in-between. Gadamer famously calls this a 'fusion of horizons', whereby

one intends to understand the text itself. But this means that the interpreter's own thoughts too have gone into re-awakening the text's meaning ... I have described this as a 'fusion of horizons' ... this is what takes place in conversation, in which something is expressed that is not only mine or my author's, but common (Gadamer, 1989, p. 390).

Gadamer's hermeneutic circling expresses a fundamental intersubjectivity and sociality of understanding.

So, we have seen several hermeneutic circles in this introduction to Schleiermacher,

Heidegger and Gadamer, some with more practical implications for interpretation than others. In the next sections, further aspects of hermeneutic circling will emerge in the work of both these and other theorists in the tradition, underscoring the claim that the circularity of understanding is the most fundamental of all hermeneutic principles (Gallagher, 1992; Palmer, 1969). The hermeneutic circle is not like a clock, with fixed and mutually exclusive points around a rigid circumference, which make it impossible, say, for it to be both 3 p.m. and 8 p.m. simultaneously. Instead, it is an expansive and productive way of thinking about the constitutive relationships between things, steering us away from abstract, 'either/or' thinking which strips human phenomena of contextual richness. The more circular our movements in interpretation, the larger the circle will become, embracing more contexts, more perspectives and more possibilities of understanding.

MEANING, SIGNIFICANCE AND SENSE: THE 'WHAT' OF INTERPRETATION AND UNDERSTANDING

In the previous section, we sketched out various versions of the hermeneutic circle in terms of different emphases in the quest for meaning. We suggested that Schleiermacher's quest is first and foremost for the meaning of a text-in-context; that Heidegger's project is the meaning of a life-in-context; and that Gadamer explores the ways in which both, indeed all, sorts of meaning are only possible because of our embeddedness in shared traditions which allow for continuity and development of understanding. In their various ways, these philosophers see the search for meaning, whether textual or existential, as a living process that is only possible from *within* the world of ideas, objects, debates, possibilities and challenges. Despite their different emphases, they all propose that understanding can never come from nowhere. Even if it feels like a sort

of Eureka moment of sudden insight, the ground has always already been prepared, and its potential significance always already traced. Thus, meaning is contextually and historically constructed, discovered, absorbed and resisted.

What Is Meaning?

Despite the centrality of the notion of meaning in hermeneutics, there is no straightforward definition or agreement over its status beyond this shared emphasis on context and historicity. The meaning of any given text lies in a web of influences and factors, including: the intentions, motivations and style of the author; the grammatical construction and genre of the text itself; and the interests, assumptions and concerns of the interpreter. All these factors are in play irrespective of whether author and interpreter are separated by hundreds of years or are contemporaneous but separated by their individual subjectivities. Within such a complex web, different theorists emphasise different elements, resulting in vibrant debate about what we mean by 'meaning'.

The hermeneutic debate over the status of meaning is usually expressed as the question of reproduction. If the original meaning of a text is reproducible, as Schleiermacher would insist, then this implies that meaning has a sort of objectivity; that is, there is a true or essential meaning latent in the text, waiting to be uncovered if the interpreter uses the right tools and works with appropriate rigour. The notion of objectivity here is not the same as that found in the natural sciences, i.e. it is not about absolute, universal, a-historical fact. Rather, objectivity here means not arbitrary. There are criteria for establishing the greater accuracy or validity of some interpretations over others, the most crucial of which is an interpretation's correspondence with the author's intention. Thus, interpretive work in the Schleiermacher mould involves re-living the author's intuition and inspiration in order to recreate what he or she intended to impart, trying to feel the connections between the author's thoughts and

words at something close to first-hand. This approach sees interpretation as an inversion of the creative process; if creation moves from inspiration to finished product, interpretation moves in the opposite direction, from finished product back to its inspiration. Thus, interpretation is a restorative process which returns and reconnects the author's words 'to their source in the interior life which gave them birth, from which they have become detached' (Betti, 1987: 248).

For Schleiermacher, the aim of hermeneutics was indeed to work back towards the true meaning of a text and the interior life that gave birth to it. His ambition was to rediscover how early Christianity appeared to those receiving the oral gospel in its original setting, and he argued that we must peel away the layers of misunderstanding that have built up over time, preventing us from connecting with the gospel in its originary life force. A striking suggestion in Schleiermacher's thesis is that it might be possible to transpose oneself into the original lived experience so successfully that insights *beyond* the original author's conscious intention emerge. As he explains, 'the goal of hermeneutics is understanding in the highest sense ... to this also belongs understanding the writer better than he understands himself' (Schleiermacher, 1998: 228). In this view, meaning is not only recoverable and reproducible; it is something that might shine more brightly for the interpreter than for the author.

Schleiermacher's emphasis on the reproduction of meaning is challenged by Gadamer. Gadamer resists the proposition that we can get inside the original experience to recapture the author's intentions and inspirations. For Gadamer, hermeneutic understanding is more about production than reproduction, that is, its power lies in its ability to create, not simply restore, meaning: 'Understanding is always more than merely re-creating someone else's meaning. Questioning opens up possibilities of meaning, and thus what is meaningful passes into one's own thinking on the subject' (Gadamer, 1989: 368). Here, understanding

is not the recovery of the past or the recreation of another person's experience, so much as mediation or dialogue between our sense of ourselves and our sense of the author and his/her worldview. This creates the possibility of expanding our range of understanding and thereby changing ourselves and our outlook; that is, of 'being transformed into a communion in which we do not remain what we were' (Gadamer, 1989: 371).

Returning to Gadamer's 'fusion of horizons', the path towards understanding lies not in merging the perspectives of author and interpreter but, rather, in connecting them but acknowledging them as different. This is why Gadamer denies Schleiermacher's claim that hermeneutic interpretation might mean understanding the author better than he/she understands him/herself. As Gadamer argues,

perhaps it is not correct to refer to this productive element in understanding as 'better understanding' ... Understanding is not, in fact, understanding better, either in the sense of superior knowledge of the subject because of clearer ideas, or in the sense of fundamental superiority of conscious over unconscious production. It is enough to say that we understand in a different way, if we understand at all (Gadamer, 1989, p. 296).

Meaning and Significance

A useful way of framing the debate between Schleiermacher's focus on reproduction and Gadamer's emphasis on production is by differentiating between meaning and significance. Meaning is quasi-objective, embedded in the text and interwoven with the factors influencing the text's original production. Significance, on the other hand, belongs more to the life-world of the interpreter, and is imbued with the contextual influences of the text's interpretation. In this definition, meaning is said to be unchanging (if not always accessible), whereas significance changes according to the circumstances of the interpreter. Thus, different interpreters could derive different kinds of significance from a text with a putative single meaning.

Box 12.2 Hermeneutics in Action

The question of reproduction of meaning marks one of the main dividing lines between researchers drawing on different strands in the hermeneutic tradition. As we will see later, most contemporary research in organisation and management directs its focus away from authorial intention, especially research with an explicitly 'critical' emphasis. However, Schleiermacher's interest in authorial intention finds a contemporary expression in hermeneutic research in psychology which explores the subjective, lived experience of a particular organisational or work-based phenomenon. Examples of work in this genre include Gill's (2013) hermeneutic analysis of the emotional experience of status anxiety amongst management consultants, and Cope's (2011) work on the insider experience of entrepreneurial failure. Both these papers use Interpretative Phenomenological Analysis (IPA) (Smith et al., 2009) - a hermeneutic method which is heavily indebted to Schleiermacher. With this method, there is assumed to be a reasonably direct connection between what the author of a text, i.e. the research participant, says and what he or she actually means, feels or intends. The job of the interpreter is to try to feel one's way into the author's experience and explore these connections between words and intentions at something close to first-hand.

This is not to suggest a strict 'either/or' division between Schleiermacher's focus on original meaning and Gadamer's interest in significance. Rather, it is the relationship between the two that is important. In the Schleiermacher mould, Betti (1987) argues that meaning is the necessary pre-condition for all understanding; that is, that one cannot discern the significance of something unless one first knows its meaning. The inversion of the creative process highlighted earlier, i.e. the reconstruction of the author's original intention and inspiration, is simply not possible without the basic building block of meaning itself.

Gadamer, on the other hand, denies the possibility of tracing meaning and significance as independent entities. Understanding

does not mean that the text is given for him as something universal, that he first understands it per se, and then afterward uses it for particular

applications. Rather, the interpreter seeks no more than to understand this universal, the text. ... In order to understand that, he must not try to disregard himself and his particular hermeneutical situation. He must relate the text to this situation if he wants to understand it at all (Gadamer, 1989, p. 321).

In this view, significance rather than meaning is the inescapable pre-condition for understanding. Understanding cannot *but* take place within the interpreter's own hermeneutic horizon of significance. This is why, for Gadamer, all understanding is ultimately self-understanding.

As well as not being sufficient, meaning is not even necessary for understanding in Gadamer's work, for he sees potential significance even where there is no readily discernible meaning. The distinction between meaning and significance therefore helps to frame discussion of what happens when problems are encountered and we cannot get a handle on a text. This is an important issue, because we have an expectation – usually unconscious – when we approach a text that we will be able to make something of it. In the following sections, we explore barriers and disruptions to understanding using the notion of 'sense' as an umbrella term to encompass both constant, quasi-objective meaning – a text's sense-per-se – and contingent, reflexive significance – its sense-for-us. This allows different perspectives to emerge on what happens when sense eludes us.

Barriers to Sense: The Status of Prejudice

In a Schleiermacher-inspired quest for meaning, barriers to sense are obstacles to be overcome mostly through the application of technique:

misunderstanding is either a consequence of hastiness or of prejudice. The former is an isolated moment. The latter is a mistake which lies deeper. It is the one-sided preference for what is close to the individual's circle of ideas and the rejection of what lies outside it. In this way one explains in or

explains out what is not present in the author (Schleiermacher, 1998, p. 23).

If we do not understand what the author of a text is trying to say, this is either because of sloppiness or because we are filtering the text in terms of what is familiar to us. If we become aware of this, we should re-double our efforts to examine the text itself, perhaps drawing someone else into the interpretive endeavour in order to 'triangulate' and hence objectify our textual readings.

We saw earlier that Heidegger and Gadamer took a different view of an interpreter's pre-conceptions. Gadamer, in particular, sees anticipation of a text's meaning as a necessary condition for interpretation. In other words, without assumptions, expectations and prejudices, there is no way into the hermeneutic circle; no way of gauging or even intuiting what the text might be about. This is not to imply that one applies or deploys prejudices in a conscious decision to enter the hermeneutic circle as if from outside but, rather, that we cannot *but* have prejudices by virtue of already being in the midst of the world of ideas; that is, always involved in a cultural conversation that has already started. As Gadamer (1989: 278) explains, 'long before we understand ourselves through the processes of self-examination, we understand ourselves in a self-evident way in the family, society and state in which we live'. In this view, prejudices are not blockages to interpretation, they are its enablers. They are the very scaffolding of understanding.

The desire to rehabilitate the notion of prejudice lies behind Gadamer's charge against the Enlightenment and the scientism it inspired for their 'prejudice against prejudice itself, which denies tradition its power' (Gadamer, 1989: 273). This is not to say that Gadamer is anti-science, but, rather, that he believes the quest for scientific objectivity masks the prejudices with which all human inquiry is both necessarily and productively interwoven. The 'prejudice against prejudice' obscures the way in which even the most rigorous scientific experiment is a historical event, which

only has salience because of what has come before, what tools and techniques have been established for the purpose, and how the scientist hopes to apply his findings. Thus, for Gadamer, the hermeneutic task is not to try to rid oneself of biases and assumptions, but, instead, to acknowledge them and learn to distinguish between those that are productive and those that are non-productive. Productive prejudices help us to expand our horizons and reach out to others, in person and in text. Non-productive prejudices keep us locked in solipsism and single-mindedness.

Disruptions to Sense: Encounters with Non-Sense

So, prejudices mould our experience of a text into something more-or-less intelligible, that is, into something which is coherent in itself, but not necessarily consistent with the original meaning of the text or the intention of the author. Prejudices are more likely to be seen as a barrier to understanding if one's emphasis is on meaning, and as an enabler of understanding if one's focus is on significance. A similar pattern emerges when we turn to the question of disruptions to sense; that is, when no such intelligibility or coherence seems possible; in other words, when sense breaks down.

For hermeneutic theorists interested in meaning, the absence of sense is a problem to be resolved, that is, it is a failure of interpretation. For those more concerned with significance, on the other hand, breakdowns of sense are not only inevitable, they are constructive. Thus, Gadamer sees value in being surprised, befuddled or pulled up short by a text. Because we assume when we approach a text that we will find some sort of sense in it, we get lulled into a false sense of security which works *against* understanding. It is only when the attempt to engage with a text fails that we are jolted into having to work at understanding it. It is the shock of not understanding, not finding sense, which alerts us to the presence of our own preconceptions and the importance of placing these within

Box 12.3 Hermeneutics in Action

The hermeneutic interest in the historicity of science can be traced in several papers which problematise the professions which are assumed to be very technical, scientific and objective, e.g. accountancy, auditing and information systems. For instance, Francis (1994) draws on Gadamer to argue that 'good' auditing practice emerges not from applying objective standards and methodologies, but rather, from seeing auditing as lived experience, in which understandings of, enablers of, and barriers to 'good practice' are embedded in tradition. Llewellyn (1993) invokes Ricoeur for her analysis of accounting practice, suggesting that periods of organisational change lend themselves especially powerfully to hermeneutic reflection, because they expose the contingency of, and competing claims for, legitimacy of meaning. Klein and Myers (1999) examine the historicity of information systems strategy, suggesting that a hermeneutic approach can shed light on the crucial question of why so many IS implementations fail. In their various ways, these papers all challenge the 'prejudice against prejudice'.

a larger web of possible understandings. In short, we need disruptions to sense to trigger hermeneutic reflection (Gadamer, 1989).

From Gadamer's perspective, disruptions are valuable because they alert us to a tension between text, author and interpreter which might not lend itself to easy resolution. The task of hermeneutics is not to try to cover up this tension, but, rather, to consciously bring it out as a way of reflecting on the differences between horizons, the very fact of otherness, and the interplay between familiarity and strangeness which is essential to understanding. Thus, a further kind of hermeneutic circling emerges between what we can capture and thematise and what seems to elude such capture and thematisation. Those seeking quasi-objective meaning in the Schleiermacher tradition will engage in this circling in the hope of eventually privileging sense over non-sense, resolution over irresolution of meaning. Those interested in the contingencies and fluidities of significance in the Gadamer mould are more likely to view this circling as a way of keeping the

non-sense in play and the tensions alive; for without them, the prospects for understanding remain limited to what we already know.

MOTIVATIONS AND INTERESTS: THE 'WHY' OF INTERPRETATION AND UNDERSTANDING

In the discussion so far, we have assumed, not problematised, the historical embeddedness of text, author and interpreter. In defining both meaning and significance as accessible only from within the world of ideas, discourses and conventions, the theorists we have focused on share a concern for assimilation within tradition.

However, there is a more critical strand in hermeneutics which challenges this view from within tradition, suggesting that such an emphasis on assimilation and accommodation simply reproduces existing power relations, many of which are inimical to human flourishing. Critical hermeneutics is interested not only in the 'how' and the 'what' of sense-making, but also in the question of 'why' we engage with texts, including exposing the interests, motivations and implications of such engagement. So, in this section, we move on from the distinction between meaning and significance to approach the issue of interpretation from a different angle, namely the question of whether our basic motivation is to believe or distrust, that is, to reinforce or unsettle meaning. One way to approach this question is through the distinction between a 'hermeneutics of faith' and a 'hermeneutics of suspicion'.

Faith or Suspicion?

The importance of faith in hermeneutics owes much to its roots in biblical exegesis. Thus, a 'hermeneutics of faith' involves a fundamental motivation to believe (and suspend disbelief) in textual pronouncements, whether holy or secular. Faith motivates the kind of hermeneutics

advocated by Schleiermacher and his followers, with their reliance on methodology and intellectual self-discipline, and their relative confidence about the reproducibility of meaning. Faith also underpins Gadamer's work, with its optimism about the possibility of productive and mutual understanding. Gadamer's faith is in the connective and creative potential of human beings, rather than the enduring meaning of a text, but it is faith nonetheless.

The distinction between faith (*la foi*) and suspicion (*le soupçon*) is elaborated especially powerfully by Ricoeur (1970), although it appears in the hermeneutic canon long before his time (Jasper, 2004). Faith assumes the possibility of bringing meaning into the realm of conscious reflection, whereas suspicion aims to expose and reduce the lies and illusions of consciousness. For Ricoeur (1970: 28), the 'hermeneutics of faith' brings a kind of naïvete into the hermeneutic circle; 'believe in order to understand, understand in order to believe'. Here, Ricoeur uses the notion of faith in a similar way to Gadamer's anticipation of what a text is about, but Ricoeur nudges us to consider the motivation, not just the content, of such anticipation.

Much of Ricoeur's work concerns the interpretation of symbols, including those appearing in myths, dreams and ideological narratives; that is, he is interested in meanings as they are both concealed and revealed, both absent and present. This interest in the sense *beneath* the sense aligns Ricoeur with a 'hermeneutics of suspicion', which challenges the trustworthiness of text and urges us to reach behind surface meanings to try to tease out other hidden meanings. For Ricoeur, the task of interpretation is to expose these multiple meanings, not in order to resolve conflicts of understanding between different belief systems, but rather to highlight the contingencies, motivations and implications of their construction.

There are interesting points of connection between Ricoeur's interest in the direct and indirect meanings of symbols – the sense beneath the sense – and Gadamer's elaboration

of foregrounding. For Gadamer, foregrounding 'is always reciprocal. Whatever is being foregrounded must be foregrounded from something else, which, in turn, must be foregrounded from it. Thus all foregrounding also makes visible that from which something is foregrounded' (Gadamer, 1989: 304). Both Gadamer and Ricoeur encourage us to consider human phenomena in terms both of what they are and of what they are not. So, to our list of definitions of the hermeneutic circle, we now add circling between presence and absence.

For Ricoeur, the three foremost practitioners of suspicion are Freud, Marx and Nietzsche (Ricoeur, 1970). In their various ways, these theorists argue that meaning is not reducible to the immediate or straightforward consciousness of meaning, and they see symbol as the representation of false consciousness; that is, of distorted sense-making. For Freud, false consciousness manifests in dreams and neurotic symptoms as signs of repressed libido; for Marx, it is economic alienation and the ideological disguise of class domination; for Nietzsche, it is the apparently timeless concepts of value and reason masking hidden strategies of the Will to Power. For these three practitioners of suspicion, 'to seek meaning is no longer to spell out the consciousness of meaning, but to decipher its expressions' (Ricoeur, 1970: 33). This kind of sense-making involves cracking the codes of the systems of contemporary life, whether moral, institutional or psychological. It means being distrustful of whatever appears to us in consciousness, whether this is explicit knowledge or more tacit intuition, for *both* modes are potentially manifestations of false, not true, consciousness. In this way, the 'hermeneutics of suspicion' mounts a radical challenge to what we think we know, feel and believe; that is, to subjectivity itself.

Compliance or Emancipation?

With this emphasis on the enigma and unreliability of meaning, hermeneutics moves

towards the domain of critique and brings us to the work of Habermas. We do not have space to do justice to Habermas here; but we include him in this overview to show the development of hermeneutics towards a more political, ideological take on sense-making. With Habermas (1967), we find a radical critique of the role of tradition in shaping our understandings of both self and world. Connection or assimilation within tradition is effectively just compliance or conformity with tradition, and thereby allows ruling power structures to go unnoticed and unchallenged. Habermas criticises Gadamer for failing to recognise the way in which interpretation is distorted by compulsion and coercion. Whereas Gadamer sees misunderstanding as basically a failure of dialogue (which can be corrected and used constructively), Habermas sees misunderstanding as the result of consciously perpetrated falsities such as propaganda and political rhetoric. Whereas Gadamer sees understanding as our historical heritage, shaped by the discursive fabric of family, society and state before it becomes personal reflection, Habermas sees *misunderstanding* as our historical heritage, *distorted* by the power relations of family, society and state which need to be exposed and undermined in critical reflection.

Habermas proposes a 'depth hermeneutics' to decipher the deceptions of sense-making. This approach supplements personal reflection with 'meta-hermeneutical' explanation, which seeks to highlight sources of distortion and manipulation, such as economic status, social class and gender relations. For Habermas, every interpretation must come under suspicion for being inspired by such material relations, which shape both interpretation and understanding in ways that go beyond conscious reflection and linguistic sense-making: 'the linguistic infrastructure of a society is part of a complex that, however symbolically mediated, is also constituted by the constraint of reality ... behind the back of language' (Habermas, 1967: 361). Critical reflection is required to stand back from the

Box 12.4 Hermeneutics in Action

An interest in power, discourse, resistance and compliance has directed the majority of contemporary hermeneutic researchers of organisation and management towards the philosophies of Ricoeur and Habermas. A particular strand of this work considers organisational communication, and the way in which corporate stories and accounts both reflect and construct a particular view of events. For instance, Gopinath and Prasad (2012) use a critical hermeneutic framework to analyse accounts of Coca Cola's exit from India, suggesting that critical hermeneutics has a particular relevance in international studies where accusations of cultural insensitivity expose competing and contradictory versions of events. Gabriel (1991) invokes Ricoeur to explore the subterranean aspects of organisational culture and highlight the sense beneath the sense of our constructions of organisational life. These and other works in this critical strand of hermeneutics are uninterested in and/or suspicious of the author of a text's original intention, and focus instead on the multiple interpretations that organisational phenomena both invoke and reveal.

processes of tradition in order to evaluate the constraints to which it subjects us. The 'deep' meaning to be discovered by the critically suspicious interpreter will not only be enlightening, it will also be emancipating.

Gadamer argues that such a desire to move outside the constraints of tradition is untenable, suggesting that Habermas's concept of emancipation is as historically and contextually bound as the power relations it seeks to unmask, i.e. that it is blind to its own ideology. The notion that one could stand outside one's historical setting to conduct an ideological critique simply masks the ways in which resistance is as culturally and discursively mediated as compliance – just as revolution tends to substitute one regime for another, rather than ushering in a genuinely different way of life. As Gadamer (1989: 573) puts it, the nature of critical reflection is that 'in dissolving the old ends, it concretizes itself again in new ones. ... It would become vacuous and undialectical, I think, if it tried to think the idea of a *completed* reflection ...

so as to achieve an ultimate, free and rational self-possession'. Trying to think oneself out of the hermeneutic circling of tradition, context and relationality – whether in the service of emancipation from repression or any other purpose – 'would be like trying to step outside of our own skins' (Gallagher, 1992, p. 87).

The critical strand of hermeneutics is a good place to bring our overview of these key motifs to a conclusion, or, rather, a provisional resting point. For it is with Habermas's arguments, in particular, that we begin to see the hermeneutic circle collapse, or at least buckle significantly. We have discussed several aspects of hermeneutic circling in this chapter – whole and part; general and particular; pre-understanding and understanding; anticipation and encounter; familiarity and strangeness; sense and non-sense; belief and understanding; and presence and absence. But with Habermas's emphasis on the material factors which distort our linguistic, reflective sense-making, we need some sort of 'bird's eye view' to be able to distinguish between compliant and emancipatory understanding. Thus, it is here that the circle is no longer able to contain the experiences of understanding. It is here that we start to move away from the world of interpretation and into the domain of explanation – that fundamental distinction between hermeneutics as the universal methodology of the humanities and causal epistemology as the universal methodology for the natural sciences (Dilthey, 1958). It is here that hermeneutics confronts its own limits.

HERMENEUTIC INFLUENCES ON ORGANISATION AND MANAGEMENT STUDIES

The most concrete way in which hermeneutics has influenced organisation and management studies is by inspiring various approaches to the interpretation of text. In this context, 'text' can be something developed specifically for research purposes, such as a transcript of an

interview with a participant, or it can be something that appears more naturalistically which is then analysed for research purposes, such as a leader's public speech or an organisation's press releases. Most of the time, 'text' refers to something linguistic, whether the written or the spoken word. However, one also finds 'text' used to refer to non-linguistic phenomena, such as organisational practices. Nevertheless, the written script remains the paradigm 'text', and 'reading' is the paradigm interpretive activity.

Interpretive Methods

The results of such interpretive 'readings' can take a number of forms; that is, the content of texts can be abstracted and shaped into themes, discourses, narratives, moments, incidents, etc. It is interesting to consider how prevalent the theme has become as the basic building block of interpretive research, as evidenced by the wealth of thematic analysis techniques (Braun & Clarke, 2006). Hermeneutics invites us to reflect on whether the theme is necessarily the most appropriate foundation-stone of human inquiry. It raises the question of how we might shape and structure our interpretations in terms of values, textures or relations, or indeed by dimensions of hermeneutic circling, such as presences and absences.

The distinctions between meaning and significance and between faith and suspicion find their way into the choices we make between individual interpretive methods. For instance, one of the methods we have used, IPA (Smith et al., 2009), is a psychological approach in the Schleiermacher tradition. IPA focuses on meaning as the pre-condition of understanding, and defines its quality and validity metrics accordingly. It is basically inspired by a hermeneutics of faith, in that empathy, connection and attunement guide the interpreter towards an understanding of a particular phenomenon through the participant's eyes, encouraging a sense for the participant's intended meaning through a kind of reliving of experience.

As we have seen in this chapter, such emphasis on an author's intention and inner life-world is relatively unusual in organisation and management studies (Prasad, 2002). This is due to the field's concern for the dynamics of power and institution and its relative disinterest in first-person experience (Nord & Fox, 1999), at least until recent 'turns' to emotion and embodiment. Critical hermeneutic explorations of organisation and management are, therefore, more likely to position the interpretive endeavour as an act of suspicion than of faith (Genoe McLaren & Helms Mills, 2010; Gopinath & Prasad, 2012).

For instance, Phillips and Brown (1993) analyse corporate advertising by focusing on hermeneutic 'moments', encompassing the social-historical moment, the formal moment of the text itself and the interpretation–reinterpretation moment. The social-historical moment incorporates questions about who produced the text, who was the intended recipient, what the text is supposedly about, and where the text fits in the broader social and historical context. The formal moment incorporates questions about the syntactical and lexical conventions of a text, and the way in which belonging to a particular genre encourages a certain kind of reading. The interpretation–reinterpretation moment unfolds in the interplay between these issues of production, interpretation and situation. Thus, this method has elements of Gadamer's 'fusion of horizons', Habermas's concern for ideology and Ricoeur's emphasis on multiple meanings, as well as the core hermeneutic theme of reciprocity between 'text' and 'context'.

An alternative approach to critical hermeneutics is outlined by Klein and Myers (1999). This describes guidelines for critical hermeneutics in terms of the interdependency of parts and whole; critical reflection on the social and historical background of the research setting, so that the intended audience can see how the situation under investigation emerged; the principles of reflexivity and interaction between researchers and participants, so that the nature of data as collectively

and socially constructed can emerge; the role of dialogical reasoning and sensitivity to possible contradictions of interpretation; and finally, and explicitly, the principle of suspicion, and the importance of seeing past what participants *say* to examine the work that their speech does to reinforce or undermine certain versions of events. This emphasis on suspicion reveals this particular method's sympathy for the work of Ricoeur and Habermas over those writers in the hermeneutic tradition who are motivated more by faith.

These interpretive methods in organisational research connect with the crucial constitutive importance of context in human understanding. This is context as discourse, ideas, habits, practices, norms, systems, etc., and it directs the hermeneutic gaze to the public as well as the private ways in which sense is generated, shaped, experienced and resisted, including the ways in which both researchers and participants are enmeshed and complicit in promoting some versions of sense over others. Researchers reach for different methodological options, depending on whether they are primarily interested in capturing and crystallising a participant's life-world or exposing and exploring the contingency, vulnerability and ideology of sense-making. Despite their different emphases, these methods are all fundamentally 'historical' in the way we have defined historicity in this chapter.

Revisiting Sense-making

At the outset of this chapter, we suggested that hermeneutics encompasses two things which are interrelated but different: the activities of interpretation and the philosophy of understanding. In its definition as the activity of interpretation, hermeneutics becomes one of a number of different methodologies for qualitative inquiry, one of the items in the bottom left-hand corner of Burrell and Morgan's (1979) classic taxonomy. This locates hermeneutics in the quadrant which represents (1) subjectivity on the subjective versus objective dimension and (2) regulation on the regulation

versus radical change dimension. Given our discussion of the meaning/significance debate, of course, we would challenge the suggestion that hermeneutics is *only* concerned with subjectivity; and with the faith/suspicion framing, we would argue against its characterisation as *only* regulatory. We might even want to argue, with Dilthey (1958), that hermeneutics is *the* overarching method for inquiry into human and social phenomena, that is, that it should be present in all the boxes in any taxonomy of qualitative methods.

In its second definition as a philosophy of understanding, however, hermeneutics seems to defy such allocation into boxes, because boxes imply that human phenomena can be disentangled and categorised into things that make *sense*. In this chapter, we have seen several arguments for there being more to understanding than sense; that is, more than what we can capture, encapsulate, describe and control. These include acknowledging a role for intuition in interpretation; the elusiveness of meaning hidden behind symbol; the role of the pre-conscious, including the constitutive power of public meanings that pre-date private ones; the role of strangeness and unfathomability in the dynamic of hermeneutic circling; and the radical challenge to consciousness for its ideological distortions. Thus, in several ways, hermeneutics takes us beyond sense and our attempts to harness it.

We see fascinating connections between this challenge to the primacy of sense and Weick's (1995) organisational sense-making approach. Indeed, Weick's description of sense-making as 'a frame of mind about frames of mind' (Weick, 1995: xii) has distinct Heideggerian overtones. Recent forays with Weick's work have downplayed the primacy of sense, if by sense we mean our efforts to resolve and settle things, and to order our worlds into coherent, manageable entities. Holt & Cornelissen (2013) suggest that we have turned organisational sense-making into an almost exclusive focus on what is practically and instrumentally desirable, retrospectively orientated, and driven by the need to control events and lessen cognitive dissonance. Returning Weick's sense-making to its

Heideggerian roots, they argue that we should redefine sense to encompass a broader range of experiences. These include our moods of dislocation and unease, which signal some kind of shift or disconnect between self and world. For instance, in their different ways, boredom and anxiety both signal that the world is not anchoring us; and feelings of awe can be read as a sign that the world may be overwhelming us (Holt & Cornelissen, 2013). Moods suggest that there is more to understanding than what we can grasp and intellectualise. They invite an engagement with hermeneutics as philosophy, and as 'reflection on the non-epistemological conditions of epistemology' (Ricoeur, 1981, p. 75).

A Hermeneutic Orientation

This kind of philosophical reflection on where 'sense' fits within our overall experience of ourselves and our worlds is less obviously useful from an applied perspective than the more concrete explorations of method inspired by the Schleiermacher school. Or, rather, it suggests a different kind of application, one directed at the orientation of research as much as its methods. It is inspired by the Heideggerian insistence that interpretation is not necessarily carried out verbally or thematically, but rather in the way we relate to things within the field of our concerns.

A hermeneutic orientation towards research is one which emphasises the mutually productive and illuminating relationships between things; the presence of other possibilities and perspectives; the value of dialogue and reflection; and a tolerance of ambiguity, inconsistency and disjuncture in meaning. It involves reflecting in depth about the very nature of our research questions because, as we have seen in this chapter, different hermeneutic solutions are helpful for different kinds of problems. As Gadamer suggests, one of the cornerstones of hermeneutics is this particularity, for 'we can understand a text only when we have understood the question to which it is an answer' (Gadamer, 1989: 363).

The hermeneutic orientation that we have in mind draws on a range of ideas from the theorists we have discussed. It attempts to incorporate their differences as well as their commonalities, that is, to make use of the dialogue, even tension, between positions and possibilities. It engages with both faith and suspicion, and with the relations between them. Thus, we are able to be suspicious of X only because we have faith in Y, where Y might be only our ability to ask the right questions (Gallagher, 1992). We think such an integrative hermeneutic instinct has an important role to play in contemporary organisation and management studies, especially in relation to bridging the gulf that sometimes appears between functionalist and/or psychological approaches and more critical alternatives.

Perhaps more than anything, a hermeneutic orientation involves a respectful, reflexive participation in tradition, both in terms of what we inherit and in terms of what we might pass on. In a phrase used by both Gadamer and Ricoeur, hermeneutic reflection entails joining a conversation which has already begun, and which none of us individually can conclude. Understanding is as much experience as achievement, as much participation as clarification, as much tone as method. It is an ongoing project; we will never reach completion or total synthesis, but this does not mean disintegration, fragmentation or pointlessness, either. In this spirit, we give the remaining space to Gadamer (1989, p. 581):

I will stop here. The ongoing dialogue permits no final conclusion. It would be a poor hermeneuticist who thought he could have, or had to have, the last word.

Critical Realism and Qualitative Research: An Introductory Overview

Steve Vincent and Joe O'Mahoney

INTRODUCTION

Many of the methodology textbooks that business and management students are encouraged to use employ a simple and, in our view, flawed dichotomy between objectivist (positivist, deductive and empiricist) approaches, which are typically aligned with quantitative empirical methods, and subjectivist (social constructionist, inductive and interpretive) approaches, which are typically aligned with qualitative empirical methods. Whilst this dichotomy certainly simplifies approaches to research, it is based on the odd assumption that some data should, a priori, be ruled out simply on the basis of whether it is appropriate and consonant with the general orientation of the approach. Such an assumption is not only, as we discuss later, theoretically flawed, but is also out of kilter with the day-to-day experiences of individuals: counting can often give us insights into meaning or values (for example when suicide rates rise), and interpreting sights and sounds can give us greater understanding

of an external and objective reality (think about all the signs drivers respond to when obeying 'the rules of the road', for example).

Critical realist scholars seek to overcome this odd dualism (objectivism or subjectivism) by distinguishing between ontology (what is real) and epistemology (what we know). Critical realist scholars assume the existence of an objective ('intransitive') world that has powers and properties that can be more accurately known as a consequence of scientific endeavour, but recognise that knowledge is a subjective, discursively bound (i.e. transitive) and constantly changing social construction. Crucially, for science, social science, and for the purposes of this chapter, careful methodological practices form a bridge between our epistemological knowledge and ontological reality: good research means we can understand the world better. This marriage of epistemological relativism and ontological realism, however, presents novel challenges to qualitative social scientists, not least of which is the question of how researchers make discoveries

about any social formation from qualitative datasets when participants may be unaware of or (consciously or otherwise) misrepresent the social formations of which they are a part.

In our view, dealing with this problem requires qualitative researchers to think about the research act in theoretically grounded ways (see also, Edwards et al., 2014), which we attempt to distil in this chapter. We begin by offering a brief introduction to critical realism, as a particular philosophy of science, before then sketching out the implications of this position for theorising with qualitative data. The overall argument is that critical realist researchers should be led by ontological concerns and, consequentially, they should embrace all qualitative (and many quantitative) research techniques. However, their approach to data collection and analysis is likely to be different from those who are committed to alternative ontological positions because their approaches to theorising, which we sketch below, are also distinctive.

CRITICAL REALIST ONTOLOGY

The origin of critical realism, as a philosophy of science, is attributed to a series of books by Roy Bhaskar (1975, 1979, 1994). He argues that the universe, including the social world, is a *stratified and open system of emergent entities*. This section breaks this phrase down into simple parts in the effort to clarify its meaning, so if you are already familiar with this ontological position you might want to skip forward to the next section.

Entities, Powers and Systems

Entities are things which ‘make a difference’ in their own right, rather than as mere sums of their parts (Fleetwood, 2005, p. 199). Molecules, individuals and organisations are all entities, even though one may be (partially) comprised of others. Entities may be material (e.g. water), immaterial (e.g. class) or both (e.g. a contract).

Bhaskar differentiates between ‘real essences’ which are the ‘structures or constitutions in virtue of which [a] thing or substance tends to behave the way it does’ (Bhaskar, 2008, p. 209), and ‘nominal essences’ which are ‘those properties the manifestation of which are necessary for the thing to be correctly identified as one of a certain type’ (Bhaskar, 2008, p. 279). Such a distinction enables a separation of the essential generative or enabling processes of an entity and its epiphenomenal features. We may thus identify a book nominally, as paper bound together in a particular way, or in a more sophisticated way in terms of its language, genre, intended audience or purpose, to realise the real essence of the specific book observed.

Entities may also be real in different ways and at different levels. For example, the bogeyman is not materially, but ideationally real: the discourses about him have real effects, not least on the bedtime activities of children and on the writers of children’s fiction. The bogeyman thus exists as a conceptual/cultural schema in some societies, which affects social and material events (such as the production of books and toys). Entities are thus organised hierarchically, in that they exist and have relations at different levels. For example, the entity ‘organisation’ is made up from (among other things) people and resources (broadly defined); people are (partially) constructed of tissue and organs; which are, in turn, made up of cells, and so on.

The relationship between these levels can be usefully conceived in terms of *emergence* (Elder-Vass, 2010), wherein one level is dependent upon but irreducible to the level below. For example, we cannot understand the wetness of water in reference to its components of hydrogen and oxygen, nor can we explain the functioning of an organisation with sole reference to its separate roles, routines and resources. This because each entity has *causal powers* that depend on the relational properties of its parts. These relational properties can be usefully conceived of as *essences*. An essence is ‘what makes something that thing and not something else’ (O’Mahoney, 2011, p. 726). Water is H₂O

and has the power to soak; organisations have directors and the power to employ; money has legal status and has the power to purchase.¹

Ideas about the causal powers of entities are important because change often occurs when the powers of one entity interact with another: water can be heated by fire, teams may elect a leader, and organisations might be bought by other organisations. Such *mechanisms* often transform entities: water might turn into steam, a new leader might change the organisation, and a purchased organisation might be asset-stripped. So, entities emerge and may be transformed (i.e. manifest with new properties and powers) as a result of the interactions of entities and causal powers.

We should note here the different ways in which a power may exist. An entity may *possess* a power simply due to its properties (a government may have some power to increase employment); this power may be *exercised* by the power being triggered (the government takes on more public sector workers); yet this power may or may not be *actualised* (i.e. come to be) because there may be countervailing powers (e.g. private sector employment may have collapsed). The social world is full of powers, the actualisation of which are often retarded by other powers within the *open systems* in which they are located.

It follows that social mechanisms cannot be empirically isolated, as happens in laboratory experiments. As a consequence, critical realists theorise social mechanisms as ‘laminated systems’ (Bhaskar, 1993; Elder-Vass, 2010) ‘whose internal elements are necessarily “bonded” in a multiplicity of structures’ (Bhaskar, 1993, p. 25). Examples might include financialised capitalism, the Russian legal system or the British public sector: whilst these cannot be separated from the rest of society, they comprise systems, mechanisms and entities which can be usefully considered and conceptualised together.

We can now see that any power necessitates the actualisation (manifestation, existence) of at least one mechanism for the potential exercise of that power. For example, the possessed power of an employer to sack a worker implies a mechanism (legal termination of a contract)

by which this occurs. Powers thus depend on mechanisms (such as employment laws) that relate one entity to another. The exercising of powers (the employer’s ability to dismiss employees) results in tendencies (attempts at dismissing employees in the event of absenteeism) which, in the social world, may be manifest in observed patterns of events (employees leaving). However, such event regularities are not constant conjunctions (sometimes workers quit before they are dismissed and the termination of an employment contract may not be legal), and so observation (employees leaving) does not ‘prove’ one thing or another. As we have seen, powers are often unexercised or unactualised, and so investigation is required to explain the *specific* manifestation of events.

This framing is important because it allows a conceptualisation of what could happen, what should happen and what isn’t happening, which gives the researcher prompts for further investigation. Thus, when we observe the unexpected (women dominating in highly paid jobs, global temperatures decreasing) it indicates that there are (perhaps) deficiencies in our current theorisations or methods which need attention. Moreover, as Bhaskar (2008) argues, this reading of events also allows a conceptualisation of absences which accords causal powers: the absence of legislation on worker rights, for example, has real effects (such as on employer behaviour) which empiricist and constructionist accounts of the world might miss. However, knowing such things requires a commitment to a *depth ontology*, which we now turn to.

The Empirical, The Actual, The Real

In the introduction, we saw how critical realism commits to both ontological realism and epistemological relativism, yet the picture is more complicated than this, as critical realism, whilst accepting that actual events do occur, also proposes that these events are caused by real mechanisms that are often invisible to the researcher. This *stratified* or ‘depth ontology’ makes a distinction between the ‘empirical’,

the ‘actual’ and the ‘real’. The empirical is what we perceive to be the case: human sensory experiences and perceptions (we observe a driver approaching a speed camera and slowing down). The ‘actual’ is the events that occur in space and time, which may be different to what we perceive to be the case (we may assume the driver has slowed down before the speed camera when this is not what happened). The real or deep is constituted of the mechanisms and structures which generate (and explain) events, a point which we shall illustrate below.

This stratified conception of causation facilitates a more adequate understanding of how (material and social) powers, which operate in different times and/or locations and/or at different hierarchical levels, are related. As reality is ‘multiply determined’, with no single mechanism determining events (Bhaskar, 1975), multiple causes must be teased out from detailed explorations of the setting. It follows that a key commitment of critical realist research is that there are deeper levels awaiting discovery. Thus, and beyond direct observation, it is also possible to posit various other *potential mechanisms* that may be (in part or whole) neither manifest nor readily observable, but that still have an effect.

To clarify this critical realist jargon, we might continue with the example of the fixed roadside speed camera, which routinely slows down the traffic regardless of whether the camera within it is actually working. A traditional positivist approach might measure the incidence of new speed cameras (working or not) and the changes in speed of cars, and undertake a regression analysis to show, for example, that a positive correlation, they claim, *proves* that cameras cause speed retardation. Whilst the numbers here can be (though are not necessarily) useful, this analysis contains an inadequate or ‘thin’ conceptualisation of cause which focuses on description rather than explanation. Crucially, it misses out on the most complex element in the processes: the human. An alternative, post-structural approach might emphasise the self-disciplining Foucauldian effects of

disciplinary surveillance, and the role such technology has in producing compliant subjects (for example, Fyfe & Bannister, 1996). This perspective can also produce useful insights, but when discourse is over-emphasised, and the self is seen as constructed, then resistance, social structure and the wider historical context can be missed.

A critical realist perspective, however, not only accepts the distinction between the empirical (the appearance of a speed camera) and the actual (a speed camera with no film), but also seeks to discover the (deep) causal mechanisms that relate the appearance of the camera with the person, asking what variety of causal relations must exist in order for the empirical events to occur. This not only opens up a wider variety of interesting phenomena, such as the mind of the driver, the powers of the police and the braking mechanisms of cars, but also helps us understand why things might change. For example, when the camera gets vandalised because people think cameras are simply a mechanism for extorting fees, passing drivers may change their behaviour. The critical realist approach, therefore, can place the speed camera in a number of related, stratified ‘laminated systems’ – which might include both the structural relations of the citizen, the state and the police, as well as the psychological institutionalisation of drivers and their responses (and resistance) to disciplinary techniques – which rely upon the identification of deep causal relations that may be invisible to the researcher focused merely on actual events.

CRITICAL REALIST RESEARCH

An Underpinning Ontology

The example above highlights an obvious limitation of critical realism: it is a metaphysical ontology and (contrary to some writing) does not imply anything about the existence of the self, society, social structures and so on. To achieve a critical realist account of such things, we need to develop and use what

Cruickshank (2003) refers to as ‘domain specific’ theories. These emerge when general critical realism is drawn upon to develop a framework for studying a specific empirical domain, and the consequence is that the theories that are developed, whilst adhering to the principles and language of critical realism, are only implicitly ontological. For example, those studying labour process theory might (and often do) use critical realism as an ‘underlabourer’ to build theories concerning the exploitation or alienation of workers. However, there is nothing in a critical realist ontology which demands such propositions. Indeed, the epistemological relativism inherent in critical realism means that one would expect such theories to be at best approximations of reality, not least because all social theorising involves simplification.

Applied critical realism, therefore, provides an underpinning structure and language to guide good research by asking what the entities, causal powers, dependencies and relations are, but it does not specify what these should be. The task of the researcher, then, is to work out a better and more causally accurate, correct or reliable explanation for observed patterns of events via the development of more adequate (and domain specific) accounts of the powers, entities, mechanisms and relations which created them. However, as we saw with the example of the speed camera, developing such an explanation can be difficult because the powers of entities do not have to be present or even exerted in order to have an effect.

One consequence of both the ‘domain agnosticism’ and stratified nature of critical realism is that it is compatible with a wide array of other theoretical (though not ontological) positions. For example, critical realists are comfortable with the domain level concepts of discourse, identity or materiality (Elder-Vass, 2014; Mutch, 2013), though clearly not with the ontological positions that discourse is everything or that the material is entirely social (e.g. Barad, 2007). This provides critical realists with great opportunities

to re-examine competing ontological positions, which might make important theoretical insights but which are limited by ontological structures. Such approaches have not only led to many critical realist re-readings of concepts such as discourse (Fairclough, 2005), identity (O’Mahoney, 2011) and socio-materiality (Mutch, 2013), but also to claim that theorists such as Foucault and Derrida are more critical realist than post-structuralist (Pearce & Woodiwiss, 2001; Wright, 2004).

Mechanisms, Contexts, Outcomes

In seeking to understand and explain the mechanisms behind empirical and actual events, critical realism is primarily interested in causal explanations – moving from the what to the why. This challenges the researcher, the policy maker or the manager to develop deep understandings of the worlds they inhabit: away from the simplistic certainty of regression analyses, that might show implementing X ‘causes’ Y, and towards an understanding of why different contexts, conditions and aspects of X can cause Y. The key to this enquiry is the ‘mechanism’ and the events that it produces, but the mechanism in an open system cannot be isolated from its context, hence Pawson and Tilly’s (1997) equation, Mechanism + Context = Outcome. In more detail:

Mechanism: how do the properties of one or more entities affect those of others?

Context: what conditions are needed for an entity’s causal mechanisms be to triggered?

Outcomes: what are the empirical manifestations produced by causal mechanisms being triggered in a given context?

The role of context means that, unlike the image promoted by positivists, there are no clear, simple or easy answers in the social world (Fleetwood & Hesketh, 2010). For example, we might find that low-waged service workers working in a call centre can be happy when they work on quality services, have high levels of discretion in their jobs and positively

identify with the values of their work (Jenkins & Delbridge, 2014). The mechanisms that manifested here concern the relational identifications of the workers with the values of their employer and their work. However, Jenkins and Delbridge also make clear that the context of this mechanism was a labour market in which there was limited choice and a family-owned, small and successful business, and so the identified mechanisms may produce different outcomes in different contexts or even within the same company at a different time.

CR Research Design

The centrality of identifying mechanisms to explain *why* things happen means that critical realists put theory first. Thus, the aim of critical realist research design is to produce explanations (theories) about the essences (properties) and exercise of transfactual, hidden and often universal mechanisms. This takes any potential generalisations from the empirical to the theoretical, in contrast to the positivist approach where generalisations are only concerned with an empirical population (Danermark, 2002, p. 77). This distinction is important because theoretical generalisations are more enduring and can be applied through time and space. For example, a theoretical generalisation that capitalism tends to commodify should not only be applicable in all forms of capitalism (including future ones), but when one finds empirical evidence to the contrary it should prompt the researcher to seek reasons which prevent the mechanism being actualised. In contrast, a generalisation that notes only the empirical instances of capitalist commodification has limited explanatory value because it simply identifies the empirical event and says little about why it happens, to what extent and in which circumstances. Moreover, evidence to the contrary simply modifies the generalisation and does not prompt a pursuit of counter-mechanisms.

The importance of CR emphasising ontological questions (what is X? how does it work?)

over epistemological questions (how can we know X?) means that CR is methodologically ecumenical. Indeed, many realists would argue that the emergent stratified nature of social reality means that a wide range of methodological approaches or 'extended methods' is necessary for a richer conceptualisation of the mechanisms at work in the social world. For this reason, CR scholars embrace a range of qualitative research techniques. Our own edited collection (Edwards et al., 2014), which looked at the implications of CR for a range of methods within the field of organisation studies, included chapters on discourse analysis (Sims-Schouten & Riley, 2014), grounded theory (Kempster & Perry, 2014), interviewing (Smith & Elger, 2014), ethnography (Rees & Gatenby, 2014), case studies (Vincent & Wapshott, 2013), comparative case methods (Kessler & Bach, 2014), action research (Ram et al., 2014), and historical and documentary methods (Mutch, 2014). Elsewhere, CR scholars have used observational (Bøllingtoft, 2007), diary-based (Næss & Jensen, 2002) and autoethnographical (Botterill, 2003) methods.

As Ackroyd and Karlsson (2014) have argued, the choice of research design for critical realists very much depends on the position of one's research purpose on two dimensions. The first relates to the focus of research, and ranges from *intensive* research to *extensive* research. Intensive research prioritises qualitative research designs, such as case-studies or action research, where the context is known and the mechanism is unknown (for example, *why are workers happy in this factory?*). Extensive research examines the effect of different contexts on a mechanism, for example by using surveys (see also, Sayer, 1997). Quantitative data can be used to generate taxonomies and is useful more where mechanisms are known (or at least inferred), but the context varies (for example, *in what contexts do 'sophisticated' approaches to HRM result in happier workers?*). Between these two extremes are examples of where the focus of study is on the interaction of mechanisms and contexts.

Table 13.1 Critical realist research designs (amended from Ackroyd and Karlsson 2014)

	<i>Intensive B à Extensive</i>			
	<i>What is the mechanism?</i>	<i>How do context & mechanism typically interact?</i>	<i>How do context & mechanism historically interact?</i>	<i>What is the context?</i>
Detached	Case-study	Comparative case-study	Institutional / historical analysis	Surveys
Engaged	Action research	Intensive realist literature evaluations	Barefoot research	Extensive realist evaluation

A second scale concerns the extent of detachment of the researcher, whether they are simply diagnosing from a distance or whether they are trying to manipulate the mechanism or context under study. In Table 13.1, we amend Ackroyd and Karlsson's categories to re-present eight CR research designs. This provides us with eight research designs that are described and illustrated briefly below.

CR Data Collection Methods

There is little to say about CR methods, because they do not exist. As detailed earlier, CR has a highly ecumenical approach to data collection and holds that methodological choices should 'depend on the nature of the object of study and what one wants to learn about it' (Sayer, 2000, p. 19). Thus, whilst CR work is often based on case-study research using methods such as interviews and ethnography, it has also involved observation, focus groups, literature reviews and surveys. The designs detailed in Table 13.2 will often share methods, and the distinction between methods and designs is not always unambiguous.

One caveat that is rarely explored with either research designs or methods is the extent to which the phenomenon being studied can be isolated. It is true that in the social world this is probably futile, but in many disciplines which are increasingly turning to critical realism, such as psychology (Ponterotto, 2005), the focus of study may be mechanisms which are more capable of being isolated, at least at one level, than others. This raises interesting questions about

the extent to which experimental design may be appropriate, perhaps as part of a mixed methods study. As critical realism is still a relatively nascent topic, we hope to see developments on this and other questions by other researchers.

ANALYTICAL METHOD: ABSTRACTION AND RETRODUCTION

As far as analysis is concerned, whilst both induction and deduction are used in critical realist research, the need to move from the empirical to the real (causal mechanisms) means that the emphasis tends to be on abstraction and retroduction. Abstraction, as in 'taken from' the concrete or empirical, involves one-sidedly representing the different elements of a phenomenon in order to synthesise how they work in combination to affect events (Sayer, 1998). The analytical process involves re-description of findings as a causal mechanism or process between related elements which serves to explain them (see also O'Mahoney & Vincent, 2014). This involves re-describing that which is observed (interviews, observation, documents) in terms of (the abstracted) theory in order to describe the sequence of causation, or the relations between things, that gives rise to observed regularities in the pattern of events. It involves combining observations, often although not inevitably in tandem with theory, to produce the most plausible explanation of the mechanisms that caused the events. For example, a researcher looking at HR practices might

Table 13.2 CR research strategies, explanations and examples

<i>Research Design</i>	<i>Explanation</i>	<i>Examples</i>
Case-study	The most common, and arguably most useful, form of CR research. In-depth exploration of a case to abduct causal mechanisms from their empirical manifestations. Cases may range from people to companies to whole economies.	Gouldner (1964); Beynon (1979, 1973); Burawoy (1979)
Action research	Intervention by researchers to explore the workings of a mechanism by triggering it or changing its context.	Cassell and Johnson (2006); Friedman and Rogers (2009); Morgan and Olsen (2008)
Comparative case-study	Exploring how similar mechanisms operate in different contexts.	Delbridge (1998); Taylor and Bain (2003); Kirkpatrick et al. (2005)
Intensive realist literature evaluations.	Builds theories to explain what mechanisms work in different contexts by reviewing the extant literature.	Marchal et al. (2012)
Institutional / historical analysis	Examining causal sequences over time to explore how mechanisms and contexts interact over time, and the conditions for such interaction.	Smith and Meiksins (1995); Clark (2012), Mutch (2007)
Barefoot research	Training / encouraging participants / employees to do their own research.	Lindqvist (1979)
Surveys	Primarily focuses on descriptive statistics (e.g. sampling or population data) to illustrate the empirical consequences or conditions of mechanisms. Occasionally used to prompt explanatory investigations, but in conjunction with other methods.	Cully et al. (1999)
Extensive realist evaluation	Mixed methods: stage one uses qualitative work to identify causal mechanisms. Stage 2 uses statistical techniques to examine how different contexts affect a mechanism.	Kazi (2003); Kazi et al. (2002)

interview a group of workers about their appraisal and seek to explain these data in terms of theory about the disciplinary power of managerial discourses (what is said in the appraisal situation) in the employment relationship, wherein it is theoretically assumed that the bargaining position of the appraisee (worker) is weaker than their appraiser (manager). Here, and if the explanation of the mechanisms is successful, theory and data will be consistently and effectively 'fitted together' in such a way as to render the nature of the mechanism clearer.

Retroduction involves imagining a mechanism, which, if it were real, would account for the phenomena *in question*. In other words, it seeks to ascertain what the world (i.e. the broader context) must be like in order for the phenomena we observe to be as they are and not otherwise (Sayer, 2010). This often involves first identifying patterns over periods of time and in different contexts to creatively ask 'what if?', to identify often hidden causal mechanisms. For example, extending the example used above, we might observe (1) that some managerial discourses are more persuasive than others, and (2) that in certain organisational contexts (opportunity structures, labour markets, etc.) workers are more inclined to accept the managerial version of 'the truth', however this might be constructed. This, in turn, suggests that a number of other causal processes are also at play to affect the mechanism observed, suggesting the opportunity to understand more about the relationship between the mechanisms we observed and the contexts in which they operate.

In order to build better explanations of the interconnections between strata which might explain such variance within a known mechanism, we must either bring in or develop other theoretical resources. For example, we might use comparative analysis to demonstrate that it is those appraisers who are able to transpose the dominant cultural tropes of their appraisees into the appraisal meetings who prove to be the most persuasive. As a result, we might develop a new theory that connects the organisational

outcomes with broader cultural contexts. Alternatively, and drawing on existing theory, we might consider the nature of opportunity structures within the broader labour market in order to explain why it is that, say, managerial trainees and those with an interest in opportunities for further technical training have a greater interest in being complicit with managerial discourses than, say, those with little opportunity for career advancement. In either case, new lines can be drawn between the operation of a mechanism, at one level, and the context(s) within which the mechanism resides.

As different theories emphasise different aspects of mechanisms that are simultaneously implicated in a pattern of events, retroduction implies a commitment to *theoretical pluralism*, at least at the outset of an investigation. Multiple theoretical lenses can be considered for what they tell us about the various and stratified influences that are affecting the things we observe.

Abstraction and retroduction can also be used as part of an *immanent critique* of a competing position in order to develop theorising in a field. This provides a critique from within a theoretical position and identifies contradictions, ambiguities or inconsistencies. It seeks the 'Achilles heel' (Bhaskar & Hartwig, 2010) of an existing theoretical position in order to identify theoretical weaknesses that require further investigation. For example, Archer undertakes an immanent critique of conceptions of the social agent within economics and social-constructionists sociology to demonstrate the need for a new theory about the ways in which humans are conditioned by, but irreducible to, social norms and structures. This then spurs Archer's (2000) investigation and development of a theory of humans which incorporates the notion of morphogenetic cycle and the subject's 'inner dialogue'. In undertaking an immanent critique, critical realist research may seek to ameliorate the flaws they discover by asking what the theory could be like in order to overcome its inconsistencies and re-describing the theoretical tools of the position within an alternative

(in this case, critical realist) theory. For example, O'Mahoney (2011) shows that the anti-essentialist positions of many anti-essentialist scholars are inconsistent with their own practices and theorising. He uses this flaw to redescribe their main theoretical commitments (for example, concerning identity and discourse) within a critical realist ontology.

Thus, when abstraction and retroduction succeed, they offer a new and often unanticipated view of things: what was hitherto unobserved becomes the basis of new understanding. By postulating a new view of the object of study in the light of a new or existing theorisation, a successful realist study, therefore, re-conceptualises the subject and the processes to which it is connected. Finally, it should be noted that many researchers, for simplicity, treat abstraction and retroduction as one movement, often from qualitative data to the best theory that explains the data (Mingers, 2006; Ketokivi and Mantere 2010). As we believe that abstraction necessitates some form of retroduction, and vice versa, we do not disagree with this combination.

AN EXEMPLAR ANALYSIS

One qualitative CR study that uses abstraction, retroduction and multiple theoretical lenses is Vincent (2008). This study wanted to understand more about the way in which public sector organisations procured complex goods from private sector suppliers, and so it came to focus on an exemplar case: a 'strategic Partnership' between Govco (a large and bureaucratic government department) and Futuretech (a multinational software development specialist). This 'Partnership' became the focus of a case-study, and a range of qualitative data collection tools, including interviews, observation and documentary analysis, were used to abduct the Partnership as an inter-organisational mechanism.

Abstraction was used to work out how the organisation functioned, as a mechanism

in itself. The interviews indicated that the partnership was created because Govco was interested in accessing Futuretech's stock of in-house technology and expertise. Futuretech, on the other hand, wanted to make a profit from the arrangement. A contract was agreed, which stipulated (amongst other things) that the cost of IT systems development should halve over five years, with Futuretech benefitting (financially) where performance exceeded these expectations. The analysis came to focus on how this contract was managed, with subsequent interviews, observation and documentary analysis focused on this contractual mechanism.

The data indicated that a group of senior IT experts and managers who constituted the Partnership were employed, by both organisations, to manage the contract. These managers knew a great deal about the technological possibilities, capabilities and susceptibilities of both organisations. They met regularly to define the work Futuretech would deliver and, subsequently, they were responsible for ensuring that it was delivered to contractual targets. As such, the Partnership had a good deal of latitude to decide what 'good performance' looked like (even if most respondents didn't say so). Some, more junior, managers admitted that, as there was no easy yardstick with which to measure time spent developing IT systems, some technologies were much easier to deliver than others. Others hinted that, where performance dipped below contractual expectations, any underperformance could be reconciled against easier-to-deliver work. In the end, contractual targets were consistently delivered, but there was little evidence to confirm whether performance was 'good' or 'bad' (and thus no way to easily work out what the Partnership delivered as a whole).

In some ways, the Partnership appeared to be effective: it hit contractual targets, and IT user surveys showed improved perceptions of performance. In interviews, senior personnel boasted about the cordiality of relations. All were committed to Futuretech making a 'reasonable' profit and had a strong interest in

the contract being a 'success' (future careers depended on it!). However, there was also evidence that performance was less than effective. Some (knowledgeable) respondents complained about the quality of the technologies delivered and suggested that, over time, Futuretech delivered increasingly 'off-the-peg' rather than more complex and challenging 'bespoke' technologies. Ultimately, it is likely to have been more generally recognised that the Partnership was failing to deliver as effectively as it might (the contract was not renewed after its five-year term ended).

In this case, abstraction from qualitative data revealed the Partnership as a set of inter-organisational meetings that negotiated contractual details. In this study, access to the Partnership was good and so abstraction of the basic mechanisms (the Partnership) from the data required little prior theoretical engagement. However, the realists' movement, from the description of the mechanism to an account of the specific outcomes associated with it, also assumed a context in which deeper levels were awaiting discovery. It is explaining these deeper levels that necessitates the use of novel theoretical resources. For example, and from the data, we might have tracked the career interests of the people who constituted the Partnership and abstracted a novel theory about these interests, which resulted in self-serving outcomes. However, such data-abstracted, domain-specific theories can always be deepened. Why did the Partnership have so much latitude to determine its own 'successes'? Why could Futuretech get away with delivering apparently shoddier and less customer-focused technology? Answering these questions involves taking a retroductive steps 'backwards' to ask why the Partnership manifested itself as it did and not otherwise.

At this point, existing theory can be an invaluable tool in developing a deeper understanding of the mechanism observed. As the data were collected, the researchers also trawled the literature to see how others theorised cooperative inter-organisational relationships. Various theories were considered

and combined in the effort to provide a more effective insight into particular outcomes observed in the Partnership. Three theories, in particular, appeared to be useful. These were *transaction cost economics* (TCE), which suggests that inter-organisational relations are affected by the type of product developed and exchanged; *resource dependency theory* (RDT), which suggests that inter-organisational relations are affected by each partner's relative dependency on the other's resources and abilities; and *institutional theory*, which suggests that inter-organisational relations can be affected by broader ideological trends and norm-enforcing mechanisms. There is not space here to do justice to the complexities of these theoretical frameworks or why they were selected. Instead, we explain *how* these theories were incorporated within an explanatory framework for the Partnership.

Each of these theories resonated with different patterns in the data. For example, TCE suggests that where contractual mechanisms govern complex, uncertain, changeable and idiosyncratic tasks and technologies, the actors involved will necessarily have greater autonomy in determining their own ends. Documentary analysis confirmed that technologies were developing quickly within the market and interviews confirmed that benchmarks for good performance were ineffective. TCE, a theory about how market conditions affect contracts, thus helped explain the Partnership's apparent autonomy and rooted this explanation in a specific cause (technological uncertainty within a broader social formation).

Suffice to say, a similar story can be told for RDT, which appeared to account for the increasingly 'off-the-peg' technologies Futuretech apparently delivered. Specifically, as Futuretech assumed responsibilities for developed technologies, knowledge accrued on Futuretech's side of the contract rather than Govco's. As a result, Futuretech's agents became increasingly powerful in asserting their own technological imperative and interests, even if these did not meet Govco's needs exactly. RDT thus contributed to the theoretical

model developed, with data suggesting that Govco (as one entity) became increasingly dependent on Futuretech (as another) over time, and that this may have altered the balance of power negotiations about technologies developed. Again, this theory fits the data.

Finally, institutional theory, which suggests (institutional) mechanisms are conditioned by dominant organising logics that operate across broader social formations, contributed to the explanation of the Partnership's tendency to extol its own successes. At the time of the Partnership's inception, private sector provision was prioritised over public sector provision as a matter of policy prescription – owing to a generalised ideological faith in the relative efficiency of private sector providers (even where transactional considerations suggested this may not actually be the case). In these circumstances, it is unsurprising that few were shouting about the Partnership's failures.

Arguably, this synthesis of existing theory and the qualitative case data generated a better and theoretically informed model of the generative mechanism that more accurately accounted for the specific empirical tendencies observed within the case. It added richness to the explanation of the Partnership by rendering more explicit the causal dynamics that existed between the Partnership and its antecedents, including the material (e.g. technology/resource) and ideational (norms, discourses) phenomena to which it related.

Theoretical models, such as this combination of TCE, RDT and institutionalism, are transferable generalisations that can be reapplied in analyses of similar institutional settings. More specifically, the combination of insights about idiosyncratic technical conditions, mutual resource dependencies and supporting institutional rule systems, which inhered within the Partnership, are likely to be present in cooperative, inter-organisational forms more generally. This model can, then, be used as a basis for building alternative explanations of the particular configuration of contextual determinants that patinas other similar structures. Knowledge obtained about

a single case-study is thus not confined to the boundaries of the case itself, but is theoretically transferable across a class of cases. Thus, the theoretical models we develop through our case-studies, as we explain their peculiarities, also help articulate the specific conditions that makes a class of cases classifiable in terms of their common antecedents. It is this form of theoretical generalisation that qualitative CR researchers should seek to extend and develop.

CONCLUSION

Critical realism provides, in our view, a more serious, consistent and credible alternative to positivism, interactionism, socio-materialism and constructivism, and allows researchers to move beyond the cultural and moral relativism inherent in many of these accounts. Moreover, through its commitment to stratification and emergence, critical realism is entirely capable of incorporating epistemological insights from these competing positions without accepting their ontological flaws. This is because critical realism overcomes the objectivist/subjectivist and qualitative/quantitative dichotomies, because it is methodologically pluralist and inclusive, and because it provides philosophically informed methodologies (abduction and retrodution) for generating new insights.

Yet, critical realism is not without its difficulties. First, as we have shown, it does not (and cannot) generate any specific *domain*-level theorising, other than by ensuring that studies commit to a stratified, emergent account of the social world. Second, it does not prescribe which methods are suitable for investigating which problems. This again is down to the researcher's experience and intuition. Third, in its ontological guise, critical realism is not actually particularly critical. Its commitment to truth does mean that false beliefs and ideologies can be labelled as such, but, in order to *really* emancipate, we must do more than identify the disempowered. As Collier explains:

When it is just a set of false beliefs that enslaves, their replacement by true beliefs is liberation. But the vast bulk of human bondage, misery and repression is not like that. The extension of emancipatory critique from cognitive error to unsatisfied needs makes it clear that false belief is not the only chain that binds us ... unemployed workers, homeless families, bullied wives, tortured prisoners, may all know exactly what would make them free, but lack the power to get it. ... Hence cognitive enlightenment is a necessary, though not a sufficient, condition of their emancipation. (Collier, 1998, p. 461)

Yet some critical realists are working to develop this limitation. Sayer (2011) and others have sought to detail the properties humans possess which imply ethical practices for how they should be treated (see also Nussbaum, 2003; Smith, 2010). CR researchers should therefore be challenged to consider the means required to act on and change the world (see Ram et al., 2014).

Finally, critical realism is relatively difficult to operationalise: many critical realist pieces in sociology and organisation studies are compatible with critical realism, but do not end up detailing a clear set of entities, properties, causal mechanisms, triggers and so on. Others use theorists, such as Archer (2003), to provide an applied critical realist framing concerned with social structure, agency and reflexivity, which is more suited for social research than a pure critical realist ontology. Others, including many Marxists, and Labour Process Theorists, undertake studies which do not mention, but are entirely compatible with, critical realism (see Edwards, 2005). As one prominent theorist recently retorted to one of the authors, 'I don't see why you need to mention critical realism, surely it's just good sociological research!'

And yet, we would retort, good sociological research benefits from having clear analytical targets (indeed, this what makes it an 'ology' in the first place!). As such, critical realism offers a common language for the identification of such targets that does more than appeal to 'common sense'. However, as critical realism is a relatively new position, it

is still developing: making new connections, re-interpreting alternative perspectives, and responding to challenges. The work of Bhaskar (2008) on dialectical critical realism, for example, certainly offers opportunities for novel research which has not yet been incorporated into mainstream social research. As we have seen, this nascence presents challenges to researchers but also offers them opportunities to contribute meaningfully to one of the most important developments in social theory in recent times.

Note

- 1 'Power' here does not concern the sociological concepts of power (such as that detailed by Lukes, 2005), but, instead, the metatheoretical specification of the (potential) of one entity to act upon another (e.g. heat on water; wages on labour markets; competition on innovation). Although we need to be careful when using terms like 'essence' and 'power', it is important to note that without some idea that an entity has one or more essences or powers, it is indistinguishable from anything else.

Ethnomethodology

Andrea Whittle

INTRODUCTION

What is ethnomethodology? Despite sounding a bit like one, ethnomethodology is not in fact a ‘methodology’. It is not a research method like semi-structured interviews or questionnaires. Nor is it really a ‘theory’ as such. It is probably best described as a different ‘perspective’ in sociology, or perhaps even a ‘paradigm of enquiry’ in its own right (Button, 1991). The term was coined by an influential sociologist called Harold Garfinkel. Let’s break the term ethnomethodology down. ‘Ethno’ comes from the Greek word *ethnos* and means ‘people’. These people could be organized into a variety of different types of groupings, large or small, formal or informal: a crowd, a sports team, a large multi-national corporation or even a whole network of professional organizations that make up a social institution such as the legal system. The key thing is that the people in the group share, recognize and employ similar ‘methods’ to do whatever they do, such as playing a sports

game, operating a global business or upholding the law. The term ‘methodology’, then, refers to the methods or procedures that competent members of that social group use to go about ‘organizing’ themselves. Put simply, then, ethnomethodology is the study of the practical methods through which members of a particular social group accomplish ‘organization’. The relevance for business and management studies is now immediately obvious: businesses, and the people that manage them, are centrally concerned with getting a group of people *organized* to achieve some kind of common task or goal.

The purpose of this chapter is to explain what ethnomethodology is, how it differs from other qualitative approaches, what influence it has had on social science more generally, and business and management studies more specifically, and its implications for questions of methodology and research design. The first section gives some background on the history and origins of ethnomethodology and explains some of its core concepts. The

second section looks at what it means to study organizations – the usual focus of research in business and management studies – from an ethnomethodological perspective. The third section reviews the contributions that have been made from using ethnomethodology in a variety of business settings: starting with the early classic ethnomethodological studies of institutional settings such as law enforcement and public welfare institutions, moving on to more contemporary settings known as ‘workplace studies’ and also more recent studies of market exchanges. The final section examines the promises, challenges and practicalities of the research methods associated with ethnomethodology, with its emphasis on close empirical analysis of real-time interaction as it happens in real-life settings through observational methods of various kinds.

GARFINKEL, ETHNOMETHODOLOGY AND THE STUDY OF SOCIAL ORDER

Garfinkel was one of the most original – and controversial – thinkers in sociology. The publication of his book in 1967, *Studies in ethnomethodology*, divided academic opinion. Ethnomethodology attempts to rethink the fundamental premise of mainstream sociology: the existence of ‘social facts’ such as rules, norms and values. Ethnomethodology takes these social facts used within mainstream functionalist social science to explain social action, such as ‘social rules’ or ‘social norms’, and instead treats them as endogenous accomplishments of knowledgeable members of a social group (Leiter, 1980; Handel, 1982; Button, 1991; Coulon, 1995; Francis & Hester, 2004; ten Have, 2004). In other words, what others take as pre-given external social ‘facts’ and ‘forces’ that make members of a social group ‘orderly’ and ‘organized’, ethnomethodology takes as things that people have to *produce* in an ongoing social process. Ethnomethodology is the term that the field’s founding thinker, Harold Garfinkel, used to

describe the study of ‘the work of fact production *in flight*’ (Garfinkel, 1967, p. 79, emphasis added).

From its inception, ethnomethodology was never a unified field. Even today it is best described as a splintered set of related sub-fields (Button, 1991). One of the most significant relationships is that between ethnomethodology (EM) and conversation analysis (CA), the latter field emerging from the work of Harvey Sacks. Some people use the term EM/CA to highlight this link (Llewellyn & Hindmarsh, 2010). This chapter will focus primarily on ethnomethodology, but interested readers are invited to consult Drew and Heritage (2013) for an overview of CA.

Ethnomethodology emerged as a critique of the structural functionalist sociology of Talcott Parsons – under whom Garfinkel studied at Harvard University in the 1940s. Functionalism sought to identify the social structures, facts, variables and forces that are presumed to create social order. The term social order refers to any kind of cooperative, predictable and stable set of social relations that exhibit some kind of orderliness. This could be the kind of social rules, norms and values that are presumed to emanate from so-called ‘macro’ institutions such as the State, the education system or religion, which are understood to govern society writ large. It could also be the so-called ‘micro’ social order of forming a queue. However, for ethnomethodology, this distinction between micro and macro is a misnomer (Hilbert, 1990), as all social action is endogenously generated, and the classification of ethnomethodology as a ‘micro’ approach has been strongly rejected (Garfinkel & Rawls, 2002). Thus, ethnomethodology does not ignore social structure or indeed organizational structure; rather, it re-specifies it as an ongoing accomplishment of members (Button, 1991) – what Boden (1994) refers to as ‘organization-in-action’.

Ethnomethodology addresses the same ‘problem’ or ‘topic’ as sociology – namely, how social order and structure is generated or transformed – but ‘turns it on its head’. Rather

than seeing people as ‘judgemental dopes’ or ‘dupes’ who are ‘pushed and pulled’ by social facts – such as a social rule, norm or value – it views social order as the ongoing, artful and knowledgeable *accomplishment* of members (Garfinkel, 1967). Drawing on the phenomenology of Alfred Schutz (1953), Garfinkel was interested in how members used their stock of knowledge and reasoning procedures about the social world to produce the ‘social facts’ that other sociological theories treat as unproblematic. Systems of order and organization are of course how business and management practices of various kinds get done, but this order is now understood as ‘an ongoing achievement of member’s methods for producing it – rather than the result of structures, cultures, habits, routines, power, or interests, as other theories assume’ (Rawls, 2008, p. 709).

What is an ‘Ethno-method’?

It might be useful to take a simple example. Llewellyn and Hindmarsh (2010) use the example of customers forming a queue – a social practice commonplace in retail businesses and a very basic unit of social organization commonplace across Western society.¹

As a basic form of social organization, the queue is only witness-able, and thus join-able, because people are able to recognise, and orient their conduct to, ‘what queues look like’ and ‘what queuing practically involves’. (Llewellyn & Hindmarsh, 2010, p. 4)

What are the ethno-methods we routinely use to recognize that a line of people is, in fact, a queue? And what are the ethno-methods we use to display to others that we have joined it? These ethno-methods involve all the taken-for-granted social *knowledge* and associated forms of *reasoning* that we have about queues, such as:

Where the ‘front’ and ‘back’ is, and which to join;
Whether to face other people’s front or back;
How to stand not-too-far and not-too-close to the person in front;

How to signal to others you are waiting to pay and not doing something else;
And so on.

In other words, we have our own ‘social theory’ of queues that we put to use in order to recognize and join one. In essence, the people that sociologists study are also sociologists of a kind: they are ‘folk sociologists’ (Wieder, 1974) or ‘practical sociologists’ (Benson & Hughes, 1983), using their knowledge of the social world to accomplish their practical tasks, such as queuing or running a business. Sociology – knowledge of the social world – is not just something that academics in sociology departments of universities know about. It is something that we are all competent in, as members of society.

Ethnomethodology is interested in studying these ‘theories-in-use’ that constitute actual organizing processes (such as queueing, or running a business), not in replacing these with their own (supposedly more complete or accurate) academic theory. As an empirical programme of research, this means studying actual scenes as they unfold, in real time, in order to identify the kinds of knowledge and reasoning – the ‘ethno-methods’ – that enable people to organize themselves to accomplish some kind of joint activity. The world of ‘business’ is only possible because people have methods for accomplishing the activities involved – a sales pitch, a strategy presentation, a recruitment interview, a performance appraisal – and ethnomethodology seeks to study empirically what these methods are and how they are used to get that business activity done. It asks the deceptively simple question: how do members make sense of their social world? As Llewellyn (2008, p. 767) puts it, ‘the question of what should be inferred from specific expressions, utterances and bodily movements is a problem – not for analysts – but for members’. The task for the ethnomethodologist, then, is to undertake systematic and fine-grained studies of how members solve these ‘problems’ in order to produce order and organization in various social settings – including formal business organizations of different kinds.

Key Concepts in Ethnomethodology: Indexicality, Reflexivity and the Documentary Method

The example of forming a queue illustrates a number of central ethnomethodological constructs (see Garfinkel, 1967): *indexicality* (developed from earlier uses in linguistics), *reflexivity* and the *documentary method of interpretation* (a concept first developed by Mannheim, 1952). The term *indexicality* originates in linguistics and, within linguistics, it is used to refer to certain words which mean different things depending on the context that they 'index' (think of how an index in the back of a book 'points to' a page location). The word 'they', for instance, derives its sense from particular group that is being 'indexed' or 'pointed to' in that particular context. Ethnomethodology extends this by proposing that *any social action* – not just certain words but any utterance, any gesture, or indeed any kind of socially recognizable action – only 'makes sense' through inferences about what the action 'indexes' or 'points to' in that particular context. A cough is a good example: it can be taken to 'index' a (not socially meaningful) physical act of clearing one's throat, or – done in a particular way by a particular person in a particular context – can be read as 'indexing' disagreement, a desire to interject or a signal to stop what you are saying or doing for some reason.

The *documentary method of interpretation* refers to the circular process through which each 'appearance' of social action we encounter is made sense of as 'documenting', 'indexing' or 'pointing to' an underlying pattern or 'typification', the latter concept taken from the phenomenology of Schutz (1953). Think of the appearance as the 'here and now' immediate scene you have just encountered (e.g. an utterance, a gesture or a cough) and the pattern as how this is connected to the 'larger social scene' (Leiter, 1980, p. 171) – something that is an enduring, typical and recurring aspect of the social world (like a norm, rule, role, motive, social type and so

on). Moreover, because the 'pattern' itself is derived from collecting together these 'appearances', this is an ongoing cycle of 'pattern-making'. The term *reflexivity*, then, refers to the inherently circular nature of this process of making sense of particular appearances through reference to wider patterns and simultaneously creating these self-same patterns through collections of appearances. In the queuing example, an appearance in a shop of a person standing still, standing close to another person (who is also standing still) and each person looking at the other person's back would routinely be made sense of as 'documenting' or 'indexing' the pattern 'a queue'. And we use the pattern 'queue' to understand what we have just seen an 'appearance' of. Both elaborate each other. Reflexivity is the term used by ethnomethodologists for this process of mutual elaboration. Of course, should something about the immediate 'here and now' scene change – the person turns around or walks off, for example – a different 'pattern' would probably be applied: namely, 'person shopping'.

The appearance of stability and orderliness, in everyday life as well as formal business organizations, is therefore built from the continuous use of member's common-sense *knowledge* of what is happening and common-sense *reasoning* about what they should do. Hence, ethnomethodology seeks to study the 'stock of knowledge' and 'reasoning procedures' – or what Cicourel (1973, p. 52) alternatively calls 'interpretive procedures' – that makes social organization possible. Maintaining something as simple as a queuing system therefore requires constant, albeit largely imperceptible and predominantly unconscious, effort and activity. It is what Rawls (2008, p. 701) refers to as the 'constant mutual orientation' to unfolding scenes of action. In short, what appears to the social scientist as a stable object of analysis – a 'rule' or a 'norm' – belies a continuous process of social fact production, and it is this process that ethnomethodology seeks to study.

THE ETHNOMETHODOLOGICAL STUDY OF ORGANIZATION

What implications does an ethnomethodological perspective have on the approach to researching formal organizations – the topic of study for business and management studies? Ethnomethodology rejects the idea that organizations – or indeed any other social phenomenon – can be understood as ‘entities’ with various ‘attributes’ that are amenable to analysis with a cause-and-effect logic. Therefore, it does not see things like organizational structures, job attributes, rules, norms or values as ‘input variables’ that can be measured as predictors of organizational outcomes, such as employee engagement, firm performance, level of innovation or sources of competitive advantage. Within business and management studies, terms such as organizational structure or culture are typically listed as an ‘attribute’ of an organization, and typically treated as a variable that either causes other things to happen, or is itself a causal output of another variable. Sometimes these ‘facts’ and ‘factors’ are represented visually as a word in a box, with an arrow arising from it or pointing to it, as if to indicate that they are objects that have properties that do things, or can have things done to them – in the same way that, say, water has the property of being able to be heated to produce steam. The social process that is ‘organization’ is treated as a ‘thing’, and presumed to have ‘attributes’ like a structure and a culture, in the same way that an office block as a physical object can be said to have attributes like a particular height or number of floors.

Bittner (1974, p. 73) explains how ethnomethodology seeks instead to study how people’s common-sense and taken-for-granted reasoning enables the rational structures (or what he calls the ‘formal scheme’) of bureaucracy to operate:

one is confronted with a rich and ambiguous body of background information that normally competent members of society take for granted as

commonly known. ... [This] information enters into that commonplace and practical orientation to reality which members of society regard as ‘natural’ when attending to their daily affairs.

Hence, it is through their ‘everyday mundane knowledge and reasoning procedures’ that organizational members “‘make sense of’ and ‘act on’ the situations in which they are involved’ (Samra-Fredericks & Bargiela-Chiappini, 2008, p. 660). The formal schemes of organizations – their rules, hierarchies, guidelines, procedures, plans and instructions – do not simply push and pull members into compliance, as if working as invisible background forces. Rather, they rely on the knowledge and reasoning of members regarding when, and how, they should apply. Bittner uses the term ‘gambit of compliance’ to describe the ways in which competent members find in the formal scheme the means for doing whatever needs to be done, connecting an infinite variety of actual circumstances to instances of ‘rule compliance’, making rules do things that could never be predicted from their abstracted written form. As a result:

problems referred to the scheme for solution acquire through this reference a distinctive meaning that they should not otherwise have. Thus the formal organizational designs are schemes of interpretation that competent and entitled users can invoke in yet unknown ways whenever it suits their purposes. The varieties of ways in which the scheme can be invoked for information, direction, justification, and so on, without incurring the risk of sanction, constitute the scheme’s methodical use. (Bittner, 1974, p. 76, emphasis in original)

The point is not that organizational members ‘misbehave’, and should be more strictly controlled to comply with formal instructions. The point is that this is precisely *how* organizing is possible. Literal, grammatical readings of rules would threaten to bring organizations to a halt without the competence of members in supplying their ‘rich and ambiguous body of background information’ (Bittner, 1974, p. 73). Those applying rules ‘literally’ could actually expect to be sanctioned for such behaviour.

For Bittner and other ethnomethodologists, then, ‘the task of deciding the correspondence between schemas and actualities is one that should be transferred from the sociological theories back to the workplace participants who operate with those schematics’. (Sharrock, 2012, p. 22). As Gephart (1978, p. 558) argues, ‘members must work to define activities as falling within the organizational scheme. As members confront practical problems, they invoke the organization as a scheme furnishing solutions, but this scheme is reconstructed, modified and negotiated continuously to fit the practical problems at hand’. This continuous *work* of making sense of organizational schemes of various kinds – both formal prescriptions and informal ‘ways of doing things’, both ‘macro’ aspects of broad institutional fields and ‘micro’ aspects of immediate work groups – means that they cannot be understood as stable ‘variables’, but must instead be understood as *social and interpretative processes*.

BUSINESS AND MANAGEMENT STUDIES: ETHNOMETHODOLOGICAL INSIGHTS

This section will provide a brief overview of how ethnomethodology has been used to generate insights into how businesses and other kinds of formal organizations work – both in its ‘home’ discipline of sociology as well as in business, management and organization studies. It might be helpful to the reader who wants to delve into some existing studies that have drawn on ethnomethodology, to get inspiration for designing their own study.

Right from its very inception in the 1960s and throughout the decades that followed, ethnomethodologists have been interested in studying not only informal social interaction but also the work of, and in, formal organizational settings. Classic early studies of the ‘business’ of organizations include:

Coroners tasked with deciding the cause of death when presented with a dead body (Garfinkel, 1967, p. 11–18);
Police officers detecting crimes and dealing with criminals (Sudnow, 1965; Bittner, 1967; Meehan, 1986);
Case-workers in a welfare agency assessing benefit claimants (Zimmerman, 1969);
Staff in a half-way house for rehabilitating offenders working with ex-convicts (Wieder, 1974);
Jurors, lawyers and judges doing their work of upholding ‘justice’ in the criminal justice system (Garfinkel, 1967, Chapter 4; Cicourel, 1968; Atkinson & Drew, 1979; Pollner, 1987);
Scientists at work in a laboratory (Garfinkel et al., 1981; Lynch, 1993).

Interestingly, almost all of the early studies were in formal ‘organizations’ of some sort, with some kind of ‘business’ to conduct (whether for-profit or not) and formal structures, regulations and rules concerning how they should operate.

More recent work has set about explicating the ethno-methods employed to accomplish all kinds of business operations and work tasks. The collection of studies in the book edited by Garfinkel (1986) entitled *Ethnomethodological studies of work* began to unpack the locally produced orders of work that existing studies of work all relied upon, but typically ignored. The term ‘Workplace Studies’ began to be used as a label to describe ethnomethodological studies that sought to reveal the methods that organizational members use to make coordinated action possible by interacting with other people, spaces, artefacts and machines of various kinds. Many of the influential studies involved technological artefacts of some kind, and work in this field often focused on ‘computer supported cooperative work’. Suchman’s (1987) early ground-breaking work on human–machine interaction challenged the dominant thesis that plans – or for that matter any formal system of instructions or rules – are what guides conduct, using the example of an expert system designed for photocopiers. Julian Orr (1996) also draws on ethnomethodological

inspiration in his study of photocopier repair technicians, showing the inadequacy of even the best instruction manual given the tacit knowledge required to 'read' the machines. Button and Sharrock's (1998) study of a large-scale technology project in a multinational company shows how members of the project team designed their actions to be organizationally accountable.

Suchman (1993) later went on to show how various digital displays and controls in air-traffic control centres are used to accomplish the organization of flight paths. Christian Heath, Jon Hindmarsh and Paul Luff took up a similar project in their study of the use of information systems in a variety of organizational settings, most notably the work of London Underground control rooms (Heath & Luff, 2000) and train drivers (Heath et al., 1999). More recently, Neyland (2006) explored how CCTV operators make decisions about what the images on screens mean and what actions should be taken – such as calling the police – based on their reasoning about the motive, intent and moral standing of different categories of person. This body of work within 'Workplace Studies' has also found many practical applications, particularly in the design of human–computer interfaces and information systems (Luff et al., 2000). In addition to technological artefacts and material environments, ethnomethodological studies have also shed light on how business gets done with texts, graphs and documents of various kinds. One of Garfinkel's original studies was of clinical records in an outpatient psychiatric clinic and how seemingly 'bad' records may fulfil other 'good' organizational functions because of the way they were created for potential future readers (Garfinkel, 1967, Chapter 6). Zimmerman's (1969) study of document-use by welfare claim assessors also showed how documents come to make sense – and serve as a basis for inference and decision-making – through the bureaucrat's social knowledge of who or what created them and for what purposes.

For ethnomethodology, organizing occurs through the production of 'accounts' of various

kinds, whether these are oral or written, linguistic or numerical, verbal or non-verbal. Accounts do not describe 'the facts of the matter', they produce them. Documents of various kinds, such as strategy texts, management accounts or financial reports, therefore require study within the *social interactions* through which they are made to make sense (Watson, 2009). Heath & Luff (1996) show how medical records relied upon the background reasoning shared by doctors to make inferences about the 'facts' concerning the patient. Recent work in Rouncefield & Tolmie's (2011) book *Ethnomethodology at work* considers how people in organizational settings produce numbers that transform the organization into a 'calculable' entity (Hughes, 2011), how activities are rendered intelligible in relation to formal plans (Randall & Rouncefield, 2011), how meetings are organized around documents and artefacts such as agendas, projectors and spreadsheets (Hughes et al., 2011), how documents – both paper-based and digital – are used for mundane coordination and decision-making (Hartswood et al., 2011), and how various texts are 'read' and made sense of in situ (Rooksby, 2011). Documents of various kinds are also important in the collection of studies in Llewellyn and Hindmarsh's (2010) book *Organization, interaction and practice*. Samra-Fredericks (2010) study shows how strategic plans are put to work in business meetings, and Moore et al. (2010) examine how apparently simple order forms enable the coordination of dispersed organizational activities.

Ethnomethodology has influenced studies of how those formally tasked with managing or leading organizations get their job done. An early paper by Gephart (1978) studied how a sense of 'crisis' was constructed during a committee meeting that enabled the 'status degradation' of a current leader and succession to a new leader to be accomplished. Housley (2003) examined how critical decisions about social care and welfare are made when 'expertise' from different professionals is brought together in multi-disciplinary

teams. Work by Samra-Fredericks on strategic decision-making and leadership has shown how boardroom influence is accomplished (Samra-Fredericks, 2000), how managers attempt to shape strategic direction (Samra-Fredericks, 2003), how emotions and rationality are intertwined in leadership talk (Samra-Fredericks, 2004), and how power effects are constituted through everyday interaction (Samra-Fredericks, 2005). Iszatt-White (2010, 2011) has developed insights into how leaders go about influencing others at work. Bolander and Sandberg (2013) draw on ethnomethodology to examine the reasoning procedures used by managers and HR professionals to make recruitment decisions following job interviews. Llewellyn and Spence (2009) and Llewellyn (2010) have delved into the job interview itself, exploring how the interviewer and interviewee mutually oriented to, and thereby produced, the 'recruitment interview'. As an approach to studying 'sensemaking', ethnomethodology is also one of the key influences in Karl Weick's (1969, 1995) influential theory of organizational sensemaking. Bob Gephart's work in particular has been influential in advancing the more ethnomethodological 'version' of sensemaking in business and management studies, through studies of sensemaking in a succession battle (Gephart, 1978), crisis sensemaking following environmental disasters (Gephart, 1984, 1993) and how statistics are made sense of in and by organizations (Gephart, 1988, 2006).

Finally, a small but growing body of ethnomethodological work has started to emerge examining the accomplishment of market exchanges. Here, the 'material' consequences of members' ethno-methods for coordinating action are often most visible, as studies trace the consequences of interactions for the exchange of money for goods or services. These studies pose questions such as: how are markets constructed through interactional practices of displaying, recognizing, evaluating, comparing and valuing goods and services? Clark and Pinch (2010) show

how shoppers in a retail store attempted to elicit, or evade, the attention of salespeople, even before a conversation about a 'sale' had begun. Heath and Luff (2010) demonstrate how deceptively simple actions, such as the nod of a head, are produced and recognized to accomplish the order of bidding in a fine art and antiques auction. Llewellyn (2011) examines how a 'gift exchange' is established when people offer to 'pick up the bill' for another person, such as a friend or family member. Another study by Llewellyn of a street salesman showed how, in a matter of seconds, a market exchange was transformed into a gift exchange through the use of speech, gesture and bodily position (Llewellyn, 2011a). Llewellyn and Hindmarsh (2013) also coin the term 'inferential labour' to describe the importance of the taken-for-granted but essential work that service workers undertake in 'sorting' their customers of various kinds to establish relevant 'facts' about them, such as their age or employment status. This emerging body of ethnomethodological work on economic exchange shows great potential for recovering the activities that are 'glossed' in disciplines such as marketing, finance and economics, which often trade on the idea of 'facts' such as 'markets', 'buyers' and 'sellers' without seeking to uncover the social practices ('ethno-methods') through which these processes are created *as* facts.

IMPLICATIONS FOR RESEARCH METHODS

What are the 'research methods' best suited to studying these 'ethno-methods' used in business and management settings? For researchers studying 'organizations' of various kinds, ethnomethodology invites us to look for very different things compared to conventional, positivistic styles of research. Ethnomethodological studies of organization do not seek to measure 'variables' relating to the organization or its members. Even the

term 'organization' itself is viewed as an unhelpful abstraction, as it treats a social process as if it were a stable 'thing' (Rawls, 2008). An ethnomethodological analysis would examine how the appearance of stability of 'an organization' relies upon ongoing *organizing* work: the 'constant attention and competent use of shared methods of organizing action for its achievement' (Rawls, 2008, p. 702). In methodological terms, studying this organizing process should involve *close observation of people going about their everyday work*, perhaps with the aid of some kind of recording technology that would enable these organizing processes to be slowed down and subject to repeated analysis (Llewellyn & Hindmarsh, 2010). Hence, observation is the central 'research method' used in ethnomethodological studies. This can involve gathering *primary* data – your own records of what happened in the form of field notes or recordings, or, particularly where this is not possible or practical, gathering *secondary* data – existing records produced by the organization being studied (documents, websites, data records, etc.). Gephart's (1984, 1993) studies of publicly available data, such as transcripts of official hearings and reports by investigatory bodies following an environmental disaster, is a good example of the latter approach.

What do the myriad of ethnomethodological studies detailed in the previous section have in common in terms of research methods? They share in common a close attention to the details of how social reality is produced as members generate and exchange accounts (oral or written, linguistic or numerical, verbal or non-verbal) of their social reality. This means studying organization 'as it happens' (Boden, 1990), not as it is retrospectively recounted or rationalized, or how it is translated into inscriptions designed for the researcher (interview accounts, survey questions, diaries, etc.). As a basic methodological requirement, then, an ethnomethodological study needs to use research methods that enable the researcher to identify how a particular

sequence of real-time, organized action is accomplished by observing it in some way *as it unfolds*. It would also ideally be informed by deep immersion in the field site(s) that enables 'an embodied experience of the work in question' (Rawls, 2008, p. 711).

Such deep immersion could mean *participant* observation – quite literally training to become competent in doing the business activity and then actually taking part in the activity with those you are studying. Particularly where the knowledge and reasoning procedures are more specialized and technical rather than 'common knowledge', this enables the researcher to *identify* and *understand* the ethno-methods that are used to 'do business' in that setting. Ethnomethodologists sometimes refer to this as the 'unique adequacy requirement', in which the researcher must have 'adequate' mastery of the setting under study 'as a precondition for making ethnomethodological observations and descriptions' (Lynch, 1993, p. 274; see also Rawls, 2008; Rouncefield & Tolmie, 2011). The study would also ideally – should access be possible and practical – be accompanied by audio- and/or video-recording that enables activity to be later 'slowed down' and 'repeated' during the analysis process (Llewellyn & Hindmarsh, 2010). Social interactions often happen so quickly, and in such 'un-noticed' ways, that a researcher has little time to notice or capture their detailed features in a notepad, so technology can help by making a permanent record that can be scrutinized and replayed multiple times.

As a 'qualitative' approach, ethnomethodology does not mean shunning all interest in quantification *per se*. However, the ethnomethodological researcher does not seek to turn their various forms of data – tape-recordings, video-recordings, field notes, documents, etc. – *into* numbers. Rather, an ethnomethodological researcher would seek to study how forms of quantification and calculation are *used* by members of a social group or formal organization to accomplish some business or management activity, such

as producing an accounting spreadsheet (Hughes, 2011) or conducting a customer satisfaction survey (Gephart, 1988).

The scope of empirical settings that can be studied using an ethnomethodological approach is vast. No setting is in principle ‘out of bounds’, providing sufficient access can be granted to study the ethno-methods being used in real-time as it unfolds. Researchers in the field of business and management studies could use ethnomethodology to study how people working in businesses design and sell their goods and services to customers, whether through traditional retail settings or through the Internet, thereby contributing to knowledge in the field of *Marketing*. Research could be conducted on how people organize the flow of materials or information within the organization during the production process, and how goods or services are shipped to customers or end users, thereby contributing to knowledge in fields such as *Logistics*, *Operations Management* and *Information Systems*. Studies could also be conducted of how leaders and managers get their job done – hiring and firing, making strategic decisions, managing change and innovation, gathering and using management information, and managing people and processes – thereby generating contributions to *HRM*, *Leadership and Strategic Management*. The social process through which businesses are created, how they grow and how they innovate would also enable insights into *Innovation and Entrepreneurship*. *Accounting and Finance* are also ripe fields of inquiry, given the potential to study how financial data and accounting information is created and used in business settings. Indeed, studies in many of these fields have already been listed in the previous section above.

Like other qualitative approaches such as ethnography,² ethnomethodology is interested in studying the phenomena in the environments in which they naturally occur (Gephart, 2004). That means avoiding ‘artificial’ or contrived set-ups, which do not happen as part of the normal activity of that

organization, such as interviews, surveys or experiments designed purely for the purposes of research that the organization does not normally undertake themselves.³ This means a different approach to research methods, such as semi-structured interviews, life history interviews, focus groups, visual methods, open-ended questionnaires, or diary studies. Other ‘mainstream’ approaches to research typically get their participants to undertake these things as a way of gathering ‘data’ about them and the organizations they work for. Ethnomethodologists think this tells us little about the ethno-methods that members use to accomplish their work. These methods are more likely to tell us about the ethno-methods – the common-sense stock of knowledge and reasoning procedures – that people use to accomplish ‘being interviewed by a researcher about my work’ or ‘selecting a Likert scale response on a questionnaire survey about my work’. Instead, the ethnomethodological researcher would study where, how and when these various kinds of ‘research methods’ are used in organizations as part of their ordinary business practices, in order to get some kind of ‘business’ done. For example, earlier I described how ethnomethodologists have studied how recruitment interviews (Llewellyn, 2010) or welfare claimant interviews (Zimmerman, 1969) are accomplished. The researchers did not conduct qualitative interviews with the people involved *about* their experiences of going for job interviews, or applying for welfare benefits. Rather, the researchers *observed the real-time practices* (‘ethno-methods’) used to accomplish the organizational activity of job interviews and welfare claim assessments.

Having collected their data through various forms of observation of social practices, what kinds of claims do ethnomethodological researchers make from their data? It might be useful to finish this section with some key points about what ‘doing an ethnomethodological study’, as a research perspective or paradigm, means for researchers – and crucially what it also does *not* mean.

- 1 Ethnomethodology's emphasis on 'knowledge-ability' must not be confused with claiming that members are always *conscious* of these ethnomethods. In fact, a central project of ethnomethodology is to explicate, study and document the typically *taken-for-granted* ethno-methods used by members. Samra-Fredericks and Bargiela-Chiappini (2008) use Garfinkel's phrase 'seen-but-unnoticed' to describe this taken-for-granted nature of common-sense reasoning. Rawls (2008, p. 711) describes it as the 'normally thought-less' character of ordinary activity: citing Garfinkel's infamous 'breaching experiments' as exercises designed to help us 'see' the constant mutual orientation that makes social organization possible. These breaching experiments showed that taken-for-granted 'facts' are only topicalized when they become problematic in some way. The fact that it is 'obvious' and 'just common sense' to competent members of society that a particular person is in a queue – just as most business activities like buying goods in a shop or phoning a call centre also seem common sense to us – is precisely the point. It is our common-sense knowledge that makes these activities happen without us noticing the *work* we do to make them happen. Only when the person in front of you in the 'queue' does not move forward when the queue moves forward, or suddenly turns around and faces you, or starts to wander off, does this activity become 'problematic' and therefore noticed.
- 2 Ethnomethodology's emphasis on the 'ongoing' and 'artful' accomplishment of social organization does not mean that 'anything goes': that any social action is viewed as sensible or that any account will be accepted or ratified by others. It also does not mean that people are 'free to do what they like' in social situations (Cuff et al., 1992, p. 174). Quite the contrary: ethnomethodology is centrally concerned with uncovering the more-or-less institutionalized and unequal opportunities and rights of different social actors to produce accounts and have them accepted by others and also the extent to which members are socially sanctioned in their attempts to deviate from expected or required types of behaviour (Watson & Goulet, 1998). It is an *empirical* question precisely how much 'room for manoeuvre' people have in particular situations (Cuff et al., 1992, p. 174).
- 3 Ethnomethodology does not seek to use its 'data' to make claims about what an event or activity 'really is' – either by ratifying an explanation given by one particular member as the

most accurate or reliable version of reality, or by replacing all of the member's explanations with the analyst's own version of 'the reality'. It is most certainly not about judging whether members are right or wrong in their understandings and explanations of their social world. The point is not to criticize, undermine or expose as 'false' how members make sense of their reality. Rather, the point is *to study empirically* how they produce and use these understandings and explanations. As Cuff et al. (1992, p. 177) explain:

In order to investigate members' understandings as practical accomplishments, ethnomethodology abstains from taking any position on what an action or event 'really is'. Its central interest is in how members decide such matters. ... Ethnomethodology, as a form of sociological inquiry, does not depend upon giving final or definitive descriptions of actions or events, far less upon giving unchallengeable explanations.

- 4 Ethnomethodology has its own answer to the 'so what?' question. What is the point of finding out about these ethno-methods used to accomplish business? Isn't it just 'obvious' – just 'common-sense'? For ethnomethodologists, the point of studying what members take as 'obvious' – and more importantly how they produce that 'obviousness' – is that this common sense is what is *constitutive of*, and *consequential for*, the unfolding scenes of social action they are involved in, such as conducting a recruitment interview (Llewellyn, 2010) or a conversation about business strategy (Samra-Fredericks, 2003). It is through their talk (and other social actions) that these business activities, processes and activities get done. Members' methods are what are used to 'get the task done' in consequential ways. For example, Zimmerman (1969) shows how case workers in a public welfare agency used their common-sense knowledge and reasoning procedures about the welfare claims they received to make the decisions about which claims should get approved and which claims should be rejected. It was this knowledge and reasoning that *constituted* their 'decisions', and these decisions were clearly *consequential* for those people who made the claims.
- 5 This takes us to the fifth and final point. Ethnomethodology is not concerned with just 'talk', or even just 'interpretation', understood as separated from so-called wider 'material structures'. Material outcomes most certainly

flow from the ethno-methods used in various institutional settings. Forms of unequal power, domination, inequality and exploitation are also thus implicated. The ethno-methods used in institutions such as the education system and the judicial system *are* what produce the unequal outcomes according to gender, race or class, as illustrated by studies of school classrooms (Leiter, 1976; Mehan, 1979), high school counsellors (Cicourel & Kitsuse, 1963), and the policing and prosecution of juvenile offenders (Cicourel, 1968; Meehan, 1986). Hence, ethnomethodology is not 'silent' on the 'big issues' of structural inequality in society, even though the commitment to so-called 'ethnomethodological indifference' means it deliberately does not 'take sides' and privilege or ratify certain versions over others (Gubrium and Holstein, 2012) (see point 3 above).

METHODOLOGICAL CHALLENGES

Before concluding this chapter, it is worth considering some of the challenges that can often be encountered by researchers using an ethnomethodological approach. The first and most obvious challenge is one of *access* to the setting being studied. Unlike surveys, experiments and interviews, which are typically understood as relatively low-risk and low-commitment by participants (usually just a few hours of their time and with a guarantee of anonymity), ethnomethodological studies tend to require either deep immersion in the setting over a long period of time in the form of participant or non-participant observation – what Crabtree et al. (2000) refer to as ethnomethodologically informed ethnography – and/or the use of video or audio recording technology to capture the details of social interaction as it happens. Both of these methods rely on participants trusting the researcher(s) enough to let them in to observe them and/or record them. These methods can also pose a form of distraction or disruption to their everyday activities – especially if they are aware of being recorded. As the infamous Hawthorne studies showed, recording or observing people can affect their behaviour and this needs to be taken into account.

Some *ethical approval* procedures employed in universities nowadays also stipulate informed consent procedures that prohibit the recording of people without their explicit signed consent – something that would scupper any attempt to record people in their naturally occurring environment. To this end, researchers have made good use of existing recordings that are generated as part of the normal workplace activities, such as the recordings routinely made in call centres or webcasts. Other researchers have placed video cameras in public places where people expect to be filmed for other purposes (e.g. by CCTV on the high street and in museums) and used information posters to inform people that they are being recorded for research purposes, coupled with pixilation of faces and voice disguises on audio recordings to give additional anonymity (e.g. Llewellyn, 2011, 2011a; Llewellyn & Hindmarsh, 2013). The availability and placement of the technology is also a consideration and a potential drawback. Cameras must be strategically placed to capture the 'action' and often cannot capture every angle, an important consideration for ethnomethodological studies given the focus on how non-verbal behaviour such as gesture, gaze and bodily position are used to accomplish turn-by-turn organization.

There is also the issue of how to analyse the data and write up the findings. There are two related challenges here: the *analytic* challenge of deciding how to carve up the data for analysis and the *technical* challenge of presenting the 'raw material' of the video or audio data in a readable format for a written output. The analytic challenge is distinct for ethnomethodologists because they do not 'code' their data in the same way as other qualitative researchers. Two main strategies can be employed (see Francis & Hester, 2004: Chapter 2). Extended case analysis looks at a sequence of social action (for example, a manager giving instructions or an employee selling a product) and studies how it unfolds over time within its naturally occurring setting in order to identify the ethno-methods used to accomplish it, often embedded in a rich description of the field setting. This approach is particularly valuable when the activity being

studied is non-routine in nature and cannot therefore be naturally ‘grouped together’ with other such instances to form a ‘collection’.

A ‘collection’ refers to the grouping together of similar social actions (for example, managerial instructions to subordinates or sales pitches to customers, to continue the examples used earlier) to examine patterns of similarity and difference in how those social actions are accomplished and responded to. This latter approach of creating collections is typically used in the ‘sister’ field of ethnomethodology known as conversation analysis (CA), developed from the work of Harvey Sacks, who was himself inspired by Garfinkel’s ethnomethodology. CA uses these collections to develop systematic studies of how interaction is organized and accomplished, including applied studies of how talk is organized in institutional settings such as businesses (see e.g. Antaki, 2011).

The technical matter of how to present the video and audio data is the final challenge. Some ethnomethodologists capture ‘stills’ of the video to present alongside the transcript at various points when noteworthy social actions are being accomplished non-verbally. Transcripts are normally presented in the so-called Jeffersonian transcription system developed by Gail Jefferson (see Antaki, 2011, p. xii for a simplified version of Jeffersonian transcription notation) – a system alien to many editors, reviewers and readers that poses a challenge in itself. Some journals nowadays will allow video or audio clips to be uploaded with the written paper – subject to ethical consent from participants – a move that would certainly alleviate the challenge of trying to translate the raw data into a readable, text-based format.

CONCLUSION

Ethnomethodology offers a way of studying ‘the flow of “real-time” or “live” conduct within organizations’ (Llewellyn & Hindmarsh, 2010), which sets it apart from other ‘theories’ and their approach to research methods. Where other perspectives take the

accomplishment of organized action for granted, or merely provide a brief description of this work in order to get on with the business of ‘analysis’, ethnomethodology turns its analytic attention to this very fundamental activity that makes organization possible. As Llewellyn and Hindmarsh (2010, p. 4) argue: ‘It is only possible to witness, as seemingly objective and concrete phenomena, a business presentation, a recruitment interview or an action because they are continually being built and reproduced that way by members’.

According to Garfinkel and Rawls (2002), if we look at organizations such as firms and see that they manifest some kind of stability over time, some kind of ‘patterned orderliness’ to use their term, then we must therefore assume that, first, this is something that people must work constantly to achieve, and second, that these people must therefore have some shared methods for achieving it. In other words, while other approaches to business and management studies start with the assumption that ‘an organization’ exists with various ‘attributes’ or ‘variables’, ethnomethodology provides a radically different approach to business research by inviting us to study the activities through which these ‘facts’ are produced. The point is not to judge whether these facts are right or wrong: to prove or disprove their ‘factual’ status. Nor is it to replace them with the analyst’s own version of what the facts really are. Rather, the point is to study the *activities* (‘methods’) that are used to make them ‘fact-like’. This aim of this chapter has been to provide an overview of the main tenets of ethnomethodological thought, show how it approaches the study of formal organizations, provide an overview of existing ethnomethodological studies of business and management settings, and provide some guidance for researchers wishing to take up an ethnomethodological approach in their own studies.

Notes

- 1 Queueing has also been subject to ethnomethodological study - see Ball and Smith (1986).
- 2 Wieder’s (1974) book *Language and social reality: The case of telling the convict code* provides a useful guide to the differences between

ethnography as commonly conducted in anthropology and sociology (Part 1 of the book) and its ethnomethodological variant (Part 2 of the book). See also Rouncefield and Tolmie (2011) for a more extensive exposition of what they term 'ethnomethodologically-informed ethnography'.

- 3 Businesses often do forms of 'research' themselves, such as R&D or market research, and these activities – where they occur – are perfectly suited to ethnomethodological study.

From Grounded Theory to Grounded Theorizing in Qualitative Research

Judith A. Holton

INTRODUCTION

Since its inception fifty years ago, grounded theory¹ (GT) has achieved canonical status in the research world (Locke, 2001). Qualitative researchers, in particular, have embraced GT, although often without sufficient scholarship in the methodology (Gephart, 2004; Partington, 2000, 2002). The tendency has been to consider GT a qualitative research approach while ignoring its quantitative roots and its inherent flexibility as a general research methodology amenable to a range of epistemological perspectives and research paradigms (Glaser, 2003, 2005; Holton, 2008). Consequently, we have seen a range of methodologies claiming GT status (Birks and Mills, 2011, 2015; Charmaz, 2000, 2006, 2014a; Gioia et al., 2013; Goulding, 2002; Redman-MacLaren and Mills, 2015; Strauss and Corbin, 1990, 1998; Urquhart, 2013). Over time, GT has emerged as synonymous with a more general term, ‘grounded theorizing’ (Langley, 1999; Locke, 2007) or ‘grounded analysis’ (Johnson and

Harris, 2002: 113). Walsh et al. (2015a) suggest that ‘[t]his blurring of terms is at the heart of the persistent “rhetorical wrestle” (Glaser, 1998) surrounding grounded theory’ (p. 625).

Given the various interpretations and approaches, this chapter addresses important distinctions between GT as a general research methodology and its popularization as an evolving and pluralistic approach under the umbrella of qualitative research (Charmaz, 2009). The perspective offered here is that the term ‘grounded theory’ should be reserved for work that respects the original intention of the classic methodology; i.e. the systematic generation of theory from data presented as a core category, abstract of the descriptive details of people, time and place, to conceptually explain a main concern in the area under study and its continual processing or resolution. To illustrate this distinction, this chapter begins with a brief overview of GT’s origins, foundational pillars and methodological principles then continues by addressing the methodological drift to the more general

notion of grounded theorizing as adopted by qualitative researchers who align their work to some extent or other with grounded theory. The chapter continues with an overview of the criteria for judging the quality of classic grounded theory and concludes by proposing that choosing to differentiate grounded theory from grounded theorizing offers the management field a way forward in resolving the persistent ‘rhetorical wrestle’ (Glaser, 1998) around grounded theory.

ORIGINS OF GROUNDED THEORY METHODOLOGY

GT originated in the mid-1960s with the ground-breaking work in medical sociology of Barney Glaser and Anselm Strauss (Glaser and Strauss, 1965) and the subsequent publication of *The Discovery of Grounded Theory* (Glaser and Strauss, 1967). While the text is generally acknowledged as the seminal work on GT, Glaser reveals that he was actually developing the method in his doctoral work at Columbia University and that he authored the first draft of *Discovery*, later sharing it with Strauss who added comments and wrote an additional three chapters (Glaser, 1998: 22–7).

The well-documented schism between the methodology’s originators occurred with the publication of *Basics of Qualitative Research* (Strauss, and Corbin, 1990), which publicly surfaced ‘rather disparate traditions ... and planted the seeds of divergent directions for the method’ (Charmaz, 2009: 129). Glaser’s (1992) polemic response, *Basics of Grounded Theory: Emergence vs. forcing*, offers a sharp critique in which he differentiates the original methodology from what Strauss and Corbin were advocating. He clearly regarded the 1990 publication as a remodelled method that he termed ‘full conceptual description’ (p. 123); a reaction against its excessive operationalism and his desire to preserve GT’s openness (Gibson and Hartman, 2014: 100). Glaser is generally recognized as having

retained both the spirit and the substance of the original work (Locke, 2001: 64). His continuing concern with the eroding impact of various subsequent ‘remodellings’ has motivated him to produce several additional publications in which he endeavours to clarify the purpose, principles and procedures that together constitute classic (Glaserian) GT and which, together with *Discovery*, offer researchers a solid base for its study and application (Glaser, 1978, 1992, 1998, 2001, 2003, 2005, 2007, 2008, 2011, 2013, 2014).

With its roots in inductive quantitative analysis (Glaser, 1992, 1998), GT reflects a latent structure analysis approach for revealing fundamental patterns of social behaviour that explain conceptually how a main issue (core concern) in the area under study is processed or resolved. Hypothesis generation in GT is essentially the statement of probabilities that explain these latent patterns of social behaviour (Glaser, 1998: 22). Glaser (2003: 127) claims that classic GT stands alone as a conceptualization method and that to understand the nature of classic GT one must appreciate the distinction between conceptualization and description. Glaser (1992) defines a concept as ‘the underlying meaning, uniformity and/or pattern within a set of descriptive incidents’ (p. 38). While offering descriptive findings is an important value in qualitative research (Gephart, 2004), GT is not about reporting thematically organized detailed, descriptive findings. Descriptive detail is not the concern of the grounded theorist but rather the abstraction of concepts that lie within the data. Data collection and analysis is focused on the emergence and specification of a core concept or category that identifies a main issue or concern in the area under study and *conceptually* – not descriptively – explains how that concern ‘plays out’; i.e. how it is managed or resolved. GT uses any and all types of data, both qualitative and quantitative (Glaser, 2001; Holton and Walsh, 2017).

Qualitative description confines theoretical ideas to specific contexts, limiting conceptual transferability. ‘Describing what is going on

does not explain conceptually what is going on as a fundamental pattern of social behaviour' (Glaser, 2002, para. 41). Conceptual abstraction transcends standard qualitative research concerns with accuracy, interpretation and representation of multiple perspectives via data displays to put the focus on concept generation from empirical data in service to the discovery of a latent pattern that theoretically explains rather than describes behaviour that occurs conceptually and generally in many diverse groups with a same concern (Glaser, 2003: 117). While empirically grounded, contextualization of meaning may or may not be relevant in explaining how a main concern is continually resolved (Glaser, 2004: para. 62). 'Only concepts can relate to concepts to achieve hypothesis construction. ... Descriptions cannot relate to descriptions in any clear or precise way if at all. Hypotheses, if achieved, are unit empirical with no generalizability' (Glaser, 2001: 38).

This distinction between a focus on conceptualization rather than description is a major differentiation between GT and grounded theorizing in qualitative research. It does not suggest that GT is superior to qualitative (or quantitative) methods but rather complementary. 'Quantitative research and QDA [qualitative data analysis] provide description of aggregates and in-depth cases respectively and GT provides the conceptual overview with grounded interpretation, explanations, impacts, underlying causes and so forth' (Glaser, 2003: 118). As with all theory, a grounded theory is tentative, not factual; open to modification based on additional data and analysis.

GROUNDED THEORY AS A GENERAL RESEARCH METHODOLOGY

Various scholars have positioned GT as post-positivist (Annells, 1996), objectivist (Charmaz, 2000), interpretivist (Lowenberg, 1993), pragmatist (Locke, 2001), realist (Lomborg and Kirkevold; Partington, 2000,

2002) and symbolic interpretivist (Kenealy, 2008). Much of this confusion, of course, can be attributed to the array of terminology used by various scholars to set out the boundaries and distinctions between and among the espoused research paradigms and associated issues of ontology, epistemology and methodology. Charmaz (2000) attributes the confusion to a lack of explicitness in *Discovery* (Glaser and Strauss, 1967) and the subsequent search to fit GT to accepted research paradigms (p. 524). While espousing an interpretivist perspective, Charmaz suggests that individual grounded theorists need to examine and declare their own epistemological premises; that '[t]he theory depends on the researcher's view; it does not and cannot stand outside of it' (Charmaz, 2014a: 239).

Glaser (2005) has dismissed the notion that GT is essentially interpretivist and insists that it is a general methodology that can be used with any kind of data – qualitative, quantitative or a combination thereof (p. 141) '... whatever the paradigm and the methodology for achieving it' (Glaser, 2003: 182). With its binary roots in quantitative methodology and qualitative mathematics, Glaser asserts GT's theoretical transcendence of a positivistic focus on verification in pursuit of theory generation through pattern recognition: 'Pattern search is survey modelled as it aggregates incidents like surveys aggregate people. And then the task is to start relating these conceptualized patterns to generate a theory using theoretical codes' (Glaser, 1998: 31). He notes that Lazarsfeld did not perceive any research method as wholly quantitative or qualitative but instead 'showed constantly how all research contained both elements' (Glaser, 1998:29). Rejecting the neat divide between positivist and interpretivist paradigms, Glaser claims that GT is neutral and as 'issues free as research can get' (Glaser, 2003: 115).

When viewed as a general research methodology, GT is not confined to any particular epistemological or ontological perspective; rather, it can facilitate any philosophical perspective as embraced by the researcher.

Holton and Walsh (2017) maintain this philosophical flexibility of GT, suggesting that it is the researcher's philosophical stance that comes into play in terms of 'the substantive area of interest they may choose as their initial focus and what they consider to be appropriate data sources' (p. 11). Acknowledging GT's philosophical flexibility puts to rest much of the 'rhetorical wrestle' (Glaser, 1998) – a seemingly circular process that has inhibited understanding and acceptance of the methodology and has subsequently led to numerous (mis)interpretations and remodelled versions.

GROUNDING THEORY'S FOUNDATIONAL PILLARS

Perhaps an appropriate place to begin distinguishing between GT and 'grounded theorizing' would be to identify what is essential or foundational in justifying a claim to GT. A return to the seminal text (Glaser and Strauss, 1967) is a necessary first step for anyone wishing to understand and use GT, but it is simply a start. As Partington (2002) suggests, 'despite the frequency with which [*Discovery*] is cited, by no means all of those who refer to the work are true to its purpose, which was to achieve the fine balance between procedural rigour and creativity' (p. 136). Charmaz (2014b) has suggested, *Discovery's* 'symbolic significance ... exceeded its usefulness as a guide' (p. 1076). Holton and Walsh (2017) describe the text as more an outline than a procedural guide (p. 6). Still, for any researcher wishing to understand the essence and power of GT, it is essential reading. Classic grounded theorists consider Glaser's (1978) text, *Theoretical Sensitivity*, their fundamental guide in 'setting forth a systematic approach to analysis and ... explicating the general and specific nature of GT, integrating and elaborating on methodological advances discovered and developed through ... [Glaser's] years of teaching' (Holton and Walsh, 2017: 6).

Qualitative researchers making claims to GT have frequently been accused of methods muddling (Stern, 1994) when citing their use of specific aspects of the methodology (e.g. constant comparison, theoretical sampling) but at the same time ignoring another foundational pillar, emergence. But GT is more than a 'toolbox' (Charmaz and Keller, 2016: 38) or a 'cookbook' (Gioia et al., 2013: 26). Its systematic procedures are coupled with a non-linear process of data collection and analysis that facilitates researcher creativity. Gephart (2004) suggests that 'most authors making qualitative submissions claim to have used grounded theory processes, although references to grounded theory are more common than detailed application of grounded theory techniques' (p. 456). Others make claims that misinterpret specific GT procedures (e.g. confusing theoretical coding² with coding of extant theory in the literature). Gibson and Hartman (2014) distil the essential elements of GT as openness, explanatory power, generation versus justification, theory structure and the research process (pp. 32–42). Holton and Walsh (2017) suggest three foundational pillars of GT that must be respected: emergence, constant comparison and theoretical sampling (pp. 29–30). These pillars (as elaborated below), together with GT's methodological principles (see Appendix A), enable the systematic generation of a classic grounded theory.

Emergence

While many qualitative researchers who claim GT will assert their use of constant comparison and theoretical sampling, there is much less clarity around claims to respecting GT's emergent nature. Emergence necessitates that the researcher remains open to what is discovered empirically in the data 'without first having them filtered through and squared with pre-existing hypotheses and biases' (Glaser, 1978: 3) or theoretical frameworks drawn from extant theory. Examples of GT studies respecting this fundamental precept of emergence

include Pettigrew's (2002) grounded theory of image management, Raffanti's (2005) of weathering change, Holton's (2007) of fluctuating support networks and Walsh et al.'s (2016) of expectable use. In many qualitative studies, however, emergence is restricted to the analysis phase (e.g. Corley and Gioia, 2004), and with data collection actively framed through an initial review of the literature (e.g. Partington, 2000), articulation of specific research questions, frequent privileging of interview data and the development of interview protocols for 'consistency' in data collection (e.g. Xiao et al., 2004).

While ignoring the emergent nature of GT in favour of accepted precepts of qualitative research, Partington (2002) advocates pre-framing a study through extant theory as a means of making 'explicit the researcher's ontological and epistemological assumptions [as] the best foundation on which to construct and defend a theoretical argument' (p. 141). Strauss and Corbin's (1998) linear, prescriptive approach is frequently espoused by qualitative researchers while applying preconceived theoretical frameworks together with pre-formulated problems and research questions (Strauss and Corbin, 1998: 36–42), a 'sensitizing' review of the literature (pp. 46–8) and the use of one theoretical code – the conditional matrix as a coding paradigm (pp. 181–99). While their approach may have been offered to address the inexperienced researcher's methodological hesitancy, the result is 'preconceived, forced, conceptual description' (Glaser, 1992: 4).

Another approach to theory building increasingly cited in management research papers and handbooks as equated with GT is the Gioia methodology (Gioia et al., 2013). Closely aligned with Strauss and Corbin, what Gioia et al. (2013) set forth, however, is more appropriately grounded theorizing. While the approach is inductive, they too ignore GT's foundational pillar of emergence. The focus of the study is assumed and preconceived by the researcher's professional interest rather than an emergent main

concern. While there is emphasis on concept development, concepts are described as 'more general, less well-specified notion[s] capturing qualities that describe or explain a phenomenon of theoretical interest' (p. 16) and their development is nested within a thematic analysis, emphasizing rich description of data sets that 'make extraordinary efforts to give voice to the informants in the early stages of data gathering and analysis and also to represent their voices prominently in the reporting of the research' (p. 17). Similar to Charmaz (2006, 2014a), they make no reference to a core category – the essential 'lynch pin' for theoretical integration in GT.³ While these differences may seem subtle (and unapparent to many new to GT), they significantly influence the direction of data collection and analysis, rendering it inconsistent with GT.

Constant Comparison

Glaser's early training in '*explication de texte*' at the Sorbonne would be a foundational influence in GT's constant comparative method by which the researcher examines and conceptually codes data with 'as little imputation and interpretation as possible' (Glaser, 1998: 24).

The social organization of life goes on and on. The GT goal is to discover it conceptually not describe it ... The worldview of GT is to allow the researcher the freedom to discover and generate conceptual theory about 'whatever' and not preconceive its nature. Its limits are the researcher's self and resources. (Glaser, 2003: 127–8)

The constant comparative method enables the generation of theory through systematic and explicit coding and analytic procedures whereby data are continuously compared with previously collected and analysed data as the researcher looks for similarities and differences. Each new empirical incident is analysed in relation to previously analysed data to see if the data continue to support the emerging concepts. This interchangeability of empirical indicators found within the data

moves the development of theory forward: (1) first to the emergence of a main issue or concern and a core category that appears to explain how that issue is managed, then (2) through selective coding and theoretical saturation of the core category and related concepts to (3) the emerging theory's final integration through theoretical coding.

The constant comparative process raises the conceptual level of the data. The process involves three types of comparison. First, incidents are compared to incidents to establish underlying uniformity and varying conditions. The uniformity and the conditions become generated concepts and hypotheses. Then, concepts are compared to more incidents to generate new theoretical properties of the concept and more hypotheses. The purpose is theoretical elaboration, saturation and verification of concepts, densification of concepts by developing their properties and the generation of additional concepts. Concepts are then compared to concepts. The purpose is to establish the best fit from among many choices of concepts to a set of indicators and to establish conceptual levels between concepts referring to the same set of indicators and, finally, their integration into hypotheses to establish relationships between the concepts as an integrated theory (Glaser, 1978: 49–50). Some qualitative researchers find the constant comparison process a challenge as they grapple with attending to what Glaser has termed 'worrisome accuracy' (Glaser and Holton, 2004: para. 2) – the reluctance to leave behind rich descriptive detail in service to conceptual abstraction. As such, they revert to thematic analysis or confine their attention to descriptive elaboration of a core category, neither of which produces a conceptually integrated theory. What results is 'linear, thin and less than fully integrated' (Glaser, 1978: 116).

Theoretical Sampling

The explicit coding and analytic procedures of constant comparison work in tandem with

GT's third foundational pillar, theoretical sampling, whereby in collecting, coding and analysing data, the researcher makes decisions about what data to collect and where to find those data based on theoretical ideas emerging through the iterative analysis process; what Gobo (2008) suggests is an interactive, progressive and iterative approach to sampling. As such, the process of data collection is controlled by the emerging theory. Beyond the decisions concerning initial collection of data, further collection cannot be planned in advance of the emerging theory. Only as the researcher discovers codes and tries to saturate them by looking for comparison groups can decisions be made about where to collect subsequent data for conceptual elaboration of emerging concepts. By identifying emerging gaps in the theory, the researcher will be guided as to next sources of data collection. The basic question in theoretical sampling is: to what groups or subgroups does one turn next in data collection – and for what theoretical purpose (Glaser, 1978)? The possibilities of multiple comparisons are infinite and so groups must be chosen according to theoretical criteria. The criteria – of theoretical purpose and relevance – are applied in the ongoing joint collection and analysis of data. In this way, the researcher can continually adjust the control of data collection to ensure the data's relevance to the emerging theory. Concepts earn relevance in the emerging grounded theory through this careful, systematic generation and analysis of empirical data (Glaser, 1978). This tandem process of analysis and sampling ensures that the emergent theory is grounded in the data, not extant theory, and that the emergent theory is conceptually elaborated rather than logically deduced (Glaser, 1978: 37–41).

FROM GROUNDED THEORY TO GROUNDED THEORIZING

Qualitative research represents 'a range of rich and vibrant approaches to the study of human

lives and social phenomena' (Brinkmann et al., 2014: 40), facilitating the study of issues in depth and detail (Patton, 2002: 14). Denzin and Lincoln (2011) describe qualitative research as a complex, interconnected family of terms, concepts and assumptions that cuts across disciplines, fields and subject matter (p. 3). In describing qualitative research, methodologists refer to a bewildering array of paradigms (Locke, 2001), perspectives (Chia, 2002), tensions, contradictions and hesitations (Denzin and Lincoln, 2011), strategies and approaches (Creswell, 2014), theoretical orientations (Patton, 2015), and genres (Marshall and Rossman, 2016). The varying perspectives espouse a range of epistemological and ontological premises.

While describing qualitative research as a 'vibrant and contested field with many contradictions', Brinkmann et al. (2014: 17) suggest that its existence had been 'rather shadowy and marginalized' (p. 31) until late in the twentieth century. GT's emergence had offered a much-needed response in this struggle to rebalance 'taken-for-granted hierarchies' (Charmaz, 2014b: 1074) in academia that privileged positivistic emphasis on theory verification over theory generation and that disregarded qualitative methods as holding little value, possibly even unscientific (Brinkmann et al., 2014: 17) and lacking scholarly rigour (Gioia et al., 2013: 15). Charmaz (2014b) suggests that Glaser and Strauss 'democratized theory construction and made it within the realm of the working researcher. ... They argued that qualitative research proceeds by a different canon than quantitative inquiry and cannot be judged by the criteria for quantitative research' (p. 1076).

This qualitative embrace, however, has led many to position GT as solely a qualitative research method (Eaves, 2001) or methodology (Gioia et al., 2013); 'a generic term to refer to any qualitative approach in which an inductive analysis is grounded in data' (Jones and Noble, 2007: 84), or 'simply a set of coding techniques' (Pozzebon et al., 2011: 178). Glaser (2009) has suggested that perhaps

GT's greatest contribution has been to provide qualitative researchers with a methodological vocabulary, however inappropriately applied.

While Strauss and Corbin's (1990) approach marks the initial deviation from classic GT to grounded theorizing in qualitative research, GT's devolution has been gradual but persistent. Glaser's (2002, 2003, 2004; Glaser and Holton, 2004) chief concern is that confining GT to qualitative research remodels the methodology to fit with the canons of qualitative research, thereby eroding its power as a general research methodology. Despite the wide acceptance of methodological pluralism as inevitable and a natural evolution of a methodology (Charmaz, 2014a, 2014b; Gibson and Hartman, 2014; Locke, 2001), Hood (2007) echoes Glaser's concern that this 'blurring the distinction between Grounded Theory and the generic inductive model risks losing the unique power of Grounded Theory' (p. 152). Walsh et al. (2015b) suggest remodelling 'provide[s] limitive and restrictive perspectives on GT, which is much broader and should be investigated from seminal texts if one is to grab its reach and scope' (p. 595). While Bryant and Charmaz (2007) imply that Glaser has become 'far more amenable' (p. 4) to the remodelling and has adopted a 'more accommodating view that at least acknowledges' (p. 5) the disparities, one should not confuse such acknowledgement with acceptance.⁴

Gibson and Hartman (2014) concede that methodological pluralism 'can make the task of understanding what a grounded theory should look like more complicated' (p. 30). Morse (1997) suggests that qualitative researchers are theoretically timid and may be inhibited by what she sees as the hard work of conceptualization necessary to produce theory. While acknowledging the possibility of timidity, Glaser (2001) suggests that many researchers simply lack knowledge and competence in conceptualization and, therefore, embrace the idea without fully understanding what is required. The resultant remodelled approaches are often a dim reflection of the theorizing power of classic GT methodology.

Fendt and Sachs (2008) and Evans (2013) offer us such accounts of novice efforts to understand and apply GT. In detailing the difficulties one doctoral student encountered in navigating the pluralistic approaches to GT, Fendt and Sachs (2008) advocate against what they perceive to be ‘an overly orthodox application of [GT’s] rigorous objectification procedures’ (p. 430). Their account can perhaps be best described as what Glaser (2001) has termed ‘reflexivity paralysis’ (p. 47); an unfortunate example of both novice and supervisor entrapped in methods slurring (Stern, 1994). The crux of their difficulties stems from their efforts to accommodate standard expectations of qualitative research (e.g. preconceived researcher interest as the focus of the study, extensive initial literature review), while pulling on various qualitative methods and techniques (e.g. triangulation of data sources, interrater checking, extensive verbatim quoting) that resulted in the student amassing ‘a Herculean mountain of data’ (p. 438) all the while being consumed with concerns for what Glaser (2002) has coined ‘descriptive capture’ (para. 9) and ‘full coverage’ (para. 44). While endeavouring to adhere more consistently to the classic GT methodology, Evans (2013) concludes his account by cautioning novice researchers to ‘[a]pproach the how-to grounded theory books with a great deal of caution, many speak the terms but do not walk the talk’ (p. 49). Thus, we can see how methodological pluralism without canonical clarity can lead many into methodological confusion and its inherent frustrations!

Further complicating the pursuit of canonical clarity is the globalization of research methodologies into contexts very different from those in which methodologies emerged and developed. Gobo (2011) suggests that methods are rooted in specific historical, cultural and sociopolitical contexts. Chen (2016) offers an account of efforts to embrace and adapt qualitative research methods to the modern Chinese context, noting the strictures of Western research protocols (e.g. informed

consent) and analytic techniques (e.g. fractured coding of detailed descriptive data) as culturally incompatible with Chinese thinking. Here, grounded theorists may find some common ground with Chinese thinking; in particular with what Chen refers to as the Chinese cultural tradition of holistic thinking, which emphasizes imagery and pattern recognition over the ‘hairsplitting’ and ‘dissecting’ (p. 78) of some Western approaches to qualitative data coding and analysis. Chen’s reference to the Chinese pedagogy of unity of knowing and doing, i.e. experiential learning (p. 75), certainly resonates with Glaser’s (1998) view of GT as a delayed action learning process (p. 220) and his anthem to ‘Just do it!’ (p. 19).

While it is beyond the scope of this chapter to provide an exhaustive review of the various approaches offered as GT, a small sampling of how the classic methodology has been remodelled to fit with a range of qualitative approaches may serve to illustrate some of the issues that result in methodological drift into ‘grounded theorizing’ (Pozzebonn et al., 2011). Charmaz (2000) accepts the general nature of GT methodology when she suggests the method can be used with either quantitative or qualitative data and from either an objectivist or constructivist perspective. She acknowledges *Discovery* (Glaser and Strauss, 1967) and *Theoretical Sensitivity* (Glaser, 1978) as ‘the classic statements of the method’ (Charmaz, 2009: 148) while asserting that the boundaries around what constitutes GT ‘need not be rigid and inflexible’ (Charmaz, 2014b: 1081). In so doing, however, she appears to reduce GT to a toolbox of methods ‘transportable across epistemological and ontological gulfs (Charmaz, 2014a: 12). Gibson and Hartman (2014) suggest that, while inspired by classic GT, Charmaz’s constructivist GT produces a different product in the form of ‘a loose set of constructs with a critical discussion’ (p. 63).

With reference to constructivist GT, Glaser (2002) writes:

Constructivism ... is an epistemological bias to achieve a credible, accurate description of data collection (para. 10) ... her quest is not to take the data as it comes but to be sure it is accurate, so she gets to mutual interpretation as the answer (para. 8). ... Charmaz has clearly remodelled GT from a conceptual theory to a QDA conceptual description method with worrisome accuracy at issue (para. 38). ... The strength of QDA research has clouded and swayed her view of GT, and thus she denies and blocks its true conceptual nature. (para. 28).

Glaser (2003) has also challenged Lincoln and Guba's (1985) positioning of GT as qualitative research. He views their naturalist inquiry perspective as 'changing views of worrisome accuracy, but always accuracy. It does not address the abstract nature of GT ... a flexible, conceptual, inductive methodology abstract of their discussion on finding the right truth, belief, to wit their focus on worrisome accuracy' (p. 182). Locke (2001) embraces GT while also nestling it within a 'qualitative paradigm' (p. 30). In a later publication, she conflates GT with 'grounded theorizing', vigorously defending the pluralistic evolution of the methodology while dismissing the classic GT approach as a step back in time (Locke, 2015: 616). Partington (2002), however, recognizes the erosion of GT to 'grounded theorizing' when he says,

in qualitative management research, the term 'GT' has taken on a more generic meaning, tending to embrace all theory-building approaches that are based on coding of qualitative data. An inevitable consequence of this broadening of meaning has been a certain loss of attention to the essential principles of the Glaser and Strauss approach, and to their purpose. (p. 136)

He acknowledges, as well, the general inconsistency with which research methods are applied in qualitative management research. 'One of the consequences of this lack of uniformity is that every qualitative researcher tends to develop their own individual approach' (p. 137). He then proceeds to prescribe his own requirements that in effect produce yet another version which, like many remodelled versions, encourages preconception. He also advocates taping and transcribing of interviews,

suggesting a need for full data capture rather than a reliance on the researcher's ability to capture the data more conceptually through field notes. He emphasizes audit trails to validate the research results and identifies criteria for judging the quality of a GT which are in fact qualitative research criteria and not the criteria of fit, workability, relevance and modifiability that align with classic GT (Glaser, 1978, 1998; Glaser and Strauss, 1967). Use of phrases such as 'thickness of description' (Partington, 2002: 154) and 'full richness of the data' (p. 144) further mirror the concerns of qualitative data analysis for full conceptual description rather than the abstract conceptualization of GT.

JUDGING THE QUALITY OF GROUNDED THEORY

Different approaches to research necessitate different criteria for judging the quality of research outcomes. Attempts at GT vary in quality according to the methodological approach and thoroughness of the study but must be assessed from the internal logic of the GT methodology itself and not from the inappropriate application of external criteria from other research paradigms and methodologies (Charmaz, 1994). The criteria of fit, workability, relevance and modifiability as established by Glaser and Strauss (1967: 237–50) and reaffirmed by Glaser (1978: 4–6) remain the standards by which the quality of a grounded theory should be assessed. *Fit* refers to the emergence of conceptual codes and categories from the data rather than from the use of preconceived codes or categories from extant theory. *Workability* refers to the ability of the grounded theory to explain and interpret behaviour in a substantive area and to predict future behaviour. *Relevance* refers to the theory's focus on a core concern or process that emerges in a substantive area. Its conceptual grounding in the data indicates the significance and

relevance of this core concern or process, thereby ensuring its relevance. *Modifiability* refers to the theory's ability to be continually modified as new data emerge to produce new categories, properties or dimensions of the theory. This living quality of GT ensures its continuing relevance and value to the social world from which it has emerged. 'A [grounded theory] is neither right nor wrong, it just has more or less fit, relevance, workability and modifiability. Readers of [grounded theories] should evaluate them against these criteria' (Thulesius, 2003: 27).

GROUNDING THEORY OR GROUNDED THEORIZING – A WAY FORWARD?

For the past quarter century, scholars have been debating the nature of grounded theory. All the while, its popularity has continued to grow. As management scholars, we have seen a diverse range of research outcomes published in doctoral studies and academic papers claiming to be grounded theories. While not disputing the value of such work or its contribution to our discipline, perhaps the issue is whether we are content to tolerate what at times appears to be an 'anything goes' (Jones and Noble, 2007: 84) approach to such claims or whether we might benefit from establishing at least some basic parameters to guide the veracity of such claims.

I have suggested elsewhere that it is simply a matter of respecting GT as it was intended and differentiating it from subsequent variations that have blurred the boundaries with other research approaches (Walsh et al., 2015a, 2015b). The emergent term 'grounded theorizing', I suggest, offers this possibility by allowing for an encompassing range of empirically grounded, inductive qualitative approaches. It is a term already well established in our field (Burgelman, 1985, 2009; Clarke and Freise, 2007; Langley, 1999; Locke, 2001, 2007; Pozzebon et al., 2011; Schatzman, 1991; Vaast and Walsham, 2013).

By reserving the term 'grounded theory' for works that respect GT's foundational pillars of emergence, theoretical sampling and constant comparison and that systematically employ its methodological principles, we can align with Walsh et al.'s (2015a) definition of GT as 'the systematic generation of theory from data that has itself been systematically obtained (Glaser, 1978:2). GT's exploratory approach may be adopted irrespective of the researcher's philosophical positioning. It may include qualitative or quantitative data, or both' (p. 626). Differentiating GT from 'grounded theorizing' in this way would help to resolve this seemingly persistent muddling of methodologies. Doing so would be particularly helpful for those new to research and theorizing. It might also assist in shifting the conversation in our discipline away from the rhetorical wrestle (Glaser, 1998) toward a greater appreciation of the inherent power of GT and its foundational contribution to the development of qualitative research in its many manifestations.

Notes

- 1 Throughout this chapter, the term 'GT' will be used in reference to the research process (the way the research is conducted) and the term 'grounded theory' in reference to the end result (the resultant theory of a GT study).
- 2 See Appendix A for an explanation of theoretical coding.
- 3 Charmaz (2006, 2014a) has distanced herself from theoretical integration via a core category in favour of what she terms 'greater scope' via 'focused codes'.
- 4 While Bryant and Charmaz (2007) have suggested that Glaser has 'distanced' himself from theoretical codes (p. 19), their claim is a puzzlement given his publication of *The Grounded Theory Perspective III: Theoretical Coding* (Glaser, 2005).

APPENDIX A – CLASSIC GROUNDED THEORY METHODOLOGICAL PRINCIPLES

Glaser has articulated the essential elements that comprise classic GT methodology (Glaser, 1978, 1992, 1998; Glaser and Holton, 2004) and emphasizes that a study can only be considered a true grounded theory when the complete package is utilized. In addition to classic GT's foundational pillars of emergence, constant comparison and theoretical sampling as elaborated earlier in this chapter, essential methodological principles of classic GT are as follows (largely excerpted from Glaser and Holton, 2004):

THEORETICAL SENSITIVITY

Theoretical sensitivity, the ability to generate concepts from data and relate them according to normal models of theory in general, requires two things of the researcher. It requires, first of all, the personal temperament to maintain analytic distance and tolerate regression and confusion while trusting in preconscious processing and conceptual emergence. Second, theoretical sensitivity requires the ability to develop theoretical insight and conceptualize data.

GETTING STARTED

As a generative and emergent methodology, GT requires the researcher to remain open to discovering what is really going on in the field and not what should be going on according to extant theory or preconceived notions from the researcher's worldview. While the researcher will have an area of research interest, getting started in GT means entering the research field with no preconceived problem statement, interview protocols or review of literature but instead remaining open to the

discovery of a main concern in the area under study and its processing or resolution. Thus, forcing preconceived notions of an initial professional problem or a theoretical framework on the study is suspended in service to seeing what will emerge conceptually by constant comparative analysis.

USE OF THE LITERATURE

It is critical in classic GT methodology to avoid unduly preconceiving the study through extensive reading in the substantive area or forcing an extant theoretical framework on the collection and analysis of data. To undertake an extensive review of literature before the emergence of a core category violates the basic premise of GT – that the theory emerges from the data, not from extant theory. Subject expertise also increases the risk of clouding the researcher's ability to remain open to the emergence of a completely new core category that has not figured prominently in the research to date. Practically, it may well result in the researcher spending valuable time on an area of literature that proves to be of little significance to the emergent grounded theory. Instead, GT treats the literature as another source of data to be integrated into the constant comparative analysis process once the core category, its properties and related categories have emerged and the basic conceptual development is well underway.

ALL IS DATA

This dictum expresses the flexibility of GT in utilizing all types and sources of data as opposed to a focus on one specific type of data. The grounded theorist uses all data that are available. The richer the range of data, the greater the potential for producing multivariate theory. 'Preconceiving what data will be used for a study severely restricts the generative

aspect of the study and consequently the theory' (Glaser, 1998: 9). While GT welcomes the use of any type of data, it is important to recognize that some data collection methods (e.g. interviews following a pre-defined protocol) and analysis techniques (e.g. pre-defined codes or themes) commonly associated with qualitative research contradict GT's fundamental principle of emergence.

OPEN CODING

The conceptualization of data through coding is the foundation of GT development. The essential relationship between data and theory is a conceptual code. Incidents articulated in the data are analysed and coded, using the constant comparative method, to generate initially substantive, and later theoretical, categories. Coding conceptualizes the underlying pattern of a set of empirical indicators within the data, enabling the researcher to transcend the empirical level by fracturing the data to give the researcher a condensed, abstract view of the data that includes otherwise seemingly disparate phenomena.

To begin open coding – with a minimum of preconception – tests the researcher's ability to trust in herself, the method and her skill to use the method to generate codes and find relevance. The process begins with open coding of incidents as indicators of substantive codes emergent within the data. The researcher begins by coding the data in every way possible – 'running the data open' (Glaser, 1978: 56). From the start, the researcher asks a set of questions of the data – 'What is this data a study of?', 'What category does this incident indicate?', 'What is actually happening in the data?' (Glaser, 1978: 57). These questions keep the researcher theoretically sensitive when analysing, collecting and coding the data. They force her to focus on patterns among incidents that yield codes and to conceptually transcend the detailed description of these incidents while remaining focused on trying to ascertain a main concern

in the area under study and discovering what accounts for the continual resolution of this concern by coding for as many categories as fit successive, different incidents. As coding progresses, new categories emerge and new incidents fit into existing categories.

Open coding allows the researcher to see the direction in which to take the study by theoretical sampling before she has become selective and focused on a particular problem. Thus, when she does begin to focus, she is sure of relevance. The researcher begins to see the kind of categories that can handle the data theoretically, so that she knows how to code all data, ensuring that the emergent theory fits and works. Open coding incident by incident forces the researcher to verify and saturate categories, minimizing the omission of an important category and ensuring the grounding of categories in the data. The result is a rich, dense theory with the feeling that nothing of relevance has been left out. It also corrects the forcing of 'pet' themes and ideas, unless they have emergent fit. It is essential that the researcher does her own coding as coding constantly stimulates ideas.

INTERCHANGEABILITY OF INDICATORS

GT is based on a concept-indicator model (Glaser, 1978: 62) of *conceptual specification* (p. 64) through constant comparisons of incidents to incidents and, once conceptual codes are generated, of incidents to emerging concepts. This ensures that the researcher confronts similarities, differences and degrees in consistency of meaning between indicators, generating an underlying uniformity which, in turn, results in a coded category and the beginnings of the properties of that category. Interchangeability produces saturation of concepts and their properties (Glaser, 1978: 62–5). From the comparisons of further incidents to the conceptual codes, the code is sharpened to achieve its best fit while further

properties are generated until the code is verified and saturated. Conceptual specification, not definition, is the focus of GT. The GT concept-indicator model requires concepts and their dimensions to earn their way into the theory by systematic generation of data. Comparing in new incidents and thereby generating new properties of a code can only go so far before the researcher discovers saturation of ideas through interchangeability of indicators (incidents). This interchangeability produces, at the same time, the transferability of the theory to other areas by linking to incidents (indicators) in other substantive or sub-substantive areas that produce the same category or properties of it.

CORE CATEGORY

As the researcher proceeds to compare incident to incident in the data, then incidents to categories, she develops several workable coded categories and begins, as much as possible, to saturate those that seem to have explanatory power. A main concern begins to emerge, with a core category that appears to account for most of the variation around this main issue or concern as the focus of the study, explaining how this issue or concern is continually processed or resolved. The core concept becomes the focus of further selective data collection and coding efforts. This core category is always some type of theoretical code; e.g. a process, a continuum, typology, dimensions, a range and so forth. Its primary function is to integrate (i.e. conceptually model) the theory. The core category reoccurs frequently in the data and comes to be seen as a stable pattern that is increasingly related to other concepts. The criteria for establishing the core category are that it is central, that it relates to as many other categories and their properties as possible and that it accounts for a large portion of the variation in a pattern of behaviour. It relates meaningfully and easily with other

categories. It has clear and ‘grabbing’ implications for further formal theoretical elaboration, beyond the initial substantive area.

SELECTIVE CODING

The emergence of a core category marks the beginning of selective coding. Selective coding begins only after the researcher is sure that she has discovered the core category. The researcher ceases open coding and delimits coding to only those concepts relevant to the emerging conceptual framework in sufficiently significant ways, so as to produce a parsimonious theory. This selective data collection and analysis continues until the researcher has sufficiently elaborated and integrated the core category, its properties and its theoretical connections to other relevant concepts.

DELIMITING

Integration of a theory around a core category delimits the theory and thereby the study. This delimitation occurs at two levels – the theory and the categories. First, the theory solidifies, in the sense that major modifications become fewer and fewer as the researcher compares the next incidents of a category to its properties. Later modifications are mainly about clarifying the logic, taking out non-relevant properties, integrating elaborating details of properties into the major outline of interrelated categories and – most important – reduction.

The second level of delimiting the theory is a reduction in the original list of categories for coding. As the development of the theory progresses and it becomes reduced by delimiting, it increasingly works better for ordering a mass of qualitative data and the researcher becomes committed to it. The researcher discovers underlying uniformity in the set of categories and their properties and then

reformulates the theory with a smaller set of higher-level concepts. This allows her to pare down the original list of categories for collecting and coding data, according to the present boundaries of the theory. She now focuses on one category as the core category and only concepts related to the core variable will be included in the theory. The list of categories for coding is further delimited through theoretical saturation.

MEMOING

The writing of theoretical memos is a core stage in the process of generating grounded theory that parallels the coding process by capturing the researcher's emergent theoretical ideas. Memos are the researcher's theoretical notes about the data and the conceptual connections between emerging categories. If the researcher skips this stage by going directly to sorting or writing up, after coding, she is not doing GT.

Memo writing is a continual process that helps raise the data to a conceptual level and develop the properties of each category. Memos also guide the next steps in further data collection, coding and analysis. They present hypotheses about connections between categories and their properties and begin the integration of these connections with clusters of other categories to generate a theory. The basic goal of memoing is to develop ideas with complete freedom and to collect these in a 'memo bank' for later sorting. Memos slow a researcher's pace, forcing her to reason through and verify categories, their integration and fit, relevance and work for the theory. In this way, she does not prematurely draw conclusions about the final theoretical framework and core concepts.

Memo construction differs from writing detailed description. Although typically based on description, memos raise the description to a theoretical level through conceptual rendering of the material. As codes conceptualize

the data, the original description is subsumed by the analysis. Memos reveal and relate the properties of substantive codes – drawing and filling out analytic properties of the descriptive data. Initially, memos arise from the constant comparison of indicators to indicators, then indicators to concepts. Later memos generate new memos. Reading literature generates memos; sorting and writing also generate memos. In GT, memoing is never done!

THEORETICAL CODING

While substantive codes conceptualize the empirical substance of the area of research, theoretical codes are abstract models or frameworks that conceptualize how the substantive codes may relate to each other as hypotheses to be integrated into a theory. As such, theoretical codes give integrative scope, broad pictures and a new perspective. They help the analyst maintain the conceptual level in writing about concepts and their interrelations.

SORTING AND WRITING UP

Once the core category and related concepts have been theoretically saturated, the researcher proceeds to review and hand sort memos looking for an emergent organization (theoretical code) that integrates the theory by accounting for the relationships between the core and related concepts as a set of conceptual hypotheses. Hand sorting requires the researcher to thoughtfully consider where each concept fits and works, its relevance and how it will carry forward in the cumulative development of the theory. Hand sorting also generates more memos – often on higher conceptual levels – further integrating the theory as a parsimonious set of concepts. It is at this point as well that the relevant literature can be introduced into the theory as more data to be memoed and added in with the memo sorting.

This theoretical sorting of memos is the key to the formulation of the theory for presentation or writing. Sorting is essential – it puts the fractured data back together, making theoretical discriminations as to where each idea fits in the emerging theory. There are no preconceived outlines. To preconceive a theoretical outline is to risk logical elaboration (Glaser, 1978: 118) with the outcome lacking ‘the internal integration of connections among a great many categories’ (Glaser, 1978: 116).

ANALYTIC RULES DEVELOPED THROUGH SORTING

While theoretical coding establishes the relationships among concepts, analytic rules guide the construction of the theory as it emerges. Glaser (1978) and Glaser and Holton (2004) detail several fundamental analytic rules which are summarized here. First, sorting can start anywhere. It will find its own beginning, middle and end for writing. The important thing is to start. Once started, the researcher soon learns where ideas are likely to integrate best and sorting becomes generative and fun.

Starting with the core category and then sorting all other concepts and properties only as they relate to the core requires focus, selectivity and delimiting, with further constant comparisons likely to generate many new ideas, especially on potential theoretical codes for organizing and integrating the overall theory. The researcher stops sorting and memos ideas, then sorts the memo into the integration. All ideas must fit in somewhere or the integration must be changed or modified. This is essential, for ignoring this fitting of all related

categories will lead the researcher to break out of the theory too soon, with important ideas and relationships ignored.

If the researcher cannot find the integration, memos must be re-sorted and re-integrated for better fit, forcing underlying patterns, integrations and multivariate relations between the concepts to emerge. The process is intensely generative. Theoretical completeness implies theoretical coverage by requiring the researcher to explain the behaviour and issue under study with the fewest possible concepts, the greatest possible scope and with as much variation as possible to sufficiently explain how the main concern is continually processed or resolved with concepts that fit, work and have relevance.

PACING

Generation of a GT takes time. It is a delayed action phenomenon (Glaser, 1978: 6; 2003: 78). Little increments of data collection, coding and analysis build, mature and emerge as theoretical memos. Significant theoretical realizations come with growth and maturity in the data, and much of this is outside the researcher’s conscious awareness until a preconscious processing facilitates its conscious emergence (Glaser, 1998: 50). The researcher must exercise patience, accepting nothing until this inevitable emergence through preconscious processing has transpired. Confusion is inevitable and must be tolerated with persistence and trust in the discovery process. Rushing or forcing the process will shut down the researcher’s creativity and conceptual abilities, producing a theory that is thin and incomplete.

Researching Bodies: Embodied Fieldwork for Knowledge Work, Which Turns Out to Be Embodied

Alexandra Michel

INTRODUCTION

Our economy has changed from predominantly industrial to knowledge-based. For example, all net new jobs that were created during the last decade were knowledge-based. Knowledge-based jobs now amount to more than 40 percent of all work (Manyika et al., 2012). Knowledge work, such as banking, consulting, accounting, and software engineering, uses knowledge as an input and output and employs highly educated and qualified workers, who work on intellectual tasks (Alvesson, 2004). With the advent of the knowledge economy, new work practices are emerging that challenge our understanding of how organizations control and thereby change participants, which is the management discipline's 'most fundamental problem' (Van Maanen & Barley, 1984, p. 290) and central topic (Pfeffer, 1997). Understanding these new work practices requires qualitative research, but here, too, innovations are needed in response to the changing empirical phenomenon.

Challenging our discipline's foundational ideas is a trend toward all-encompassing work schedules. A traditional employee might have worked 40 or 60 hours per week, leaving time to participate meaningfully with – and be socialized by – other communities. In contrast, knowledge workers such as software engineers (Kunda, 1992), consultants (Perlow, 2012), and doctors (Kellogg, 2011) can work up to 120 hours per week and are electronically available twenty-four hours a day, seven days a week (Mazmanian et al., 2005). They are wrapped up in an 'always-on' mentality even when they are not actually working, leaving little time for friends, family, participation in outside communities, and even sleep, as exemplified in the following excerpt about work at the internet retailer Amazon:

At Amazon, workers ... toil long and late (emails arrive past midnight, followed by text messages asking why they were not answered), and held to standards that the company boasts are 'unreasonably high' ... the company ... is conducting a little-known experiment in how far it can push white-collar

workers, redrawing the boundaries of what is acceptable ... Bo Olson (a former employee) ... said that his enduring image was watching people weep in the office, a sight other workers described as well. ... 'Nearly every person I worked with, I saw cry at their desk.' ... One time I didn't sleep for four days straight,' said Dina Vaccari. ... One ex-employee's fiancé became so concerned about her nonstop working night after night that he would drive to the Amazon campus at 10 p.m. and dial her cellphone until she agreed to come home. When they took a vacation to Florida, she spent every day at Starbucks using the wireless connection to get work done. ... 'That's when the ulcer started,' she said ... 'I would see people practically combust,' (said) Liz Pearce, (who) worked on Amazon's wedding registry. (Kantor & Streifeldaug, 2015)

Similarly, a consultant summarizes the all-encompassing commitment that knowledge-based organizations extract:

There's a correlation between success and the willingness to just put everything else aside and do a ton of work. People here are probably doing 14, 15 hours of work a day. Pretty much just working and sleeping during the week. They sleep 6 hours a night or less. ... Your ability to get by on little sleep is a necessary skill set. (Padavic et al., 2013, p. 7, emphasis added)

Dominated by a cognitive approach, management scholars conceptualize organizational influence primarily as a change in participants' minds. In this view, when people enter into an organization, they learn concepts, including subject matter knowledge, values, norms, and identities, which are self-concepts. This cognitive approach to persons may appear particularly relevant to knowledge work, which presumably involves 'thinking for a living' (Davenport, 2005). Yet, clearly, for the Amazon workers above, who 'combust' and have ulcers, more is changing than merely what they know. But the cognitive approach does not have sensitizing concepts for asking research questions about a more encompassing, embodied transformation through work – what else could possibly change in people, in their bodies, as they become skillful organizational members? – and for designing effective studies to answer such questions.

To understand how organizations transform participants holistically, I outline an embodied research approach, which uses a novel set of sensitizing concepts and methods. This approach introduces a different conceptualization of what the body is and what data to gather about it. It is not only a biological thing with universally occurring processes, but a fluid aspect of a culturally and historically situated economic complex, molded by and continuously reproducing a specific set of organizational practices. Because the body changes, and is changed by, the specific organizational practices that it is entangled in, we cannot utilize the decontextualized medical measures that organizational scholars currently use to include the body in their theories, such as stress data, but instead need to study the body within its organizational context.

Ethnographic fieldwork, short 'ethnography', is ideally suited for this purpose, but requires new tools, which I introduce. Ethnography is the collection of naturalistic social science data through immersion. It entails the scholar entering a cultural context, such as an organization, and writing down what he or she observes, with the goal of understanding the concepts, meanings, and symbolic tools that informants use (e.g. Geertz, 1979). Ethnography thus affords the needed contextualized perspective. To supplement this prevailing semiotic approach to ethnography, which focuses on meaning-making, I propose an embodied approach. Briefly, a powerful method for discovering what changes in participants through their organizational tenure and how uses the body of the researcher – the researching body – as an instrument for researching bodies. It involves immersing the analyst as deeply and for as long in the field as possible, 'going native', but armed with sensitizing concepts and rigorous methods. This embodied approach to ethnography involves a change from participant observation to observant participation; from 'being there' to 'becoming them'.

HOW ORGANIZATIONS TRANSFORM PERSONS

The Predominant Cognitive Approach

From its inception, the management discipline has accepted a cognitive imaginary. An imaginary is an internally consistent way of thinking about and researching persons, organizations, and their interrelation. In order to turn the natural person into an analytic entity, scholars have to make a decision about what aspects of the person matter most for explaining the discipline's focal phenomena. Not everything about the person can be included in an analytic conception. Such aspects as hair color and eye form, for example, are irrelevant and, therefore, do not become part of the analytic conceptualization. Influenced by the cognitive revolution in psychology, of which the organizational discipline's founding members (e.g. March & Simon, 1958; Simon, 1976) were a part, much of the organizational discipline has adopted an 'unabashed commitment to mentalism' (Fiske & Taylor, 1991, p. 14), which entails conceptualizing the person in terms of the mind and its content, such as concepts.

I refer to an organizational imaginary because this cognitive conceptualization of the person entails specific, and it turns out limiting, ways of conceptualizing and researching the organization and how it influences participants. Because the analytic person consists of concepts, it follows that the organization influences the individual primarily by changing these concepts. For example, socialization research examines the kinds of skills and knowledge that participants gain when they enter into organizations (e.g. Chao et al., 1994), culture research investigates how organizations influence participants' values and norms (e.g. O'Reilly & Chatman, 1996), and identity scholars study the internal 'cognitive structures', such as identities, through which contemporary organizations control participants, replacing

the external controls prevalent in industrial organizations, such as hierarchies and direct supervision (Albert et al., 2000).

Because the cognitive approach assumes that the person, reduced to the mind, is conceptually separate from the context, with which it only interacts, scholars can study the person and the context separately. This conceptual separation of person and context, too, is adopted from cognitive psychology, which assumes that basic psychological processes are universal (Higgins & Kruglanski, 1996; Molden & Dweck, 2006). The universality assumption means that psychological processes are not affected substantively by a given context. Since the context does not matter, researchers can study participants in the supposedly neutral environment of the laboratory. For organizational researchers, the analytic separability of person and context means, for example, that behavioral or micro-scholars can study the person in isolation, adding this knowledge to the findings of macro-scholars, who study the organizational context in the form of strategy, organizational design, or routines.

Why Organizational Scholarship Needs an Embodied Approach

Organizational scholars treat the cognitive conceptualization of the person as context-free. They do not explicitly assess the boundary conditions under which this conceptualization is more or less useful. Intuitively, it makes sense that traditional organizations primarily affected participants' concepts, partly because the socialization influence of these organizations was too limited to restructure the person more comprehensively. This boundary condition, limited socializing influence, does not hold in the contemporary 'greedy' or 'omnivorous' knowledge-based organizations (Coser, 1967), which 'seek to make total claims on their members ... reduc[ing] the claims of competing roles and status positions on those they encompass within their boundaries'

(Coser, 1967, p. 4). Such all-encompassing influence – a historically new phenomenon, especially for highly educated workers – renders organizations unusually powerful ‘forcing houses for changing the self’ (Goffman, 1961, p. 12), which means that they reshape the person more profoundly and comprehensively than merely a change in skills and concepts. Because they have the power to cut off the person from alternative socializing influences, contemporary knowledge-based organizations do not have the traditional status of an organization in a person’s life, as a culture among cultures. They are more like the meta-cultures studied by anthropologists, with a similar ability to influence the individual holistically, ‘down’ to the biological, embodied level. This meta-cultural status of organizations in participants’ lives invites a revised imaginary, starting with an embodied conceptualization of the person.

The biological level, such as endocrinology, is often viewed as a ‘brute, precultural [and therefore universal] fact’ (Geertz, 1973). In contrast, more recent research in anthropology shows that cultures restructure persons at the level of the body, suggesting that one should talk about ‘biologies, not biology, and that they are literally local’ (Worthman, 1995, p. 11). Unlike the medical concept of the ‘body’, which is a biological thing exhibiting genetically determined features that follow a universal logic, I use ‘embodiment’ to refer to the cultural modulation of the body (cf. Csordas, 1990). Studying the body permits the usage of medical data, while studying embodiment renders such decontextualized data problematic.

Contemporary knowledge-based organizations are where local biologies are produced. Engaging participants in organizationally structured activities for most of their waking hours, organizations influence how participants eat, sleep, how much and how they move, how they sit, for instance tensed with their spines bent around computers, and the kinds of stressors people encounter. For example, my ethnographic data collection, which is now in year fifteen, shows that

bankers, who often worked up to 100 hours per week, incurred similar work-related illnesses at similar points in their organizational tenure, such as chronic pain, exhaustion, and endocrine disorders that doctors had rarely seen before, especially in people in their twenties (e.g. Michel, 2011), indicating that biology can manifest in new ways in new cultural-historical conditions.

This means that person and context are not conceptually separate; they do not interact, but are mutually constituted. A person’s psychology and embodiment are shaped by the socio-material features of a context and reproduce these features in action. For example, because of their work, bankers developed embodied dispositions, such as the ability to sit for a prolonged period of time, which reproduced the practice that generated these dispositions in the first place. Because even young bodies wear out rapidly through prolonged, tense sitting and sleep deprivation, the banks had to design a workaround set of practices that accounts for the bodies’ limitations. Through cohort-based hiring they pumped in ‘new blood’ every year, replacing exhausted bankers, who leave in their mid-thirties, after a tenure of only about seven years.

Similarly, Bourdieu (1977) documented how in Kabyle society men work in trees and women pick up the branches that fall down. This simple division of labor structures participants’ cognitive and embodied dispositions in ways that reinforce the practices that created the dispositions. Men are upright and above women. Women are stooped, in a bent physical position that leaves lasting traces on their posture, such that they embody the societal gender hierarchy. While men proactively conquer the natural environment through their strength and have an expansive view, women’s perceptual field is narrowed. Their physiology and psychology are trained to be reactive to the narrow set of cues emitted by men, which prompt a narrow and routinized set of responses that do not require, and therefore do not develop, strength. This

example indicates that work shapes the person holistically and in highly context-specific ways.

Together, these examples illustrate the complexity confronting organizational researchers as they seek to arrive at a more suitable conceptualization of the person, the organization, and the latter's influence on the former. While the cognitive approach assumes a priori what aspects of the person are analytically relevant, namely the mind, the examples show that the particular aspects of the person that matter depend on the attributes of a specific context. For example, in Kabyle society, but not in investment banking, gender-specific body postures mattered. The societal division of labor influenced differential gender posture to maintain the society's gendered ideology. Organizational scholars do not know (1) what aspects of the person are shaped through knowledge work, (2) how, and (3) how this influence evolves over time.

The examples also illustrate that the operative aspects of the organizational context cannot be claimed a priori, but need to be empirically demonstrated. Organizational research assumes that organizations influence participants through well-known activities and structures that are designed for this purpose, such as socialization activities, culture, or organizational routines. Moreover, this influence is exerted by the powerful, such as top management, to influence the comparatively less powerful lower-level employees. In contrast, Bourdieu's example shows how practices can affect participants, without being designed to do so. There is not one powerful entity, such as top management, that created these practices to submit or socialize the less powerful. Rather, both the powerful and the powerless keep reproducing these practices because they cannot conceive of acting in any other way.

Similarly, my research (e.g. Michel, 2011) shows that participants are shaped by a web of diffuse and overlapping practices that are not necessarily designed for the purposes

that they end up having. For example, one investment bank moved senior bankers out of their offices to sit next to junior bankers in an environment of hip-high cubicles. This practice was designed to facilitate learning. Junior bankers were supposed to benefit from overhearing senior bankers' conversation. The unintended consequence was the intensification of work pace. Both junior and senior bankers worked harder because now everyone could watch everyone else. Working hours also escalated as the unintended consequence of practices that were designed for the opposite purpose. Namely, banks offered amenities such as free meals and free car service if bankers stayed after 6 pm, child care, and valet services for dry cleaning. These practices were designed to unburden bankers from chores so that they had more leisure. The unintended consequence was that bankers worked even more because it was now more convenient to do so, contributing to their subsequent physical breakdowns. These examples indicate that all organizational practices can influence participant behavior (and biology), not merely those that are explicitly designed to do so. Yet we do not have any guidance on how to identify consequential person-shaping activities, which is a necessary first step toward updating our understanding of organizational control.

In summary, the above examples show the reciprocal formation of the embodied person and the historically situated context, which is invisible to a cognitive approach because it overlooks the body and relies on such sensitizing concepts as 'interaction' that steer research toward decontextualized methods.

An Embodied Approach

Sensitizing concepts: Habitus

The first step toward generating a better understanding is to develop a set of sensitizing concepts for conceptualizing the person in a holistic, embodied, and contextualized

way, such as the *habitus* (Bourdieu, 1977). The habitus is a set of acquired embodied cognitive structures that are mutually constituted with contextual structures. Bourdieu (1977, p. 53) defined it as ‘structured structures predisposed to function as structuring structures’. It lets persons experience reality in ways that fit with the social structures that they participate in and predisposes them to actions that generate and maintain these structures, without perceiving their choices as such. Habitus captures the mutual constitution of person and context because the person’s dispositions are shaped by context – ‘structured (cognitive) structures’ – and also generate the context – ‘structuring (contextual) structures’.

Habitus allows us to understand the relation between the person and the organization in non-cognitive ways. It suggests that the practical mastery of a participant does not come from knowing a discrete set of mental concepts, but is prediscursive and embodied. The knowledge that people need to do their jobs comes not from learning a finite sum of discrete explicit information that gets transmitted through words. Instead, as the Kabyle work practices described above illustrated, organizations shape people by kinetically reeducating and remodeling the body to fit the situation at hand. People learn a body–mind–tool complex, a diffuse repertoire of body techniques, wants, and physical and mental gestures that fit with particular situational affordances, such as tools.

Prediscursive knowledge is different from tacit knowledge. For example, we stand at a culturally appropriate distance from others and, usually without realizing it, calibrate for noise, smell, and situational formality. People can only self-report on distance standing incompletely, not because concepts are tacit but because they do not have the requisite concepts (Taylor, 1993).

The habitus directs research methodology differently. Because a person’s dispositions are shaped by the specific aspects of a context and reproduce those features, in turn,

the person cannot be studied in a laboratory, but must be studied within a given context, as ethnographic fieldwork is uniquely suited to do. Because the habitus is context-specific, organizational researchers cannot simply apply the presumably universally valid principles of cognitive psychology to understand action in organization. Quite the contrary. It is upon organizational scholars to contribute toward a basic science of human functioning, but with a different aim, which entails understanding human plasticity, as opposed to universal human fixity. Because the essence of what fieldworkers are studying is prediscursive and embodied, new fieldwork methods are needed, which I introduce next.

New Fieldwork Methods: Embodied Ethnography

I propose ethnographic fieldwork, or ‘ethnography’, as an ideal method for developing a more accurate understanding of how organizations affect participants holistically. But to fit the purpose at hand, important modifications are needed to our standard practices. I first explicate the need for the innovations that I will then introduce in this chapter’s final section.

Ethnography entails a specific approach to social science and a set of methods. ‘Fieldwork’ can refer to any naturalistic data collection activity, meaning a data collection in a real-life setting, and can be used regardless of a researcher’s ontological and epistemological assumptions. For example, a botanist conducts fieldwork by studying flowers in a garden. In contrast, ethnography is based on the assumption that a social scientist stands in a different relation to the object of study, as compared to a natural scientist. While the natural scientist can be a mere observer, the social scientist must be a ‘fellow participant’ in social practice (Winch, 1956, p. 31). The term ‘ethnography’ refers both to the scholarly investigation and the written report produced from it. A further

basic assumption underlying ethnography, congenial to my project at hand, is that it entails a '[s]pecial scientific description of a people and the cultural basis of their peoplehood' (Vidich & Lyman, 2000), responding to traditional psychology, which assumes that much of what matters about a person's make-up has a universal, not a cultural, basis.

While ethnography is used across disciplines, it has been 'at the heart of cultural anthropology' (Marcus, 1994, p. 42) since its inception, resulting in a high refinement of ethnographic methods by anthropologists. Scholars from other disciplines, such as organizational scholars, often learn about ethnography through classes or textbooks that decontextualize it from the original anthropological setting, presenting it as an unproblematic set of practices. Briefly, these methods involve that one enters into a cultural setting for a prolonged period of time ('immersion'), participates in daily activities, and writes down what one observes. The typical class or book on ethnographic methods gives tips on how one obtains access, establishes rapport, chooses one's role along the participation and observation continuum, conducts interviews, as well as records and analyzes field notes. However, it turns out that ethnographic methods have structured into them assumptions that are specific to the prototypical cultural-anthropological setting, which involves the study of an exotic culture. These assumptions do not hold in the contemporary knowledge-based setting, requiring a revision in ethnographic methods that will be my focus.

The Specialized Problematic of the Prototypical Anthropological Setting: Unbridgeable Cultural Distance

To demonstrate the culturally contingent diversity of human psychology, ethnographers need settings that together constitute maximum cultural variation. Therefore, the

traditional approach to ethnography involves the anthropologist studying an exotic culture, such as the Trobriand Islands in Melanesia (Malinowski, 1922) or Bali (Geertz, 1972). While the goal of traditional psychology is deductive, testing the concepts that the psychologist has developed, anthropology uses a discovery epistemology (Locke, 2011), aiming to uncover informants' concepts. For instance, Malinowski argued that 'the final goal of anthropology' was 'to grasp the native's point of view, *his* relation to life, to realize *his* vision of his world' (1922, p. 25, emphasis in original). Anthropologists thus immerse themselves in the cultural setting, aiming to obtain full membership.

However, while studying exotic societies is ideal for documenting cultural diversity, these settings also have a fatal flaw, namely an unbridgeable cultural distance between the scholar and the informant, which makes it impossible for the scholar to fully capture 'the insider's viewpoint' (Jorgensen, 1989, p. 14), anthropology's final goal. This distance exists because the anthropologist has not been born into the informants' culture, has no desire to convert to it, and has none of the constraints that informants have (Bittner, 1973). Malinowski argued that this distance could be minimized through a special kind of empathy with informants:

I had to learn how to behave, and to a certain extent, I acquired the 'feeling' for native good and bad manners...*I began to feel that I was indeed in touch with the natives, and this is certainly the preliminary condition of being able to carry on successful fieldwork.* (Malinowski, 1922, p. 8, emphasis added)

However, when his diary (Malinowski, 1967) was published post-mortem, it turned out that far from being sensitively attuned to informants, he viewed them with disparaging detachment.

While Malinowski's diary created moral outrage, Geertz (1976, p. 236) recognized this situation as primarily an epistemological problem:

[I]f anthropological fieldwork does not stem, as we have been taught to believe, from some sort of extraordinary sensibility, an almost preternatural capacity to think, feel, and perceive like a native (a word that I should hurry to say, I use here 'in the strictest sense of the term'), then how is anthropological knowledge of the way natives think, feel, and perceive possible?

He proposed that instead of aiming to attain informants' sensibilities, the anthropologist should study their symbolic system, 'searching out and analyzing the symbolic forms – words, images, institutions, behaviors – in terms of which in each case, people actually represent themselves to themselves and to one another' (Geertz, 1976, p. 228), data that is publicly observable. In summary, the prevailing semiotic approach to ethnography, which focuses on meaning, is not a 'positive' design choice, but a compromise. Because ethnographers could not bridge the cultural distance between them and their informants, they gave up the quest to feel themselves into their informants.

The prototypical anthropological study, which involves the anthropologist visiting an exotic setting, also generates another research practice that we now take for granted, namely that the scholar ought to generate field notes with the aim of 'fixing' culture, generating a static 'snapshot' of a given culture at a given point in time (Erickson, 2002). Because the anthropologist could not undergo the same induction into the culture as the informants, who were born into it, the scholar's transformation to full membership was not informative about the native's transformation process, moving the study of the cultural transformation of the person into the background of our collective research agenda.

By unreflectively using the methods of traditional ethnography, organizational scholars are unwittingly adopting the underlying assumptions that generated these methods, even though these assumptions do not hold in the prototypical organizational setting, and are limited unnecessarily by anthropologists' constraints. Contemporary knowledge

work differs from the exotic cultures of the anthropologist in consequential ways. Most importantly, organizational scholars do not encounter the unbridgeable cultural distance that constrains the cultural anthropologist. Organizational scholars *are* knowledge workers with a similar educational background as their informants and engaged in similar work practices. Moreover, like the scholar, informants are not born into but enter the organizational culture under study. This means that the organizational scholar can come very close to achieving the anthropological ideal of 'becoming one of them'. Consequently, I revisit the semiotic approach, which focuses only on the mind and neglects the body, and the 'snapshot' approach to studying culture in favor of an embodied transformational approach, outlined next.

OBSERVANT PARTICIPATION: FROM 'BEING THERE' TO 'BECOMING THEM'

One particularly promising method for understanding how organizations change participants at a prediscursive, embodied level is for the analyst to undergo these changes, as a professional apprentice (Van Maanen & Kolb, 1985) to a particular culture. Equipped with sensitizing concepts and methods, the scholar can identify dynamics that escape participants' untrained experience by documenting changes in the self in real time, as they are unfolding in response to specific situations. In contrast to the more familiar participant observation, which merely involves 'being there', this observant participation involves 'becoming them'.

Wacquant (2004), one of Bourdieu's students, exemplified this approach when he became an apprentice boxer. Cultural scholars have argued that apprenticeship is the primary mode of social knowledge transmission (e.g. Lave & Wenger, 1991). People acquire practical mastery not through learning decontextualized concepts, but by being engaged in

a culture's practices with the goal to become a socially recognizable kind of person, such as a banker or scholar. Building on this insight, Wacquant transformed apprenticeship into a technique of social inquiry, but in novel ways that are informed by the habitus as a sensitizing construct.

Traditionally, when ethnographers use apprenticeship, they do so to obtain better information from informants, to better understand informants' subjective experience (e.g. Van Maanen & Kolb, 1985, p. 36). This function of apprenticeship is based on a set of ontological assumptions, namely semiotic ones, which view culture as consisting of text-like concepts, human beings as meaning-making, and the aim of anthropology as interpretation (e.g. Geertz, 1973). In contrast, Wacquant (2003) underwent apprenticeship to construct and empirically elaborate different ontological assumptions, according to which the most consequential elements of culture are prediscursive and, therefore, unlike texts, and which acknowledge human beings as also embodied. Therefore, one important aim becomes bringing embodiment into the foreground of culture and learning, construing bodies as both socially structured and socially structuring.

Observant participation differs from 'going native' (Adler et al., 1986, p. 364) or conducting an 'autoethnography'. In North American organizational research, 'going native' is a problem because the deep immersion that it entails makes it likely that the scholar loses *axiological neutrality* (Weber, 2004, p. 22), which is the desirable ability to detach oneself from the focal phenomenon. A scholar who immerses the self might depict the setting in more favorable ways than merited, or share in informants' taken-for-grantedness, coming to 'know the rules of the game so deeply' that one 'never even notice(s) that there are rules' (Luker, 2008, p. 157). Observant participation does involve going native, but doing so while armed with the concepts and methods of the discipline as one enters the setting. Equipped with the concept

of habitus, observant participation capitalizes on the evolving taken-for-grantedness that will occur as the scholar is immersed in a setting; it is not a distraction, but the focal phenomenon. It is how the most influential forms of organizational influence act on the person. In contrast to the participants, who undergo this transformation non-reflexively, the scholar can use methods to understand this transformation as it occurs. All ethnographers can use methods for detaching the self from a setting to restore neutrality (Anteby, 2013). Observant participation thus primarily differs from other forms of ethnography in that it utilizes the co-presence of the ethnographer with other informants as a tool for doing so.

Observant participation differs in a variety of ways from autoethnography conducted as a social science (e.g. Anteby, 2013). Autoethnography can also be conducted in non-scientific ways, as I discuss below. One, social science autoethnography, consists of selective 'collections of autobiographical reflections on past projects', such as confessional tales (van Maanen, 2011, p. 82). In contrast, observant participation unfolds in real time and is not selective. One has to capture all of the changes in the self as they occur. Similar to how one takes notes about a social context, the comprehensiveness of the record matters because only ongoing analysis reveals which aspects constitute data, as opposed to noise. The ongoing analysis of experience also allows one to steer this experience, sampling purposefully as one would with studying a context.

For example, my investment banking informants experimented with ways to redesign their physiological needs to make themselves more productive, such as using a polyphasic approach to sleep in which they only slept for twenty minutes or so at a time (Michel, 2011). Normally, a scholar who enters a setting deeply, but remains only a scholar, might merely record this practice as he or she conducted normal investment banking work. The focus of this 'being there'

approach is about capturing the meaning of a practice for the informants. In contrast to a 'becoming them' approach, the scholar may not feel the urges that becoming an investment banker entails and, therefore, may not feel compelled to engage in behaviors that extract a cost, such as sleep deprivation. The 'becoming them' aspect of observant participation may entail that one feels these urges and willingly submits to costly behaviors. For example, Wacquant (2004) submitted himself even to the risky aspects of boxing, breaking his nose once. In fact, he was so captivated by his boxing experience that he contemplated becoming a professional boxer. However, even if the scholarly role remained in the foreground of one's experience, such that one does not feel the participants' urges, the methodological aspects of observant participation, sensitized by the habitus concept, would dictate that one sampled such attempts at reshaping the body by undergoing the same types of experiments and recorded their evolving impact on the self.

In observant participation, thus, the scholarly role remains in the foreground. This is the second important distinction from an autoethnography, which entails that the person was a cultural member first and only became a scholar after the participation experience had been concluded. As a result, in autoethnography the only types of scholarly methods that can be used are methods of subsequent detachment. One cannot iterate between detached analysis and immersed experimentation on the self, which is the hallmark of observant participation.

Observant participation also differs from non-scientific forms of autoethnography that ground themselves in the humanities (e.g. Ellis et al., 2011). Non-scientific autoethnography questions the ability of science to uncover 'truths'. In this view, a better aim of scholarship is narrative. It involves the construction of stories, as 'complex, constitutive, meaningful phenomena that taught morals and ethics, introduced unique ways of thinking and feeling, and helped people make

sense of themselves and others' (Ellis et al., 2011, p. 273). In contrast, the observant participant scholar is (1) not a central character in (2) a narrative, but one of many informants in an account of research findings. It uses the self to understand what is collective and 'real', being committed to social science, albeit a postpositivistic one; it is designed to examine objective social structures. It may borrow tools from the humanities and art, but does so in the service of science, as another way to provide the phenomenon with face validity, which is a scientific criterion. For example, Wacquant (2004) used the novella form to make it possible for the reader to vicariously experience the 'ache and pain' of boxing, thereby also enrolling the reader's body in the scientific endeavor.

A Primer on Observant Participation in Knowledge-Based Organizations

This chapter thus proposes ethnography in the form of observant participation as a preferred method for understanding the holistic transformation that contemporary knowledge workers undergo as they submit to historically novel, all-encompassing work schedules. I posit that this approach can reorient the management discipline, which has as its central task the goal of understanding the organizational influence on the individual, but has been constrained by a narrow focus on studying component parts of persons, most notably their minds. To conduct ethnography from this broader perspective of reorienting research on the organizational discipline's central task, it is necessary to formulate an agenda to guide our collective effort, including a set of research questions and the broader disciplinary goals to be pursued by answering these questions. The remainder of this chapter proposes such questions and goals and shows how observant participation can be utilized to advance this disciplinary agenda.

The research questions we need to answer collectively include: What aspects of persons change through their participation in knowledge-based organizations? Through what mechanisms do these changes occur? How do these changes evolve over time? How do the person and the context mutually constitute each other? One challenge fieldworkers confront in addressing these questions is that the observational territory that we need to cover is much greater than before, more complex, and largely uncharted. Whereas prior behavioral constructs set our focus on the mental realm of the person, we now also need to cover the prediscursive, embodied realm, for which we do not have any guidance. And whereas prior organizational constructs set our focus on the visible organizational structures that are designed for the purpose of control, such as socialization activities, we now need to cover the invisible aspects of control that are designed for other purposes. Moreover, all of these elements have to be studied together to understand how they keep modulating each other and how they do so in distinct ways over time.

Illustrating such evolving reciprocal modulation, my research (Michel, 2011) shows how investment banking practices and bankers' bodies and minds interrelated in distinct ways over time. A variety of bank practices worked together to create a culture of high quality work conducted at an intense pace. To fit with this culture, bankers' socialized minds repressed their bodies' needs and cues, for example, often working multiple 'all-nighters' in a row. During the first four years, this repression enabled the bankers to reproduce the banks' work pace and quality. But after about four years, the relation between practice, body, and mind changed. The body started to rebel through breakdowns, thwarting the socialized mind's goals, and affecting work quality. For some bankers, after about year six, the relation changed again, as the mind now started to utilize the body's cues to modify bank practices that benefited bank and banker.

Observant participation is a powerful method for addressing the proposed research questions. First, as an apprentice who engages in the organization's activities, the researcher is the nexus at which the diverse causally active aspects of the socio-material context, including 'micro-' and 'macro-' aspects, come together and exert influence. For example, by executing deals, the apprentice banker engages with aspects of the economic context, including clients and competitors; aspects of the firm's strategy, such as how the bank positions its products; behavioral aspects, such as how bankers interrelate; and aspects of the socio-material context, such as working environment layout and technology. The researcher can thus witness the evolving interplay of these elements over time. In contrast, if one were to approach the same challenge with a deductive approach, one would have to guess what specific aspects of the context have an impact, which is difficult because we have little conceptual guidance for doing so. Moreover, because deductive research is often conducted from a specialized perspective (e.g. either micro or macro), the likelihood is high that one would miss elements and mis-specify them because how a given aspect manifests depends on how other aspects manifest. For example, the body is a qualitatively different kind of activity aspect (e.g. a repressed object, rebellious antagonist, or helpful resource), depending on how the mind relates to it and depending on the specific set of practices it is engaged in.

Second, observant participation also has an advantage over traditional ethnography because of how it utilizes the researcher's own experience. Because the researcher has more continuous and more invasive access to the self as an object, as compared to other informants, the researcher can explore more facets of change, especially vaguely felt embodied changes. For example, in my ethnographic study (Michel, 2011), participant observation could have helped me fill in the categories of 'mind' and 'body', as they were manifesting in this particular setting, adding subcategories and

more finely grained interrelations. Moreover, since changes in persons come from how persons engage with aspects of the socio-material context, the researcher can continuously formulate hypotheses about this reciprocal transformation and test these hypotheses in action, by using different tools and using tools differently to discern the evolving influence on the self. This ongoing and rapid iteration between action, hypothesis formulation, and hypothesis testing promises to yield fast results, as compared to what would be possible through conducting separate studies.

The kinds of methods that the observant participant researcher uses are comparable to the methods that other types of ethnographers use, with the added dimension that the researcher also directs these methods toward the self, turning the self into a research object, as captured by Bourdieu's (2003) notion of 'participant objectivation'. In addition to keeping field notes, promising methods for this purpose include filming the self (and others) at work, interviewing oneself (and others) in front of a camera regularly, and interviewing preexisting relations, such as family members, about their evolving experience with the self. Video work is especially useful because it allows one to track embodied changes that might only be meaningful over time and changes that develop too gradually for the self and others to notice, such as sitting-induced posture changes. It also generates material that other analysts can access, allowing for assessing inter-observer reliability. Whatever data collection method one uses, it is important to remember that the self is not a privileged epistemic object; what occurs in the self is merely of interest to the extent that it unlocks what is collective. Therefore, the researcher has to (1) collect data on both self and others, and (2) continuously iterate analytically between data on self and others, with the goal of identifying those aspects that are socially shared.

While we do not have much guidance on where to focus analytic attention, one promising starting point is to examine the evolution

of habits as the basis of how the context controls and transforms the person in ways that are invisible to the person, as illustrated in the following quotation by Erin Callan, the former CFO of Lehman Brothers, in her candid New York Times OpEd about her experience with high-intensity investment banking work practices:

I didn't start out with the goal of devoting all of myself to my job. It crept in over time. Each year that went by, slight modifications became the new normal. First I spent a half-hour on Sunday organizing my e-mail, to-do list and calendar to make Monday morning easier. Then I was working a few hours on Sunday, then all day. My boundaries slipped away until work was all that was left. (Callan, 2013)

Like Callan, my informants could only articulate consequential habits retrospectively, after they had left the cultural setting, often induced by a severe personal crisis. Like all retrospective recollection, much detail gets lost about how a particular habit evolved. Also, because informants are not trained researchers and usually do not keep detailed notes, they may only have noticed or remembered some habits, perhaps not even the most important ones.

Moreover, many habits are interrelated in ways that may not be apparent to the untrained informant. For example, the increasingly long working hours of my informants led to health problems, such as insomnia, which decreased output and made it necessary for the person to work even harder. This cycle cued other habits, such as consuming drugs that allowed the banker to sleep and drugs that kept the overtired banker awake. These habits gave the person the experience that body cues could simply be overridden, which the person then generalized to other situations, such as ignoring signs of serious illness or consuming other substances to suppress anxiety and depression, forming (1) a meta-habit of repressing the body in the service of organizational goals, that (2) was likely to implode over time, leading to new types of modulations between work, mind, and body

(e.g. Michel, 2014). Together, these examples illustrate that the modifications that constitute a habit are often minor, private, inter-related with other habits, and evolving over time – attributes that make observant participation the best bet for uncovering them.

As evidenced by the prior example, longitudinal research is an integral component of the observant participant approach, required to uncover the evolving effects of organizations on participants. For example, Wacquant (2011) instructs the researcher to stay as long and as deep in the field as possible. Part of what we need to discover is how long the researcher needs to stay in the field to capture important changes. Prematurely exiting the field can lead to consequential incorrect conclusions. For example, because socialization research conceptualizes change in persons as merely cognitive, such as a change in concepts, and because organizational participants learn important organizational concepts within six months, most socialization research only studies participants' first year at an organization (e.g. Bauer et al., 1998). However, because I stayed in the field longer, I had the opportunity to observe that changes continue to occur, for example, in years four and six and beyond (e.g. Michel, 2011, 2014). These changes did not reflect the tempo at which the mind was socialized, but the evolving effect of socialization on the body, which changes at a different tempo, as compared to the mind. The more holistic conceptualization of the person that I advocate is partly a matter of discovering how different aspects of the person change at different and potentially interacting timescales, all of which are specific to a particular cultural and historical context. The very long research timeframes that are required for answering this question mean that observant participation needs to be complemented with other methods. For example, once observant participation yields propositions about what aspects of persons change through what specific aspects of work, we could conduct more targeted, cross-sectional survey studies that track how these

aspects (1) differ across different types of knowledge work, and (2) change over long periods of time.

What Type of Research Can Benefit From Observant Participation?

Participant observation is a powerful tool for studying aspects of action that are invisible to quantitative and other qualitative approaches, including embodied and taken-for-granted aspects. This attribute benefits approaches such as organizational practice theory, situated perspectives on organization change, and institutional research.

Observant participation can assist organizational practice scholars with elaborating the human aspects of practice. Congenial to the approach I outline here, organizational practice scholarship conceptualizes persons and the social context as mutually constituted (e.g. Feldman & Orlikowski, 2011) and critiques cognitivist approaches for folding action and cognition into the mind of the person (see Nicolini et al., 2003 for a review). Through empirical research, practice scholars have provided an understanding of how cognition is instead an attribute of a system to which both participants and the socio-material context contribute elements. To balance the undue person focus of cognitivism, practice researchers have prioritized elaborating the socio-material aspects of cognition. While practice scholars have articulated how the person should *not* be conceptualized, namely as cognitive and decontextualized, they have not yet provided a compelling replacement for cognitivism's conceptualization of the person-as-mind.

Given the lack of conceptual guidance, formulating an alternative conceptualization requires qualitative, discovery-oriented research. However, this research cannot rely on such traditional methods as participants' self-report because our colloquial understanding of personhood, cognition, and action is infused

with a cognitive perspective; informants and researchers alike use cognitivism as a lay theory. Armed with sensitizing concepts, observant participation can help break through taken-for-grantedness, partly because the scholar can conduct experiments on the self, such as varying the tools that one engages with and observing the concomitant changes in the person.

For example, after about year ten of my data collection, some of my informants experienced their second and often incapacitating breakdown from overwork. A few took up sports, initially to heal. Over time, they transferred the embodied dispositions they had learned in banking, such as marshaling resources for high performance, to this new context, where they marshaled specialized training techniques, technological devices, and equipment to supplement and coax high performance out of their aging bodies. To understand my informants' experience, I experimented with similar training regimens, observing the resulting, diverse changes in my person, including systematically changed blood tests, new emotional responses, different ways in which others approached me, new ways of responding to others, different types of illnesses and injuries, and different ways of thinking and writing (e.g. characteristic length of sentences, types of sentence structures). This experiment showed how a different set of tools can bring out wide-ranging changes in the person, inviting a composite conceptualization of the person-with-tools to substitute for the impoverished and decontextualized cognitive one.

Observant participation can also advance our understanding of organization change as continuous and situated. Such notions as improvisation (Weick, 1998), performativity (Callon, 1998), structuration (Orlikowski, 1996), and organizational becoming (Tsoukas & Chia, 2002) have revealed how flux occurs naturally, as a result of participants' daily business activity, and predisposes organizations to continuous change, whereas fixity is an active accomplishment, thus reversing the previously predominant assumption that stability is natural. This approach redirects the attention

of organizational change research from top management's abstract cognitions toward situated action (e.g. Jarzabkowski, 2004; Vaara & Whittington, 2012) to which both persons and the social context contribute structure. Yet we currently have an incomplete understanding of what these situated structures are and how they keep forming each other. For example, Eisenhardt and colleagues (Eisenhardt, 1989; Brown & Eisenhardt, 1997) found that continuously changing organizations have (1) employees who attend to concrete information and (2) semi-structures that facilitate improvisation, but do not explain (a) what other dimensions of the person change and (b) how personal and structural attributes interrelate and keep forming each other. Placing the scholar at the nexus of embodied and socio-material structures, observant participation can supply this foundational understanding.

Observant participation is also an ideal methodology to study taken-for-grantedness, a central construct for institutional research (for reviews, see Scott, 2008a; Tolbert & Zucker, 1996). Scott (2008b) deplored that empirical institutional research has focused on the 'more superficial, "thinner", and less consequential' aspects of culture, 'including rule-setting, monitoring, and sanctioning' (pp. 428–9) and choices elicited by legitimacy or obligation. He noted that this misinformed focus resulted from methodological preferences. Namely, institutional scholars tend to study concepts and how they become taken-for-granted, for example, through social circulation. Because institutional research investigates at the aggregate and macro-level (Scott, 2008b), it does not explain how taken-for-granted cognitions are instantiated in practice; how they shape what people do on a daily basis that requires behavioral research. As an unusually powerful type of behavioral research, observant participation allows institutional scholars to also investigate the deeper cultural levels on which Scott (2008b) invited research, which compel people to act not out of agency, legitimacy, or obligation, but because they cannot conceive otherwise.

These actions are particularly consequential: They maintain the system that generated them since actors who do not recognize their choices as such are less likely to alter the system in their own interests. Because participants cannot self-report on what they take for granted, the participant observer, equipped with sensitizing concepts and methods, has a higher likelihood of uncovering these deeper dimensions of culture, and discovering how they become embodied in persons.

CONCLUSION

In summary, the cultural-anthropological embodiment lens I outline here makes it possible to capitalize on a pivotal cultural moment, in which new forms of human functioning are emerging, driven by the work cultures of a new form of organizing, namely knowledge work. This means that hand-in-hand with the need to understand new forms of organizational functioning and control, we need to understand these new forms of human functioning and how the one is tied to the other, helping organizations to structure their work practices in ways that transform participants for the benefit of all.

ACKNOWLEDGMENT

I am grateful to Ann Cunliffe for providing invaluable suggestions. Thanks to Dana Kaminstein for helpful conversations and resources.

Organizational Ethnographies

Sylwia Ciuk, Juliette Koning
and Monika Kostera

INTRODUCTION

While there is no commonly agreed definition of organizational ethnography, it can be succinctly described as a particular type of ethnographic study, including its written representation, which is concerned with organizations and their processes of organizing (Ybema et al., 2009). It is important to note that organizations are understood here in a broad sense and do not necessarily need to be confined to formal ones (Watson, 2012). At times, organizational ethnography is differentiated from workplace ethnographies, which are seen as being primarily concerned with the study of work (Down, 2012), workers and their 'relations of conflict and cooperation with managers' (Edwards & Bélanger, 2008, p. 292). Organizational ethnographies, on the other hand, are preoccupied with broader aspects of organizing (Ybema et al., 2009). While some authors put forward criteria which differentiate workplace and organizational ethnographies (e.g. Hodson, 2004;

Yanow & Geuijen, 2009), for the purposes of this chapter, we avoid such strict differentiations and focus on organizational ethnography, although, as the readers will notice, many of the observations we make and the sources we quote refer both to organizational and workplace ethnographies.

ORGANIZATIONAL ETHNOGRAPHY: WHAT, WHY AND HOW

Organizational ethnography, and ethnography more generally, can be seen as a particular type of a 'social practice which is concerned with the study and representation of culture' (Van Maanen, 2011, p. 219). Similarly, it is often presented as a distinctive type of research (Watson, 2012) and a methodology (Neyland, 2008) rather than a method. It entails not only fieldwork, but also headwork and textwork (Van Maanen, 2011). With regards to fieldwork, ethnography is predicated upon

observation, albeit with different and often shifting degrees of participation and changing roles of the ethnographer (see e.g. Börjesson, 2013). As Van Maanen (2011, p. 219) observed, it entails ‘subjecting oneself to at least a part of the life situation of others’. This immersion and close observation of the life of others in particular settings requires careful attention to the everyday interactions, situations and occurrences. Ethnography aims to achieve intimate knowledge of situated actors and objects (Marcus, 1995). As Neyland (2008) warns, ethnographic preoccupation with culture can sometimes mistakenly be understood as being confined to people, not objects or technology, although ethnographic research also concerns the latter (Jarzabkowski et al., 2015). The everydayness of organizational ethnography means that ‘fine grained daily interactions constitute the lifeblood of the data produced’ (Falzon, 2009, p. 1) which the ethnographer tries to capture and convey, relying on a powerful extracted example (Fine et al., 2009). Ethnography seeks to grasp and provide a truthful account of people’s experiences. As a consequence, ethnography ‘has the potential to inform the projects and practices ... of anyone entering the type of setting covered by the study’ (Watson, 2011, p. 209). It is interested in how selected groups and communities go about their lives by exploring events and staying attuned to language, rituals and artefacts (Cunliffe, 2010) in a given context. Attention to context is key in organizational ethnography as practices are seen to be inherently ‘contextual and difficult to fully understand without taking into account interactions and actions emerging in the flux of organizational activities’ (Rouleau et al., 2014, p. 4).

Organizational ethnography strives to understand social practices and processes rather than reified states, and so it takes into consideration everything that occurs, no matter how rare or common it turns out to be. As Fine et al. (2009, p. 611) observe, this attention to process ‘enables the identification of mechanisms through which organizational behaviour occurs’. As

is the case with interpretive research more generally (see e.g. Gephart, Chapter 3, this *Handbook*), ethnography seeks to ‘reveal the intricate, evolving connections between taken-for-granted understandings and human activities’ (Schwartz-Shea, 2006, p. 92). It stays attuned to what may seem as banal and mundane features of organizational realities (Neyland, 2008). In particular, the cultural understandings held by others, ‘meanings about work, about careers, about life’ are core to the ethnographic practice (Van Maanen, 2015, p. 40).

While the need for some immersive strategies in ethnography appears to be a commonly shared assumption, what this means in practice remains a topic of some debate. Echoing wider concerns within the fields of anthropology and sociology, the traditional homelands of ethnography (Czarniawska-Joerges, 1992), some organizational ethnographies have attracted considerable criticism for their speediness and superficiality (Bate, 1997; Wright, 1994). Indeed, the time-span of much research in organizations is usually much shorter than that of social and cultural anthropology. The involvement is also usually less intense, because the methods used tend to be less immersive (direct observation and interviews dominate over full participant observation). While we certainly do not promote superficiality in ethnographic work, it is important to recognize that organizational settings typically *are* less immersive cultures themselves; people come and go to work, only exceptionally do they dedicate all of their lives to it. It is important to acknowledge that organizations are fragmented and fragmentary cultures. Although they do define much of our identities and ways of life, they do not monopolize or occupy our social imagination the way that the larger cultural context might do (Kostera, 2012).

Intensive fieldwork in a natural setting, while crucial in ethnography, is not enough to turn the written work into an ethnographic study (Brannan et al., 2012). What is required is a special type of ‘headwork’ (Van Maanen, 2011), one that draws connections between the observed local phenomena and broader

cultural and societal context. Knowledge gained through organizational ethnography, therefore, concerns ideas and practices directly relevant at the level of the field (and other, similar ones) and is of a holistic nature, that is, it helps to grasp the social world in all its dynamics and complexity, to consider phenomena in their broader context. While ethnographic holism has been described as ‘something of an ethnographic fiction’ (Van Maanen, 2006, p. 16), ethnography strives to combine ‘subjective experience and individual agency with a sensitivity to the broader social settings and the historical and institutional dynamics in which these are embedded’ (Yanow et al., 2012, p. 335). In order to achieve this, ethnography is often described as being predicated upon the researcher’s ‘ethnographic sensibility’ (Yanow & Geuijen, 2009, p. 254), ‘ethnographic awareness’ (Watson, 2012, p. 18) or the ‘anthropological state of mind’ (Czarniawska-Joerges, 1992, p. 72), the definitions of which often appear to be quite elusive. According to Pader (2006), ethnographic sensibility refers to the way in which we engage with our research setting, remaining attuned to detail and trying at the same time to discern the meaning of the observed events, objects and practices within the local and the wider context. It is about trying to ‘move about with a questioning attitude and a meaning-focused eye in all manner of settings and circumstances’ (Ybema et al., 2009, p. 15), combining openness to new realities and meanings with a constant need to problematize and a reluctance to take anything for granted since to:

make explicit the meaning, the significance, of everyday practices in any kind of truly explanatory manner requires going beneath the surface to those messy spaces of our lives where we commonly don’t explain why we do what we do ... The careful observation and self- and cultural discovery of research, however, turn this acceptance into explicitly stated, empirical data. (Pader, 2006, p. 174)

One can argue that the need for ethnographic sensibility becomes even more pronounced in the case of organizational ethnographies

where researchers study fields that are, in fact, very similar to their own ones (Czarniawska, 2014). Organizational ethnographers may not encounter many strange adventures; rather, they often find themselves stuck with the familiar and the mundane. It is this everyday world, a standard workplace, that the ethnographer needs to approach with curiosity, respect and inquisitiveness. This is what Bruno Latour and Steve Woolgar (1979, p. 29) mean by anthropological research of the everyday world, as they argue ‘the importance of bracketing our familiarity with the object of our study’.

The questioning attitude or ‘reflexive distance’ (Ybema & Kamsteeg, 2009, p. 115, see also Hayward and Cassell, Chapter 22, this *Handbook*) is seen to enable ethnographers to ‘make the familiar strange’ (ibid., p. 101). Indeed, it is the ‘encounter with the “foreign”, or “unknown”, or “strange” [that] is the very essence of ethnography’ (Van Maanen, 2015, p. 40). This careful attention to how organization members go about and make sense of their daily lives enables organizational ethnographers to shed light onto hidden dimensions of organizational life, such as the issues related to emotions, power and politics (Ybema et al., 2009). Since the purpose of ethnography is ‘to provide a localized understanding of the cultural processes – meaning-making – as it occurs from a few vantage points within the organization’ (Van Maanen, 2011, p. 221), ethnography is not only about immersion, but it also entails translation (Cunliffe, 2010). According to Agar (2010, p. 290), ethnography is ‘fundamentally about *translation*, about the exploration, learning, and documentation of one perspective together with a mapping between it and another’.

The ethnographer not only has to be directly involved in the studied setting but they also need to be prepared for a cognitively intensive engagement (see e.g. Rosen, 2000). It is true of organizational as it is of all other ethnography that it is a borderland experience: ‘[it] is actively situated between powerful systems of meaning. It poses its questions at the boundaries of civilizations, cultures, classes, races, and genders. Ethnography

decodes and recodes, telling the grounds of collective order and diversity, inclusion and exclusion' (Clifford, 1986, pp. 2–3).

Ethnography can therefore be described as an approach that enables the researcher to go beyond the dualism of experiential and collective perspectives. Ethnography 'is neither subjective nor objective; it is interpretive, mediating two worlds through a third' (Agar, 1986, p. 19). The headwork of ethnography is intimately connected with deskwork. The written outcome of the ethnographer's work is an integral element. In fact, some authors (e.g. Watson, 2011) suggest that ethnography should be seen primarily as a written document rather than the fieldwork that leads to it. Organizational ethnography as a written document is not just concerned with a realistic representation of the social actors in the field, but it also strives to be democratic instead of casting some voices as illegitimate (Yanow, 2012). It is important to note, however, that while organizational ethnography and ethnography more generally 'claims a sort of informative and documentary status' (Van Maanen, 2011, p. 219) and is concerned with a detailed mapping of different voices and perspectives (Yanow, 2012), it also carries a promise for theorizing work and organizations (Rouleau et al., 2014), not least because of the flexibility of its design, which allows for immediate assessment of emerging theoretical propositions (Hammersley & Atkinson, 2007). It is, however, the 'theoretical pluralism' that is favoured in order to answer the 'how' questions (Van Maanen, 2015, p. 48).

ORGANIZATIONAL ETHNOGRAPHY: PAST, PRESENT, FUTURE

We will not attempt to join the 'crowded domain' of trying to establish the origins of organizational ethnography (Van Maanen, in Luthans et al., 2013, p. 110). We concur with Yanow (2009) that organizational ethnography is far from 'new'. In fact it is fair to say

that today's organizational ethnographies stand on the shoulders of a rich tradition of 'ethnographic' research in a variety of disciplines. Its heritage can be found in anthropology (the 'fieldwork' tradition of participant observation as dedicated to Malinowski; thick description as put forward by Clifford Geertz), sociology (the famous ethnographic tradition of the Chicago School with such well-known scholars of urban sociology as William Foot Whyte), and (industrial) psychology (Elton Mayo and the Hawthorne studies). However, Van Maanen (in Luthans et al., 2013, p. 107), argues that, if we 'need a primogenitor for organizational ethnography, W. Lloyd Warner is the one and Yankee City is the birthplace, not Hawthorne'. Warner, an anthropologist, had been part of the Hawthorne studies but his community ethnographies of Yankee City, which he did after Hawthorne, excel in being 'far broader' and more 'thoughtful' than what came out of the Hawthorne studies and he thus deserves a prominent place among the studies named as important for present-day organizational ethnography (ibid.).

Organizational ethnography as a research approach, to date, has undergone several important changes since these 'beginnings'. A trajectory can be sketched starting with the 'early' studies depicting and revealing 'bureaucratic' organizations with such classics as Selznick's *TVA and the Grassroots* (1949), Gouldner's *Patterns of Industrial Bureaucracy* (1954), and Goffman's *The Presentation of Self* (1959), followed by a first wave of renewal in the 1980s and 1990s with a stronger ethnographic (socio-cultural) focus, such as Kunda's *Engineering Culture* (1992), Watson's *In Search of Management* (1994), and Delbridge's *Life on the Line* (1998) and specific methodology-focused works in the 2000s by Kostera (2007), Neyland (2008) and Ybema et al. (2009), to name a few. Far more detailed and comprehensive overviews have been compiled by Yanow and Geuijen (2009) for organizational ethnography and by Hodson (2008) for workplace ethnographies.

A second wave of renewal is currently under way. This wave is inspired both by new technologies for the doing of organizational ethnography as well as by how technologies and increased connectivity are reshaping organizational life, leading to a far more open stance towards 'the' organization and its supposed boundaries. The rise of new organizational forms, and by extension the proliferation of cultural processes that take place across and in-between potential ethnographic sites, means that what constitutes the ethnographic field can hardly be considered 'exclusively local or whole' (Van Maanen, 2011, p. 225). Similarly, ethnographic objects of study are often mobile and therefore cannot be studied within a single location (Marcus, 1995). These changes, coupled with technological developments and evolving approaches to the purpose and role of ethnography, have resulted in a rise of new forms of organizational ethnography. While it is impossible to consider them all within the scope of this chapter, we would like to discuss a few examples which illustrate these emergent trends, namely multisited ethnography, para-ethnography, applied and reflexive/engaged ethnography. Autoethnography (e.g. Doloriert & Sambrook, 2012; Haynes, 2019; Humphreys, 2005; Learmonth & Humphreys, 2012; Sambrook, 2015) and netnography/virtual ethnography (e.g. Bowler, 2010; Kozinets, 2002, 2015, 2019; Murthy, 2013; Wittel, 2000), which we also see as important developments, have been addressed in detail elsewhere.

According to Yanow et al. (2012), when it comes to organizational ethnography, multisitedness should be considered a norm rather than an exception and as such might be regarded as one of its distinctive features. For Yanow and colleagues (2012, p. 342) multisitedness can manifest itself even 'within the walls of a single organization, [since when] "mapping" across its departments and hierarchical levels, one is perforce engaged in a multi-sited study'. Typically, *multisited ethnography*, however, is associated with organizations that are themselves multisited. When researching such fields, 'the "ethno" of ethnography takes

on a quite unreliable, non-localized character' (Fayard & Van Maanen, 2015, p. 17), which leads Van Maanen (2015, p. 46) to argue that this 'shifting field' might be a fertile area for future organizational ethnographic research.

According to Marcus (1995), multisited ethnography is concerned with following objects, stories, processes and metaphors across different geographical locations rather than seeking out new sites as a means for comparison. Multisited ethnography focuses on 'cultural work across boundaries' (Islam, 2015, p. 237) as ethnographic objects, be it people, discourses or goods 'are in a constant state of displacement' (Falzon, 2009, p. 5). As Marcus (1995, p. 105) explains, it is 'designed around chains, paths, threads, conjunctions, or juxtapositions of locations in which the ethnographer establishes some form of literal, physical presence' and seeks to explore connections among sites.

At times, the ethnographic object that is being followed is a distinctively global practice, or one that cuts across the global and local levels of analysis. Therefore, this type of multisited ethnography is sometimes called global ethnography (e.g. Burawoy, 2001; Jarzabkowski et al., 2015). Similarly, Czarniawska (2007) discusses mobile ethnography, which sets out to follow actors and practices instead of focusing on a specific location. The multilocality of multisited ethnographies is not linked to the mere existence of multiple sites, but rather, the connections and relationships between them (Hannerz, 2003). The principle of following the ethnographic object, which is so central to multisited ethnography, means that this type of fieldwork often takes even more unexpected directions than more traditional ethnographies which, as we discussed earlier, are themselves necessarily improvisational in character. For example, Prasad et al. (2011), who set out to carry out a multisited ethnography to explore the ways in which the discourse of diversity management played out in different organizational settings, had to expand their original study to include the suppliers of

diversity management tools so as to be able to follow the discourse in question. Similarly, Jarzabkowski et al. (2015) explain how they had to extend their fieldwork to include new sites as their object of study – a global risk trading practice – and the researchers' understanding of it evolved.

This displacement and movement inherent to multisited ethnographic research necessitates a search for innovative methods and techniques of doing fieldwork (Rouleau et al., 2014). Smets et al. (2014), for example, discuss in this context a team-based video ethnography which, as they explain, not only enables shared and simultaneous immersion in multiple sites but also facilitates collective sensemaking and can subsequently contribute to 'interpretive density' of ethnographic work (Jarzabkowski et al., 2015, p. 18).

A second important development in the practice of organizational ethnography is related to the changing nature of collaboration when doing fieldwork and attempts to decentre the researcher. As Yanow et al. (2012, p. 345) observe, discussions about 'going native' and clear distinctions between 'insiders' and 'outsiders' might no longer be appropriate as they objectify participants instead of fostering a relational nature of ethnographic fieldwork. Lassiter and Campell (2010, p. 4) elaborate on this point further, explaining that 'ethnographers no longer enter into projects with clearly defined "subjects" or "informants" but with "epistemic partners"' who might themselves be pursuing their own research questions.

The nature of collaboration between the researcher(s) and organization members will of course differ between ethnographic projects; however, in *para-ethnography* it takes centre stage as organization members are seen here not as sources of raw data but rather as co-producers of cultural analysis (Islam, 2015). In this type of ethnographic work, which is at times described as 'participatory "storytelling"' (ibid., p. 5), 'the questions, products, and functions of ethnography are multi-directional' (Lassiter & Campell, 2010, p. 4). In para-ethnography, researchers can use

'thin' data – 'highly refined, technical documents ... to create contexts and preconditions for "thick" description' (Holmes & Marcus, 2006, p. 36). While para-ethnography relies on participants' ability to reflect upon, challenge and revise their cultural assumptions in ways reminiscent of the theorizing traditionally associated with researchers, it does not need to be confined to knowledge workers and knowledge intensive environments. What matters is 'collaborative critical reflexivity' (Islam, 2015, p. 236).

Para-ethnography has also been linked to wider practice-based approaches and as such it resonates with hopes for more engaged and applied ethnographic studies (Ghorashi & Wels, 2009; Lassiter & Campell, 2010). Notwithstanding some often well-founded concerns about combining ethnographic roles with more clinical approaches (e.g. Yanow, 2012), more *applied organizational ethnographies* appear to be on the rise (Fayard & Van Maanen, 2015). As is sometimes argued, ethnography does not have to stop at recording or describing organizational realities, but it can also help social actors both in and outside of the ethnographic field (Goodall, 2000).

Ethnography enables problematization and description of, sometimes elusive, phenomena and problems and thus it can help to establish the conditions for change and learning in intervention projects such as Action Research (Scaratti et al., Chapter 18, this *Handbook*; Chrostowski & Kostera, 2011). Ethnographic description is close to experience, which helps the researcher to understand the reality being studied, and to establish the preconditions for change (compare Czarniawska, 2014). Such a practical application of ethnography is possible because it provides what Polanyi (1958/1974) called tacit knowledge or knowledge in action that is not verbalized but experienced. More applied organizational ethnographies can foster learning of new ways of organizing and social action since ethnographers do not only propagate the old ways but show that (and how) things can be done differently, inspiring and encouraging social change (Graeber, 2004). It has

therefore been suggested that organizational ethnographies can play a role in organizational development and interventions into organizations (e.g. Agar, 2010; Fine et al., 2009). As Fayard and Van Maanen (2015, p. 6) observe when discussing corporate ethnography, which is a particular type of applied ethnography initiated and sponsored by the studied organization, corporate ethnographies can ‘not only produce new knowledge and understanding for insiders, they also have a hand in producing the organizational realities they study’. As the quoted authors admit, they sought to encourage ‘cultural dialogue’ (p. 18) and to question, if not to alter with time, the dominant normative cultural discourse in the organization and to simultaneously promote a more relational view of culture. It was hoped that the new cultural dialogue initiated among a wider range of organization members would have the potential to influence, at least to some extent, the agenda of senior managers by allowing new voices and new perspectives to be heard.

Organizational ethnography can help organization members to acquire what C. Wright Mills (1959) called sociological imagination, or the ability to combine the experiences of an individual person with one’s consciousness of one’s place in society and history. People tend to grasp their lives in a fragmentary way, limited to their everyday world that consists of their family, workplace and local community. Social imagination helps to overcome this limitation and enables individuals to see the relation between the particular and the social. This connection makes it possible to acquire a distance that is necessary to envisage and learn new practices and ideas, which, in turn, can not only lead to small and structural changes but also at times can trigger even revolutionary ones (Goodall, 2000). In this sense, organizational ethnography can help to achieve courage of thought and action in the workplace, a readiness to test new things and to accept failure as a part of the collective learning process.

Finally, another important, albeit less common, approach is *reflexive ethnography*

(Cunliffe, 2003), also known as *engaged ethnography* (e.g. Behar, 1996; Clair, 2012; Ghorashi & Wels, 2009) or *new ethnography* (Goodall, 2000). Reflexive approaches in social sciences have emerged as an attempt to answer three key areas of problems with traditional perspectives: the crisis of representation, the emphasis on the constitutive role of language and the problems caused by objectification of ethnographic research material (Cunliffe, 2003). While reflexivity, particularly related to a researcher’s location-based positionality, has become an important aspect inherent in ethnographic studies, underpinned by a constructivist–interpretivist methodology (Yanow et al., 2012), reflexive ethnography can also be considered as a particular type of ethnography.

Reflexive ethnography rests on the assumption that the social creation of realities is based on embodied and situated dialogue (Cunliffe, 2002). Social poetics is a research approach that makes it possible to explore how this process is unravelling, including its emerging structure and dynamics. The focus in such a research process is on language as ontology, seen as indeterminate and self-contradictory, with the potential to question and subvert social order – an ability characteristic of poetic language. Such an approach makes it possible to accept research as an ‘ongoing, multivoiced and multimeaning process’ (ibid., p. 131), without any one specific interpretation or mainstream viewpoint dominating the theorizing.

Reflexive ethnography is seen to help avoid the fallacy of objectivizing, petrification and determinization of qualitative research results, because of the constant attentiveness to different voices emerging in the dialogical process. No one voice is regarded as final, yet the perspective is strongly experiential, located within the consciousness of the ethnographer. The methodology includes personal and experiential stories, dialogues, and imaginative and poetic narratives. It blurs and transcends the boundary between genres and disciplines, often resulting in textual

and methodological hybrids. The personal, organizational and societal become counterpoised and the multiple dimensions – social, cultural, political, economic – are revealed and placed against each other.

Other new genres include comparative ethnography, which can be about comparing work or organizational issues in different countries or across different contexts (Van Maanen, 2015). In addition, newer ethnographic approaches for the ‘doing’ include spatial shadowing, multi-event ethnography, arts-based and dialogic ethnography, visual ethnography and the above-mentioned team-based ethnography (see Rouleau et al., 2014).

Notwithstanding these and other new developments, there are also aspects that have not changed (that much), such as the fact that organizational ethnographers prefer theoretical pluralism, write in an engaging and personalized style, have a strong focus on ‘the’ empirical, and do not work according to a standard ‘technique’ (Van Maanen, 2015, p. 48). It is still about discovery (Locke, 2011) and, as nicely put by Van Maanen (2015, p. 47), ‘we have left our cultural islands far behind and many of us are deeply enmeshed in messy and changing work worlds trying to bring back the news of what is happening in them’.

DESIGNING ORGANIZATIONAL ETHNOGRAPHY: QUESTIONS, BEING THERE AND REFLEXIVITY

Organizational ethnography, and ethnography more generally, are characterized by being more ‘improvisational’ (e.g. Van Maanen, 2015, p. 41), rather than highly procedural and rigid. This need for improvisation has been linked to both the indefiniteness of the ethnographic methods (Yanow, 2009) and the research designs that, as Van Maanen (2006, p. 18) commented, ‘have yet to leave their mark’. While there appears to be general agreement that ethnographic strategy needs to be flexible so that ethnographers can

react ‘in the moment’ (Yanow, 2009, p. 192), ethnographers are also advised to develop what Neyland (2008, p. 12) refers to as ‘an approximate strategy’, which is designed to guide, but not restrict, the study. Such a strategy does not need to be finished before commencing fieldwork (ibid.). It should be reflected upon but can also be adapted, if needed. Ethnographic strategy will therefore evolve with the research process.

Organizational ethnography is sometimes described as ‘path-dependent’ (e.g. Van Maanen, 2015, p. 41) and is often an abductive research strategy (Peirce, n.d., in Czarniawska, 2014; Yanow, 2012). It seeks to collect empirical, and often unexpected, material. It not only creates a detailed description but also coins concepts, which seek to illuminate the surprising data. These developing understandings are instantly tried out in new observations (Czarniawska, 2014). As Agar (2010, p. 289) observed, abduction ‘is the heart of ethnography’. In organizational ethnography:

abduction does not apply once. ... The key question in this kind of work is not, what is the research plan? The key question is, how do I start? After that, the same question, repeated over and over ... goes like this: What am I going to do *next*. Ethnography at time $n + 1$ is a function of what was just learned at time n . It’s a path-dependent kind of research driven by *iteration*. (Agar, 2010, p. 289)

Importantly, technological developments enable new research designs, such as team-based video ethnography (Smets et al., 2014), which allow researchers to observe organizing as it happens even though it might be dispersed in time and space and arise unexpectedly (Rouleau et al., 2014). Research designs will invariably involve choices with regards to the site(s), instruments(s) and the fieldworker(s) (Smets et al., 2014). As Lassiter and Campell (2010, p. 8) observe, there is a ‘range of possibilities for how we might imagine, think through, and enact ethnography in the present’. Organizational ethnography’s preoccupation with ‘situated detail’ (Van Maanen, 2006, p.18), however,

means that it favours combined fieldwork methods (Ybema et al., 2009). In particular, there are some concerns about interview-based ethnographies. Yanow (2009, p. 194), for example, warns that ‘if we reduce ethnography to interviews, we lose sight of its specific character as a way of knowing’.

In terms of its focus, organizational ethnographies seek to explore a multitude of problems and themes. Since ethnographies are concerned with understanding how organization members go about their daily working lives and how they make sense of their workplaces, they often ask very open exploratory questions about what goes on in a given setting. However, they can also be more narrowly focused on a selected aspect of organizing or aim to provide more clearly defined theoretical insights (Neyland, 2008). Since the rise in new forms of organizational ethnographies, often enabled by technological development, ethnographies can now ask even bolder questions. They can, for example, investigate how cultural practices operate not only within a given local context but also across organizational units and organizations (Smets et al., 2014). Similarly, ethnographies that supplement traditional observation methods with video-mediated ones can attend to a range of material and symbolic cues and explore how these impact organizational practices (ibid.). The *Journal of Organizational Ethnography* is a great source to explore the growing variety of research interests of today’s organizational ethnographers.

Because ethnographic fieldwork is about ‘being there’ (understood in myriad ways) and about ‘participating, overtly and covertly, in people’s daily lives’ (Hammersley & Atkinson, 2007, p. 3), both real and virtual, it is inherently relational. It is this relationality – the power in relationship-building and breaking, the power in negotiating access (see also Land and Taylor, Chapter 27, this *Handbook*) and rapport as well as the emotional dimensions of such relationships – that has since the ‘crisis of representation’ (Marcus & Fischer, 1986) been debated more intensely. This anti-realism movement, which took momentum in the

1980s, represents the growing recognition that ethnographers do not simply observe and describe, but, in fact, ‘interpret and inscribe’ (Robben, 2007, p. 446). This contestation, in turn, has contributed to a shift towards reflexivity. Regardless of the changing and increasingly varied (Watson, 2011) scenes in and for ethnography (Holmes & Marcus, 2005), the organizational ethnographer is (always) confronted with the challenging question of how to possibly ‘represent’ the unfamiliar and ‘the other’.

Reflexivity (Scaratti et al., Chapter 18, this *Handbook*) might appear to be the answer, but reflexivity has also come under closer scrutiny in the last decade or so. Some argue that it has become an ‘eclectic’ concept losing meaning (Tomkins & Eatough, 2010, p. 162), while others are questioning the degree of self-indulgence in reflexivity and the usage of reflexivity as a ‘means’ of establishing claims for ‘better’ research (Pillow, 2003). There are also voices that argue that reflexivity has become too rational an activity and overly individualistic (Burkitt, 2012).

These critiques, however, have triggered some interesting responses. An important implication of these recent debates is a re-evaluation of the power involved (in the relationship, the account and representation), with the aim to rebalance the power between/among ethnographer(s) and participant(s). It is not just about acknowledging that there are power dimensions involved and that these are often quite unequal (all of which is quite known already, of course), but primarily about moving towards a different stance – a stance where relationality and reflexivity transform into the realization that ‘we are always in relation to others’ (Cunliffe, 2008, p. 128) and informs the theorizing and meaning-making (see Hibbert et al., 2014). In this context it is useful to mention integrative, inclusive and interpretive reflexivity. Tomkins and Eatough (2010, p. 176), for example, propose a forward-moving reflexive integrative practice, which creates new learning, with each reflexive instance, ‘both about our research topic and about the ways in which we are accessing, interpreting and shaping it’. Inclusive reflexivity, on the

other hand, is aimed at a combined inclusiveness of the dimensions of the relationship that ‘we all hesitate to explicitly reveal (e.g. fear, alienation, embarrassment) ... it is inclusive of the research participants and their anxieties and agendas’ (Koning & Ooi, 2013, p. 17). Finally, interpretive reflexivity (Lichterman, 2015) means that ethnographers focus more on how they went about understanding the meaning-making of their participants (instead of trying to connect knowledge claims with social positions of the researchers). It is important to note that new research contexts also play a role here. For example, Reich (2015) points to greater space for negotiation, between researcher and researched, when conducting research among online communities. This type of ethnographic work can ‘provide new resources to potentially empower participants to make decisions about what participation means to them, their communities, and the issues for which they advocate’ (ibid., p. 411).

There are, therefore, specific qualities to an organizational ethnographic research design (flexibility), the open-minded approach (no fixed questions, if at all), to being there in whichever guise (relationality) and to the importance of a reflexive position (sensitivity towards the power involved and its shifting meanings). These are not mere aspects of how to ‘do’ organizational ethnography but far more the part and parcel of an organizational ethnographic mindset for the above identified ‘fieldwork, headwork, and textwork’. There are, however, a few criteria and yardsticks that we think are relevant to keep in mind while embarking on, carrying out and writing up an organizational ethnographic study. These are presented below.

CRITERIA AND YARDSTICKS

The issue of criteria for assessing the quality of qualitative work (see also Reinhard et al., Chapter 30, this *Handbook*) more generally and ethnography as a particular mode of

doing research has attracted a lot of debate in the literature. While some authors dispute the value of universal criteria (e.g. Guba & Lincoln, 2005) and propose separate lists for different research strategies (e.g. Creswell, 2007), others emphasize their pragmatic value, not least as a pedagogical tool (e.g. Tracy, 2010). Although a detailed discussion of these ongoing debates in the literature is understandably beyond the scope of this chapter and has been very skilfully done elsewhere (e.g. Schwartz-Shea, 2006; Yanow, 2006), we would like to point to a number of yardsticks that we see as useful when doing, writing and assessing organizational ethnographies. Many of the points resonate with the wider criteria used for assessing the quality of qualitative work, whereas others are more specific to ethnographies and relate to their key characteristics discussed earlier in the chapter. By highlighting what we see as useful yardsticks in organizational ethnography, we are not proposing that our list is exhaustive or that it is of universal applicability. On the contrary, we are very cognisant of the evolving nature of our field, which in turn prompts debates around the issues of quality, rigour and the changing expectations organizational ethnographers are facing. The plethora of new forms of doing, writing and disseminating organizational ethnographies further complicates the debates of rigour, as new emerging forms of organizational ethnography have their own distinctive characteristics. It is therefore reasonable to expect that these evolving forms of organizational ethnographies will require adaptations of the criteria used to judge their quality. We see quality criteria as necessarily contextual and embedded in the epistemic communities with which they are associated (Schwartz-Shea, 2006), rather than abstract concepts or hard and fast prescriptions. In light of the above, we believe that organizational ethnography might be best judged on the basis of professional ethos, ethics and some very practical and down to earth guidelines, which we present below (see also Czarniawska, 2014; Kociatkiewicz & Kostera, 2014).

First of all, as discussed earlier in the chapter, organizational ethnography, just like cultural anthropology, uses *thick description*, that is, it attempts to depict and understand meanings and contexts of the observed situations (Geertz, 1973). It is important not to confuse thick description with an 'exhaustive listing of details'. Instead it should be understood as 'a nuanced portrait of cultural layers' (Schwartz-Shea, 2006, p. 101). Building on this point, the quality of ethnographic work can be judged by its ability to convey an embodied sense of participants' experiences (Richardson, 2000). In this context some scholars talk about the criterion of credibility (e.g. Tracy, 2010). According to Cunliffe (2010, p. 231), for example, ethnographic 'validity' is based on the credibility of the text, which ought to contain detailed descriptions that grasp 'the intricacies of life in that setting'. This description needs to contain 'textual texturing' understood as the 'piling on of thing on top of thing, act on top of an act, describing, thickly, a particular activity, setting, individual' (Yanow, 2012, p. 36).

Second, *constant problematization* of the observed reality, an effort not to take anything for granted, appears to be particularly important for organizational ethnography, as what we are studying may often appear 'mundane' and 'everyday' (Czarniawska-Jorges, 1992). Third, many scholars see 'in-depth modes of inquiry' (Brannan et al., 2012, p. 8) as a hallmark of good organizational ethnography. The written effect of the study should therefore reflect the *personal and direct engagement in the field*, although how this is realized in practice might vary depending on the given forms of ethnography and can, for example, be accomplished jointly by a team of researchers, as is the case in team ethnography, or entail participation in virtual communities, as is accomplished in netnography.

An additional aspect of quality in ethnographic research concerns the *reliability of the description*, which means that persuasive stories from the field are able to offer a diverse and complex picture, enabling the reader to look upon the described situations from different angles and viewpoints

(Czarniawska, 1999). This entails using genres and styles that enable the researcher to depict dynamics and processes (Van Maanen, 1988). In this context one can also discuss the multisitedness of organizational ethnography understood as mapping different perspectives and cultural phenomena 'across various levels and/or departments and/or actors and/or time periods' (Yanow, 2009, p. 192).

Furthermore, organizational ethnographies should also strive to provide a *contribution* to our understanding of social life that is predicated upon the authors' 'deeply grounded (if embedded) ... perspective', which is conveyed in the ethnographic text (Richardson, 2000, p. 254). Ethnographies are also expected to generate *impact* and to move the reader both emotionally and intellectually (Richardson, 2000). In this context Tracy (2010) talks about *resonance*, in which she includes an aesthetic and evocative representation. In engaged organizational ethnography, as in public ethnography, impact is associated with the transformative potential of the study and its ability to open up spaces for dialogue, audience's learning and reflexivity (Mosher, 2013). On a related note, Watson (2011) calls for ethnographies that are relevant to practice.

Similarly, demonstrated *reflexivity* on the part of the researcher, including considerations of researcher positionality, is now a commonly used criterion for assessing the quality of ethnographic work (Schwartz-Shea, 2006; Watson, 2011). This should include all layers of encounters and their emotions in *the field* as these affect the fieldwork situation and how that situation is understood. Reflexivity 'not only allows room for the imperfectness of the researcher, but also enables a fuller and deeper representation' of the communities about which the researcher is aiming to build an understanding (Koning & Ooi, 2013, p. 29). This, in turn, can enhance the trustworthiness and quality of our ethnographic work. While *representation* and *voice* criteria which refer to the diversity of voices reflected in the ethnographic texts and wider dissemination of results, as well as data collection and feedback mechanisms (Mosher, 2013), are

important in all organizational ethnographies, they are of particular significance for engaged ethnographies.

Using *combined fieldwork methods* (Ybema et al., 2009) and *transparency* understood as ‘a detailed account of “exposure” to and in a field setting’ (Yanow, 2009, p. 192) combined with a systematic, albeit also simultaneously flexible, approach to the research process and a detailed account of one’s procedures are yet further means of establishing *the trustworthiness* of ethnographies. Finally, it is important to point out that good organizational ethnographies also showcase *meaningful coherence* (Tracy, 2010), which applies to the consistency between the stated goals, methods and interpretations.

CONCLUSION

As we have tried to argue in this chapter, organizational ethnography is a vibrant strand of research in management studies. It is a dynamic field open to change with regards to the ‘doing’, ‘writing’, ‘thinking’ and its ‘focus’. Its core objective, however, and most likely its persistent strength, is that those engaged in organizational ethnography strive to shed light on the complexities of day-to-day ‘organizational’ lives. In addressing ‘how and why multiple accounts and conflicting views are at play in a specific context’ (Rouleau et al., 2014, p. 4), organizational ethnography is open to the unexpected. It is focused on discovery and on challenging the taken for granted. It has thus offered an important contribution to organizational and management studies and promises to continue to do so.

Action Research: Knowing and Changing (in) Organizational Contexts

Giuseppe Scaratti, Mara Gorli, Laura Galuppo and
Silvio Ripamonti

INTRODUCTION

The Action Research (AR) approach occupies an important and innovative position in the varied field of qualitative research for business and management. By incorporating different positionings, epistemic stances, and distinctive features and methods, AR challenges the traditional ways to interpret research, generate knowledge, and view change.

In terms of knowledge production, it goes beyond the boundaries of traditional theoretical and disciplinary approaches, which define research topics and establish a linear sequence of hypothesis application and result verification. Knowledge in AR is a circular and participative process generated by examination of questions, issues, and problems relating to real contexts by means of explicit and implicit forms of negotiation and social construction involving multiple actors, a wide range of discipline-specific bodies of knowledge, and both material and immaterial dimensions (Gibbons et al., 1994).

The interplay of these two terms – ‘research’ and ‘action’ – both captures and illustrates the structural relationship and interdependence between theory and practice, thinking and doing, researcher and practitioner, academy and other domains that the AR approach allows. While certain aspects of traditional research are shared by AR (from research questions to discussion of results within the scientific community), AR also brings to the fore the complexity and relationality arising from the needs, expectations, and change dynamics concerning the practices and organizational contexts considered.

Research that starts from the problems generated by organizational contexts and aims to produce change necessarily requires a radical reassessment of the relationship between knowledge and action, and the related image of the ‘armchair academic researcher’ (van Marrewijk et al., 2010). AR focuses on the dynamic and complex situations that people face, and therefore on unprecedented and unclear problems for which established

and acquired forms of knowledge (such as those learned from academic textbooks) are not always, or sometimes only marginally, appropriate. Hence, in order to deal with and resolve such problems, it is necessary to assume the risks of a multiple challenge: that of developing local, participative, and contingent solutions with an intentional and limited rationality.

When research strategies deal with the contexts of action and the problems generated by them, they are geared to intercepting a knowledge which exists within, and permeates systems of activity and which, since it is embedded in work practices, is for the most part tacit and unconscious. Such knowledge cannot be identified and understood without first approaching the contexts themselves, and the experiences of the actors and the meanings that they attribute. Involvement of the multiple organizational actors and stakeholders is therefore crucial because they constitute the 'expert system' and are the carriers of the knowledge used, disseminated, and deposited in the everyday work context.

This entails a major shift of perspective whereby consideration of such factors as the rigor and reliability of generated knowledge cannot ignore the material and social conditions of its production. The knowledge that is produced therefore requires consensual validation (or at least its recognition by the various actors and stakeholders involved).

Kurt Lewin has famously and emblematically illustrated this interplay between theory and practice with two lapidary statements: 'there is nothing more practical than a good theory' and 'if you want to truly understand something, try to change it'. The first statement apparently concerns the need to demonstrate that knowledge (academic, scientific) precedes and leads action, so that the change is conceived as a temporally subsequent application that logically follows theory (Cook & Brown, 1999). The second statement declares the impossibility of ignoring daily life as the primary source from which human beings draw their meanings and courses of action.

Hence the statement serves to direct attention to how people use knowledge by adapting it to what different situations require.

When reconfiguring the relationship between theory and practice, it is necessary to clarify certain aspects: in particular, the role of the action researcher; the involvement of plural organizational actors and stakeholders; the negotiation of the knowledge objectives to be pursued; and their internal and external expendability.

In this regard, Reason & Bradbury (2008) provide a general definition of AR as a family of participatory approaches concerned with developing knowledge and change. The approaches belonging to this 'family' display great variety but have some key characteristics in common:

- contextual sensitivity (focus on local problems and situated/embedded knowledge);
- the production of relevant knowledge and change through co-generation and dialog, reflexivity, polyphony, and pluri-vocality;
- the promotion of people participation and multi-stakeholdership in contributing to knowledge and change construction;
- a shared problem-setting and research agenda (governance of processes and outcomes);
- political orientation (trust in democracy; researchers as reflexive and engaged scholars).

This definition seemingly captures the main features of AR while designating a broad spectrum of meanings. In order to provide a conceptual and operational framework for the AR approach, in this chapter we will provide a historical reconstruction of its development. In so doing, we will express our position, highlighting some distinctive features. We will then examine three turning points in the process of AR that highlight its distinctive character and the issues that it must address. These three turning points are the start-up of an AR process, its management, and its conclusion: they do not convey a standardized view of AR; rather, they phenomenologically emphasize the dynamic through which each AR unfolds, albeit in

always changing, specific, and contextualized declination. Two case experiences will be used to illustrate the *crafting* of AR processes, and how their nature and quality differ from any other form of research in organizational contexts. The conclusions will summarize the most important implications of the AR-based approach.

THE HISTORICAL–CONCEPTUAL FRAMEWORK: AR AS AN EMERGENCE OF DIFFERENT TRADITIONS

To start with the various traditions that have contributed to the debate surrounding AR, there are numerous historical reconstructions of the earliest stages and precursors of AR (Heller, 2004; Reason & Bradbury, 2008; Bruno et al., 2010).

Lewin is acknowledged as having introduced the expression ‘action research’ in 1946, conceiving it as a social experiment which goes beyond the traditional linear relation between theory and practice, involving people in the process of knowledge production. Other founding figures were contributing to the emergence of the phenomenon already during the inter-war period: the clinical and social work carried out at the Tavistock Clinic from the 1930s through to 1946; the school of Moreno, which was critical of conventional social sciences and instigated a participatory approach in which the researcher does not stand outside the field of inquiry; and Saul Alinsky, who was active from the 1930s to the 1960s in contexts far removed from those just mentioned and worked as a sociologist at the School of Chicago. One key innovation to come from the qualitative tradition of the School of Chicago, alongside its empirical bent and emphasis on practical fieldwork, was the connection between the empirical approach and the endeavor of researchers to produce knowledge useful in addressing real social problems.

It was the western tradition (Susman & Evered, 1978; Elden & Chisholm, 1993; Reason & Bradbury, 2001), in particular, that recognized the importance to AR of experiences gained, during and after Lewin’s time, at the Tavistock Institute of Human Relations in London, founded in 1946 following the absorption of the Tavistock Clinic into the national health system.

From the 1950s onwards, the socio-technical approach – grown and developed at the Tavistock Institute of Human Relations – and the Lewinian concept of action research took root in Scandinavia. It did so initially with the Industrial Democracy Project in Norway, a joint project between the federation of entrepreneurs and the trade unions, which was particularly active during the 1960s. From Norway, the approach spread to Sweden and Denmark, until in the mid-1980s it began to decline, also because of funding cuts resulting from the difficulty of disseminating good practical examples from one organizational context to others. From the second half of the 1980s onwards there took shape a new paradigm of AR, known as the ‘network approach’, which was based on the ideas of Habermas (Rasmussen, 2004).

The evolution of Lewin’s original insight helps us to understand certain characteristics of the AR approach. From the markedly experimental approach, the relationship between research and action evolved into the intersubjective construction of knowledge. Having started as a form of experimental social engineering aimed at tackling practical problems, AR has gradually come to be associated with a concern for complex social issues that cannot be reduced to single variables. The researcher is no longer a neutral and detached actor, but a co-producer and co-author of change, which he or she contributes to generating and developing. In relating to the, sometimes complex, need for transformation, the researcher enters into relationship with the problems of existence, and is thus not separate from the world but immersed in it.

The plural declination of the AR approach relies also on different epistemic perspectives (Cunliffe, 2011), which generate connected ways of interpreting and applying AR.

Cassell and Johnson (2006) distinguish four main expressions of AR: Experimental Action Research, Inductive Action Research, Participatory Action Research, and Deconstructive Action Research.

The first emphasizes the intervention of scientists in real-life social situations aimed at ameliorating practical problems of actors over a period of time. Key words are ‘diagnosing–planning–acting’ and evaluating, ‘positioning’ in an objectivist research approach. This is anchored in a positivist or neo-positivist concept of knowledge so as to ensure both its accumulation and social progress or emancipation.

The second kind of AR supports the joint interpretive understanding of organizational participants’ practical reasoning as ‘theories-in-use’. Through the involvement of organizational participants, the aim is to engender reflexive learning (Argyris & Schön, 1989) whereby people can ‘surface and question their intuitive understandings, undertake on-the-spot experiments ... [and] engage in reflective conversations with their situation’ (Schön, 1983, p. 265). The principal key word in this case is ‘reflexive learning’.

The third is focused on enabling as many stakeholders as possible to participate actively throughout the entire knowledge and change process. This process is expected to change the nature of the relationship among participants. The focus is on facilitating democratic agreements, on promoting participant emancipation and critical consciousness. Key words are ‘empowerment’, ‘inclusion’, and ‘polyphony’.

Both inductive and participatory AR rely on a subjectivist epistemic stance based on an interpretive and constructionist orientation: AR leads to a reflexive exploration of naturally occurring actions, interactions, and conversations to produce situated learning and change.

Deconstructive Action Research focuses on unsettling discourses and points of contradiction as strategic opportunities for organizational change (Treleaven, 2001; Shotter, 2010). By not finding answers to problems, but rather by ‘problematizing answers’, AR helps the people involved to think about their own and others’ thinking so as to question the hegemonic, the familiar, and the taken for granted. Key words are ‘critical reflexivity’ and ‘pluri-vocality’. The epistemic stance is intersubjective and refers to a pragmatic knowing, detecting in situ knowing from within and withness thinking (Shotter, 2008). AR in this case is seen as an embedded and embodied critical exploration leading to new (transitory) understandings and alternative strategies of action.

Among these multiple epistemic perspectives we can also highlight the different possible purposes that AR provides in order to study, transform, and interact with organizational landscapes:

- a pragmatic orientation (facilitating and planning effective organizational processes/changes; getting closer to management’s and organizational needs; and fostering research relevance);
- a learning orientation (researching on one’s own learning and professional practice; questioning and analyzing organizational processes/practices; developing communities of practice);
- an emancipatory orientation (exploring and fostering new forms of entrepreneurship; empowering organizational communities; giving voices to oppressed/minority groups).

DISTINCTIVE FEATURES OF AR

Compared to other forms of research, AR seems endowed with a distinctive nature and well suited to situations of complexity and change, where the organizational contexts in question are subject to turbulence, instability, and uncertainty. Such situations are characterized by powerful elements of

changeability and shifting balances, and are marked by a transition from the forms of knowledge that are stable and well-established in habitual practices and routines to others that are characterized by a greater dynamicity and changeability.

Transitory knowledge, which is bound to particular uses in context, can help the actors recognize problems and assign names and labels to objects and instruments, and give meaning to local and situation-based events.

Since different perspectives and purposes may be adopted in applying AR, we highlight transversal and distinctive features that, in our view, characterize AR as a particular way to produce knowledge and change: situativity, relationality, transformativity, and reflexivity.

Situativity

Situativity means that AR derives from direct engagement with real and complex problems in natural contexts and in social situations, the identification and definition of which are heavily dependent on representations by the actors involved, and the solution of which is not immediately apparent, nor given, but requires engagement, sharing, and the construction of meaning. The knowledge produced is local and situated because it is dependent on both the manner in which it is constructed and used and on the manner in which it is distributed, circulated, and appropriated by the actors.

Relationality

AR activates knowledge by means of relationship because it involves several stakeholders, each bearing different points of view and each contributing to knowledge, as no preconceived forms of knowledge or solutions exist when dealing with complex problems. Relationality also entails processes of co-creation of knowledge and co-research.

Transformativity

AR is directed toward action; in other words it aims, in concert with the actors, to discover shared ways of promoting, initiating, and managing change, thereby fostering an evolutionary transformation of existing situations. Transformation may involve a change of behavior as much as wider and more complex objectives of emancipation, and clarification of contradictions and dilemmas.

Reflexivity

Reflexivity is the process of exercising critical thought on one's own practices and gleaning the various meanings that actors attribute to them with a view to gaining awareness and gathering indications for future transformation. It triggers the possibility to disrupt the existing system of activities and open an expansive learning process (Engeström, 1987).

Situativity (being close to the contexts), relationality (weaving relationships with different stakeholders), transformativity (seeking developmental changes), and reflexivity (supporting expansive learning processes), underpin a socio-constructionist epistemological framework. The ever-changing declination of these features engenders several gradients and modulations of intensity related to the adoption of the specific epistemic perspectives described above (diagnosing–planning–acting; joint understanding of theories in use; participation throughout the process; unsettling discourses; and problematizing answers). In order to highlight how such distinctive features can be articulated in dealing with specific contexts and situated challenges, in the next sections we will examine two field experiences, which will be analyzed through key phases of the AR process: how to start the AR, how to manage its process, and how to conclude it. These are three phases crucial for how relevant

knowledge and change can be produced and developed, and this is why we refer to them as three *turning points*. Our analysis will first underline the specific aspects of each turning point, and then describe the related scenario of the two illustrating cases that triggered different ways to produce and work with knowledge and change in organizational contexts.

THE FIRST TURNING POINT: STARTING THE ACTION RESEARCH PROCESS

The initial phase of any AR is crucial for determining the quality and development of the process of knowledge production and change within an organization. In this phase, five main key points, which we name process *nodes*, constitute the premises for initiating that process.

Each node guarantees the continuity of the work and contributes to the creation of sustainable working conditions with the organizational actors. After a presentation of the five nodes, we will illustrate their operational translation into two real cases of AR.

First Node: Constructing the Question

The understanding, articulation, and co-construction of the question during the interaction with the organization (from now on, we may also refer to the ‘client’, meaning the organizational partner for an AR process) is the first central node in the initial stage. The ‘problem’ needing to be addressed in the AR is not pre-set, neither is it determined by everything that the client shares with the action researcher (or ‘consultant’) and presents as being the critical points in the organization. It is the result of a coming together of more or less broad questions and a process of gradual focalization which will involve both the researcher and the client. This gradual focusing on the object of the AR

has the aim of establishing a partial but not definitive individuation of the themes in which the organization wishes to invest.

Second Node: Identifying Key Resources

The second node in the start-up phase concerns identifying the resources that are to be allocated to the AR process. Resources are both financial and related to the level of engagement that is thought possible with the people within the organization. The levels and possible outcomes of AR depend also on the type of mobilization that the different organizational actors, in concert with the researcher, deem appropriate in a given situation.

Third Node: Establishing the Advisory Board

The third node is the establishment of an advisory board to accompany the AR process throughout its development and to regulate it on the basis of indicators provided by the organization during the process. It is a work group made up of researchers and organization representatives tasked with following the developments of the AR and monitoring the connection among the various levels of the organization.

Fourth Node: Constructing the Work Setting

The fourth node concerns the construction of the work setting that is to be presented to the AR participants. This is the first task of the advisory board, which must go into the details of the AR process, defining:

- which people and which groups are to be involved, according to the limits set by the client;
- the sustainability of the intervention;
- the AR timeframe;

Fifth Node: Constructing the Research Tools

The fifth node concerns the identification and design of the research tools. An initial draft of the prompts to be used with the participants by means of specific work tools is important in order to predict and expect a range of possible outcomes.

In handling these aspects, it is crucial to get close to the actors, listening to and exchanging with them the implicit and stated theories and hypotheses regarding the functioning of the organization. In this process of gradual mutual acquaintance, the most important work tool is the one-to-one and group interview, which makes it possible to harvest various ways to conceive the organization and represent its problems. The AR approach is to 'enter on tiptoe' into an organization, assuming an attitude of respectful curiosity.

Case A – Becoming new managers: an action research in a Federation of Nursery Schools

The AR project described here took place in a Federation of Nursery Schools, a Northern Italian organization that manages services and centers for child education in nursery schools, and provides training, consultancy, and innovation strategies. The Federation coordinates 160 schools, organized into smaller networks. At the beginning of our intervention, each network was coordinated by one pedagogical manager and one administrative manager. These two roles represented two cultural anchors: the pedagogical one, for which managing meant planning and supporting the educational activities; and the administrative one, in which managing meant providing advice and assistance in running the service. This structure had functioned effectively for many years. However, as the Federation became larger and more complex, several limitations were recognized, including fragmented or chaotic communication between the administrative and pedagogical areas, and a lack of flexibility in dealing with

complex critical situations. It was thus decided that a new role was needed: the pedagogical and administrative roles were merged into one, which resulted in new responsibilities, new actions and practices, and a structural and culture change. Whereas, in the past, managers had used either their pedagogical or administrative content-driven expertise to maintain well-established procedures, a clear division of labor (Scaratti et al., 2009), and defined role boundaries, in the new organization managers were required to cross boundaries and become more process-experts, able to analyze complex situations, mediate conflicts, activate networks and relations, and develop the problem-solving skills of other employees.

To deal with this situation, the president of the Federation asked us to assist the new managers in building and interpreting their new role. The initial request was a consultancy project to help the managers interpret their new role in a shared manner. In particular, the request was to conduct initial research to identify the challenges and critical issues recurrent in the pedagogical and managerial coordination of nursery schools. The research would then serve as the basis for defining a set of skills which the Federation's managers should possess and then organizing a training course to equip the new coordinators with those skills.

The First Node: Constructing the Question

The clients requested a research process that would describe the competences profiles of the two categories of managers – administrative and pedagogical – and then create a single profile comprising the distinctive characteristics of both. The clients also stressed the need to change the relationship between two professional cultures in the Federation. The pedagogical and administrative units had always kept themselves very distinct and distant, each of them claiming to

be the organization's most important component. A solution merging the administrative and pedagogical roles would therefore have to remedy a long-standing conflict, and it would have to resolve issues related to the history and culture of the Federation.

Faced with this situation, before devising a new skills profile, we deemed it crucial to accompany the two managerial groups to a mutual cultural rapprochement. During the initial discussions with the clients, therefore, the research and consultancy design was partially changed. We proposed an AR plan in which the pedagogical and administrative managers would meet personally to discuss the challenges and benefits of their new role, and how they could combine their skills to build a repertoire of shared practices.

The Second Node: Identifying Key Resources

We therefore agreed with the top management of the Federation the possibility of an AR pathway, whereby both the pedagogical and administrative managers could jointly construct their new role. The hypothesis was that these managers could play the role of protagonists and co-designers of their new profile and competences by integrating originally divided professional cultures through exchanges and dialog. The action research was allocated a suitable amount of investment in terms of days and budget.

The Third Node: Establishing the Advisory Board

A temporary working group – Advisory Board – was created to support the AR. It was composed by the academic researchers, the president of the Federation, and two members of the managerial board. The advisory group had the following tasks:

- to identify a group of willing participants who could be actively involved in the AR process to bring into focus the challenges of the new role and the professional practices that might be promoted in order to address them effectively;
- to plan the AR timeframe and design the necessary work tools;
- to monitor the progress of the AR and its results in terms of knowledge and change;
- to manage communication of the AR results in order to involve the rest of the Federation in reflection on the new managerial practices to be developed.

The Fourth Node: Constructing the Work Setting

The group of participants (25 in total) identified by the Advisory Board was made up of both pedagogical and administrative managers with sufficient experience and the desire to explore their work practices in order to build new repertoires. Selected were not only coordinators with experiences of success but also those who had faced problems and critical situations, the purpose being to identify issues and challenges for building new forms of acting. The group's task was to produce ethnographic accounts relating to their everyday work experience.

The participants were involved in eight meetings over a one-year period, with the supervision of the academic researchers/consultants.

The Fifth Node: Constructing the Research Tools

The research tools were designed by the Advisory Board in response to a threefold challenge: 1) to help the managers reflect on which implicit frameworks had informed their daily practices; 2) to help them share the knowledge arising from their previous and current experience; 3) to allow them to cooperatively revise their practices and culture according to the changing organizational needs.

The following research tools were designed for the aforementioned purposes:

- a reflexive writing tool to explore the managers' daily practices and then discuss them in dedicated work groups;
- workshops within the Advisory Board to monitor the progress of the project;
- a final workshop presenting the results of the AR project to the rest of the managers and the entire Federation.

Case B – A Healthcare Organization in search of authors

The second case that we describe in illustration of the specific features and challenges inherent in starting and conducting an AR process relates to a large-scale reorganization initiative involving several community services and a hospital in a Local Health District in Northern Italy.

We conducted AR with a large number of healthcare professionals involved in preparing the ground for, and implementing, a change that had been decided top-down at regional level. While the top-down change concerned the relocation to a new hospital, the improvement of forms of collaboration among disciplines, and a better integration among professionals, the AR, as agreed along the process, explored new bottom-up initiatives and strategies for interpreting and translating the broader change.

The First Node: Constructing the Question

We were contacted by the Head of the Training and HR Department of the Local Health District, who did so on the basis of personal acquaintance. A previous experience of AR in his organization had sparked his interest, and that of his staff, in new training and development initiatives drawing on the incoming change opportunities. The Local Health District was to be

reorganized for financial reasons and prepared for relocation to a new hospital. The Head of Training and HR saw this as a promising opportunity to foster and spread the good existing practices throughout the system, to create and develop new ones, and to provide new learning across the organization. In his view, a participatory intervention would prepare the ground for the imminent change so that it was not merely implemented top-down but would also be interpreted and adapted by the practitioners concerned – doctors, nurses, coordinators, and psychologists.

It emerged from the initial conversations that the expected change could bring out issues of integration, communication, and harmonization of procedures and cultures among different professions due to be merged with the reorganization and the hospital's relocation. An AR could provide an important opportunity to engage the practitioners in participative forms of local translation of these challenges, avoiding a top-down decision and forwarding more functional and meaningful operational practices.

The Second Node: Identifying Key Resources

Because he was the Head of Training, our key partner (the client) could rely on the necessary financial support devoted to learning initiatives. He could also count on our mutual interest in developing relevant interventions and in circulating the emerging knowledge both regionally and within the academic field. He was willing to take an active part in the process, to work jointly with his staff and with the academic staff, and to participate in some final writing processes (as, in fact, happened after the intervention). He involved three people from his staff to follow any development of the initiative and support the researchers.

The Third Node: Establishing the Advisory Board

In this way a Advisory Board was formed. Consisting of four people from the Local Health District (Training and HR department), and three academic researchers (two of whom are authors of this chapter), the Advisory Board met periodically to shape and facilitate the development of the process. It closely followed all activities of the groups of participants involved, both through emails exchanged and elaboration of the emerging data, and in vis-à-vis meetings.

The Fourth Node: Constructing the Work Setting

Doctors, nurses, charge nurses, and psychologists were invited to participate on a voluntary basis. Approximately 100 participants agreed to meet once a month (for six months in total, plus an initial meeting and two final events) in groups of about twenty participants for four hours at a time. The groups, representative of identifiable communities of practice (Wenger, 1998; Koch et al., 2002), were drawn from four departments: the local community hospital (doctors and nurses); community nursing (nurses and home visitors); nephrology and dialysis (nurses and managers); and drug addiction and mental health (doctors, nurses, psychologists, and other support staff). Members of the four groups, which proceeded in parallel, worked on three main tasks: conducting a first *exploration of work practices*; *analysis* (critically examining and identifying the best practices and those needing improvement); and planning new *actions* (suggesting specific improvement projects and strategies for the future).

The Fifth Node: Constructing the Research Tools

The steering group agreed that the research tools should detect local practices

and cultures. Practice-based methods, and at-home ethnographically oriented methods (Alvesson, 2009; Tagliaventi & Mattarelli, 2006; Thomson & Hassenkamp, 2008; Tsoukas, 2005) seemed the ones best able to achieve this result, and they were designed and tested with the active involvement of the participants. The aim was to investigate and describe working practices by means of ethnographic and interpretive tools (for details, see Gorli et al., 2016, 2015).

THE SECOND TURNING POINT: MANAGING THE ACTION RESEARCH PROCESS

Managing an AR process requires participants and researchers to generate new knowledge and explore new solutions through a collaborative and recursive path of data gathering, interpretation sharing, design, and commitment to new actions.

The main goals of this phase are therefore: exploring the context with and through the participants' eyes; generating and interpreting data; developing reflexive and open dialog; promoting and valuing participant engagement; and sharing ideas and perspectives to generate new courses of action.

Such a complex path requires the researchers to accomplish several strategic and tactical operations.

In terms of strategy, they must negotiate the AR setting and methods with participants, and manage them during the process.

The setting represents a 'temporary organization', the relational boundaries that 'hold' participants and researchers temporally and spatially. The setting represents a boundary between the 'productive' action within the organization and the reflexive and transformative process surrounding the organization that occurs within the AR context (Ripamonti et al., 2010). It is thanks to this boundary that participants are able to analyze their 'organizational realities' and create discontinuities

and new ways of knowing, acting, and working (Barbieri et al., 2010; Galuppo et al., 2011).

From a tactical point of view, specific techniques and practices must then be negotiated and put into action in order to sustain the generation of new knowledge, new problem-setting, and new solutions.

Since AR is a situated, participatory, transformative, and reflexive process, the setting and tools must be handled in a particular way. They are not defined once and for all by the researchers alone; rather, they are the result of negotiation with participants and vary greatly according to the relational and organizational conditions, as well as the objectives of the AR. Unlike in 'traditional' research, AR settings and techniques are not in themselves a *guarantee of the success of the process*. Other conditions need to be taken into account: the generation of situated knowledge close to contexts and organizational practices; the initiation of dialog and interaction between divergent perspectives; the engagement of all participants; and the promotion of reflexive practices around the theme in question with a view to allowing new representations, new courses of action, and new relationships between the participants and in the organization as a whole. The AR process becomes a microcosm in which researchers and participants tackle new ways of relating in order to re-enact and play out relevant problems related to the organizational context.

ACTION RESEARCH SETTINGS AND TOOLS

In the central phase of the AR process, three levels of knowledge production and change may be identified. All of them are necessary for the construction of a truly dialogic and transformative process. They are the *individual* level, the *social/collective* level, and the *institutional* level. The researcher is responsible for

ensuring that each level receives the necessary attention and that the dialog and connection between them are maintained.

Individual Level

In order to guarantee contextual sensitivity and to value different perspectives and experiences, it is necessary that each participant is allowed to express themselves on the theme and to state their own particular interpretation of it. For the researcher, this means providing space, time, rules of engagement, and relationship – tools that legitimize each and every role and point of view. S/he must listen to all voices and 'languages', and promptly analyze the experiences and work practices of each individual.

Two types of tool may be used in this regard: 1) individual interviews (for instance ethnographic and narrative interviews; interviews with the double; etc.); 2) observational techniques aimed at detecting specific professional practices (for instance participant observation; shadowing; reflective journals or diaries).

These tools belong to the tradition of narrative and ethnographic qualitative research. In AR, such tools are used with a view to generating descriptions, repertoires of practices, symbolic reference systems, perspectives, and possibilities of interpretation that are as 'dense', multiple, and differentiated as possible.

Social/Collective Level

This level, namely the small work group, is crucial for AR. It is thanks to the relationship and dialog between participants that it is possible to construct collaborative and reflexive processes and to experiment with new forms of participation and new organizational solutions. The small group – 8/10 people who meet according to an agenda that is agreed upon with the researcher on

an ad hoc basis – is a ‘place of mediation’ between individual experiences and the experiences of the organization.

Typical techniques for small work groups are: brainstorming, focus groups, case discussions, project works.

A vital element here is the facilitation offered by the researcher, whose task is to guide these groups in such a way as to foster democratic exchange, on the one hand with the possibility of dissent and conflict, on the other with the exercise of reflexive interaction. In order to maintain constant engagement, it is important that the groups assign themselves tasks between each meeting, be it observation, reflection, or attempts to transform certain organizational practices, so as to enable investigation over time of new data that may be included in the ‘community of inquiry’.

Institutional Level

The institutional level is concerned with the legitimation of the AR process and the involvement of actors with strategic and political power inside the organization. From an institutional standpoint, the AR process aims to guarantee the validation and adequate verification of the outcomes, to achieve a cascade effect within the organization as a whole or the external environment, and to mitigate possible resistances arising as a result of hierarchical intervention.

At this level, the work of the Advisory Board, on the one hand, and the organization of collective events on the other, are the primary tools. The researcher is responsible for negotiating periodic Advisory Board meetings throughout the AR process with a view to ensuring ongoing monitoring and legitimation of the work at both the individual and the collective levels. The prediction of moments/ events which are symbolically significant and visible during the AR process is of vital importance in ensuring the legitimacy and visibility of the work process, for instance

alongside specific turning points or on the basis of contingent needs and requests that arise in the field.

The specific task of the researcher is to manage all the three levels responsibly, and to guarantee connections. S/he must do so in negotiation with the actors involved and in accordance with the context, the expectations, and the relational conditions that are in place. The following cases provide a concrete illustration.

Case A – Working on managers’ reflexive writings

In order to help the AR participants explore and revise their managerial practices, we suggested that they periodically write and discuss a reflexive written account. This technique was inspired by Argyris, Putnam, and Smith’s ‘two-column format’ (1985), a narrative and reflective practice developed within the action science field, as well as by Gobo’s ethnographic grid (2008) used to orient the ethnographic and auto-ethnographic observations.

The reflexive written account was organized by a semi-structured grid with three main thematic sections filled in by the area managers, either individually or collectively (see Table 18.1).

The first section (*Critical events column*) asked managers to describe individually a key situation or event in their daily practice. This first column was a description of *fresh events*, recently happened and narrated as freely as possible without any analysis or evaluation.

The second section (*On the spot column*) asked managers to express how their emotional state might be influenced by the situation, together with some first interpretations and thoughts on the event.

The third section (*Group comments column*) provided a specific space to be used only after discussing the critical event within the AR group. Here managers could share and discuss one another’s writings. In this discussion, we as researchers triggered open dialog and

Table 18.1 The grid

<i>Critical event – Individual</i>	<i>On the spot comments – Individual</i>	<i>Group comments</i>
Describe a situation or event in your daily practice that has required all your energy and thinking. Describe the details of what happened: the actors involved, and the organizational and contextual features and characteristics that you consider may be useful in explaining what happened and why.	Describe your emotional response to the situation. Describe your thoughts and interpretations of the event: how might these help explain what happened?	Describe key aspects emerging within the group discussion: ideas, comments, feedback, interpretations, and considerations. Record any new solutions, alternative visions, or new agreements achieved by the group.

alternative interpretations in order to bring to the surface different voices and perspectives and to question what might be taken for granted. While sections 1 and 2 often appeared *reflective*, section 3 was openly *reflexive*, and the researchers acted as catalysts in helping managers question their taken-for-granted assumptions and actions as a means to generate new and alternative interpretations of their role and practices.

About every month, managers wrote at least two accounts of their experience (columns 1 and 2), to be circulated and eventually discussed during the group meetings. These were collected in a blog, and each month two or three writings were voted as the most representative and meaningful cases to be discussed more deeply in the group. This strategy allowed the managers to identify the *hot issues* to be discussed along the way, and to negotiate the AR agenda.

The meetings were organized as follows: first, the chosen writing was read and discussed; as researchers, we then performed a kind of *scaffolding function* (Alby & Zuchermaglio, 2006), helping managers to 1) connect their personal experiences to the story, 2) describe different possible views and strategies of action, and 3) critically question the taken-for-granted knowledge and expertise emerging from their accounts; finally, researchers helped managers negotiate what to write in the third column. This moment represented a way to track how new meanings and practices were being built by the new community.

The above-described AR setting and methods aimed to pursue the following goals. They gave participants opportunities to reflexively explore *how things worked* in their/our organizations. The writing process, followed by dialog, sustained a subjective and intersubjective process of inquiry and confrontation (Cunliffe, 2010; 2013). In the written accounts, managers were required to provide a tale *from within* (Shotter, 1993) of the meaningful events occurring in their daily lives. Each perspective was compared to, and integrated with the others, and then used to compose a new polyphonic account of organizational life and potential opportunities for moving on (Shotter, 2008). In this way, practitioners developed a deeper understanding of the local and contextual underpinnings of their practices and began to reflexively question what was taken for granted.

They sustained participation and learning at individual, collective, and institutional levels. Writing personal accounts allowed deep engagement of writers and readers. The managers' lively accounts became concrete, detailed, and shareable materials. The written nature of the texts facilitated multiple readings and dialog. The first two columns represented individual narration and reflection and provided a way to give voice to every single participant. The space for group dialog and editing of the third column then allowed collective learning (Marshall, 2011). It enabled managers and researchers to tune into other accounts by encountering divergent ideas.

The case described above shows that, if the AR setting and techniques are negotiated and managed functionally, they can provide space, time, and relational conditions that help participants play unexpected roles and experience micro-organizational changes, thereby developing new insights, alternative visions, and transformative solutions (McNiff & Whitehead, 2000; Schön 1983; Mezirow, 1991). An example was the redefinition of the managers' competences profile, more complex and articulated than the previous one: new tasks were added to the daily activities related to institutional functions (Scaratti et al., 2009), while other aspects were shifted and allocated to central organizational units (such as communication and training).

During the AR process it is important that participants progressively increase their autonomy in sharing their experience and reflexively questioning their taken-for-granted assumptions. Thus, while the researchers should take the responsibility and exert their power to ensure the presence of a setting and techniques that generate dialog and reflexivity (Ripamonti & Scaratti, 2012; Scaratti & Ivaldi, 2015; Ivaldi & Scaratti, 2015), they must also be willing to gradually surrender part of their power in order to give space to participants (Barbieri et al., 2010; Galuppo et al., 2011). This requires reflection on their responsibility and personal impact on the AR process, and a readiness to put some choices into perspective as the situation dictates.

Case B – Growing authors through at-home ethnography

Exploration of work practices, analysis, and actions were the three main tasks in which the participants of Case B were involved. The first task was intended to develop diagnostic capacities; the second allowed participants to refine their reflexive abilities; and the third enabled them to engage in the active authorship (Gorli et al., 2015) of new work practices and organizational arrangements.

Between one meeting and the next, participants were asked to work both individually and in groups on specific emerging tasks. Opportunities were provided for planning, reflecting, and reporting among members of the same group and with the rest of the staff. At the end of this phase, all groups were asked to formulate specific projects for implementation within their operational units. An overview of the process's phases is provided by Table 18.2.

In the exploration phase, we used a tool that we called 'Writing Instructions to the Double'. Participants were asked to undertake the following 'assignment':

Imagine that you have to be substituted by a Double who will take your place in doing your job. Write instructions (things to be done and how to do them, suggestions, warnings, recommendations) that he or she should follow when going to work tomorrow morning in your place, so that: (a) he or she knows what to do from the beginning to the end of the day; (b) nobody suspects that a switch has been made between you and the Double.

The participants were free to write the texts (instructions) as they saw fit. The only requirement was that they should provide as many details as possible about the actions that the Double would have to perform throughout the entire working day. This tool, adopting the principles of at-home ethnography where the participants become researchers from within (by describing the cultural setting to which they have access and participate), engages them in an investigative process intended to deconstruct and uncover connections and meanings associated with everyday practices.

The narrative and writing dimension of the tool then allowed circulation and joint analysis of the data gathered within each group of participants. The 'one-another mirroring' among professionals yielded categories and key elements that were plotted on a large map and then discussed within the groups.

Each group was invited to express critical aspects and promising practices. They were

Table 18.2 Project flow and phases

then asked to highlight tractable issues using a scheme that linked the problems with their perceived causes. This tool provided a practical way to define the problematic issues, to position them, and to set priorities, thus initiating the action phase.

Between one meeting and another, the group was challenged to take an active role with respect to the issue or problem raised, and to report any results, critical situation, and comments in the next meeting. This reflection and action was close to the tradition of Action Learning (Revans, 1980), and it inspired a complex network of actions and processes that were closely and constantly monitored by the members of the steering committee.

THE THIRD TURNING POINT: CONCLUDING THE ACTION RESEARCH PROCESS

Wrapping up an AR process is a delicate step that raises two challenges: concluding the process while negotiating an agreement with the parties involved; and giving visibility and value to the results. The delicate nature of this final

stage is determined by the gradual definition of the question and the development of the objectives during the AR process, because outcomes must be monitored and the meaningfulness of the examined contexts must be maintained. We focus on distinguishing between the concept of 'result measurement' and the need to support a 'sense-making process', thus giving participants – and also the clients – the opportunity to position themselves and attribute relevance to what has been jointly constructed. This way of thinking about the conclusion implies that it is not necessarily possible to 'quantify' what has been done while still being able to evaluate the process by shedding light on the achievements and critical points from the standpoint of the protagonists.

In order to do this, certain issues must be considered, namely:

- how to reclaim the dimension of participation that includes all participants;
- how to make visible all the products of the work groups that were established during the process;
- how to highlight what has been modified in terms of the work process or in terms of new representation of the theme or the problem with respect to the initial stage;

- how to express the value of the outcomes in order to convey the practical and social importance of what has been accomplished;
- how to make outcomes/acquisitions circulate to the rest of the organization.

It is important, during the concluding phase, to highlight the dimension of expanded participation in the AR. It is possible that, during the process, micro groups form in relation to the work objectives, so that other intermediate dimensions are introduced alongside that of the general participation of all protagonists. In this case, during the concluding phase, it is important to draw all participants into discussion within a plenary setting in which what has been produced may be granted the maximum visibility, and in which exchange, comparison, and validation of the outcomes is made possible. The literature refers to meetings of larger groups where AR results are presented, discussed, and developed within the organization (Owen, 1983).

Particular attention must be paid to highlighting the results obtained, being modifications of shared participant representations of a problem, or modifications of the organization and its work practices. Related to this is the need to assess the results, and therefore to engage participants in identifying what is important and valuable. This step opens up the theme of power in AR. Attributing value means setting questions regarding the importance of what has been done. Being responsible for deciding that a process has had a positive outcome for the organization is a task that endorses the power of the individual who has undergone that process. Evaluation of organizational change processes and appreciation of the results are typically the prerogatives of the leaders. The challenge is to achieve the closest possible involvement of the participants in the evaluation process (Ivaldi et al., 2015) because this enhances their identification with the results while increasing the likelihood that the trajectories of development and change identified are, in fact, pursued even beyond the end of the research.

Case A – Setting up and circulating a new repertoire of managerial practices

At the end of the AR process, a final report was created and presented in a workshop in order to share the results with the other managers and with the rest of the Federation.

We devoted the last meetings with the AR participants to joint analysis and discussion of the material collected during the year. The reflexive writings were organized by the researchers on the basis of the recurrent thematic areas and the hot issues discussed. Then managers, with the help of researchers, classified and mapped the managerial actions described in the accounts. The maps enabled identification of the issues and problems around which new knowledge and change were generated. The overall opinion expressed in the discussion was that the Federation's new managers should perform their new role by exercising more discretion in dealing with the requirements of their organizational contexts, thus becoming activators of processes rather than experts on pedagogical or administrative contents. This appeared to be the strategy in which the managers finally decided to invest.

Discussions of this type led to the construction and validation of the new repertoire of practices, which the Advisory Board deemed sufficiently promising to circulate within the Federation. By virtue of the reflexive work on the writings, it was possible to move from individual and group learning toward an organizational level. In effect, the analysis and discussion of the overall corpus of writings enabled us to construct a research report containing first clues and indicators of a new management mandate and of a new set of practices, to be shared and discussed with the rest of the Federation in a workshop.

The final workshop was an opportunity for the Advisory Board and the AR participants to meet their colleagues and to discuss with them their hypotheses of renewal. The AR results were presented as 'open outcomes', to be discussed further and shared before

their implementation. The other managers recognized the outcomes as a valuable basis for changing their professional practice, and demonstrated their willingness to be trained for this purpose.

One manager said: 'If the new repertoire had been designed and proposed by the Board, it would have been different. I would have felt much more resistance and suspicion. Here I see the work of my colleagues. I can mirror myself in these results, and I trust my colleagues enough to understand that a change is necessary and worthwhile. I hope the Federation will engage all of us in learning how to develop our new role!'

Case B – Authors engaged in evaluating and spreading new practices

Also for case B, the final phase of the project helped the conclusion and evaluation of the AR process: the initiative was named 'Wrap-up seminar and evaluation'.

In this last phase of the process, the various participant groups were invited to share with colleagues and with the organization the results of their work, followed by discussing and testing possible future actions. The half-day meeting involved the AR participants, the other colleagues who had not participated in the process, researchers, and members of the steering committee. A specific section of this meeting was devoted to garnering feedback on the initiative from the participants.

In order to evaluate and close the AR process, participants (divided into the four groups/communities of practices illustrated above) decided to present some outcomes achieved throughout the process. One group narrated the process that accompanied new insights or new action plans defined for the future; two other groups prepared a presentation showing the pathway followed and the practices still ongoing; the last group presented a video. This video was made autonomously by the participants in order to evidence a revolutionary process that

happened during the AR: the nephrology and dialysis clinicians decided upon, and experimented with, new ways of communicating with one another.

The video was produced by the participants themselves, who not only designed and produced it, but also filmed it and took part as actors. The 'screenplay' was as follows:

The scene is divided into three parts. At the center is a patient lying on a bed in a dialysis and nephrology ward. A sign is shown saying: 'YESTERDAY'. The actors arrive: they are dressed in blue and represent the nephrology clinicians who have come to consider the patient's condition, read his clinical report, and take action by moving him and expressing their views on the correct course of treatment. Then they leave. Other actors arrive: they are dressed in white and represent the dialysis clinicians. They do the exact opposite of the previous group, moving the patient around again and suggesting other courses of treatment. They leave.

Another sign: 'TODAY'. The actors with blue shirts return: they find the patient in a position different from what they expected (they intuit the intrusion of the white-shirts), and they take action to restore their own configuration. They leave. The white-shirts arrive, and they also see the changes made by the blue-shirts, but they introduce other forms of treatment, with the result that the patient is moved and turned around on his bed in a way not at all beneficial to his well-being and recovery.

A third sign: 'TOMORROW'. The blue-shirts and the white-shirts arrive together. They all gather around the patient's bed and together they read the clinical report, discussing how to interpret the treatment. They act in concert; they leave; and the patient appears in a state of total harmony, properly laid out on the bed and smiling, bearing witness to a process of integration of treatments and disciplines which has functioned properly and harmoniously.

The video was immediately understood by everyone, transmitting the importance of sharing integrated communication practices and the value of real and applied multidisciplinary. The video is a program of action: once the actors have devised the script and enacted it, it becomes real life. It is no longer

possible to go back to one's post and abandon this way of communicating. The video thus carries a program of values and effective action, and may be easily communicated at every level within the organization, showing the capacity of the protagonists of AR to become interpreters of a scene and new scripts.

The emphasis the organization chose to give to the initiative was then extended not only to the hospital, but subsequently also to the network of healthcare facilities across the region by means of a one-day regional public conference with the participation of various stakeholders, from politicians and managers to the public and the press. The conference was titled 'Promoting and Developing Communities of Practice and Learning in Healthcare Organizations'. It was conceived as an opportunity to give wide visibility to the results of the innovative project. It was also an opportunity for politicians to publicize the training and research investments made by the regional administration, as well as its ongoing innovations.

Since the closure of an AR process hinges upon leaving a trace, valuing what happened and circulating it, and making it applicable to the rest of the organization, we can underscore the following challenges:

- To restore an active voice to the participants and promote autonomy and an independent interpretation of how the overall process is evaluated, with a view to defining areas of value and resource upon which to build future configurations. In this case, the power of authorship is entirely in the hands of the participants.
- To give space to collective and public events where those who were involved in the process can bear witness to the stages of its activation and the responsibility taken with their own (new) actions. This means speaking to the highest levels of the organization as much as to one's peers.
- To predict conditions and indications with a view to ensuring the continuity of the processes thus activated beyond the facilitation of researchers and consultants, by directing the focus onto the future path of the organization.

CONCLUSION

We can highlight how the distinctive features on which we have focused are entangled in the temporal steps and evolution of the AR process, allowing possible gradients and modulations of the AR approach and the connected epistemic perspectives (see Table 18.3).

We stress that the features described assume particular forms in relation to the different temporal steps of the AR path, due to internal and external constraints and the physiological turbulence, uncertainty, and unpredictability of the unfolding process. The concrete declination of such features in specific and contextualized situations (as in the two cases analyzed) allows the generation of appropriate knowledge actionable in order to enhance processes of change and expansive learning. The customary type of connection involving a kind of linear sequence comprising base paradigms, problems/objects of research, and the individuation of questions and knowledge-related objectives to be developed, following a logic in which reality becomes an area in which prevailing theories are applied, is penetrated and stimulated by the AR perspective. We acknowledge that the different AR approaches are not rigid and separated; rather, they are useful lenses and understandings to be adapted to different situations.

The organizational context, with its physiological changes and unpredictable articulations, generates the call for new knowledge beyond the replication of established and standardized knowledge that proves increasingly inert and unable to cope with the incredible increase in complexity of organizational and work-related situations at both macro and micro levels of society, culture, politics, and economics.

We acknowledge the need to break away from the logic of simply translating current theories to operative environments, and to accept the interaction with different kinds of knowledge-building processes that are close to action contexts.

Table 18.3 Synopsis of the AR distinctive features

	<i>Starting</i>	<i>Managing process</i>	<i>Going out</i>
Situativity	Use of sustainable tools Addressing implicit knowledge and practices in use (routine, habits, rules...)	Generating new knowledge and exploring possible solutions Listening to voices and languages	Monitoring of outcomes meaningfulness
Relationality	Gradual focalization through interaction and negotiation From initial needs to a shared problem definition	Collaboration and recursive path in data-gathering, sharing, and circulating Dialogue between different perspectives Small group work	Sense-making processes Expanded participation People inclusion
Transformativity	Mobilization of different resources (knowledge, people, time, space, budget)	Tackling new ways to acknowledge problems Social validation (steering group, collective events)	Circulation of acquired knowledge throughout the organization
Reflexivity	Activating conditions (advisory board, proper setting) in order to allow discussion, collective thinking, and regulation of the AR group's path	Promotion of reflexive practices Nurturing individual, social and institutional levels	Dialogue Plenary setting (visibility, artifacts, confrontation) Trajectories of further development

In AR, the production of knowledge is geared to the actors' responsibility for elaborating (rethinking the forms and sense of what they do), developing (seeking to imagine other, unprecedented modes of action), transforming (seeking to implement pre-figurations of change), and improving (verifying results of growth and effective innovation) their practice within organizational contexts.

The researcher thus becomes an actor insofar as he or she is called upon to both organize processes (multiple transactions that connect material and immaterial aspects, resources and ties, and relational, organizational, and political-institutional interests and dynamics) and to oversee the examination and production of data and information that are coherent and significant (as well as rigorous and reliable). The researcher operates by generating a field of methodologies able to guarantee the activation of provisional and realistic tools for a viable and sustainable production of knowledge and change in a situation.

The role of the researcher as actor (Scaratti & Zuffo, 2010) is close to that of a performer, for example in a jazz jam session

or *commedia dell'arte*, who does not follow a structured and repeatable script. The action researcher distances him/herself from a research practice based on objective and universally valid procedures; instead s/he is inspired by an idea of improvised research practices capable of adapting and responding to contextual elements as they arise.

From this perspective, studying organizations, taking action in them, and generating knowledge and change, means entering contexts of action characterized by uniqueness, ambiguity, unpredictability, and provisionality, and handling them with a practical knowledge deposited in implicit forms of knowledge and in the actions of the subjects. The challenge is therefore dealing with objects of inquiry that increasingly take on the form of research problems generated by urgent and highly unformalized situations, configured by social exchanges with stakeholders with varying degrees of expertise. Research objects, therefore, do not depend on the logical coherence of a project that connects them to a theoretical paradigm; rather, they emerge from the process of concrete construction that

links real issues and problems to knowledge needs that can be expendable and consensually recognized (Scaratti et al., 2010).

Several challenges are faced by researchers and participants in an AR process:

First, managing an AR process is a resource-consuming effort. There must be a strong mandate from the hosting organization and from the AR participants themselves, who must commit themselves to co-research by assuming the challenge of using relationality as a key mode of the process. In fact, the AR path requires a major investment by participants and significant willingness to experience new (collaborative) ways of generating knowledge, new relations, and highly emotional experiences with colleagues and researchers. This mandate should also formally acknowledge that co-researching requires availability and time. Researchers have the responsibility of carefully negotiating these aspects in order to guarantee the sustainability of the process.

Second, it is necessary to negotiate a clear and explicit agreement of mutual trust and confidentiality with those participating in the AR, and to return to this agreement periodically, if required. In this regard, the selection of situations to discuss in the group is important. Personal situations or issues of work overload are often inappropriate if they remain individual needs, since they pose a risk of manipulating the group for personal gain rather than using individual experiences to develop collective learning. It must therefore be agreed that the topics should relate to work-based interactions and shareable problems at a collective or system level, rather than individual concerns, which require other settings to be addressed.

Third, researchers themselves should be aware of and manage the power asymmetry between themselves and the participants (Galuppo et al., 2011). Researchers ought to take responsibility for the process by proposing and negotiating proper settings and tools, guaranteeing and legitimizing the expression of different voices and levels, promoting

connection and dialog among them, and recognizing and assuming the management of the different powers in play.

As a concluding remark we can highlight some issues raised by the cases analyzed:

- the researchers are required to enter into contact with the organizational actors, seeking in-depth understanding of the specific features of the organizational culture. This entails the use of specific tools in order to develop a process intended to foster engagement among the participants at the various levels in which they are situated (Cunliffe & Scaratti, 2017);
- a relational climate has to be warranted. The researchers must encourage reciprocal listening and select ways in which protagonists can present their views while activating a generative dialog with the researchers;
- it is important to ensure the process's sustainability by providing a work setting that is well balanced between stability and shifting, in order to scaffold the entire AR process (Scaratti et al., 2010).

Researching Organizational Concepts Processually: The Case of Identity

Fernando F. Fachin and Ann Langley

INTRODUCTION

Process research implies considering phenomena as in motion, as unfolding over time, as becoming. Process researchers seek to understand and explain the world in terms of interlinked events, activity, temporality and flow (Langley et al., 2013) rather than in terms of variance and relationships among dependent and independent variables. While quantitative analysis may sometimes be mobilized for process research (Van de Ven & Poole, 1995), qualitative data seem much better adapted to this purpose (Langley, 1999). Thus, this chapter will focus, in particular, on how qualitative designs may be used to research organizational concepts processually.

To do this, we adopt a somewhat unusual angle, however. Previous writings have examined the general issues of designing process research (Langley, 2009; Pettigrew, 1990), collecting process-based qualitative data (Dawson, 1997), analyzing it (Jarzabkowski

et al., forthcoming) and theorizing from it (Feldman, 1995; Langley, 1999). The overall terrain already seems well explored. However, as Langley et al. (2013) noted, process research may be undertaken, building on different ontological assumptions. Thus, one can distinguish between process research that adopts a substantive ontology focusing on changes that happen to things which retain their identity as they change, and process research that builds on an explicit process ontology in which the world is seen to be composed only of processes (see also Van de Ven & Poole, 2005). Applied to the concept of organization, for example, a process ontology would tend to focus on the way in which events, activities and practices come to constitute and reconstitute organization (or organizing) in every moment, rather than focusing on *the* organization as a well-defined object, which might then be subject to change in the form of a discrete displacement (Tsoukas & Chia, 2002). These two perspectives on organization could have different

consequences in terms of appropriate research designs. Our approach to considering methods for process studies in this chapter will therefore be contingent and focused on how different ontological assumptions about the processes associated with organizational concepts might lead to different kinds of methodologies and research designs.

We shall argue, in fact, in this chapter, that there are a number of different ways of operationalizing the notion of process in empirical research (not just two), and that each has its own methodological requirements. Moreover, in order to illustrate these contingencies, we will focus our analysis on a particular organizational concept that has given rise to an important body of empirical research, and which serves as an exemplar: that of organizational identity.

The notion of organizational identity was originally coined by Albert and Whetten (1985) as referring to ‘who we are as an organization’ and as encompassing those characteristics viewed by members as *central*, *distinctive* and *enduring*. Subsequent scholarship drawing on the notion of organizational identity began to question the last element (its ‘durability’), and argued that organizational identity can, does and must evolve adaptively over time (Gioia et al., 2000; Ravasi & Schultz, 2006). Gioia et al. (2013b), in fact, replaced the last characteristic of the Albert and Whetten triad by the label *continuous*, suggesting that organizational identities normally maintain some kind of continuity as they shift, often with labels staying the same but meanings changing over time. Thus, scholars of organizational identity began to see the concept in more processual terms. Authors discussed identity as ‘flow’ (Gioia & Patvardhan, 2012), and as under ‘construction’ (Pratt, 2012; Schultz et al., 2012). Some scholars began to introduce the notion of ‘organizational identity work’ (Clegg et al., 2007; Kreiner et al., 2015) to describe activities people and organizations engage in to establish or influence understandings of an organizational identity,

turning the concept further in the direction of fluidity and process-based thinking.

In fact, we chose the concept of organizational identity because we see it as representative of a range of organizational concepts that are often viewed in non-processual, static or ‘thing-like’ ways (e.g. identity as fixed – something that organizations ‘have’), but where processual understandings may offer novel and useful insights (e.g. identity as fluid – something that people ‘do’ or ‘work’ on). Other concepts relevant to organizations to which one might apply a similar type of thinking might include strategy, culture, structure, trust, power, leadership, etc., concepts that are quite abstract and intangible, but whose normal usage is in the form of a noun or as an object that can be described and qualified. Yet all these concepts have potential to be considered in processual terms as susceptible to change and transformation over time or as inherently constituted by activity or flow. The chapter aims to explore, using the example of organizational identity, some of the conceptual and methodological adjustments that need to occur when such abstract objects are placed in motion to different degrees and in different ways.

The notion of organizational identity also has another property that renders its analysis particularly interesting: it is one of several concepts (organizational learning is another example) that imply the transposition of a concept originally attached to individuals to an organization (Gioia et al., 2013b). Thus, not only does the notion of organizational identity raise issues of change and evolution, but also questions about aggregation and emergence that are themselves processual (How does organizational identity form? How do different individual conceptions of identity coalesce, interact, conflict or co-evolve?).

The chapter will be structured into four main sections corresponding to four different conceptions of process thinking: process as evolution, process as narrative, process as activity and process as ‘witness’ (for a

Table 19.1 Four conceptions of process thinking applied to organizational identity

	Process as <i>EVOLUTION</i>	Process as <i>NARRATIVE</i>	Process as <i>ACTIVITY</i>	Process as <i>WITNESS</i>
Focus	How an entity changes or develops over time	How people make sense within narrative accounts	How people negotiate understandings in situated interactions	How understandings are lived forward with research subjects
Research design and data	Longitudinal case studies with data from multiple sources	Texts or interviews incorporating narrative accounts	Naturally occurring observation of real-time interactions	Dialogic action research or auto-ethnography
Analysis	• Hierarchical coding into a unified temporal narrative • Temporal bracketing and visual mapping	• Theme analysis • Narrative analysis techniques (Boje, 2001; Czarniawska, 2004)	• Deep dive vignettes into interaction strips • Conversation analysis or other discursive methods	• Collective sense-making with research participants • Iterative temporally grounded analysis
Dilemmas and limitations	• Complexity of integrating data across space and time • Monological accounts that underplay divergence	• Need for consistency in narrative approach • Confined to understandings in individual texts (neglects interaction)	• Reaching beyond description • Snippets may generate decontextualized understanding (need for context)	• Processes increasingly hard to pin down because of ephemeral nature of observation • Fading potential for transferability
Illustrative studies relating to organizational identity	Corley & Gioia (2004); Dutton & Dukerich (1991); Howard-Grenville et al. (2013); Ravasi & Schultz (2006)	Brown & Humphreys (2006); Chreim (2005); Clegg et al. (2007); Humphreys & Brown (2002); Navis & Glynn (2011)	Drori et al. (2009); Fachin (2016); Fachin & Langley (2015); Karreman & Alvesson (2001); Ybema (2010)	Hatch, Schultz & Skov (2016); Other studies not on organizational identity: Kempster & Stewart (2010); Lorino et al. (2011)

summary of our analysis, see Table 19.1). The first three conceptions are quite well established (Langley & Tsoukas, 2010), and there is existing literature relevant to organizational identity associated with each, although this is more strongly developed for the first two. The fourth conception of process constitutes a more speculative development, inspired in part by Shotter (2006), that stretches the idea of process beyond existing work. We introduce this perspective to stimulate novel thinking about the implications of a strong process ontology for research methodology. For each perspective, we will describe the assumptions behind it, and illustrate the implications of this orientation for research design, data collection and analysis, drawing on the notion of organizational identity as an example. We also identify some dilemmas and limitations of each approach. We conclude with a brief discussion of the overall challenges of moving from more substantive ontologies toward more strongly process-based ontologies in conducting empirical research.

PROCESS AS EVOLUTION

The first perspective on studying concepts processually focuses on temporally evolving processes, but essentially adopts what we described above as a substantive ontology, seeking to better understand how and why an entity or organizational level construct might change or develop over time. Research will thus be longitudinal and focus on a period of time long enough for an observable shift to have occurred in the specific object of study.

In the case of organizational identity, referring to Albert and Whetten's (1985) definition, the researcher will therefore aim to examine periods of significant change or development in what is perceived to be central and distinctive about an organization, and to understand the events and processes underlying this transformation. A large body of empirical work on organizational identity

has in fact focused in one way or another on processes of change and emergence seen from this perspective (Clark et al., 2010; Corley & Gioia, 2004; Dutton & Dukerich, 1991; Gioia et al., 2010; Hatch et al., 2015; Howard-Grenville et al., 2013; Ravasi & Schultz, 2006; Rindova et al., 2011).

Research Design, Data Collection and Analysis

Studies that focus on what we label *process as evolution* tend to adopt case study designs that rely on qualitative and longitudinal data, drawing on multiple sources to capture all the events that might be relevant to understanding the changes considered in one or more cases. This approach to studying organizational concepts processually is the most frequent and well-recognized manifestation of process research in the methodological literature (Langley, 1999, 2009; Pettigrew, 1990). All of the studies of organizational identity change mentioned above fit this pattern, and were carried out over a sufficient time period for recognizable shifts to occur in organization members' constructions of organizational identity. Although there is no logical reason why an evolutionary perspective on process might not involve more than one case – and indeed, many studies in areas other than organizational identity have done so (Denis et al., 2001; Jarzabkowski, 2008), all of the organizational identity-related studies mentioned above are also based on a single case study organization. This may in part be due to the richness and density of data needed to construct understanding of the emergence or evolution of organizational identity in any given case over time, as well as the complexities of effectively representing multiple case histories in depth within the confines of a journal article.

Data analysis in this kind of study essentially involves piecing together from multiple sources a unified temporal narrative that captures the events and processes studied,

digging beneath them to identify more general theoretical ‘mechanisms’ that underlie this evolution. Studies of the emergence and evolution of organizational identity have in fact often used what has come to be known as the Gioia method (Gioia et al., 2013a) for operationalizing grounded theory-building. For example, in their study of identity ambiguity during a spin-off, Corley and Gioia’s (2004) 24-month study comprised 80 interviews, different types of documentation and non-participant observation. Through their analysis, the authors lead us through the hierarchical process of coding data according to this version of the grounded theory method. We see how verbatim quotes from different participants (e.g. ‘There is ambiguity as well in the sense of what is really going on?’) are successively grouped into first order codes (e.g. ‘Who are we going to be?’) and then into eight broader second-order themes (e.g. ‘Temporal identity discrepancies’) to be finally pulled together into three aggregate dimensions. Temporal linkages between the eight second-order codes grouped into aggregate dimensions are then identified, constituting a theoretical model. The method thus enables the movement from a huge quantity of temporally embedded raw data to a very parsimonious representation of the process of evolution from a pre-spinoff to a post-spinoff identity (for other examples of the use of this analytical method in the study of organizational identity, see Clark et al., 2010; Gioia et al., 2010; Gioia et al., 2013b).

Other analytical devices that are of particular value in studying ‘process as evolution’ are ‘temporal bracketing’ and ‘visual mapping’ techniques (Langley, 1999). Temporal bracketing involves decomposing timelines into segments that are used for comparative analysis. This can be useful to show how the process dynamics of change are replicated or repeated in different forms over time. For example, Ravasi and Schultz (2006) showed how the interaction between internal cultural factors and external images contributed to responses to identity threat during

two separate iterations of identity change at Bang and Olufsen. Visual mapping involves ‘drawing’ the data, that is, representing key elements of evolution over time (events and their interactions) schematically. Howard-Grenville et al. (2013) used temporal bracketing to analyse multiple iterations of attempts at identity resurrection in Eugene, Oregon, revealing the repeated interactive dynamics of resource mobilization and authentication. They used visual mapping to represent these iterative processes over time, both in abstract and in empirical forms. Figure 19.1 is taken from their paper and illustrates three empirical iterations of their final conceptual model, embedded in a visual map. The process of making a visual map will usually involve coding events, activities and choices chronologically, according to relevant categories, before creating visual displays. Miles, Huberman and Saldaña (2013) provide a repertoire of methods for achieving this for qualitative research in general. Feldman (forthcoming) offers some more specific suggestions concerning visual displays that are compatible with process research more specifically.

Dilemmas and Limitations

Studies that consider ‘process as evolution’, especially at the organizational level, encounter the complexities of capturing, aggregating and interpreting organizational events that may evolve over long periods of time, and that may be spread out at different physical locations. For example, when attempting to understand ‘organizational identity’, the perspectives of multiple individuals (and not just top management) would seem to be potentially relevant. Indeed, Corley (2004) revealed how organizational identity constructions can differ for different hierarchical levels. To address the challenge of capturing processes that are happening across a large organization in many places at once, Balogun, Huff and Johnson (2003) suggested qualitative data

collection strategies such as the use of informant diaries and focus groups along with other more traditional kinds of data collection, avoiding the necessity for the researcher to be personally present everywhere. Methods such as video recording without actual researcher presence might also enable the capturing of processes at different levels and locations simultaneously.

However, the challenge then becomes one of analysis. Process data of this kind are 'big' and messy (Langley, 1999). As we showed, in practice, most authors who have drawn on these kinds of data (at least to analyse organizational identity evolution) have generally proceeded through a form of data reduction in which elements are compared and aggregated into abstract overarching categories. In this process, identity-related phenomena have generally been treated as based on *agreements* among members, discarding divergences or summarizing them in aggregate abstract concepts such as 'tensions'. Moreover, the temporality within the data has often been discretized into 'brackets' or periods. In other words, despite the richness, complexity and messiness of the original data, 'process as evolution' studies often appear to converge on unified process stories that show movement of a reified entity (the organization, organizational identity or other focal concept) between well-defined states. This is at the same time their strength and their weaknesses. They generate parsimonious process models of how and why key concepts evolve over time, and yet the potential fragility of the underlying concepts and the possibility for fragmentation of perspectives between people over time is underplayed in favour of the monological theoretical account that purports to fully capture and explain the essence of 'what happened' (Buchanan & Dawson, 2007). This leads us to another form of process analysis in which the focus is not on 'how and why things evolve', but on how participants themselves order events and storylines.

PROCESS AS NARRATIVE

The second perspective we discuss in this chapter focuses on the reconstruction of time and process through language, an approach that we label *process as narrative*. Studies in this genre seek to understand how people make sense of, and reconstruct their experiences from, a particular standpoint in time. Through narratives, people articulate events and make them meaningful. This involves a storyline or plot with beginning, middle and end, or a movement from past to present to future woven together in a meaningful sequence (Bruner, 1991; Polkinghorne, 1988). In other words, from this ontological perspective, the 'process' examined is not the substantive temporal evolution of entities in the real world, but a narrative temporality constructed and displayed within the accounts of respondents or in other textual materials. A particularity of this form of analysis is that: 'It permits consideration of the different possible meanings of organizational action' (Rhodes & Brown, 2005, p. 177), and indeed it aims to capture and understand the diversity of such meanings to enable theorizing. Process research that takes a narrative stance is thus likely to draw attention to multiplicity and fragmentation rather than integration as we saw with the previous perspective.

Narrative perspectives on process appear to be particularly well adapted to studies of organizational identity and there are multiple examples of this in the literature. In contrast to *process as evolution*, the focus is on how time (past, present and future) and the continuity of the organization is reconstructed through language by participants rather than by the researcher. Because language is assumed to *make* reality, organizational identity from this perspective is not assumed to exist 'outside' members' narratives. In these studies, identity both *in* organizations (Brown & Humphreys, 2006; Humphreys & Brown, 2002) and *of* organizations (Chreim, 2005; Clegg et al., 2007) has been the focus of attention.

Research Design, Data Collection and Analysis

Materials for the study of process as narrative can range from written texts, sometimes in the public domain such as annual reports or media texts, which serve as sources for understanding the discursive projections of organizations from which narratives can be derived (Chreim, 2005; Martens et al., 2007; Sillince & Brown, 2009). Alternatively, they often include in-depth interviews with organization members in which narratives are solicited in interaction with the researcher (Brown & Humphreys, 2006; Humphreys & Brown, 2002; Mantere, 2005, 2008; Vaara & Tienari, 2011). In the previously described perspective (*process as evolution*), it seemed important to obtain a wide variety of sources of data in order to achieve triangulation (i.e. validation of key happenings and understandings through confirmation from various sources), and it seemed important to undertake longitudinal analysis over long periods to be able to detect changes in the focal phenomenon. Neither of these requirements (source completeness and long-term observation) are as strong when a perspective on *process as narrative* is taken. Source completeness is less important because there is an acceptance that a narrative is just one viewpoint and that this has interest in itself. And long-term observation is less necessary because the temporality of interest lies as much or more within the interpretations and stories of participants rather than in the event sequences themselves. Nevertheless, narrative researchers may often wish to compare the stories of multiple respondents to identify their nuances and distinctions (Brown & Humphreys, 2006; Brown et al., 2005; Humphreys & Brown, 2002), or alternatively compare narratives from the same source at different points in time (Anteby & Molnár, 2012; Chreim, 2005).

For example, Chreim's (2005) study of identity narratives in a bank relied exclusively on the firm's messages to shareholders.

There was no implication here that the narratives derived from these sources captured all perspectives on organizational identity but, rather, that they simply represented a key top management perspective worthy of analysis. However, Chreim (2005) did compare identity constructions over time. She studied the bank's narratives over 20 years and was able to show how in these texts, top managers mobilized the history and future aspirations of the bank to project organizational identity in different ways over time, yet using a single label ('First Bank') that was interpreted initially to mean the 'oldest' bank and in later years as 'most innovative'.

In contrast, Brown and Humphreys' (2006, p. 231) study of the discursive exploration of space focuses on identifying 'plurivocal native interpretations of place and identity in ways that promote the reading of polysemy back into case research' (i.e. focusing on multiple narrative constructions of organizational identity from different individuals rather than drawing on a single 'official' source). Conducting 75 semi-structured interviews among members of a recently merged university, the authors trace different narrative understandings of organizational identity for three groups of workers and contrast them. The authors highlight the instability of identity constructions and how individuals with different values and stories draw on the physical workplace itself to provide contrasting narratives of organizational identity. This research as well as other work by Brown and colleagues (Brown & Humphreys, 2002; Brown et al., 2005; Humphreys & Brown, 2002) reveals the fragility and fragmentation of organizational identity constructions, suggesting that research that assumes unified perspectives may be missing important dynamics that underlie assumptions of consensus.

In terms of analysis techniques, the studies described above have mainly employed variants of theme analysis, laying claim to a hermeneutic approach (Heracleous & Barrett, 2001) that involves searching for

commonalities underlying the different narratives examined, and illustrating the meanings that emerge from them. This seems to be common among most of those who adopt this perspective. Nevertheless, a variety of techniques more closely associated with narrative as storytelling could also be mobilized to examine such materials. For example, Greimas' actantial schema (Greimas, 1987), which defines story in terms of a quest and identifies heroes, villains, helpers and bystanders, could be used to code texts in such a way as to better understand organizational identities and the narrative logic underlying varying positions on issues (Demers et al., 2003; Sørderberg, 2006). Other analytical schemes for considering narrative are suggested by Boje (2001) and Czarniawska (2004).

Dilemmas and Limitations

A perspective on process as narrative takes seriously the idea that temporality is continually reconstructed within the attempts by human beings to make sense of their world. The processes that are emphasized here lie first within individual narratives and secondarily across them, either between people or over time. These studies thus offer a different and valuable way of reconsidering process from that which we have described earlier.

Note, however, that there are various approaches to considering narrative that gives rise to a certain amount of confusion associated with the mobilization of this perspective, and this is one of the dilemmas in applying it. For example, Rantakari and Vaara (2016) identify four different perspectives on narrative: the first implies the use of narrative for 'representation' (referring to the narratives emerging from other kinds of research), the second implying a social constructivist view in which meaning-making is emphasized, the third referring to a postmodern view in which dominant narratives fragment and are deconstructed (as in the work of Brown and colleagues described above), and the last

referring to a perspective in which narratives may acquire agential properties, coming to construct the activities they describe. We see the last, for example, in what some scholars have called 'identity regulation' (Alvesson & Willmott, 2002), in which organizations attempt to develop future organizational identity or strategic narratives (Barry & Elmes, 1997) that become self-fulfilling prophecies by offering desirable subject positions to individuals, who then take these up (at least to some degree), conforming to the proposed meta-narrative. All these perspectives, and especially the last three, offer intriguing ways to consider process as narrative. And yet, they are rather different and may require careful positioning to ensure consistency of approach.

A second limitation of the narrative perspective on process is that it often seems bounded and confined by the particular texts (documents or interviews) that it analyses. It does not explain, for instance, how different understandings of the world might interact and influence each other over time. For example, the work by Brown and Humphreys (2006) described above is based on interviews and enables the description of different constructions of events in interaction with the researcher. We see multiple understandings of events and resistance to managerial narratives. However, this perspective stops short of showing how different constructions of organizational identity might intervene in live discussions among the various participants. The next perspective on process offers closer attention to this with its analysis of change and evolution in the moment.

PROCESS AS ACTIVITY

This perspective focuses on the construction of the world in everyday activity and interaction. This perspective is closer to adopting an ontologically processual view, capturing and building on real-time practices. Studies in

this vein seek to derive insights from a set of, often mundane, interactions occurring in meetings or on other occasions where activity and interaction take place. Recently published examples of studies that adopt this perspective include Spee and Jarzabkowski's (2011) study of interactions surrounding the creation of a strategic plan in successive meetings, and Thomas, Sargent and Hardy's (2011) study of dialogic interactions between managers and employees around a new strategic orientation. Studies such as these focus on micro-level interactions and the way in which specific discursive interventions may build on one another, and construct shared or divergent meanings. While studies treating *process as evolution* step back from the everyday to examine long-term change, and while studies of *process as narrative* look at individual constructions of process, studies of *process as activity* move toward capturing becoming in the moment and are therefore closer to conforming to a process metaphysics or ontology than the previous two (Langley et al., 2013).

In the field of organizational identity, relatively few authors have taken this perspective. However, there are some exceptions (Coupland & Brown, 2004; Drori et al., 2009; Fachin & Langley, 2015; Ybema, 2010). Moreover, there are a number of other studies that, without focusing on *organizational identity per se*, examine individual or collective identity-related activity in organizational contexts where social interactions among co-workers imply partly shared identity constructions and negotiations (Karreman & Alvesson, 2001; McInnes & Corlett, 2012; Wieland, 2010).

Indeed, critiquing the narrative perspective, Karreman and Alvesson (2001) describe narratives as 'fixed texts or frozen states of subjectivity' that are incapable of grasping identity as it happens during the organizing process. Thus, rather than referring to the notion of 'organizational identity' as a thing which emerges over time (process as evolution) or is constructed in narrative

(process as narrative), it seems more relevant here to speak of 'organizational identity work' as *activities accomplished by individuals and groups to form, repair, maintain, strengthen or in other ways influence understandings of the central, distinctive and enduring characteristics of a specific organization*, a definition constructed by building on Sveningsson and Alvesson's (2003, p. 1165) notion of individual identity work. This definition accounts for the fragile and temporary accomplishment of identity in a collective. With this, we also see that the lines between individual and organizational identity work in an organizational context are likely to become blurred, since the very same activities of individuals aimed at influencing organizational identity construction are likely to simultaneously draw on or promote discursive constructions that fit the individual's own internal sense of coherence and distinctiveness. We now consider the implications of this approach for research design, data collection and analysis as well as the particular dilemmas this raises.

Research Design, Data Collection and Analysis

While *process as evolution* builds on long-term longitudinal studies of multiple actors, and *process as narrative* focuses on specific individual or collective sources, a perspective that considers *process as activity* aims to get close to specific instances of interaction that reveal the phenomenon studied 'in the making'. Thus, such an approach tends to involve single case studies and fine-grained data collection opportunities involving naturally occurring interaction. This may typically mean observation of face-to-face meetings (Karreman & Alvesson, 2001; McInnes & Corlett, 2012), shadowing of everyday office contacts (Drori et al., 2009; Wieland, 2010), or the collection of emails (Fachin & Langley, 2015) or web communications (Coupland & Brown, 2004). In order

to acquire such data, ethnographic approaches seem most appropriate. In studies of process as activity, interviews may serve as complementary sources to better understand what is occurring in interaction. However, direct observation appears to be a critical and necessary source.

In terms of analysis, researchers who adopt a 'process as activity' perspective are likely to collect a much broader range of data than they can actually use in any specific research article. Because interactions need to be examined in fine-grained detail, analysis will likely involve 'deep dives' into the data to identify critical incidents or interactions that are particularly revealing of the processes examined. Rouleau (2005, p. 1419) offers an analogy with the natural scientist's 'microscope [that] helps understanding of the whole through its tiny parts' to describe how the detailed investigation of specific interactions can enable a cumulative and layered understanding of the whole. Typical analysis techniques may range from formal conversation analysis (Samra-Fredericks, 2003), to less normalized forms of interaction analysis and coding.

An interesting example of this approach comes from the first author's doctoral thesis (Fachin, 2016). Using the concept of 'organizational identity work', this study in a peer-to-peer network for open innovation explores individuals' utterances concerning that which is central, distinctive and enduring about the organization in everyday conversations (see also Fachin & Langley, 2015). While in interviews with the researcher, participants provided certain constructions about the organization; in everyday interactions their performances also shaped the framework of interpretation of other participants. The focus on naturally occurring and interactive data in this study, including collective emails, meetings and observations, enabled the understanding of how discursive spaces around organizational identity concerns are negotiated in interaction. For example, participants were able to gain agency

by selectively granting undesired constructions of 'who we are' provided by others, and subsequently benefiting from their reciprocity in the resolution of defining issues. Fachin (2016) further found empirically that when this exchange of reciprocities broke down, that is, when participants insisted on pursuing their own desired constructions of the organization, the organization split. The study illustrates the value of studying situated interactions over long periods of time to detect shifts in interaction patterns.

Studies of conversations during meetings have also been used to understand how *individuals* position their own and others' personal and social identities through identity work in the moment (McInnes & Corlett, 2012). There is room for further development of a 'process as activity' perspective on both organizational and individual identities and the way in which organizational and individual identity work (often expressed in talk or other forms of discourse) are in fact inextricably bound together, an insight that is easily missed using other perspectives.

These kinds of analyses are only made possible because the interactions between participants are directly observed. These studies thus capture the co-construction and negotiation of identity directly. In this way, besides considering the performance of organizational identity, they are able to highlight how shared understandings might emerge in the interaction of participants, or on the contrary, how organizational identity constructions in discourse might be continually contested or pasted over in interaction (Fachin, 2016; Fachin & Langley, 2015).

Dilemmas and Limitations

The *process as activity* perspective brings us closer to a true process ontology by focusing on activity. Thus drawing on this approach, rather than seeing how organizational identity as a fixed entity changes over time, we see organizational identity in the making,

never actually coalescing in any final form but as continually accomplished in every successive interaction sequence. This approach is not, however, without its own dilemmas and limitations. For example, because of its proximity to everyday interaction, studies that adopt this perspective may have difficulty in reaching beyond their description. The interactions examined can easily become their own explanation. The interpretation of events within a micro-incident needs to build on theoretical concepts that lie outside it, so that patterns can be identified.

Another limitation of the kind of analysis encouraged by this perspective is that interactions are ephemeral by their nature. Yet, they have longer-term origins and consequences than might initially be perceived and this needs to be captured in the research despite the focus on activity and ‘becoming’. Thus, the context surrounding the particular events (who are the particular people in the meeting? what is the history of their prior interaction? what does each really hope to achieve?) needs ideally to be understood and included in the analysis (De Cock & Sharp, 2007). And yet, this context is not necessarily directly visible within the interactions as they are observed. Thus, an analysis of processes occurring ‘in the moment’ may often require drawing on temporal and spatial elements beyond that specific moment in order to make sense of it (Denis et al., 2010). Indeed, studies that focus on interactional events as the central focus often need to draw as well on ethnographic contextual data, interviews and other sources to stabilize and enrich interpretations that would otherwise be focused on fleeting events detached from their surroundings (Samra-Fredericks, 2003). Bringing together these elements to derive an insightful understanding of happenings in the moment can be a significant challenge. Taking the notion of process to its logical conclusion, we suggest, however, that there is an even more challenging way to consider what happens when the world is set in motion.

PROCESS AS WITNESS

A final perspective that we elaborate on here, somewhat speculatively since it has rarely been implemented in empirical research, is inspired by Shotter’s (2006) notion of ‘witness thinking’, the idea that a true process perspective places the researcher him or herself in flux along with and in direct relation to the researched. In contrast to the way in which most research is conducted by looking back on and making sense of past events once they have congealed into facts and certainties, witness thinking recognizes that human experience necessarily involves ‘living forward’ (Weick, 1999) and that attempting to capture experience in synchrony with research subjects can offer a deeper and richer understanding of the world as a process of becoming, replete with unrealized and ever-shifting potentialities. As Weick (1999, p. 135) notes:

Unsettled, emergent, contingent living forward contrasts sharply with our backward oriented theoretical propositions that depict that living as settled, causally connected and coherent after the fact. The compact causal structures that epitomize our theories are artifacts of retrospect rather than narratives of prospect.

Similarly, the editors of the *Oxford Handbook of Process Philosophy and Organization Studies* (Helin et al., 2014) identify three elements composing an approach to engaging in process research that fully conforms to process philosophy as they see it: ‘belonging to and becoming with the world’ (close to Shotter’s notion of ‘witness’ and Weick’s reference to ‘living forward’), ‘particularity’ (focusing on specific examples to understand how they emerge and how they alter their context), and ‘performativity’ (a recognition that research itself contributes to and potentially changes the becoming of the world).

Actually doing research that does justice to these process philosophical aspirations is, however, far from a simple matter, and

indeed few scholars have attempted it, or at least published their efforts in academic journals. Below we describe two different angles for designing research that might approach a form of ‘withness’ thinking.

Research Design, Data Collection and Analysis

A first way of operationalizing ‘withness’ thinking in empirical research is suggested by Shotter himself (Shotter, 2006, 2010). He argues that withness can only be achieved through dialogic interaction between the researcher and the researched, in which conversations are used to question and explore the potentialities of the moment in order to change understandings of the possible and thus of future actions (Shotter, 2006). He thus promotes what he calls ‘situated dialogic action research’ (Shotter, 2010), whose purpose is to create socially useful knowledge specific to the practices of individuals whose situations are being studied. The researcher is not therefore involved in formalizing knowledge into abstract concepts and relations but, rather, in enabling the emergence of novel sensemaking that opens up possibilities. Such research is resolutely forward-looking and particularistic, rather far from the notions of research design and theorizing represented in the three previous conceptions of process research.

While Shotter’s (2006, 2010) own writings are resolutely philosophical and concrete examples of empirical studies are limited to snippets of interaction, a more complete exposition of an empirical approach that appears to conform to his philosophy is described by Lorino, Tricard and Clot (2011), who draw on Shotter as well as Bakhtinian (Bakhtin, 1981) notions of dialogue, and pragmatist notions of inquiry (Dewey, 1980[1938]; Peirce, 1958[1931]) to propose and illustrate what they call a ‘dialogical mediated inquiry’ method. The method (illustrated case on an issue of employee safety) involves an initial

step of researcher observation of practitioner situations generating mediating artefacts (descriptions, narratives, filmed incidents) that are then successively considered in dialogue first with those directly involved, then in a somewhat wider group (in which the filmed dialogues of previous interactions are displayed and discussed), and finally to a much broader dialogical community. The inquiry dialogues and material artefacts give rise to collective sensemaking and the generation of alternative ways of approaching the practical issues raised. ‘Withness thinking’ translates here into a form of collaborative action research.

Within scholarship on organizational identity more specifically, an interesting example that approaches ‘withness’ thinking is the study by Hatch, Schultz and Skov (2015) on organizational identity development at Carlsberg. Here, two researchers (Hatch and Schultz) joined forces with a manager involved directly in developing and communicating organizational identity projections for other members of the firm (Skov). The researchers describe themselves as adopting an ‘engaged scholarship’ (Van de Ven, 2007) approach. This manifested itself in an emphasis on dialogue with participants as events and the inquiry evolved (‘After each field visit we wrote and shared first drafts of our discoveries with Skov and other key informants, the reports ranging from 3 to 12 pages. In some cases this led to further discussions with the managers of one or another of the subsidiaries’ (Hatch et al., 2015, p. 64). This resulted ultimately in a much more collaborative form of inquiry than had been initially envisaged, reflecting some of the important features of ‘withness’ thinking:

The reactions of Group executives, Skov especially, helped us recognize the need to balance our academic interests in studying the OI/OC [organizational identity / organizational culture] relationship with their need to manage these phenomena and led us to new insights concerning how the empirical study of theoretically defined phenomena can be better related to practice.

Yet despite the adoption of a collaborative approach (which may well have provided distinctive benefits to the firm and its members), Hatch et al.'s (2015) key contribution is nevertheless expressed as a conceptual model derived from a grounded theory coding approach that conforms closely to what one would expect from a 'process as evolution' perspective. While 'withness' was no doubt inherent to the creation of the data, it is not deeply reflected in the research product itself, based as it is on a retrospective reconstruction of events and their inter-relationship by the research team once data collection was complete.

An alternative research design, data collection and analysis approach that would recognize that researchers are in flux (i.e. living forward) along with the research sites they are observing would involve better capturing researchers' ongoing sensemaking as it evolves in parallel with changes in the research site. This suggests stronger use of reflexive auto-ethnography as a research method – that is, the detailed recording and explicit representation in published research outputs of the researchers' interpretations of organizational identity issues in real time as they evolve, focusing both on the events and discourses observed as well as on the researcher him or herself as the observer and/or interpreter of these events.

Such a method would recognize that what a researcher understands of a phenomenon such as 'organizational identity' at a particular point in time is embedded in the moment at which that understanding occurs and is connected to that researcher's own identity and location in time and space. At a later point in time, not only will events have moved on, but the researcher's own life and personal identity may also have shifted, changing the way in which he or she is likely to make sense of the same events. As Cunliffe and Karunanayake (2013) point out, researchers speak for and construct identities, shaping the context, selecting some voices and silencing others. As time moves on, the researcher

him- or herself changes as he or she makes sense of the phenomenon. Throughout the process of analysis, the researcher is able to see 'new' things while being blinded by others. The phenomenon thus appears in flux through an interrelated process of discovery of the field *and* self-discovery (Locke, 2011). As Sergi and Hallin (2011) suggest, doing research can be viewed as a 'process' too, which may become inextricably intertwined with the processes observed and analysed, especially if these processes co-occur over long periods of time.

In this case, the main source of data for capturing not only organizational events in flux but also the flux of a researcher's sensemaking would be the researcher's own autoethnographic journal, and the analysis of this conducted by himself or by others at different points in time. Such work is rare, in particular in mainstream journals, and is likely to be somewhat experimental because of its foreignness to mainstream thinking about legitimate forms of theorizing. However, one example (related, however, more to individual rather than organizational identity in this case) is Kempster and Stewart's (2010) autoethnographic study on 'becoming a chief operating officer'. Here, the second author took detailed diary notes of his first three months in a senior leadership position. While the research data are constituted as a reflexive construction of an experience, the first author participated in the analysis of the second author's narrative, enabling the unveiling of elements taken for granted by the first author during the process itself. Such an approach could be adapted to the study of any phenomenon (including organizational identity) by offering insight from time-stamped diary entries and analyses into how researcher analyses evolved over time as the researcher moved from novice to insider within the same study.

In undertaking such research, there may be much to be said for generating records that are as close as possible to natural observations rather than being tied to time-bound and

indirect interpretations. For example, field notes taken during a meeting are one way to capture events. However, a video recording of that same meeting is more malleable and potentially subject to novel and richer interpretations when revisited later. The same phenomenon is seen differently because the ‘eyes’ of the researcher have moved on.

Though again not dealing directly with organizational identity, an example of an explicit attempt to capture this movement in researcher perspective over time is expressed in another study by Revsbaek and Tanggaard (2015). These authors propose that when researchers listen to audio-recordings of interviews some time later, there is value in rendering explicit (i.e. within the data analysis itself) the way in which the researcher’s understanding of and reaction to the material has evolved as a function of what was learned and remembered from the research site since the interview, as well as how the researcher’s own personal experience between the time of the interview and the present informs the interpretation. They label this process ‘analysing in the present’ and illustrate it based on case studies from research on newcomer socialization. Although they do not accomplish this in their paper, they also argue that there might be added value in including the research participants themselves in such an analysis process, an approach that would clearly bring the notion of ‘withness’ even more fully to life. This would be particularly interesting for a study of organizational identity issues, enabling participants to reflect on their own past interpretations of identity in light of a new present.

Dilemmas and Limitations

A perspective on process as ‘withness’ brings process research much closer to a strong process ontology, and has been explicitly favoured by writers strongly committed to the application of the precepts and assumptions of process philosophy to organization studies

(Helin et al., 2014; Lorino et al., 2011; Revsbæk & Tanggaard, 2015; Shoter, 2006, 2010). And yet, it is a perspective that rather deeply challenges our understanding of the nature and purpose of academic research on organizations, much more so indeed than the three previous perspectives. By taking process thinking to its logical conclusion, and by placing the researcher him- or herself in flux along with the situations he or she is studying, the research enterprise as we know it appears suddenly destabilized and detached from its moorings. While ‘withness’ thinking clearly has value for practice, the goal of generating conceptual understandings of phenomena that can be at least partially transferred to multiple situations appears to fade when adopting these ideas to the full. Weick (1999, p. 134) sums up the potential of this kind of perspective on process in terms of its potential to close the ‘gap between living forward with flawed foresight and understanding backward with equally flawed but mischievously seductive hindsight’. The trick, it seems to us, is to bring both closer together without losing either. As our examples suggest, this is easier (and more often) said than done.

CONCLUSION

In this chapter, we examined four types of ways of conducting qualitative process research based on different assumptions about the nature of process: process as evolution, process as narrative, process as activity and process as withness. We have highlighted how studies within these groups consider phenomena in motion with different lenses, assumptions and methods.

Indeed, contrary to what might have been thought, there is more than one way to operationalize the notion of process in qualitative research. The *process as evolution* perspective is the approach that is most commonly adopted and well accepted in academic

journals in the field. It involves treating concepts as entities and examining their evolution over (usually long periods of) time under the assumption that this evolution can be represented and explained holistically using a limited number of related concepts. The *process as narrative* perspective moves from considering temporal evolution in the 'real' world to considering its representation and understanding in the narratives generated by organization members. Such a perspective recognizes the multiplicity of meanings present in specific situations. The *process as activity* perspective, in contrast, focuses on becoming 'in the moment' as interactions among people generate and constitute observable transformations. Concepts or entities (such as organizational identity) are viewed here in terms of activities (organizational identity work) as people interact to influence their becoming. Finally, the *process as withness* perspective that we introduced in the last part of the chapter places the researcher in motion along with the research sites they are studying, refocusing the research enterprise in rather fundamental ways.

We note that, as we move from one perspective to another, the data required are still qualitative but may be somewhat different. Viewing process as evolution requires longitudinal qualitative data, preferably from multiple sources over a period long enough to observe clear changes in concepts studied. Viewing process as narrative in contrast may rely on synchronous data collected in interviews and texts. All that is required is that these sources embed respondents' reconstructed temporality. Viewing process as activity requires access to naturally occurring interactions and activities so that the micro-level shifts as interactions proceed can be observed in a fine-grained manner. Long-term data collection may be valuable but not absolutely essential in such cases. Finally, methods such as dialogic action research or auto-ethnographical diaries are sources more compatible with viewing process as withness.

As we move through the different approaches to process research, the nature of the research output changes also, as do the challenges associated with generating these outputs. As Langley (1999) commented, process data are always messy and making sense of them is never simple. Yet, there is now sufficient published work adopting the 'process as evolution' view that the challenge with this no longer seems insurmountable. Recently, the process as narrative and process as activity views have also been developing adherents and some strong and insightful exemplars have appeared in well-ranked journals, including some of those cited in this chapter. On the other hand, the closer we come to approaching a strong process ontology as put forward by process philosophers (and as represented by the *process as withness* view), the more difficult it seems to become to not only offer contributions that effectively capture the world in flight, but also in a way that is understandable, parsimonious and potentially transferable. The philosophers of process seem here to have reached somewhat beyond the understandings and capabilities of the pragmatic empiricists among us (speaking for ourselves). A perspective that considers *process as withness* places the researcher in motion along with the research sites they are studying, refocusing the research enterprise in rather fundamental ways. Herein, perhaps, lies the next frontier.

Designing Strategy as Practice Research

Chahrazad Abdallah, Joëlle Basque
and Linda Rouleau

INTRODUCTION

Within the broader strategic management field, the strategy as practice (SAP) perspective is an approach that considers strategy not as something that an organization has, but rather as something that people do in organizations (Johnson et al., 2003, 2007). As such, it focuses on the concrete activities carried out by strategy practitioners, such as the way in which they mobilize the tools of practice or the skills and roles they adopt when engaging in strategic activity, whether they be formal leaders, middle managers, consultants, or professionals. From this perspective, strategy concerns individuals' actions at all levels of an organization, and as such is not viewed as a practice that is necessarily the exclusive domain of top managers.

The SAP perspective has been growing rapidly as empirical research has accumulated and activities around this approach have been institutionalized through special issues, books, and events in international

conferences. While the ontological and the epistemological nature of SAP has been written about extensively (Johnson et al., 2007; Vaara & Whittington, 2012; Golsorkhi et al., 2015), methodological challenges facing researchers to capture the essence of strategizing have not been sufficiently addressed. In 2003, Balogun, Huff, and Johnson opened the methodological conversation by suggesting that SAP researchers should innovate by developing flexible methods more appropriate for multinational organizations and by inviting researchers to engage with participants as long-term partners. According to these authors, interactive or focus groups, self-reports, and practitioner-led research methods were three suggestions for improving the way data is collected to better understand the set of practices through which managers and organizational members strategize. Their paper discusses four methodological conversations that have been, and still are, central in SAP: the place of ethnographic methods; the role of practitioners; the need

for innovative methods; and the challenge of connecting micro and macro levels of practice. The importance of these methodological conversations stands on the fact that they are at the core of how SAP researchers design or ‘do’ their research.

It is commonly agreed that researching ‘how managers and others do strategy or strategize’ is not an easy task and poses significant methodological and ethical challenges – but also opportunities – for researchers who choose to tackle it. Research designs, understood henceforth as the methodological *dispositif* that combines research strategies, units of analysis, data collection, and data analysis, are central for studying empirical strategy research because they enable the articulation of what we know about the phenomenon observed with the empirical and theoretical outcomes emerging from the research process. Put differently, SAP research should be able to rely on designs that would help capture a set of dimensions such as contextuality, agency, the nature of social practices, and the distributed and shifting nature of strategy. As these dimensions are fluid, complex, and socially embedded, designing a research project that will allow SAP researchers to grasp them presents multiple challenges and opportunities that need to be explored. This is what this chapter intends to do.

The chapter looks at how we do research strategy empirically and is organized in three sections as follows. In the first section, we describe what SAP research is about and discuss the challenges of researching strategy practices. In the second section, we explore the research designs of empirical SAP papers and discuss three research design profiles used by SAP researchers that we were able to identify from an extensive review of SAP literature. We label these research designs: Classical, Expanded, and Comprehensive. In the third and final section of the chapter, we address more directly the methodological conversations of the field and bring up some suggestions for advancing these conversations.

SECTION 1: SAP RESEARCH, METHODOLOGICAL CHALLENGES, AND CONVERSATIONS

The general framework used in strategy as practice for charting its territory is based on the conceptual triad of ‘praxis, practices and practitioners’ (Whittington, 2006; Jarzabkowski et al., 2007; Vaara & Whittington, 2012). In this framework, the term ‘practices’ refers to the behavioral, cognitive, and discursive resources practitioners use and the set of activities they draw on in strategy-making. By drawing upon these practices, the strategists or practitioners, in SAP terms, are contributing to negotiate and regulate the flux of activities (praxis) related to strategy shaping. Put differently, practices or ‘what people do’ in SAP research generally refer to the ‘shared routines’ or the set of ‘recognized forms of activities’ called ‘strategic’ in the organizational contexts studied (Phillips & Lawrence, 2012, p. 227).

Even though this framework provides consistency in the way SAP researchers define what practices are, there are different visions of practices that coexist in this body of knowledge. Rouleau (2013) identified five different underlying views of practice: as managerial action, as set of tools, as knowledge, as organizational resources, and as global discourse. Despite the fact that these visions convey a discourse that attempts to differentiate itself from the strategic management mainstream, most of these are still embedded in formal and rationalist strategic outcomes that are at the heart of SAP research (McCabe, 2010; Cunliffe, 2015). This is inconsistent with the fundamental nature of what ‘social practices’ are about since, according to practice-based studies, social practices are inherently contextual, performed by skillful actors involved in networks of activities regulated through diverse patterns of more or less integrated action. Therefore, to be able to capture how managers and organizational members accomplish their strategic work in practice, there is a need to draw on methods and data

that can capture empirically what social practices are about.

The issue of how to define, conceptualize, understand, and ultimately capture practice empirically is crucial in the development of strategy as practice as a field of study. Many challenges are to be taken into account when tackling the issue of how to choose the appropriate methodological approaches to study social practices of strategizing. Such challenges involve considering the material, discursive, performative, and contextual nature of social practices. A number of critiques have been addressed to the strategy-as-practice field in recent years for not adequately tackling issues of ideology, power, agency, or strategy outcomes in the study of strategy from a ‘practice lens’ (Corradi et al., 2010; McCabe, 2010). These critiques are worth examining as a source of relevant concerns for advancing SAP research design.

For McCabe (2010), strategy as practice, by relying on a conceptualization of power rooted in an epistemology of possession, focuses exceedingly on managers (top or middle), ignores inequality in the contexts through which strategy emerges, and consequently the reproduction of that inequality through strategy, and adopts a strong managerial agenda that limits its understanding of social practices. Methodologically, this critique addresses a strong preoccupation within the strategy as practice field with the practices of certain actors, that is, top and middle managers in the organization, and calls for broadening the research to a wider array of social actors involved in the strategy process. Recently, Balogun, Best, and Lê (2015) have offered a response to this critique by showing how frontline workers in a museum are involved in strategy work by embodying and ‘bringing into being’ the organization’s strategy.

A closer examination of agency is also critical for strategy as practice research. Phillips and Lawrence (2012) suggest a ‘humbler, more nuanced’ conception of

agency and a reconsideration of the role of actors in the social construction of strategy work. They point to a general shift toward the study of actors, but again insist on a humbler reconsideration of their agency and a closer examination of its limits. Agency is prevalently considered as too purposeful as researchers often focus on the intentional and very competent side of practices. The concept of ‘practice’ is also an object of debate and its definition within the strategy as practice community somewhat contested. Strategy as practice, according to Corradi, Gherardi, and Verzelloni (2010), considers ‘practice’ as an empirical object, therefore maintaining a strong focus on activities and purposeful agency and neglecting the unintended consequences of situatedness. In recent years, however, strategy as practice research has moved away from the ‘omnipotent’ strategist to a more inclusive understanding of strategy work as a site for the interplay of the social, the material, and the discursive, yet research needs to address more strongly the contingent, embedded, and situated nature of agency in strategy work.

Before we discuss how strategy as practice researchers have addressed these challenges and critiques over the years, we will introduce four extensively debated methodological conversations that are associated with these challenges.

Current SAP Methodological Conversations

In recent years, four methodological conversations were, and still are, central to SAP research. The first conversation revolves around strengths and weaknesses of ethnographic methods in SAP research; the second around the role of practitioners in SAP research; the third is about the need for innovative methods in SAP research; and the fourth addresses the challenge of connecting the micro- to the macro-level of practices.

Methodological Conversation 1: SAP and Ethnographic Methods

One of the most prevalent methodological conversations that has pervaded the field over the years concerns the pros and cons of using ethnographic and longitudinal case studies in SAP research. Given that SAP researchers are looking at practices, these methods seem to be ideal at first glance for being able to understand ‘what people do’ when they are strategizing. Nevertheless, during the period in which SAP research constituted itself as a research field (2002–2008 according to Dittrich et al., 2015), there was a movement in favor of taking some distance from ethnographic or longitudinal case studies (Balogun et al., 2003; Huff et al., 2010; Venkateswaran & Prabhu, 2011). Balogun et al. (2003) started this movement by arguing that these approaches are greatly time-consuming and do not allow the researcher to embrace the scope and speed of organizational complexity. Later, Huff et al. (2010) claimed that ethnographic and case study methods were not sufficient for understanding strategizing and that there was a need to expand evidences from methods that support more generalizable conclusions and enhance the scope and the robustness of strategy as practice research. Such a position was later reinforced by Venkateswaran and Prabhu (2011), who invited SAP researchers to use quantification or clinical methods to enhance the rigor and relevance of this body of research.

However, in the period where SAP research developed and grew – between 2009 and 2014 according to Dittrich et al. (2015) – a counter-discourse suggesting that ethnographic methods constitute the most powerful methods for investigating strategy practices strongly emerged (Chia & Rasche, 2010; Rouleau, 2013; Vesa & Vaara, 2014; Cunliffe, 2015). According to Vesa and Vaara (2014), the potential of ethnographic studies has yet to be realized in this research domain. In her investigation of SAP research, Cunliffe (2015) also confirms this diagnostic, saying

that research in this area is based on an objectivist focus that would need to be overcome to be able to capture strategizing as a lived and reflexive experience.

Methodological Conversation 2: The Role of Practitioners

Another important methodological conversation concerns the relations between researchers and practitioners in SAP research. In their seminal methodological paper, Balogun et al. (2003) urge strategy as practice researchers to engage in collaborative research with managers. Assuming that SAP is interested in ‘practices, praxis, and practitioners’, it stands to reason that SAP researchers should redefine their relations with the practitioners they are observing. Despite numerous voices in favor of that inclusion, to date very few SAP researchers have designed their research on a collaborative mode with managers (Beech & Johnson, 2005; Heracleous & Jacob, 2008; Eppler & Platts, 2009; Mueller et al., 2013). To build a partnership with practitioners would require researchers to enter a more dialogic and reflexive relation (Cunliffe, 2011) with them, which, in turn, most certainly would affect the determination and definition of the unit of analysis as well as the nature of the ‘sample’ studied.

Methodological Conversation 3: The Need for Innovative Approaches

The call for innovative methodologies has also been the object of a methodological conversation that paralleled the emergence and development of SAP research. On the one hand, Vaara and Whittington (2012, p. 291), in their extensive review of SAP research, contend that this body of work ‘has achieved a substantial methodological shift’ in introducing in strategic management a diversity of in-depth qualitative methods and data. But on the other

hand, most observers of the SAP field will agree on the overuse of case studies and interviews, thus leaving the impression that the level of methodological innovation is lower than we can think at first glance (Johnson et al., 2007; Venkateswaran & Prabhu, 2011; Vesa & Vaara, 2014). Recently, however, Golsorkhi et al. (2015, p. 14) have taken a position on this debate in the following terms: ‘the call for “methodologically innovative” approaches does not necessarily mean that one has to develop entirely new methodologies: it suggests, rather that we look at them through a “practice lens” and use innovative ways to approach managers and reconstruct their strategizing activities and roles’.

Methodological Conversation 4: Connecting Micro and Macro Levels

Over the years, SAP research has been addressing the need to connect the mundane activities involved in strategizing at the micro level with the macro organizational and even sectorial or institutional levels (Whittington, 2006; Johnson et al., 2007; Jarzabkowski et al., 2015). When looking for the in-vivo experience of doing strategy, the risk of not being able to see the forest for the trees is big. Even though the opposite is also true, there are regular attempts in the literature that come back on the need to explore more macro-strategizing issues (Huff et al., 2010; Vaara & Durand, 2012; Jarzabkowski et al., 2015). For example, Huff et al. (2010) argue for the need to expand the strategizing agenda toward a broader comprehension of macro-events. Vaara and Durand (2012) enrich the argument by inviting strategic management researchers, whomever they are (mainstream or not), to take up seriously the grand challenges that are of global relevance. Nevertheless, some authors have suggested relevant integrative frameworks in order to help researchers to deal with this methodological issue. In 2006, Whittington has proposed a framework for

integrating the intra- and extra-organizational levels. More recently, Jarzabkowski et al. (2015) have reinitiated the debate by offering an integrative perspective on the links between strategy and performance in order to develop more context-sensitive theories about strategic practices and their outcomes at the organizational level.

Prior to further addressing the methodological challenges and conversations that SAP researchers face, we will examine how SAP research has been designed and carried out so far.

SECTION 2: EXPLORING SAP RESEARCH DESIGNS

Following Cunliffe (2011), we understand research designs to consist in an interrelated set of elements that form the methodological *dispositif* around which a study is articulated. To assess how SAP researchers ‘do’, or more precisely ‘design’ their research, we proceeded in three steps.

First step: Identifying SAP empirical papers. To construct the data set on which we assess the way SAP researchers design their empirical studies, we drew on the recent recension of SAP works done by Dittrich et al. (2015), who analyzed how SAP researchers construct their contributions. From 2002 to 2014, they identified ‘seventy empirical papers that drew upon or sought to contribute to SAP research’ (Dittrich et al., 2015, p. 96). We completed this data set by including five SAP papers published during 2015. In total, 75 SAP empirical papers were identified.¹

Second step: Building a matrix. To analyze the set of papers identified, we constructed a matrix based on the fundamental requirements of an empirical paper’s methodology section. While all the SAP empirical studies to be analyzed were listed on the vertical axis of the matrix, we used the categories proposed by Johnson et al. (2007, p. 53)

to define its horizontal axis. According to them, an ‘archetypal research sequence’ can take the following steps: Approaching Strategy as Practice; Bounding Strategy as Practice; Capturing Strategy as Practice; and Theorizing Strategy as Practice. In our view, these steps also constitute the main parts that are generally found in the methodological section of an empirical SAP paper. For the purpose of this chapter, we adapted the framing of these powerful labels in order to be able to capture the What (research strategies), the Who (unit of analysis), the How (data collection), and the Why (data analysis) of the *dispositif* or method procedures generally described in the empirical SAP papers. We will now describe the content of each of these dimensions.

1 Approaching Strategy as Practice: Research strategies (What)

The first section of an empirical paper generally indicates the research positioning or the main epistemological choices adopted by the researcher. Here SAP researchers who use qualitative data generally announce their research orientation and strategies. For example, researchers might say that they are doing longitudinal or comparative case studies based either on interpretive, process, or language orientation and so on. Naturally, such choices and orientations should be coherent with the research question and other parts of the research design. After having specified these choices, it is common to justify the empirical context of the research and/or the case study chosen. Sometimes, researchers also explain how the research has unfolded over time and if they have taken a more or less inductive research pathway.

2 Bounding Strategy as Practice: Unit of analysis (Who)

The second dimension of a research design concerns the unit of analysis and, by corollary, the choice of the studied ‘sample’. This is a tricky point for SAP researchers, who are supposed to look at ‘practices’. But as we have previously seen, the definitions of strategy practices are multiple and can be very wide in the sense that for some SAP researchers everything can be strategic (e.g. Rouleau, 2005). This ambiguity about what practices are and are not renders the task

of identifying what the appropriate unit of analysis is (workshops, middle managers, strategic episodes, strategic plans, strategic decisions, and so on) particularly sensitive. Venkateswaran and Prabhu (2011) consider that the definition of the unit analysis is one of the major methodological issues for SAP research. To identify the adequate unit of analysis is imperative because it allows for defining or bounding the nature of the corresponding ‘sample’ to be studied. As will be shown in our analysis, there is a tendency in SAP research to map individual or organizational activities without always being clear on these questions.

3 Capturing Strategy as Practice: Data collection (How)

The third section of the research design has to do with the need to access the data and to obtain them. This section describes how data regarding ‘what managers and others do when strategizing’ were obtained. Put differently, research designs in this part describe what the researchers’ data sources and collecting tools were. As most SAP empirical papers are qualitative, they tend to draw on multiple and classical data collection tools ranging from interviews, observations, and documents.

4 Theorizing Strategy as Practice: Data analysis (Why)

The last section of a research design or an empirical paper is generally devoted to the description of how the data were analyzed in order to explain why practitioners did what was observed during the research. The main challenge of this part of the research design concerns the capacity of SAP researchers to show how they connect in-depth and local data to strategic outcomes and/or to findings that will have some generalizable or transferable properties. The issue concerns the capacity of SAP researchers to go over descriptive knowledge and achieve a certain level of theorizing and/or understanding about how managers and others strategize. It is generally through the back-and-forth process between empirical data and theory that SAP researchers are able to propose relevant contributions for advancing our knowledge of strategy as a social practice.

Third step: Distinguishing three profiles of SAP research designs. After completing the matrix, we were able to identify, decorticate, and compare the research procedures

generally accomplished by SAP researchers. This third step of our analysis led us to distinguish three research design profiles used in SAP research, namely: the Classical, the Extended, and the Comprehensive SAP research designs (see Table 20.1). The following section describes these profiles according to the criteria we used to examine SAP empirical research. This review of the state of SAP research designs will allow us, in the third part of this chapter, to position ourselves within these debates and suggest future avenues.

The Classical SAP Research Design

What we have labeled the Classical SAP research design is the closest to mainstream strategy research traditions, such as the study of strategy process, focusing on managerial strategic actions and on decision-making processes and behaviors that influence organizational performance (Vaara & Whittington, 2012). The Classical SAP research design generally offers an objectivist view of strategy in which a unique reality can be accessed through the accounts of top managers (Johnson et al., 2007). Such research designs still aim at offering reproducible and generalizable results. Typically, therefore, the Classical SAP research design implies a conception of strategy as being made of activities and behavioral patterns that can be systematically described and represented in a theoretical model. These activities can be conceived as enablers or constraints of strategic success (Angwin et al., 2009) and are often accompanied by process descriptions showing explanations in terms of causal relations (Johnson et al., 2010). Moreover, the classical research design almost always includes comparisons across multiple cases, providing possibilities for variance explanations, as well as enhanced validation of findings (Mantere, 2005). Some studies also have a longitudinal aspect that provides possibilities for comparing the evolution of strategy

processes over time (Jarzabkowski, 2003; Fumasoli et al., 2015).

Researchers using a Classical SAP research design focus on patterns of micro-strategies, firm resources, and competencies (Salvato, 2003), as well as the concepts and tools these firms use (Mantere, 2005; Paroutis & Pettigrew, 2007). They also pay attention to the role, activities, and capabilities of existing senior executives tasked with strategy and whether they help organizations become more effective (Jarzabkowski 2003; Angwin et al., 2009). More recently, studies have explored the use of identity as a risk-reducing device in strategic plans (Fumasoli et al., 2015). Here, there is a marked interest for traditional strategy actors, activities, and tools, even if the aim is to embrace a practice approach. Mantere (2005) explicitly refers to formal practices as the favored unit of analysis in strategy research when he writes: ‘Whittington (2003) has suggested that current strategy as practice research would benefit most by concentrating on the formal practices of strategy because they are more easily traceable empirically, and because strategy practitioners widely practice these formal aspects, of which little is known’ (Mantere, 2005, p. 161). Yet Mantere also acknowledges that the choice to concentrate on formal aspects of strategy practices restrains the possibilities of his research to trace emergent aspects of the phenomenon.

Regarding data collection, or the How dimension, the Classical SAP research design strongly relies on structured or semi-structured interviews of managers and strategists as a primary source of data (as in Mantere & Vaara, 2008). The underlying assumption justifying the use of interviews seems to be that *a posteriori* reports on what has taken place is a satisfying means to studying practices. The following quotation from Paroutis and Pettigrew (2007) is explicit regarding this point: ‘An ethnographic approach might have provided more detailed accounts of the actual activities used by strategy teams. However, this article is based on

Table 20.1 Three profiles of strategy as practice research design

	<i>Classical</i>	<i>Expanded</i>	<i>Comprehensive</i>
Approaching SAP: Research strategies (What)	Strategy as made of activities and behavioral patterns that can be described and shown in a model Predict success. Variance, causal explanations Brief description of context Comparative, multiple and single-case studies Often longitudinal	Strategy as a concrete process, involving change episodes that trigger sense-making and cognition. Discourse and interactions treated as objects Detailed description of context Multiple and single-case studies. Process and discursive studies	Strategy as a social reality and/or embodied performance carried out by discourse and dynamics that must be studied at the level of micro-practices Detailed description of context Embedded, multiple, and single-case studies. Combination of approaches (e.g. critical, material, multi-modality, ethnomethodology, conversation analysis)
Bounding SAP: Unit of analysis (Who)	Top management teams, middle-managers, behavioral patterns, strategic tools, formal strategy and strategists' roles Informants	Middle-managers' competencies, individual and collective sense-making, decision-making episodes, epistemic culture around strategy tools, cultural meanings Participants	Discursive interactions, material aspects of strategizing, relations with space, talk-in-interaction, tacit competencies, emotions Partners
Capturing SAP: Data collection (How)	Interviews (primary source) Documents, observations, and other data (secondary source)	Semi and non-participant observations of meetings, often coupled with interviews (primary source) Workshops, focus groups and documents (secondary sources)	Ethnographic observations (often including audio and video-recording or shadowing), workshops and training, meetings, collaborative research (primary source) Interviews, documents, and archival data (secondary source)
Theorizing SAP: Data analysis (Why)	Grounded theory analysis and categorizing of data according to pre-existing theories Elaboration of theoretical models Salvato (2003); Balogun & Johnson (2005); Mantere (2005); Paroutis & Pettigrew (2007); Angwin et al. (2009); Johnson et al. (2010); Fumasoli et al. (2015)	Grounded theory analysis Reconstruction of events in chronological order Theory-data iterative loops Maitlis & Lawrence (2003); Beech & Johnson (2005); Kaplan (2008); Moisander & Stenfors (2009); Fauré & Rouleau (2011); Rouleau & Balogun (2011); Abdallah & Langley (2014)	Micro analysis Successive phases of coding, scaling up from micro-practices to strategy processes Rouleau (2005); Samra-Frederiks (2005); Nayak (2008); Kaplan (2011); Aggerholm et al. (2012); Jarzabkowski et al. (2013); Balogun et al. (2015)
Examples			

the assumption that practitioners are able to express in retrospect their activities' (p. 107). The people with whom these interviews are carried out are explicitly (or implicitly) seen as informants. Often these interviews will be completed by archival documents pertaining to the context and/or the strategy process as a secondary source of data (see, for instance, Jarzabkowski & Balogun, 2009). Sometimes observations and other data sources are added to the data set (see Jarzabkowski, 2008). This extract from Mantere (2005) demonstrates it: 'The semi-structured interview outline that we created remained stable through the 301 interviews. The same outline was used in all 12 organizations' (p. 160). In this case, the stability of the interview outline across cases and across researchers was aimed at increasing possibilities of cross-examination and comparison, as well as variance calculation.

Finally, regarding data analysis, the Classical SAP research design will normally be 'combining both inductive and deductive approaches' (Jarratt & Stiles, 2010, p. 32), and will rely on grounded-theory and other similar analytic methods (Salvato, 2003; Nordqvist & Melin, 2008). By that we mean analysis phases including iterative back and forth loops between data and theory, often involving categorization and coding of data according both to emerging activity patterns and preexisting theories. In the Classical design we also observe a tendency to the elaboration of theoretical models that describe but also predict strategy processes and dynamics according to strategists' activities and behavioral patterns.

The Expanded SAP Research Design

The Expanded SAP research design also involves the studying of strategy as an objective reality, a concrete process, but the focus is on the fact that it involves change episodes that trigger interpretation and action. Discourse and interactions are considered,

examined, and theorized with more scrutiny, but they are still treated as objects that can be looked at from the outside.

In this design we encounter more single-case studies than in the Classical research design, sometimes with a longitudinal aspect that allows for process theories to be mobilized. Johnson et al. (2007) explain the distinction between variance and process theories by pointing to the elements that are considered in the analysis and the way they are conceptualized: 'While variance theories explain phenomena such as strategic change in terms of causal variables, process theories explain them in terms of the activities, events and choices that constitute them over time' (p. 54). We also find a thick description of the research context, with an emphasis on the case idiosyncrasies that allows for understanding the specificities of the discursive practices and social patterns encountered in the study (see for instance Denis et al., 2011).

Authors who use what we have labeled an Expanded research design try to depart from traditional conceptions of strategy, by taking further the idea that strategy may not just be a top-down process and that it may also involve emergent practices from all organizational levels. These authors will thus put the focus on new actors that had not been considered before but that may be involved in strategy processes, such as middle managers. For instance, Maitlis and Lawrence (2003) interviewed orchestra managers, board members, musicians, and so on. By doing so, they expanded the units of analysis considered and methods of data collection to include more diversity in data collection itself, and more variation of the types of data collected.

In the Expanded SAP research design, the units of analysis, or the Who, reflects this complexity, aiming to understand the underlying processes that support strategic activities. Units of analysis will also reflect the fact that strategy is studied through social interactions and discourses. For instance, we find units of analysis such as discursive practices in decision-making or strategy-making episodes

(Maitlis & Lawrence, 2003; Denis et al., 2011); knowledge productions (Moisander & Stenfors, 2009); identity dynamics in strategic change (Beech & Johnson, 2005); epistemic culture around strategy tools (Moisander & Stenfors, 2009); manifestations and consequences of strategic ambiguity (Abdallah & Langley, 2014); and middle managers' competencies displayed in meetings and interactions (Fauré & Rouleau, 2011).

Regarding data collection, the Expanded research design will involve direct observations at all levels of the organizations, whether they are semi- or non-participant observations, and these observations take place in meetings, workshops, or focus groups (see for instance Hoon, 2007). These observations constitute mostly the primary source of data, but they are often coupled with formal interviews. Using a combination of observations and interviews, Moisander and Stenfors (2009) met with participants before and after the focus group they organized to have the developers and the users of a strategy tool meet together and exchange ideas. Strategy and other organizational documents often complete the data set as secondary data sources. In these cases they will be considered for analysis along with meeting transcripts, as we see in Fauré and Rouleau's study (2011), in which accountants and middle managers' competencies in meetings were observed.

Reconstructing the course of events into chronological order to have a sequential understanding of strategy micro-processes and dynamics is often the first step of the analysis in the Expanded SAP research design. For instance, Maitlis and Lawrence 'developed a "decision story"' to 'chronicle the process' (2003, p. 115). This first step is most of the time followed by various steps of theory-data iterative loops, mixing inductive and deductive approaches. Again, grounded-theory and similar analytical approaches are favored, and we find a great consistency with the classical research design regarding data analysis, even if the nature of data considered is extended and if the objectivist aspect

of analysis is toned down. We note here the exception of studies using a narrative approach, as we see with Beech and Johnson (2005), who extracted the dominant narratives from their interviews and observations to understand the evolution of managers' identity dynamics during strategic change. Interpretation of data is carried out to unveil discourse uses, knowledge, and cultural dynamics around strategy practices.

The Comprehensive SAP Research Design

The Comprehensive research design departs from traditional conceptions of strategy, to embrace a view of strategy as a social reality carried out by discourse and dynamics across different levels. Strategy is even conceived as experienced by actors, and studying it through their experience can bring forth a new understanding of the phenomenon for the SAP field. Such design is consistent with a more subjective view of reality that emphasizes its symbolic and discursive aspects.

Papers associated with Comprehensive SAP research design generally propose more diversified data collection methods and data analysis than the Classical and Expanded ones. However, in this research design profile researchers do not conceive the individuals they are studying as informants or participants, but more as partners. The approach is generally more subjective or intersubjective, and the focus is on situated and enacted reality between managers, their counterparts, and their surroundings (Cunliffe, 2011). What is aimed at is finding a sort of middle ground between subjectivity and objectivity, to look at what emerges from confrontations of subjective experiences in situated interactions. As Nayak (2008, p. 424) put it, in the context of his study: "Experience" and "practical logic" point to a way of understanding individuals and organizations without bifurcating our modes of knowledge into subjective and objective dimensions'.

For some of the authors who characterized the Comprehensive profile, strategy is seen as an embodied and situated performance, involving individuals in interactions with one another, but also with artifacts, spaces, emotions, and so on. Strategy must be studied through fined-grained analysis of micro-practices performed in their specific context. Thus, discourse and materiality are studied at multiple levels with a combination of approaches, involving for instance a critical theoretical framework, or an ethnomethodological approach, or even conversation analysis. Again, Nayak (2008, p. 424) very well describes the benefits of such a combination of approaches in the context of his research:

Methodologically, the aim is to uncover the silent, latent and invisible relational space that 'lights up' the meaningful activities that are visible. Practices are a type of silence; they are things within a culture that are normatively kept just beneath the surface of language. It takes the form of an 'open secret', but one that no one verbalizes. Hence, addressing practices calls for a combination of subjective ethnomethodology and sociolinguistics approaches and the more objective discursive and governmentality approaches.

Regarding units of analysis, adopting a Comprehensive research design brings researchers to focus on material aspects of strategizing, sometimes in relation with space (Kaplan, 2011; Jarzabkowski et al., 2013; Balogun et al., 2015), as well as on the constitution of power through talk-in-interaction (Samra-Fredericks, 2005; Kornberger & Clegg, 2011). They also, for instance, look at 'competence' constituting or instantiating practice (Nayak, 2008), and unveil tacit knowledge associated with strategy practices (Rouleau, 2005). Performativity is key here, as well as complex processes underlying practices and studies in a detailed and intricate manner.

Data collection in the Comprehensive research design mostly involves ethnographic observations with people from all levels of the organization (Laine & Vaara, 2007), often including audio and video recordings, and even video-shadowing, as a primary data source

(Jarzabkowski et al., 2013; Gylfe et al., 2016). Multi-modality is emerging as a new way of approaching practices as they unfold. Here the interest is in gathering data that captures the natural interactions of the organizational members, an interest that demands a deep involvement in the field from the researchers. See this example taken from Samra-Fredericks (2005): 'Ethnographies of strategists at-work are extended to include audiorecording their naturally occurring talk-based interactive routines over time/space' (p. 803). As a primary data source we also see researchers engaging in workshops, training, meetings, and other types of involvement close or equal to action research. Some will even ask their research partners to participate in data gathering by collecting data themselves (Nayak, 2008). Interviews, strategy documents, and archival data are used as secondary data sources, providing information both on the situated context (i.e. meetings) or the general context of the study.

Finally, data analysis in the Comprehensive research design will be mainly inductive, and aimed at finding emergent processes that include considering different points of view across organization levels and participants (Jarzabkowski et al., 2013). As in previous research designs described, the analyses involve successive phases of coding and iterative loops with theory, but necessitate special attention to scaling-up from micro-practices to strategy processes. Consider this extract describing the last step of analysis by Jarzabkowski et al. (2013, p. 46):

having analytically distinguished between five artifacts and the practices of using them in strategy work, in a third step we zoomed out from the micro interactions (...) to identify how the situated use of these artifacts shapes the strategizing process. As part of this analysis, we iterated with the literature in order to conceptualize our findings...

We find a very similar analytical process in Balogun, Best, and Lê (2015), although in their case they also looked closely at data fragments to identify the various micro-aspects of the dynamics of materiality and embodied competencies they unveiled in their study.

SECTION 3: REFLECTIONS ON AN EVOLVING RESEARCH FIELD

SAP as a field of research has considerably evolved since its early days. As we have demonstrated above, methodological approaches have become more sophisticated and were expanded and enhanced to respond to various challenges and constraints and to enable a better grasp of the complex intricacies of strategizing. In what follows, we will first discuss the methodological evolutions sketched above in relation to the dimensions of the research design. Interestingly, as much as there has been an evolution on the Who (unit of analysis) and the How (data collection) dimensions of SAP research designs, the What (research strategy) and Why (data analysis) dimensions remain to be strengthened. In other words, we argue that although there has been a *technical* evolution of SAP research with regard to upon whom and how data is collected, there is still a dominant *epistemological* positioning that has not evolved on the matter of addressing social practices (what) and bridging local micro with broader macro issues in data analysis (why). We will articulate our argument around the four methodological conversations that were described above (role of ethnographic approaches, relationship with practitioners, need for innovative approaches, and connecting micro–macro issues).

The types of data collected in SAP research have considerably expanded and in recent instances qualify as ‘multi-modal’ (Aggerholm et al., 2012; Balogun et al., 2015; Jarzabkowski et al., 2015), and in some cases are collected on multiple sites (Smets et al., 2015). Data are broader in nature and scope, covering longer periods of time and incorporating elements like visual material (photo and video), material artifacts, and different types of textual platforms. In contrast to the early days of SAP research, interviews are almost always complemented by other types of data, be it self-reported data, audio recordings, detailed field notes, video

excerpts, or photographs. The modes of data collection are also very different, with more on-site involvement, longer presence in the field, broader scope in sample selection, and the use of approaches like ethnomethodology, shadowing, life-story interviews, focus groups, and archival research.

The criticisms addressed initially on the narrowness of methods, such as interviews to capture the complexity of social practice, have been answered with a wider variety of data and data collection methods. The way this challenge was addressed, if not entirely successful, was considerably stronger over the years. The Who, as a matter of consequence, was also expanded and the diversification of data sources and collection contributed to ‘opening up’ the research to new participants, thus broadening the set of actors involved in strategizing. The main manifestation of that phenomenon was the strong increase in research involving middle managers (e.g. Balogun & Johnson, 2005; Rouleau & Balogun, 2011), but it remained mostly limited to that set of actors (along with consultants) and was rarely expanded to other members of the organization, with the exception of a few studies (Maitlis and Lawrence, 2003; Balogun et al., 2015). Over the years, the Who was broader and more inclusive than the early concerns with the figure of the ‘strategist’. It is clear from our analysis of the evolution of research designs over the years that SAP research has gained in depth on those matters. From a *technical* point of view, therefore, SAP research is undoubtedly richer, subtler, and more sophisticated.

Nevertheless, the issues of agency and situatedness remain questionable. To convey a sense of situated agency, SAP research still relies on a conceptualization of agency that is too focused on the manager and that is still linked to an understanding of the manager as skilled, purposeful, capable, and with clear intentions, not to mention powerful in the sense that he/she holds most of the power for strategizing. Moreover, the nature of the relationship between researchers and

practitioners observed or interviewed has not been redefined as Balogun et al. (2003) had proposed. As discussed above in the methodological conversation on the need for innovative approaches, it is not as much the methodologies themselves that need to be 'new' as the way they are applied with a 'practice lens' and how they innovatively approach strategy practice. So far, the challenge of reconsidering agency and situatedness in SAP remains incompletely addressed since agency is mostly rooted in activity and activity is still the cornerstone of SAP research. The What and Why dimensions of the SAP research *dispositif* therefore remain mainly unchallenged. The issue of capturing practices, although partly addressed by encouraging the use of ethnographic approaches, is still done, even in the Comprehensive design profile, as an objectivist exercise.

The current methodological conversation around the use of ethnographic approaches in SAP is accurately described by Cunliffe (2015), who argues for more subjectivist analyses involving a stronger reflexive positioning and who deplores the dominant 'realist' way of 'telling the tale' (Van Maanen, 1988). Our analysis concurs with her argument that there is a strong concern for model-building, based on data categories, which erodes the richness of that data on many occasions. If we understand the What of research designs as the research roadmap or the research positioning regarding a specific definition of strategy, then we face the critical issue of how strategy is consistently being defined in SAP. Despite the concern with practice and the belief that strategy is a social phenomenon that takes form in what people do, most studies still have an underlying mainstream definition of strategy. Indeed, in most cases and as Phillips and Lawrence (2012) argue, strategy is conceived of as the activities around what is labeled 'strategy' in the organization (strategy meetings, plans, retreats, episodes, etc.), but strategy in action or strategy as practice is broader in that it encompasses everything people understand

as strategic in the organization. It is the *actioning* of what people understand/interpret/absorb/read as being strategy. Strategy in an SAP perspective does not pertain to a *function* of the organization. It is inscribed in a much larger situated context that draws on wider social practices. As long as SAP research *objectifies* and *functionalizes* strategy by only addressing what is verbalized as strategy within organizations, it will miss its non-verbalized, emotional, and profoundly social nature.

Moreover, although Comprehensive designs have demonstrated a deeper concern with the nature of social practices and the intricate weaving of networks of activity, emotion, cognition, discourse, and materiality into social practices within specific institutional settings, the way this has been done, or the Why dimension in the research design, is still, as we have mentioned above, mainly relying on an objectivist ontology. Studies are adorned with sophisticated tables, data displays, multiple order categories, and complex recursive models that unfortunately functionalize, de-contextualize, and objectify these intricate weavings that are claimed in the first place. More subjective, narrative, and interpretive analyses are needed to capture in a subtler way the 'touch and smell' of practice (Nicolini, 2012).

The drive toward categorization and neat data displays that we have observed is in large part the result of an intricate set of institutional constraints ranging from localized or country-specific pressures on academic research (such as the UK's Research Assessment Exercise, for instance, but other countries have similar evaluation processes) for the prevalence of strong 'templates' of qualitative research such as the 'Gioia methodology' (Langley & Abdallah, 2011; Gioia et al., 2013). Indeed, in recent SAP research, the influence of that template can be seen in the exponential use of data structure tables and first and second order categories and concepts in everything from ethnographies to discourse analyses. Data analyses are therefore mainly depicted with a functionalist

undertone that stems from the hegemonic nature of US publication outlets that contribute to the need to develop templates of ‘good research’ and institutionalize them. More subjectivist and reflexive approaches are hence difficult to embrace in the current context if they are doomed to a non-publishable future. Consequently, and as we have argued, technical evolutions in research designs are steady while epistemological ones are very rare. Developing studies with a different epistemological positioning, a different view of practice, ones that would be more subjectivist, closer to vividly conveying the fabric of social life and to its intricate weaving of emotions, language, materiality, and context constitutes, therefore, the next great challenge for the field of SAP.

SAP at the Crossroads: Where Do We Go from Here?

Despite what we deemed technical progress, innovative approaches are yet to be developed consistently in SAP research, specifically in the way data are analyzed and on the way social practice is addressed (the What and Why dimensions). Despite calls for more consistent use of videos and photographs, for instance, the analytical potential attached to their use is still under-developed. Also, Balogun et al. (2014) have argued for ‘connecting’ the study of strategy discourse to socio-material, sensemaking, and power dimensions in order to understand complex social processes. How to do so is the question. Is it possible to analyze data without boxing it up? Are boxes and arrows the only sensemaking tools to convey the complexity of social practice? Can SAP studies liberate themselves from the constraints of data displays and *a posteriori* classifications in multiple order categories? We argue that it is not only possible but also desirable in order to honor the ‘as-practice’ part of SAP. The turn to narrative storytelling, dialog, multi-vocal techniques where multiple researchers

superpose their analyses, as well as emerging concepts such as crystallization in qualitative research (Ellingson, 2009; Vik & Bute, 2009), are possible innovative approaches that could benefit SAP research.

The analytic potential of more subjectivist and reflexive approaches is yet to be explored by SAP researchers, but it needs to be done with the assurance of publication potential in reputable academic outlets. However, the mere existence of that potential would entail a challenging of the current institutional arrangements from the inside. In other words, SAP researchers who are also SAP reviewers have a responsibility to challenge the established templates and push for a renewal in data analysis techniques that would enable a true ‘opening-up’ of SAP research. As reviewers, we should push for more innovative research designs on *all* their dimensions and transform the reviewing process from a gate-keeping exercise to a gate-opening one, embracing bolder analytical moves, subtler conceptualizations of strategy, and more creative writing-up techniques. One way to do so would be to propose the development of Special Issues by legitimate SAP researchers that could be platforms for exploration and innovation. Additionally, new forms of writing ethnographic accounts that are more subjective and reflexive (Ellis & Bochner, 1996), closer to the ‘texture’ of life and practices (Gherardi, 1995), or technically innovative (Smets et al., 2015) are interesting avenues to explore.

CONCLUSION

In this chapter we have shown how SAP research has evolved methodologically in response to the many challenges that it faced and has coalesced around four important current methodological conversations that mirror the four dimensions of the research *dispositif* that we have identified: Research strategy (What), unit of analysis (Who), Data

collection techniques (How), and Data analysis strategies (Why). Based on a recent review of SAP publications between 2002 and 2015, we were able to identify three research design profiles labeled Classical, Expanded, and Comprehensive, which show how SAP research has evolved across time around the four dimensions of research designs. We argue that, despite a clear technical evolution on the Who and How dimensions, work remains to be done to innovate on the What and Why, whose fundamental assumptions are still unchallenged. We advocate a stronger engagement with more subjectivist and reflexive approaches and we call for SAP researchers to take a stand in their quality of reviewers of SAP work and enable an exploration of new methodological territories beyond the templates enclosure.

The Case Study in Management Research: Beyond the Positivist Legacy of Eisenhardt and Yin?

Rebecca Piekkari and Catherine Welch

INTRODUCTION

The case study remains a very popular – if not the most popular – research strategy that qualitative management scholars claim to be using (see e.g. Welch et al., 2013). Yet, as we will argue in this chapter, it is often poorly understood in management disciplines and, when applied, it rarely lives up to the ideals of how it has been defined. Perhaps this is why the case study, despite its indisputable popularity in management, is not well represented in methodological handbooks such as the present one. Numerous definitions of the case study exist: it is regarded as an empirical inquiry (Yin, 2014), a research strategy (Eisenhardt, 1989), a form of reporting (Wolcott, 2002) and even as an ideological commitment to qualitative positivism (Mir, 2011; Moore, 2011). In this chapter, we define the case study as a research strategy that involves more than the choice of method for data collection or analysis (Hartley, 2004). Rather, the case study ‘examines,

through the use of a variety of data sources, a phenomenon in its naturalistic context, with the purpose of “confronting” theory with the empirical world’ (Piekkari et al., 2009, p. 569).

The two most popular methodological authorities on the case study in management remain Kathleen Eisenhardt and Robert K. Yin, both of whom positioned the case study against other qualitative approaches. While now in its fifth edition, Yin’s original version of his book on case studies was published in 1984. Each edition has contained modifications and additional material, but the main thrust of the book is largely unchanged. Eisenhardt’s roadmap for the case study was published in 1989. Her later treatments of the topic (Eisenhardt, 1991; Eisenhardt & Graebner, 2007) have rearticulated and defended this vision. This means that the two methodological authorities on case research in management date back to the 1980s. While the qualitative methodological community has been extremely vibrant since

the 1980s (for evidence, see e.g. Symon & Cassell, 2012), this intellectual ferment has seemingly passed the case study by. Instead, in management the case study clings stubbornly to the 1980s and is in danger of being labelled anachronistic and outdated. Over time, Eisenhardt and Yin's guidelines have become solidified into rigid templates that reviewers and examiners enforce as the 'only way to conduct case studies right'.

In this chapter, we revisit the nature of this 1980s case study, which we have elsewhere termed the 'modernist' case study (Welch et al., 2013) and which represents a form of 'qualitative positivism' (Piekkari & Welch, 2011). By referring to 'qualitative positivism', we follow the usage proposed by Prasad and Prasad (2002). That is, qualitative positivism adopts qualitative methods and methodologies, but accompanies them with positivistic assumptions about the nature of social reality (ontology) and the production of knowledge about this reality (epistemology). To be more specific about these (often unstated) commitments, '[r]eality is assumed to be concrete, separate from the researcher, and cognisable through the use of so-called objective methods of data collection' (Prasad & Prasad, 2002, p. 6). These assumptions are rejected by interpretive, critical and 'post' traditions (for a review of non-positivist research traditions, see Prasad, 2005 and Duberley et al., 2012). The crucial insight of the term 'qualitative positivism' lies in breaking the commonly held dichotomy between positivistic quantitative research and interpretive qualitative research.

While the strength of the positivist case study was its ability to defend qualitative research to the mainstream, it has also attracted criticism, particularly from fellow qualitative researchers both in and outside of management. Yet this criticism has often been sidelined, which is why we wish to review it in this chapter. We then range beyond the boundaries of the management discipline to consider key developments in case study methodology in other fields of

social sciences. There, we find a very different evolution. Rather than being frozen in the 1980s, the case study has enjoyed something of a renaissance. We identify some key insights from these developments, which we argue can form the basis for a reassessment of the case study in management. We conclude by offering some more recent texts on the case study that can be a useful introduction for those using the case study for the first time, those seeking to refresh their understanding of their approach, or those teaching or supervising MSc and PhD students. To preview our answer to the question we pose in our title to this chapter, we conclude that while the case study in management has not yet gone beyond Eisenhardt and Yin, there are many resources available to do so.

THE POSITIVIST CASE STUDY

In this section, we will first summarise the key features of the positivist case study: its philosophical underpinnings, its view of the case study as a 'bridge' to generalisations, its distinctiveness in relation to other qualitative approaches and its preference for multiple rather than single case studies. Moreover, we will discuss how the positivist case study provides concrete recommendations and procedures on how to design and implement a case study to arrive at tangible results. Throughout our discussion we will contrast and compare Eisenhardt's and Yin's views on the case study. Although these key methodological authorities have a lot in common, their opinions and emphases are by no means identical. This often goes unnoticed in published research accounts, because qualitative management researchers tend to refer to Yin and Eisenhardt jointly as if they had identical views.

We will start by placing the positivist case study in its appropriate temporal context. In 1979, *Administrative Science Quarterly* published a landmark special issue edited

by John van Maanen, titled 'Reclaiming Qualitative Methods for Organizational Research'. Amongst other contributions, it featured an article by Matthew Miles which in its very title denoted qualitative data an 'attractive nuisance'. Miles criticises the grounded theory approach to qualitative fieldwork and the lack of established approaches to data analysis. He argues that, at best, 'analysis of qualitative data is a mysterious, half-formulated art' (Miles, 1979, p. 593) and poses a provocative question: 'How can we be sure that an "early", "undeniable", "serendipitous" finding is not, in fact, *wrong*?' (Miles, 1979, p. 590). Yin (1981, p. 58) followed this up with a response. His concern was that Miles's 'disarmingly candid rendition of the perils of qualitative analysis ... leaves the reader with a sense that qualitative analysis – and its implicit companion, the case study – cannot yet be regarded a rational, much less scientific venture'.

Yin's aim in his rejoinder, as well as his 1984 book, therefore became to resolve the case study 'crisis' by providing systematic, rigorous and repeatable steps that researchers can take not just to ensure, but also to demonstrate to others, the scientific worth of the case study as a research strategy. Part of Yin's argument was that the quality of a case study (and of qualitative research more generally) can meet the same standards by which quantitative research is judged: internal validity, external validity, construct validity and reliability (Cook & Campbell, 1979). The only difference is that these quality criteria are assured using procedures that are distinct from those in a quantitative study. Yin provides a catalogue of these procedures, such as triangulation, establishing a chain of evidence and providing an audit trail. Using the procedures he outlines, a researcher can achieve the systematic rigour required to demonstrate a scientific contribution. Yin did not overtly declare his philosophical position in the early editions of his book. In the latest edition, however, he makes a brief confession: '[m]uch of case study research as it is

described in this book appears to be oriented toward a realist perspective, which assumes the existence of a single reality that is independent of the observer' (Yin, 2014, p. 17). In keeping with his training as an experimental psychologist, Yin derives inspiration from traditional experimental techniques.

Eisenhardt's (1989) roadmap draws very heavily on Yin's 'rational' and pragmatic design approach to the case study. She imports many of the concepts that he introduced in his book such as pattern-matching, theoretical sampling and replication logic (literal and theoretical replication) used in multiple experiments (Yin, 2014, p. 57; 2009, pp. 53–4). Eisenhardt remains true to the ideal of the positivist quest for generalisability? – and, unlike Yin, is explicit in this commitment. Toward the end of her paper, she clarifies that 'the process described here adopts a positivist view of research. That is, the process is directed toward the development of testable hypotheses and theory, which are generalisable across settings' (Eisenhardt, 1989, p. 546). In this context, she views the role of the case study as an instrument or 'bridge' to develop hypotheses that can subsequently be tested through the statistical analysis of large-scale surveys (Figure 21.1). The role of the case study is to act as the handmaiden to this endeavour – as an intermediary step in the quest for generalisations, rather than an end in itself. This stance was even more accentuated in her later article with Graebner (Eisenhardt and Graebner, 2007, p. 25):

The case study is one of the best (if not the best) of the bridges from rich qualitative evidence to mainstream deductive research. Its emphasis on developing constructs, measures and testable propositions makes inductive research consistent with the emphasis on testable theory within mainstream deductive research. In fact, inductive and deductive logics are mirrors of one another, with inductive theory building from cases producing new theory from data and deductive theory testing completing the cycle by using data to test theory.

Eisenhardt's cyclical model of the theorising process, as depicted in Figure 21.1, is strongly

Figure 21.1 Eisenhardt's positivist view of the case study

Source: Piekkari & Welch (2011, p. 8)

positivist in other ways than the search for generalisation. It also demonstrates faith in the possibility of generating theory-free, unbiased observations, allowing the development of theory that 'closely mirrors reality' (Eisenhardt, 1989, p. 547). In the search for testable propositions, she favours the specification of correlational relationships between constructs, avoiding any reference to causality. This is despite the fact that, as she notes, qualitative data can provide insight into 'why or why not' particular relationships occur.

Ultimately, the positivist approach outlined above is about how to design and implement a case study. Eisenhardt (1989) provides a practical roadmap for theory-building from case studies and Yin devotes a considerable part of his book to research design, which he defines as '*a logical plan for getting from here to there*' (Yin, 2014, p. 28, emphasis original; see also Yin, 2009, p. 26). For Yin, the research design is a 'blueprint' that determines the questions to be asked, the data to be collected and the appropriate analytical

techniques (2014, p. 29; 2009, p. 26). This blueprint is essential because it 'helps avoid the situation in which the evidence does not address the initial research questions' (2014, p. 29; 2009, p. 27). If the research questions change and 'such unsuspected slippage' does occur, the research needs to 'start over again, with a new research design' (2014, p. 55; 2009, p. 52). Yin regards shift in research design as a weakness which should be avoided (although later editions of his book are less strident on this point than he was initially). Eisenhardt (1989) is not as strict in her view on flexibility in research design, recognising that changes to the design may be desirable to pursue 'a new line of thinking [that] emerges during the research'. However, she cautions that this flexibility 'is not a license to be unsystematic'; rather, it should be seen as 'controlled opportunism' (Eisenhardt, 1989, p. 539). Like Yin, her concern is to demonstrate the systematic and repeatable steps that case researchers can take to ensure the rigour of their studies.

COMPARING THE CASE STUDY À LA EISENHARDT VERSUS YIN

Eisenhardt diverges from Yin in three important respects that have shaped the way the case study tradition has developed in management disciplines. Unlike Yin, she prefers theory-building case studies, her template draws on grounded theory, and she believes in the superiority of multiple rather than single case study designs in producing robust theory. These differences between the two methodological authorities will now be discussed as they are, too often, missed by those who cite them. The differences are worth highlighting because they show that the case study tradition is less uniform than it is often presented: even the two authorities that are typically used in tandem, in fact provide alternative possibilities in terms of how the case study might be used.

The first difference lies in Eisenhardt's strong preference for 'theory-building' case studies that induce theory from data. She explains that 'theory-building research is begun as close as possible to the ideal of no theory under consideration and no hypotheses to test' (Eisenhardt, 1989, p. 536). This, however, leads her into difficulties as she seeks to reconcile this ideal with the need to use precise measures in fieldwork. She concedes that '[a] priori specification of constructs ... is valuable because it permits researchers to measure constructs more accurately' (p. 536). She seems to struggle to explain how case study researchers should meet the simultaneous requirement of entering the field with an open mind, 'tabula rasa', yet at the same time be guided by theory.

Unlike Eisenhardt, Yin does not limit his discussion of the role of the case study to theory-building. As is well known, Yin identifies three purposes for the case study, only one of which is the inductive (or in his terminology, 'exploratory') case study. The others are the descriptive case study, to which Yin pays very little attention, and the explanatory

case study. What is less well known is that it is, in fact, the explanatory case study that is his main interest. In management, however, this has been obscured by the popularity of the exploratory case study. In Yin's view, the explanatory case study is a superior vehicle for theoretical insight – in particular, for the isolation of causal relationships. Such case studies can be used for a variety of theory-testing purposes (Welch et al., 2011), such as to test propositions, adjudicate amongst rival explanations, revise existing theories and establish causal relationships. The explanatory case study can be likened to a 'natural experiment' (Lee, 1989). As such, its strength lies in its high degree of internal validity, so long as it is properly designed and carried out. The proper application of analytical techniques enables the researcher to converge on a set of causal relationships, isolating them from the broader context of the case. Other cases can then be investigated to establish if the causal relationships occur as predicted, just as multiple experiments are used to refine and test theory. Perhaps due to his background as an experimental psychologist, Yin is therefore comfortable with the goal of establishing causal relationships.

The second contrast between Eisenhardt and Yin is the former's close identification with grounded theory in promoting her inductive theory-building case study. Eisenhardt distances herself from other qualitative traditions, such as ethnography, that favour 'rich, complex description' and avoid generalisability and universal claims (Eisenhardt, 1989, p. 546). Instead she aligns herself with the original version of grounded theory proposed by Glaser and Strauss (1967), importing key procedures such as theoretical sampling, theoretical saturation and joint collection and coding of data. The influence of grounded theory on case research has only been reinforced by the release of software packages such as NVivo, to which qualitative researchers often refer in demonstrating the rigour of their approach. In contrast, Yin has steadfastly distinguished the case study from the grounded

theory tradition. He advocates that the case study should be theory-driven from the start – as befits a natural experiment. Accordingly, he explains that the ‘role of theory development, prior to the conduct of any data collection, is one point of difference between case studies and related methods such as ... “grounded theory”’ (Yin, 2014, p. 37; Yin, 2009, p. 35). In this regard, Yin favours a more deductive mode of theorising for the case study. Many of the procedures that Yin (2009) advocates – such as replication strategy, pattern-matching and time-series analysis – are adaptations of experimental techniques, not of grounded theory. Similarly, his reply to concerns about the case study’s generalisability is to argue that like the experiment, the case study generalises to theoretical propositions and not to populations (Yin, 2009). Lack of statistical generalisability does not preclude case studies from having a strong explanatory contribution to make.

The third difference between Eisenhardt and Yin stems from the role granted to the single case. Eisenhardt has remained a strong advocate of the multiple case study and its superior potential in theory-building. In their joint article, Eisenhardt and Graebner (2007) are even more critical of the single case study. They affirm that ‘theory building from multiple cases typically yields more robust, generalisable and testable theory than single case research’ (p. 27). Yin (2014, p. 64) agrees that in general, the multiple case study is more robust and ‘having at least two cases should be your goal’. Nonetheless, he does see a role for the single case study. He specifies the single case study is particularly suited to the following purposes: to test a well-formulated theory in a critical case, to uncover an extreme, unusual or common case, to investigate a revelatory case, which has previously been inaccessible for research, or to follow a longitudinal case (Yin, 2014, pp. 51–3; 2009, pp. 47–9).

To sum up, Eisenhardt’s 1989 ‘roadmap’ for the inductive, exploratory theory-building case study has been extremely influential in

management disciplines and legitimised the use of qualitative research methods more generally. However, its popularity has had the consequence of delegitimising the explanatory power of the case study that Yin advocates and narrowing its role. At the same time, Eisenhardt has also de-emphasised context by treating it only as the first descriptive step before data analysis. This puts her at odds with other qualitative research traditions. Accordingly, we now turn to the criticisms that the positivist approach to the case study has generated amongst qualitative researchers, both within management and outside it.

CRITICISMS OF THE POSITIVIST CASE STUDY

Eisenhardt’s and Yin’s prescriptions for the case study have attracted criticism, especially from constructivist qualitative researchers who worry that these authors have surrendered too much to the positivist mainstream. The critics vocally defend the depth of the single case study design and its ability to provide a particularised understanding of the case itself. They hark back to earlier case study traditions, which emphasise rich contextual insight and the subjective experiences and ‘emic’ meanings of the research. In this section, we profile the arguments from three critics, all of whom point to the ways in which Eisenhardt or Yin cast aside features of the case study that others consider to be strengths.

One of the earliest critiques was a rejoinder published in the *Academy of Management Review (AMR)* by Dyer and Wilkins (1991, p. 613), who brand Eisenhardt’s roadmap a ‘hybrid form of case research’ because ‘it includes many of the attributes of hypothesis-testing research’. PhD students in courses we have taught have typically already read Eisenhardt’s paper, but few are familiar with the debate it sparked in the pages of *AMR*. Dyer and Wilkins mount a defence of the

single case study, which they argue is the form taken in the 'classics' in the management field. These seminal works had the influence and longevity that they did precisely because of, not in spite of, the rich contextual understanding that they were able to achieve from their in-depth knowledge of a single setting. The route to 'paradigm-challenging' or 'paradigm-creating' insight is precisely through this depth of understanding. For Dyer and Wilkins, the distinction between the classic case study and Eisenhardt's template is not fundamentally a paradigmatic one. They point out that these earlier generations of case researchers were not just interpretivists, but also included those with positivist commitments. What distinguishes these case researchers is, rather, their commitment to penetrating the 'deep structure' of social behaviour, something that is only possible with extensive and in-depth knowledge of the case setting.

Dyer and Wilkins's concern is that Eisenhardt's template for the case study sacrifices precisely this depth, trading off 'contextual insight' for cross-organisational comparisons (1991, p. 614). They argue that Eisenhardt's focus on constructs stripped of their context results in 'thin' explanations that do not penetrate the 'deep structure' of social dynamics. Her advice to pre-specify constructs of interest prior to fieldwork also reduces the likelihood that the researcher will be open to surprises, making it less likely that the study will go beyond the bounds of existing theory, and resulting only in incremental advances. To illustrate these points, Dyer and Wilkins analyse Eisenhardt and Bourgeois' 1988 paper, which Eisenhardt (1989) uses as a model for her roadmap. Eisenhardt and Bourgeois study how politics affect strategic decision-making processes of eight firms in the 'high-velocity' microcomputer industry. Dyer and Wilkins criticise the central construct in their paper, political behaviour, as being narrowly defined – as Eisenhardt and Bourgeois themselves acknowledge – and abstracted away from the

context. Consequently, as readers we do not understand how and why political behaviour was generated from the contextual conditions in individual case companies. There is also no indication of the meaning that the focal decision being studied in each case held for participants – whether they regarded it as a strategic decision, why and in what way. The intention, as Eisenhardt and Bourgeois point out, is to make the constructs and situations across firms comparable by focusing on similarities between them. However, Dyer and Wilkins question what is then left out: 'How much deep structure have we seen if we only look at what is common about politics across organizations? Wouldn't the differences in how politics occur across organizations be potentially interesting and challenging to current conceptions?' (Dyer & Wilkins, 1991, p. 615). Leaving out contextual understanding from a study therefore potentially leads to a loss of theoretical insight.

While Eisenhardt's influence has not extended beyond the management field, Yin's version of the case study has received some attention from sociologists. In an important study that tracks the evolution of the case study methodology from its early use by the Chicago School of sociologists, Platt (1992) designates Yin's book as something of a watershed. As she points out, Yin was successful in regaining scientific respectability for the case study, but at the price of surrendering some of its traditional strengths. The 'classic' case study of the interwar period was not directed from the outset by a particular theoretical perspective; it was concerned with the subjective experiences and meanings of participants; it valorised depth and richness of data, which was typically obtained through participant observation; and it preferred the in-depth single case study over the multiple case design. All these features have been downplayed or even overturned in Yin's version.

Another critic of the type of case study advocated by Yin, writing at about the same time as Platt, was the educational researcher

Robert Stake (1994). In Stake's view, scholars such as Yin prioritise the quest for possible generalisations (i.e. an instrumental approach) over particularised understanding of 'the case itself' (i.e. an intrinsic approach). For Stake, a holistic understanding of the case must always come first – before (and, depending on the case researcher's purpose, maybe even in the place of) any theory-building efforts. He regards rich description of the case as a goal in itself. Moreover, Stake emphasises the limits of human knowledge. While the case researcher enters the field and selects a case with certain expectations, these are sure to be dashed. He cautions that '[o]ne cannot know at the outset what the issues, the perceptions, the theory will be' (Stake, 1994, p. 240). Nor is it ever possible to understand a case fully or objectively – the complexity of the social world will always exceed that of individual observers and confound simplistic causal explanations. While it is important to try not to misinterpret the local meanings in the case site, it is not possible for a case researcher to capture them without injecting his or her own judgements. Moreover, it is not the case researcher who has the last word in interpreting the case – it is the reader who ultimately decides how the case is received. In the end, the reader is not provided with the truth; the knowledge claims that a researcher can make are much more modest. At best, reading a case represents second-hand 'vicarious experience', from which the reader can draw his or her insights. Given Stake's insistence on the complexity and fundamental unknowability of the social world, it is perhaps not surprising that management researchers have found his advice on case studies less attractive than the concrete procedures and deliverable results promised by Eisenhardt and Yin.

Stake (1995, p. 100) explicitly characterises his position as constructivist: 'No aspects of knowledge are purely of the external world, devoid of human construction'. This means that he provides different recommendations for conducting a case study to

those advocated by Eisenhardt and Yin. His prescriptions for the case study reflect this paradigmatic commitment. Case selection is not guided by theory; the most important consideration is rather to choose a case that provides an opportunity for learning and for extending one's understanding. He endorses the need for validity and for triangulation of one's interpretations and observations, but cautions against the expectation that triangulation can achieve repeatability of these interpretations and observations. Rather, triangulation is important because it can 'clarify meaning by identifying different ways the phenomenon is being seen' (Stake, 1994, p. 241). He is also sceptical about any form of comparisons, except for comparisons that are made within the boundaries of the case itself such as between departments, temporal time periods or locations. Comparisons across cases inevitably lead to the holism of the case being reduced to the few dimensions along which the case is being compared. Similarly, the quest for causality is an over-simplification of the confluence and inter-relatedness of events that give rise to particular situations.

To conclude, Platt and Stake converge on a very similar set of concerns as do Dyer and Wilkins in their rejoinder to Eisenhardt. They point out that the richness and contextualisation of the case study are a source of theoretical insight. All three critics draw on alternative traditions from which both Eisenhardt and Yin actively distance themselves. However, these critics have made little impression on management researchers. More recently, they have been joined by other voices, drawing on another set of traditions, who have been active in defending the distinctive strengths of the case study.

THE RENAISSANCE OF THE CASE STUDY?

Our (rather optimistic) subheading of a 'renaissance' (for similar optimism, see

Ketokivi & Choi, 2014) reflects a renewed interest in, and a reassessment of, the potential of the case study as a research strategy. Authors with whom we associate this development, notably Charles Ragin, tackle some of the most persistent assumptions and dichotomies that have characterised the use of the case study in management disciplines. In this section, we will profile three insights in particular that we regard as central to the re-evaluation of the case study. The first is the meaningfulness of producing correlational propositions for deductive hypothesis testing and the purpose of arriving at generalisable knowledge; the second, the traditional dichotomy between induction and deduction as approaches to relating theory to data and the distinction between theory-building and theory-testing purposes of the case study. In this way, the new generation of case researchers challenge the notion that case studies are best suited to inductive, exploratory theory-building (as per Eisenhardt, 1989) and argue for an expanded role of the case study in theorising processes. The third consists of the exploration of alternatives to the positivism–constructivism dichotomy. In particular, the turn to critical realism represents a search for how case studies can produce meaningful explanations ‘without laws’, for which context is an essential component.

The Explanatory Strength of Context

One of the most important figures in driving a reassessment of the case study has been the sociologist Charles Ragin, who began writing about case research in the 1980s (see in particular Ragin, 1987). Ragin is gaining recognition in management research as the developer of Qualitative Comparative Analysis (QCA), but fascination with QCA as an analytical tool (with accompanying software) can obscure an appreciation of the premises on which it is based (see Fiss et al., 2013, for an exception). Ragin (1997) argues that the key

difference between the case study and other ‘variable-oriented’ methodologies (whether quantitative or qualitative) is the approach to analysis. In a ‘case-oriented’ analysis, the case is analysed holistically – as a specific combination of conditions producing an outcome – rather than extracting variables from the rest of the case, as would occur when using an experimental design. In the social world, ‘variables’ are not independent, they are conjunctural; that is, their effects depend on the other variables that are present at a particular point in time. A single variable may produce a particular outcome in one case but not in another, depending on the causal conditions. Different combinations of conditions may produce the same or a similar outcome (i.e. equifinality), and the same or similar causes can produce diverse outcomes (multifinality). Understanding why particular outcomes are produced therefore requires taking the full set of relevant conditions into account.

To provide an example (Ragin, 1997): understanding the effect of X on Y across four different cases cannot be achieved by extracting X and Y and conducting a cross-case analysis on the relationship between them. Rather, the relationship between X and Y can only be understood by examining the combinations of conditions in each case. For Ragin, set theory rather than probability theory is the appropriate mathematical logic for explaining causality in the social world. To continue with the example of four cases, the case researcher may conclude that X causes Y only if the conditions A, B and C are also present in the case. If any one of these conditions is absent, at the same time as X is absent, then Z causes Y. In Boolean terms, this can be expressed as:

$$Y = ABCX + ABcXZ + AbCzX + aBCxZ$$

In the equation, the upper case letters denote conditions that are present and lower case letters their absence; addition indicates alternative causal paths (i.e. equifinality) and multiplication the combination of conditions (i.e. causal conjunctures).

The differences between Ragin's case-oriented approach and Eisenhardt's are profound. Rather than extracting away from the context of the case in the analysis in order to propose covariational relationships that can be supported by evidence from multiple cases, the context becomes essential to explanation. That is, the relationship between X and Y cannot be understood without factoring in the other causal conditions which are present. This also means recognising that generalisations will always be limited in scope. While there are certain combinations of conditions that recur relatively frequently, due to the structured nature of the social world, the variations also need to be accounted for. Elsewhere, we have termed this approach to case studies 'contextualised explanation' (Welch et al., 2011).

Unlike Stake (1994), Ragin (2009) is a realist rather than a constructivist. He has not questioned the ability of researchers to be able to view the world objectively, although he does recognise that reality is 'only partially and indirectly accessible through social science' (Ragin, 2009, p. 523). He is agnostic when it comes to the number of cases: while single or small-n case studies are necessary to provide in-depth understanding of causal conditions, he has also demonstrated how case-oriented analysis can be used on large data sets (Ragin, 2009). He is very comfortable with the pursuit of causal explanation, but he insists on a complex view of causality. However, Ragin's commitment to context and to preserving the holism of the case in the analysis does mean that his case-oriented approach shares some important commonalities with Stake's version of the case study. Like Stake, he recognises that it is the holism of the case study that is its distinguishing feature – and its enduring strength.

Abductive Linking of Theory and Data

Eisenhardt's model of knowledge production in Figure 21.1 relies on traditional notions of

induction/theory-building and deduction/theory-testing, as well as the strict separation between theory and observation. Due to the popularisation of the concept of abduction, these dichotomies have been challenged. The process of abductive inference is triggered by a surprising observation that we make. It is surprising because our existing theoretical frames and preconceptions do not seem to offer an adequate explanation for it. Abduction is the process of providing a theoretical explanation for this empirical puzzle. At its best, finding a solution to the puzzle may enable us to construct new theories and concepts. According to this model of inquiry, it is precisely our existing theories and conceptualisations that enable us to be surprised, and to seek an explanation for the observations that do not fit:

As a foundation for inquiry, abduction begins with an unmet expectation and works backward to invent a plausible world or a theory that would make surprise meaningful ... abduction is a continuous process, taking place in all phases of the research process ... What makes for interesting scholarly work is the discontinuity of some (but not all) of the theoretical assumptions of the researcher and the research audience and some (but not all) of the discovered and claimed facts of the matter. (Van Maanen et al., 2007, p. 1149)

Dubois and Gadde (2002, p. 557) describe the abductive approach as a process that often leads to redirecting the study and generating 'a new view of the phenomenon itself'. They emphasise that an abductive approach is not a mix between inductive and deductive, nor is it the same as iteration. They point out that:

[o]ne major difference, as compared with both deductive and inductive studies, is the role of the framework. In studies relying on abduction, the original framework is successively modified, partly as a result of unanticipated empirical findings, but also of theoretical insights gained during the process. (Dubois & Gadde, 2002, p. 559)

While inductivist accounts (such as those found in Eisenhardt) insist on theory-free observation, the abductive process

emphasises the importance of the theoretical starting point. Being able to foster and capitalise on surprises requires an in-depth understanding of existing theories. Prior to entering the field, we need to be familiar with diverse theoretical lenses (Tavory & Timmermans, 2014). This provides us with multiple theoretical resources that allow us to see more than if our observations were guided only by a single theory, to see the limits of existing explanations and to provide us with the theoretical resources for novel explanations.

In a recent reflection piece, Dubois and Gadde (2014, p. 1283) further reinforce the differences between the ‘abductive approach’ and what they term the ‘linear school’ – to which Eisenhardt and Yin belong:

The main difference between the two approaches is their perspective on thickness and deep-probing analysis. Here, we agree with Pentland (1999) ... that the most critical challenge in theorizing is ‘how to move away from surface structure to deep structure’ ... The movement toward deep structures is problematic to achieve in linear and replicative research where research issues, frameworks and case boundaries are formulated at the outset of the study. Discovery of deep structures is more likely to occur in the continuous movements back and forth, involving matching and redirection as in systematic combining and other approaches aiming at context-specific explanations.

The abductive approach cherishes the flexibility of the research design and views redirections of the case study as a source of theoretical insight and learning. This stands in sharp contrast to Yin who, as we have seen, considers the research design as a ‘blueprint’ and for whom deviations from the intended design come only at a high price.

New Philosophical Lenses

In the search for ‘deep structures’, case researchers have been turning to alternative paradigmatic positions. One position that has attracted interest is that of critical realism, a worldview based on the philosophical

writings of Roy Bhaskar. Bhaskar argues that the forms of knowledge production advocated in both positivist and social constructivist traditions constrain our ability to truly understand and explain social phenomena, and thus inhibit the quality of our scientific effort. Bhaskar argues that not only observable facts, but also intangible forces such as false beliefs and illusions, can be causally efficacious and should be included in our explanations. This quest for causality, for discovering and understanding why things are the way they are, does not promise better predictions of the future, given that such predictions are not possible in the open system that is the social world. However, it does promise to be emancipatory, as it exposes false or incomplete understandings and replaces them with better understandings that will inform future action. In recent years, a number of management researchers have sought to articulate the implications of critical realism for social research, including the case study (e.g. Edwards et al., 2014).

Its search for causal explanations – for penetrating the empirical surface to deep structures – has made critical realism attractive to researchers seeking alternatives to the positivist case study. The search for causal explanation, rather than generalisable patterns, necessarily moves beyond what can be observed to why the observed events have occurred. The fact that, in a majority of cases, A leads to B does not explain *why* A leads to B, nor does it explain why this happens in a majority of, but not in all, cases. To explain why there is a correlation between A and B in certain contexts but not in others triggers a search for plausible explanations. This search for plausible explanations – for the ‘why’ that plays no more than a background role in Eisenhardt’s template – calls for the acknowledgement of both visible and unobservable forces (e.g. illusions, ideas, desires), as well as context, as important explanatory factors of the world around us. The search for causes requires an ‘intensive’ case study (Sayer, 1992) that can penetrate beyond surface-level

empirical patterns. That is, rich detail is necessary in order to establish a plausible causal explanation.

Critical realism also acknowledges the fallibility of the human observer, who cannot directly see all the causal mechanisms at work. In this way, it acknowledges the interpretive dilemmas recognised by constructivists such as Stake. Moreover, while a critical realist maintains a commitment to causal explanations, the conception of causality is not the over-simplified linear kind dismissed by Stake. Causality therefore takes on new meaning, rather than the regularity model favoured by the positivist account. There are consequently more intersections between various critics of the positivist case study than first appears.

AN ALTERNATIVE STARTING POINT

So, for those seeking an introduction to the case study reflecting these new insights, where can they turn, if it is not to Eisenhardt or Yin? In a slim volume, Thomas and Myers (2015) provide a useful reflection of recent thinking about the case study that can be used as a yardstick for measuring how much methodological thinking has changed since the 1980s (see also Thomas, 2011). They explain that they chose the title of the book because they wanted to dissect the ‘vital organs’ of the case study ‘and how they work together’ (p. 1). They identify the core strength and distinctiveness of the case study as tackling the complexity of the social world by dealing with phenomena holistically. That is to say, the case study road to theory development lies in understanding parts in relation to the whole, not in breaking the whole into a set of parts. Understanding in the face of the complexity and unpredictability of the social world involves questioning and probing, tracing the sequence of events, understanding the particular and comparing the case to other situations by

using techniques such as analogies and counterfactuals. Above all, it is about abduction rather than induction: of solving empirical puzzles.

Unlike Eisenhardt or Yin, Thomas and Myers (2015) do not accept that the objective of the case study – or the social sciences more broadly – should be generalisation, or that generalisation is the only valid form of scientific knowledge. Instead, they follow Bent Flyvbjerg (2001) by arguing that social science is about knowledge gained through experience (*phronesis*): knowledge which is about, and which is gained from, a particular context and transferred to other contexts. Social knowledge is inherently context-bound, so the scope for generalities about the social world is inherently limited. They therefore provide a very different justification for the case study than Eisenhardt (and those who follow her approach), who justify the case study in terms of its role in generating context-free knowledge.

CONCLUSION

In this chapter, we have mapped the key developments of the case study in management disciplines since the 1980s, when Eisenhardt and Yin published their influential methodological texts. We believe that it is very exciting to be a qualitative case researcher today, given how the case study is currently being revived and rediscovered. Over the past few years, a large number of new methodological articles and books (such as this one) have been published that seek to re-evaluate and extend the potential of the case study. Moreover, journals in a variety of disciplines are actively inviting scholars to engage in methodological debates through dedicated sections (e.g. *British Journal of Management*, *Industrial Marketing Management* and the *European Management Review*) and special issues (e.g. *Journal of International Business Studies*).

Since the 1980s, new generations of scholars have revisited the case study and provided us with the intellectual resources, concepts and approaches necessary to apply the case study in keeping with the way in which it is defined: the in-depth investigation of a phenomenon in its context. Their contributions allow us to rethink existing dichotomies – such as positivism versus constructionism, induction versus deduction, generalities versus particularities and qualitative versus quantitative – that are so persistent and hard to change. We need to replace these dichotomies with a new mindset and vocabulary, such as case-oriented analysis, abduction, deep structures and unobservables.

Rethinking the case study can make it a much more powerful, and more diverse, methodological approach. The reward for moving beyond the positivist legacy of Eisenhardt and Yin may well be more innovative theory, developed to explain surprises encountered in the field and going beyond empirical patterns to the causes underlying them. The recent literature on the case study that we have reviewed in this chapter very much values and encourages the unforeseen findings that we make in the course of our research, rather than fearing these insights as a breach of the systematic blueprint required to ensure rigour. If the next edition of this *Handbook* devotes an entire section to the case study, we will know that the renaissance of the case study is truly underway in the management field.

PART III

The Researcher

This page intentionally left blank

Achieving Critical Distance

Simon Hayward and Catherine Cassell

INTRODUCTION

The role of the researcher and their impact upon knowledge production has long been an area of interest within business and management research traditions and particularly those informed by qualitative approaches (Cassell & Symon, 1994). As qualitative researchers we see ourselves as an integral part of the management research world we study and will therefore have an impact upon that world and the phenomena we are interested in. Qualitative researchers in the field have explored the challenges this generates from a range of perspectives. Examples include traditions in which the researcher's role is actively accounted for, such as action research and ethnography (Cassell & Johnson, 2006; Van Maanen, 2011), as well as encouraging researchers to critique and understand their role and impact through reflexive practices (Johnson & Duberley, 2003). In this chapter we explore some of the issues facing researchers in the management

and organisation field in maintaining a critical distance within the research process in situations where getting close to the subject can provide deeper and richer data and subsequent insight into management practice. The challenge here is that we want our research outcomes to be trustworthy, so that other academics and practitioners can use them with confidence. However, there are situations where distance can be a challenge, for example when gaining access to research opportunities through known contacts; when interviewing the same people repeatedly in the case of longitudinal research so that relationships develop over time; when the researcher is a member of or a consultant to the research organisation; or when the researcher is sponsored by a senior stakeholder in the organisation.

In addressing issues of an appropriate or critical distance we recognise that the extent to which this can be seen as problematic relates to the philosophical assumptions underpinning the research. From a positivist

perspective, for example, the assumption is that the researcher is an objective neutral who will have no impact on the research process, whereas the notion of distance, or maintaining some distance, may be meaningless in other traditions, such as social constructionism for example, where separating researcher from the researched contradicts the whole notion of the co-production of knowledge. We also recognise that other chapters in this book, for example the one on reflexivity (Chapter 23), will also provide insights into this issue.

In what follows we question how critical distance can be achieved. We start by defining what we mean by critical distance and why it is important. We then suggest that an understanding of critical distance and the choices that researchers face at different points of the research process both require an understanding of three key features of the research endeavour: philosophical perspective, context and relationships. We explore these three areas and illustrate the different choices available to the researcher by using examples from our own research practice. We then discuss some of the tools and techniques that can facilitate the achievement of critical distance before making some concluding comments.

CRITICAL DISTANCE

In using the term critical distance, we are assuming that there is some separation between the researcher and the researched and that that separation has a critical purpose. Here we are using the term critical in two ways: first, meaning something of importance and second, as involving some kind of reflection. However, our contention is that the researcher and the researched can never be completely separate, therefore understanding separation and distance within the research process is something that needs to be managed.

Why is critical distance worthy of discussion? First, as researchers we are

influencing the research in some way by our very involvement. Our actions of observation, conducting interviews, and so on, have an influence on the research situation. As Chau and Witcher (2005: 351) suggest, the proximity of researchers and practitioners is influential: 'In general, the very fact of closeness means that a relationship has a power of its own', so researchers are active participants in creating what they observe. In this way we are in the process of co-constructing research data. Secondly, as researchers we are likely to experience a subjective response in the data gathering process, which is essentially a human interaction. Organisations are human systems, and the management of these organisations is therefore an act of human interaction, and the act of research into organisations and management also involves human interaction between the researcher and the researched. It is important to reflect upon our responses and the consequences of them for how we make sense of our research data.

In what can become a multiplicity of interactions, the researcher's ability to retain a degree of critical distance is, we would argue, a useful requirement for the trustworthiness of their research findings (Lincoln & Guba, 1989). There is also considerable value in accepting and engaging with the subjectivity involved, because it can help provide us as researchers with rich data and a more nuanced sense of meaning. Flyvbjerg (2006) captures this well in his discussion of case study research. When reviewing the 'summarizing and generalization' of scientific research he quotes Nietzsche: "Above all," Nietzsche said about doing science, "one should not wish to divest existence of its rich ambiguity" (Flyvbjerg, 2006: 219). Maintaining critical distance is a way to avoid the risk of divesting existence in this way whilst retaining research integrity. By exploring and making sense of the researcher's role we avoid the risk of losing such rich ambiguity.

A helpful way to categorise the dynamics between the researcher and the researched in

terms of identity and role is provided by the contribution of Cunliffe and Karunanayake (2013: 365), who state that ‘data collection is a human activity in which relationships emerge that may influence research in significant ways’. They describe four hyphen-spaces in which we conduct our research, with particular emphasis on ethnography but applicable, we believe, in a wider management research context. They describe the hyphen-spaces as ‘insiderness-outsiderness’, ‘sameness-difference’, ‘engagement-distance’, and ‘political activism–active neutrality’ (Cunliffe & Karunanayake, 2013: 370). These hyphen-spaces capture the multiple possibilities researchers have to make sense of the position they are occupying during their research in the field, enabling us to calibrate in a more conscious way the interaction between our identity and that of our research respondents. ‘Insiderness-outsiderness’ describes whether we are ‘indigenous to the community being studied’ and whether the researcher is ‘perceived ... as “one of us”’, i.e. an ‘insider’ (Cunliffe & Karunanayake, 2013: 372). In terms of critical distance, this hyphen-space helps us to recognise the way in which we are perceived by the respondents, and therefore how trusting they are in disclosing the data which we seek to hear and understand. This is related to ‘sameness-difference’, which describes to what extent we are like our respondents (such as gender, ethnicity, culture and values), which can influence their level and rate of acceptance and therefore trust in us as recipients for their narrative.

‘Engagement-distance’ describes the extent of the researcher’s involvement with the respondents in terms of physical activity, emotional involvement and the degree of co-creation that is happening in the data gathering and sensemaking processes (Cunliffe & Karunanayake, 2013: 372). This is particularly relevant to research methods such as ethnography and action research, which suggest a high degree of involvement with the community being researched, but also has relevance to other methods such as

longitudinal case studies where increasing engagement is a possible consequence of in-depth and repeated contact with respondents. The last hyphen-space is ‘political activism–active neutrality’, which refers to ‘the politics of positionality’ and whether the researcher is ‘involved in the agendas of the respondents’ (Cunliffe & Karunanayake, 2013: 380). These last two spaces are more at the discretion of the researcher, we believe, as they are less dependent on predetermined factors such as being indigenous or religiously similar to the researched agents. In the case of action research, the researcher will typically be ‘oriented towards social/organizational change’ or intervention (Cunliffe & Karunanayake, 2013: 372). Whilst movement within each hyphen is possible, it is in these latter two that critical distance is more likely to be a conscious act by the researcher as they decide to become more engaged or politically active with the respondents.

Cunliffe and Karunanayake make the point that the researcher and the respondent’s positions in all four spaces may vary over time: ‘we suggest that researcher–respondent relationships are often emergent (Hastings, 2010), multiple, and agentic in the sense that researchers and respondents shape each others’ identities and actions’ (2013: 365). This highlights a potential issue in comparing longitudinal data which may have been collected at times of differing degrees of distance. The researcher’s reflexive account of this variation therefore becomes particularly important when conducting longitudinal research. Overall, the hyphen-space construct provides a helpful way to make sense of the relationship between researcher and researched, and to track changes in it over time. In this way we can describe critical distance with a shared language and meaning.

In understanding critical distance, our argument is that the research process can be characterised by three key features: philosophical framework, context and relationships. We now address each of these in turn.

PHILOSOPHICAL FRAMEWORK

The extent to which the distance of the researcher is seen as a critical issue is impacted by the philosophical tradition within which the research is conducted. There is considerable diversity in the different methods and methodological perspectives available to the researcher seeking to access the organisational world qualitatively. As Cunliffe (2011) highlights, 'Our metatheoretical assumptions have very practical consequences for the way we do research in terms of our topic, focus of study, what we see as "data", how we collect and analyse the data, how we theorize, and how we write up our research account' (pp. 3–5). This is particularly the case for how we consider the role of the qualitative researcher. As Duberley et al. (2012) highlight, the development of management and organisational research has been characterised by the domination of positivism as an underlying philosophy. Here, the aim is to produce generalisable knowledge through testing of hypothetical predictions deduced from a priori theory where the role of the researcher is one of neutral observer. Therefore, we would expect that the researcher does not impact upon the research process and an appropriate objective distance is assumed. Hence, maintaining some form of critical distance would not be an issue if working in this tradition. For researchers approaching qualitative research from other traditions, however, the role of the researcher in knowledge production is actively recognised and accounted for. If a researcher is analysing discourse from a constructionist perspective, for example, they will reflect upon their role and impact in the context within which the data is generated.

There is not the space here to review a wide range of philosophical approaches, but we now turn to look briefly at two particular traditions where the role of the researcher in how research is conducted has been centrally positioned and critiqued: ethnography and action research.

Ethnography

If our research is to be trustworthy it is helpful to demonstrate a level of neutrality, which is also characteristic of some ethnographic work, particularly that informed by traditional approaches. Indeed, it was a classic ethnographer, Bronisław Malinowski, who argued that 'ethnography's peculiar character is the production of ostensibly "scientific" and "objective" knowledge based on personal interaction and subjective experience' (cited in Yanow & Schwartz-Shea, 2006: 261). Thus what is 'out there' is presumed to be independent of the knower and is accessible to the trained observer or ethnographer following the correct procedures. Here the threats to that neutrality, such as 'engagement' and 'political activism' (Cunliffe & Karunanayake, 2013: 377–81) for example, are seen as potential traps for the researcher to fall into that should be avoided on all counts.

Hammersley and Atkinson (1995) advise that ethnographers should critically scrutinise the impact of their field role upon a research setting as a form of internal reflexivity with a view to reducing any contamination which may threaten the ecological validity of the research. So here again the researcher is striving for distance, though there is some recognition that they will inevitably influence the research, hence the need to be aware of that impact. Ways of enhancing distance in the analytic process are to avoid over-rapport with the informants in an organisation; to treat the setting as anthropologically strange; to retain the balance between the roles of cultural insider and outsider; and to retain social and intellectual distance to preserve analytic space. This is evidence of a different philosophical approach informed by some of the commitments of positivism whilst recognising some subjectivity in interpretation.

What characterises most contemporary ethnography, however, is the recognition that there are diverse ways of conducting research which position the researcher and

their distance or closeness in different ways. Indeed, the complex nature of the issues relating to distance in organisational ethnographic research has been well documented (e.g. Yanow et al., 2012: 335). Van Maanen (2011), in his classic ethnographic text *Tales of the Field*, positions the researcher's role in terms of different sets of tales. It is the telling of the tales that impacts upon how distance is understood. For example, in *realist tales* the researcher is positioned as having experiential authority assuming an interpretive omnipotence to tell the study from the native's point of view. In *confessional tales*, the authority becomes more personalised and focused upon the fieldworker's interpretation or point of view. *Impressionist tales* focus upon fragmented knowledge and textual identity. Here the researcher is recognised to be integrally linked to the story produced, and separating out their role or an assumption of distance would be philosophically meaningless. Van Maanen also identifies other types of tale such as those that are critical, formal, literary or jointly told; the key point here is that the notion of distance is different depending on the style of the tale told.

Action Research

Another tradition where the role of the researcher is often critiqued is action research. A defining characteristic of action research is that the researcher also impacts upon the research process by taking action as a result of what they learn from their research. Action research has a long history within management and organisational research. It is usually traced back to Kurt Lewin's application of experimental logic and social psychological theory to practical social problems during the Second World War. Lewin (1951) was determined that research should have an impact on the practical social problems of the day and therefore coined the term 'action research' to highlight an iterative process of research and action. Since then the term has

been used in increasingly diverse ways, and different views of action research abound within the literature (Cassell & Johnson, 2006). Action research is usually seen as an iterative cycle of problem identification, diagnosis, planning, intervention and evaluation of the results of action in order to learn and plan subsequent interventions. The researcher is seen to play an active role in all of these stages, though again the philosophical position of the action researcher will impact upon how distant or otherwise they are seen to be. For example, experimentally based action research is underpinned by positivist assumptions where the researcher is a distant neutral observer, whereas more participative approaches place more emphasis on collaboration between the researcher and managers and other organisation members, as Eden and Huxham (1996) highlight. This may involve the joint identification of a problem that needs solving and the participation of a range of different organisation members at various stages of the research and action processes. Cassell and Johnson (2006) highlight that the range of different philosophical traditions in which action research is located includes experimental, inductive, constructive and participative approaches.

In summary, even in qualitative research traditions where a critique of the researcher's role is at the forefront of the research design, the critical distance or otherwise that the researcher maintains from the research is informed by their philosophical assumptions.

THE CONTEXT OF THE RESEARCHER'S ROLE

Apart from philosophical assumptions, key facets of distance emerge from the context within which the researcher's role is constructed and understood. Qualitative researchers have long been aware of the importance of having an understanding of context to enable access to the rich ambiguity around

social research noted earlier. Recognising the significance of context is an important part of maintaining critical distance in organisational and management research. It is helpful here to consider the researcher's role from a contextualist perspective. Contextualism provides a pragmatic view of knowledge, with justification dependent on the standards relevant in each context, which in the social research world is multi-faceted and based in part on the interaction, dialogue and perceptions of the people in the organisation (Feldman, 2010: 12).

For example, it can be helpful for us to understand how different agents perceive the same event differently, often motivated by the way it impacts upon their personal situations. In a case study research project about distributed leadership that Simon (Hayward) conducted, for example, there was a significant shift towards a more collaborative governance model in one of the cases. One senior manager in that case saw the move towards a more collaborative approach as a reduction in their level of independence, whereas another manager saw it as an opportunity to be more successful by working with others across the business more closely. Context was an important factor in how each agent interpreted events happening around them. There are some distinctive contexts that are worthy of note here – where, for example, the researcher is researching their own organisation, or acting as a consultant. We now consider each of these in turn.

Researcher as Employee

Where the researcher has a separate 'insider' role in the research organisation, critical distance is a potential area of conflict. Such situations have become more frequent with the growth of the DBA (Doctor of Business Administration) programme in contemporary Business Schools, where the doctoral researcher is often also a practising manager. Tietze (2012) highlights the issue of closeness

and distance in these scenarios: 'Researchers are "situated", i.e. they will bring a particular socio-political, historical, gendered, generational, ethnic and racial background to their research projects' (Tietze, 2012: 54).

Tietze (2012) describes how working in one's own organisation creates for the researcher a particular closeness and an ability to understand. In terms of legitimising such an approach, she points out that: 'Work by scholars such as Becker (1967) and Berger and Luckman (1966) had contributed to the dismantling of "impartiality" and "objective neutrality" as the only basis for investigating the social world' (Tietze, 2012: 55). From this perspective, the insider has a unique insight into their organisational world which can aid the research effort, and the partiality of the account is something that can be critiqued and reported upon.

Whatever the philosophical standpoint, the employee researcher has a dependence on the employer for livelihood, and this introduces a more deep-seated issue relating to distance in that the researcher has an underlying interest in maintaining a positive relationship with the organisation. This has the potential to create conflicts of interest for the researcher (such as when research findings are critical of the established hierarchy) which need to be made explicit and dealt with effectively, for example through robust peer and supervisor challenge and review.

Researcher as Consultant

When the researcher is a consultant to an organisation involved in fieldwork, it raises some related but subtly different issues of distance. The risk of a conflict of interest is still present, but the relationship is less dependent in that the consultant is typically not reliant on one client organisation for their livelihood. Having said that, for the consultant there are issues such as the tension between professional and commercial interests: when the research findings are critical

of the established hierarchy, as above, the consultant has a responsibility to 'tell the truth' while at the same time there is a commercial risk of being rejected by the client organisation. For the consultant there is also the possible perception inside the organisation that they are using research for commercial ends. Simon has experienced both cases as researcher consultant and has found that there are certain tactics that help to maintain both the substance and appearance of distance with the client organisation. The first tactic is to signal a clear difference between interactions with people in the organisation as a researcher and as a consultant, through using different days, different diary management practices, dressing differently, using props such as audio recorders for research interviews, and so on. Second, these signals can then be reinforced by making the different purpose of meetings or interviews explicit at the outset, making it clear in what guise the researcher is present. The third tactic is to review the nature of the research process regularly with key stakeholders in the organisation in order to check for any feedback or perceptions of inadequate distance, and to review and challenge the data itself.

Researcher Identity

Apart from the clear role positions that a researcher may have, such as consultant or employee, all researchers are in the position of handling identity in the field (Brewer, 2004; Simpson et al., 2014). The researcher may seek to construct a particular identity but this is also influenced by how the research participants understand and make sense of the researcher's role. In a positivist tradition this may be the role of the distant and objective researcher, but such distance may be challenged by the research participants. One way to consider this in terms of critical distance is to focus upon the performative aspects of the research and the 'identity work' that both researchers and research participants,

interviewers and interviewees do as part of the research process (Cassell, 2005). Identity work as defined by Sveningsson and Alvesson (2003) can be seen as a set of active processes which serve to construct a sense of identity. Here we are not seeing identity as something static but rather as an ongoing process, hence the focus turns to understanding how research entails identity work by both the interviewer and the interviewee.

In a previous paper, Catherine (Cassell) outlined a number of different type of identities she believed she and her interviewees had co-constructed for a variety of different reasons, each requiring identity work to sustain or challenge (Cassell, 2005). Other researchers have also noted and discussed how identity can be handled in the field; for example, Brewer's ethnographic work with the Royal Ulster Constabulary (2004). Our argument here is that research context and identity are interlinked, which clearly impacts upon critical distance.

RELATIONSHIPS

Relationships within the field are crucial for the qualitative management researcher. The depth of relationship management researchers have with their participants clearly varies, from the anonymous questionnaire respondent to the ethnographic familiarity of the embedded co-worker. Across this spectrum, we need to be conscious of the impact we are having through how we set up and manage the interactions with research participants, and the influence that has on the data we derive from the process. For example, if we use a formal tone in an introductory email requesting a response to a questionnaire, we are framing the data collection process as a formal activity in the mind of the respondent, which may cause them to respond in a more superficial way than if we had set it up with a personal conversation. Hence there are a range of complexities associated with field

relationships, in particular issues relating to access, sponsorship and the different levels of the organisation where we work, which we now explore.

Gaining Access

Feldman, Bell and Berger (2003) present a general theory of organisational access that recognises it as a way of building relationships. In arguing that access is a relational process, they draw attention to the importance of the relationship between the researcher and the researched.

Gaining access to organisations and individuals can be a challenging aspect of management research. If we can achieve high quality access to a research organisation we are, we would suggest, more likely to gain high quality data. In the situation where our access is achieved through a senior figure in the organisation we are likely to have the benefit of wider access to data gathering opportunities by dint of the individual's influence. On the other hand, we need to recognise that this access point may bring with it certain assumptions from others in the organisation. In our experience, these assumptions can be unhelpful to our research activity, and have ranged from suspicion of our motives and those of the senior figure, an initial lack of confidence that confidentiality would be maintained and a perception that participation is not really voluntary. On the other hand, we have also experienced assumptions that can be helpful, such as that this research is important to the organisation and therefore worth investing time in being part of, and assumed credibility for us as researchers.

It can be helpful in managing these varied assumptions to raise awareness of them at the outset and to review them during the research activity. Raising awareness can be in various forms, including reflexively, exploring the way this is affecting the participants and how they may be responding to involvement in the research. It can be with one's peers (or

supervisors in the case of doctoral research), to talk through the dynamics that access has created, and to highlight possible alternative explanations of response. It can also be with the organisational members themselves, such as with interviewees, or with a trusted observer. In one example from Simon's work this was a senior executive in a particular case who was aware of the research activity but not directly involved, and whose experience was helpful in making sense of the possible distortions the access point might create.

The development of trust within research relationships needs considerable work. As Brewer (2004: 316) suggests in relation to ethnography: 'Ethnographers are viewed differently as a relationship is built up and trust developed. This bond of trust is premised on the same qualities people bring to all social relationships – honesty, friendliness, reciprocity, openness, communication and confidence building. Trust is rarely instantaneous and normally builds slowly'. Brewer continues by highlighting that in his work with the Royal Ulster Constabulary he realised that the level of trust was not something that was a one-off assessment at the point of access. Rather, it needed to be worked at with reassurances constantly given. Hence the maintenance of relationships within the field also needs ongoing commitment and nurturance.

Dimensions of Sponsorship

The issue of access may be related to the issue of sponsorship, in that the point of access may also be the sponsor of our research activities. Whether or not this is the case, the sponsor or sponsors of our research are likely to influence how our research is perceived by research participants. If a sponsor is from a particular function, this may position the research activity as being functionally oriented. In one case involved in Simon's research, for example, the human resource director was a sponsor and this led some interviewees to perceive the research as 'an HR initiative', which in turn

caused some to use phrases such as ‘this HR stuff’. In the interview context he therefore asked questions to explore the wider organisational position, but was conscious of the risk of the data being skewed by interviewee assumptions that this was a human resource-related topic.

The sponsor may also affect the level and type of disclosure provided by research participants. Simon found some managers he interviewed were initially wary of disclosing what they perceived to be less positive aspects of the culture and ways of working across the organisation because they either did not want to ‘let the sponsor down’ by revealing weaknesses or they were wary of the repercussions for themselves if they were seen to be critical of the organisation. We will discuss the importance of dialogue in getting beyond these participant reservations later in the chapter.

Another source of potential influence from having strong sponsorship is the impact upon the researcher’s own perceptions. The researcher’s relationship with the sponsor or sponsors is likely to have a significant influence on the way the research is set up, and through this the sponsor’s own views will be a source of insight. For the researcher it is helpful to keep these views in perspective, and to avoid the risk of treating the sponsor’s views as more important than other sets of data.

Having strong sponsorship can be helpful in maintaining access during the research activity, especially with longitudinal research where it can be more challenging to gain repeated access over time. Simon found that having more than one sponsor in each research organisation was helpful in being able to continue with data collection over time, reducing the risk that a single sponsor might lose interest in the research, move to a new role or even depart the organisation.

Sponsors can be helpful reviewers of data analysis, providing a commentary on the way the researcher is making sense of the data and adding further detail where it might be missing from the data set. In one case where

Simon had several sponsors he was able to gain a different perspective from each of them, which helped to identify possible areas of conflict in the analysis, as well as developing a deeper appreciation of, for example, the historical context of the organisation and how previous executives had influenced the current way management decision making played out in practice. The insight is ‘locally grounded’, with a ‘richness and holism’ that allows us to move from the micro to the macro and back so that we understand how agents are interacting within the context of the case itself (Miles & Huberman, 1994: 10).

Relationship Mapping

In the situation where data collection involves people from different levels of an organisation, there are potential issues relating to distance due to varying degrees of history and closeness, both at the beginning of the research and as these relationships evolve over time. It is helpful to map out the relationships one is going to develop during the course of data collection at the beginning of the research and then to review this at regular stages to identify where there are potential or actual issues regarding distance. For example, in one of Simon’s cases he had an existing relationship with the key sponsor, who was also the chief executive, and with some members of the executive team. In a second case, he had existing relationships with various people in one of the operating units in the organisation. In both instances these relationships were helpful in providing access as well as an accelerated level of understanding of the cases as organisations. But there was also the risk of these preconceived views creating a skewed or one-dimensional perspective about the case and therefore being unhelpful in the overall research activity. Simon therefore found it helpful to check with peers and his supervisor on a regular basis to manage the influence of these closer relationships and to support a more balanced

approach to all relationships in each case (Yanow et al, 2012: 344).

In terms of the way relationships develop over time, particularly when the research is longitudinal in nature, there is both benefit and risk associated with deepening relationships between researcher and participant. In a repeated sequence of interviews, for example, Simon found that people were increasingly willing to disclose more personal information and to discuss its meaning in context in second or third interviews. This has the benefit of deepening the richness of the data, supporting what Lee calls the 'benefits of the particular' (Lee et al., 2007: 172). Given that access is relational, it is important that relationships within a research setting are nurtured and cared for. One consequence of this is how it influences the situation when you are telling the sponsor what they might perceive to be 'difficult' research results. In one case in which Catherine was involved, for example, the research was looking at engagement within a large public sector organisation. The study had been sponsored by the chief executive, who was keen to understand the impact of a cultural change programme he and the Board had initiated. Some of the results from the qualitative interviews were potentially sensitive and critical of the senior team. In order to deal with that feedback, Catherine stressed to the chief executive that as he was the sponsor of the research these were useful findings for him to consider which did not need to be shared elsewhere. The research relationship was with him as an individual rather than with the organisation. This reassurance meant that he felt more comfortable with the results, which led to him discussing them with the senior team and then commissioning another piece of research that focused upon the organisation more widely.

Leaving the Field

In theory, the ultimate distance is put between the researcher and the researched when the researcher leaves the field. Traditionally there

has been far more consideration within the management and organisation research field about how research sites are accessed rather than how they are left. However, increasingly within the literature, issues to do with how fieldwork is concluded and relationships potentially ended are now more widely considered (e.g. Michailova et al., 2014). Michailova et al., in taking a relational approach, highlight how there may be a number of emotions associated with exit. It is evident that the nature of exit is important in terms of consequent relationships. In particular, where the researcher is an employee or a consultant, they may leave the research role, but they remain in the site of fieldwork. Whether there is an ongoing relationship with the field of research or not, as with any stage in the field, the end of a project and the relationships associated with it need to be managed with due care and attention. An elegant exit leaves a positive point of closure, which is in itself part of conducting effective research, and the opportunity for re-entry at a later date should this be of potential interest to either party.

TOOLS FOR FACILITATING CRITICAL DISTANCE

In this section we outline some of the tools and techniques that researchers have used to promote critical distance. These include methodological tools, the use of quality criteria, reflexivity, keeping a research diary and peer review.

Methodological Tools

The methodological choices made within a project clearly impact upon distance. Some methods enable a particular closeness to the researched, such as the interview, whereas others, such as document analysis, enable a clear distance. In qualitative management research interviewers often seek to develop

an environment in which the interviewee feels comfortable to disclose and explore content that is potentially risky or controversial for the individual to discuss, such as managerial practices, quality issues, or organisational climate. The notion of developing rapport is seen as an important skill for the interviewer (Cassell, 2005), which is interesting in that here we are seeking ways of enhancing physical and emotional proximity. In our experience, the interviewer is providing an opportunity for people to make sense 'out of the process of interaction' (Weick, 1995: 20). An interview is a retrospective process, and one in which the interviewee is in some way fulfilling a need to look back and make sense, possibly oversimplifying to help the process (Weick, 1995: 17). As researchers, we need to build rapport and create an environment where the interviewee feels safe to disclose and explore the research questions in sufficient depth to draw out the nuances of meaning that give us the richness we seek. In longitudinal research we have the added advantage of being able to build that rapport and resulting trust over repeated interviews, which can provide further depth to the data collection process. The more we can create quality dialogue, the more we are likely to draw out the data that gives us a more comprehensive understanding of the situation under review. As Isaac wrote, 'human beings create, refine and share knowledge through conversation' (Isaac, 1999: 2). Hence, here we are arguing that paradoxically the critical distance required can be enabled by methods such as interviews that facilitate a closeness or proximity to our data and participants.

There are other ways in which critical distance can be located within the methodological choices that researchers make. For example, multiple sources of data can help to ensure that data from certain key relationships is not given undue emphasis. Rather, the insights garnered can be located within the context informed by data generated by other research participants. For example, within Simon's case study

research two populations were interviewed twice. This, plus observation of key meetings and document analysis, enabled him to draw on different sources of data, method and data type to corroborate or challenge research conclusions. Simon also weighted the evidence by using only direct or published sources and by spreading the interview sampling sufficiently widely across the potential audience in each case. Other methods, like discourse analysis for example, explicitly expect the researcher to account for their role and impact in the generation of the data and analysis. Hence some form of critical reflection of the researcher's role is embedded in such methods.

The Use of Quality Criteria

Within the field of qualitative research more generally, there is an increasing application of quality criteria. In discussing quality criteria, we acknowledge that they have been used in a variety of different ways within the literature. Symon and Cassell (2012) highlight that such criteria can be universal, in that they apply to all types of qualitative research, or methodological, in that they apply to specific methods such as interviewing or ethnography, for example.

A number of different criteria posited relate to critical distance. The aim is that through the use of a range of criteria we are able to describe the way we have maintained a level of distance – if philosophically appropriate, see Johnson et al. (2006) – whilst being involved in the organisational system we are researching. This is in line with the advice of Symon and Cassell (2012) that, given the diversity of qualitative research, 'qualitative researchers should draw on those elements of quality that they think are most relevant to their own research and be careful in their writings to indicate to potential assessors what the aims of the research were and therefore how they should be judged' (Symon & Cassell, 2012: 221).

By way of illustration, Johnson et al. (2006) outline a range of different quality

criteria that are contingent upon the epistemological commitments of the researcher. For example, from a neo-empiricist perspective a researcher may use an audit trail of the analytic process to highlight how the effects of researcher bias have been accounted for. The term *bias* is a loaded one, which may be inappropriate in some qualitative research traditions but a key source of concern in others. Miles and Huberman (1994) discuss some of the ways the researcher can avoid bias when conducting case study research. They suggest the possible downsides of case studies are holistic fallacy, where the researcher sees more congruence than there really is; elite bias, where there is an over-emphasis on the accounts of particular individuals; and 'going native', where we lose our research perspective by aligning with the case. In avoiding 'going native' (Miles, 1994: 263), Simon found it helpful to hold periodic review meetings with key stakeholders, including the senior leadership team of each of his research cases, to review and help validate the interim findings throughout the research process. It was important to Simon that he felt confident that he was interpreting the data 'accurately'. Hence he used these review meetings to check for 'researcher effects' and going native – both from and to the cases. It was beneficial in these cases that the key stakeholders were robust, insightful and direct in their feedback.

A different criterion altogether would be taken by authors working in a postmodernist perspective. Johnson et al. (2006), for example, outline the criterion of de-centring the author, where the researcher reflexively considers their own narrative and the different elements that have impacted upon its construction. This criterion relates to reflexivity, which is covered in the next section, and which is important in order to ensure a balanced perspective throughout the research endeavour.

In summary, there are a range of quality criteria associated with proximity/distance which the researcher can draw upon to make sense of their role.

Reflexivity

Reflexivity focuses on the role the researcher has in knowledge production and is therefore fundamental to understanding how distance is managed. Reflexivity should be an iterative process throughout a research project, and other chapters in this volume discuss examples of reflexive practice. The aim is that the researcher is aware of their own influence and contribution to shaping their research and the consequent analysis and interpretation of findings (Salzman, 2002). In doing so, the research may change as it progresses as a result of reflexive insights. Moreover, a reflexive stance enables the researcher to account for their own interests in the research process. For example, in a piece of research that Catherine conducted with Gillian Symon about how occupational psychologists assess the quality of qualitative research, when publishing their analysis both authors felt it was important to critique their own role and interests in the production of the analysis:

Our analysis of the data although firmly grounded in the interview talk, was also influenced by our experience of working in the field as work psychologists and as qualitative researchers. Hence our interpretations are also located within our own sensemaking framework about our commitment to qualitative research and the potential we see for it in the work psychology field. Furthermore, we argue that any more favourable treatment of qualitative research within our discipline would not only be welcome to qualitative researchers like ourselves, but may also be in our own professional interests. (Cassell & Symon, 1994: 648)

Weick (2002) advises that attention on the researcher is important and that researchers can focus upon a range of aspects of the research, including making sure that all voices are listened to. Hence reflexivity is an important tool for understanding the researcher's role and how they effectively manage critical distance. As Nadin and Cassell (2006) highlight, the 'potential benefits in relation to qualitative research [of reflexivity] relate to both a greater understanding of the role and impact of the researcher (Cassell, 2005), and

an increased “trustworthiness” of the data, and general “integrity” in the research process (Finlay, 2002, p. 531).

Using a Research Diary

An effective method to start the process of reflexivity is for the management researcher to keep a diary throughout the research process. The process of writing down one's experiences, thoughts, learning, issues and reactions to the research activity is in itself a helpful way to make sense of it. It also helps to raise one's own awareness of oneself, and to seek to interpret what is happening in the research process and how one is responding to that as it plays out and in retrospect. Here, issues regarding the development of relationships in the research, for example, can be monitored and evaluated on a regular basis.

Nadin and Cassell (2006: 208) suggest that ‘all researchers should systematically use a research diary, regardless of epistemological position. However, what is needed first and foremost is a commitment to the pursuit of reflexivity and awareness on one's own epistemological assumptions’. This reflects the assumption noted earlier that in relation to quality criteria, epistemological and methodological congruence is important. However, there is the danger that this congruence risks the use of epistemological blinkers, where researchers justify their method and role because it is consistent with their epistemological position. Behaving in a reflexive way is fundamentally about accepting challenge, so it may be helpful to create some distance from an epistemological position by accepting challenges from peers with different positions. This could provide a fresh perspective to the research process and the methods used.

Some of the benefits Nadin and Cassell (2006) suggest that we can derive from maintaining a research diary include exploring ‘methodological issues’ to find improvements in research methods, supplementing the content of the interview data, increasing personal

insight (‘my own observations of myself as a researcher’), helping to organise the research, providing a ‘forum’ to record insights outside the specific research focus, and longitudinal reflection and learning as ‘reflexivity is an ongoing process’ (2006: 211–12).

In our experience we have both used research diaries as a way of creating room for reflexivity. Simon maintained a research diary throughout his doctoral research, which was a helpful source of insight and a way to make sense of the journey he undertook. It was an ongoing record of events such as conferences and supervisor meetings, reading and research experiences, insights gained and implications for the research activity. It contained over 10,000 words of reflections and interpretation. It was useful for developing the conceptual framework in that it helped to tie together the various strands of insight, and to maintain a helpful perspective towards particular aspects of the cases or theories. The structure of a research diary is a matter of personal taste in some respects, and the form it takes will in itself reflect something of the researcher's mindset. In considering how to set up a research diary it is helpful to reflect upon how it might enable us to answer the questions posed by Haynes (2012) in relation to reflexivity: ‘What is the motivation for undertaking this research? What underlying assumptions I am bringing to it? How am I connected to the research, theoretically, experientially, emotionally? And what effect will this have on my approach?’ (Haynes, 2012: 78). Such questions bring issues of critical distance to the fore.

Simon found that reading through diary entries at different stages of his research stimulated new thinking. For example, at one point in the middle of data collection, reading the diary was a reminder about why the cases had initially been selected and the caveats he originally had about each case. Before selecting one case in particular, Simon had considered several potential problems, as recorded in the research diary, including a possible conflict of interest given his association with

the case as a consultant, and whether it was too complex as a case. Through this process of review he was able to consider these issues and check that sufficient distance was present through holding specific discussions with both his supervisor and his sponsors in the case. By collecting insights in the diary over time he was also able to identify and correct trends in interpretation that he felt were potentially biased, such as recognising his personal desire to reach a simple set of conclusions based on a single theoretical position, which was in practice not how the analysis ended up.

As a reflexive tool the research diary is a foundation for maintaining critical distance. As Haynes (2012: 76) suggests: 'reflexivity forces the researcher to re-examine his or her positioning in relation to methodology, theory, participants and the self'. This is in order to achieve what Haynes (2012: 87) describes as 'increase[d] accountability for the knowledge that is produced'.

Peer Review

An issue that Nadin and Cassell (2006: 210) highlight with reflexivity is that it 'is conceived as a process located within, and owned by, an individual researcher'. Reflexivity is often seen as an isolated process, whereas we would agree with Salzman's (2002) contention that debate and challenge are also important aspects of achieving critical distance. Salzman (2002: 812) argues for the value of debate rather than reflexivity to achieve greater objectivity and therefore greater likelihood of knowledge rather than subjective experience or opinion. He argues for 'a vital and vigorous marketplace of ideas ... to replace solitary research with collaborative team research, in which the perspectives and insights of each researcher can be challenged and tested by the others' (Salzman, 2002: 812). The long-respected route of peer review and challenging debate among researchers is also useful in ensuring that

researchers are challenged and can achieve appropriate levels of critical distance.

As Salzman, writing about anthropological research, describes: 'Dahrendorf asserts, "Insofar as truth exists at all, it exists not as a possession of the individual scholar, but as the net result of scientific exchange". (1968: 243)'. It is through collective criticism and discussion that knowledge emerges (Salzman, 2002: 812). Simon found in his research that it was through dialogue and debate with peers and supervisors that his data analysis was refined and meaning sharpened. Debate also helped to make sense of the impact he was having as a researcher in the cases he was researching, and to work out how to explore this with those cases to understand better the impact of his activity. There is a powerful combination between the self-criticism of reflexive thinking and the challenge from peers in constructive debate that helps to develop an appropriate level of critical distance and confidence in the knowledge contribution of particular research.

CONCLUSION

As stated at the beginning of the chapter, we know that the qualitative management and organisational researcher will have some sort of impact upon the phenomenon they study, so a key issue becomes how researcher distance and proximity are managed. We have argued that managing this relationship is critical in that it is both important and worthy of reflection. In thinking of ways of structuring such reflection we have suggested that there are three main areas of focus: (1) the philosophical framework within which the research is conducted; (2) the context and (3) relationships within the research field. We are not arguing that these three areas are mutually exclusive, but rather in identifying them as significant we can highlight the various choices available to the researcher in critiquing their role and their proximity to their

research participants. The constant challenge for the qualitative researcher into organisations and management is to contribute to knowledge whilst acknowledging our subjectivity and its impact upon our research. Through active and ongoing critique of this subjectivity as researchers (through reflexion and debate), we can make sense of the complexity of human systems and indeed use the subjectivity of both ourselves and our research participants to understand different perspectives as data that help to inform our research.

Reflexivity and Researcher Positionality

Sandra Corlett and Sharon Mavin

INTRODUCTION

Reflexivity is considered an integral aspect of qualitative research. It involves us, as researchers, understanding how processes of doing research shape its outcomes (Hardy et al., 2001), reflecting upon the ways in which we carry out our empirical research projects, and explaining to an audience how we move through research manufacturing processes to certain conclusions. Reflection and reflexivity are sometimes used synonymously, but Alvesson and Sköldbberg (2009: 8) distinguish between them, conceiving ‘reflexive empirical research ... as a particular, specified version of reflective research, involving reflection on several levels or directed at several themes’. Hibbert et al. (2010: 48) go further and understand reflexivity as related to, but ‘qualitatively different from’, reflection. For them, whilst reflection might enable researchers to observe research practice, as it might be reflected back to them from a mirror image, reflexivity involves

‘exposing or questioning our ways of doing’ (Hibbert et al., 2010: 48). Therefore, reflexivity has a ‘self-referential characteristic of “bending-back” some thought upon the self, such that it takes the form of *subject-object-subject*’ (Archer, 2009: 2, emphasis in original) and also a recursive dimension where, ‘through questioning the bases of our interpretations, reflexivity brings about change in the process of reflection’ (Hibbert et al., 2010: 48). For us, therefore, reflexivity is always a self-monitoring of, and a self-responding to, our thoughts, feelings and actions as we engage in research projects.

In this chapter we outline understandings of reflexivity as practices of appreciating our own researcher positionality in relation to questions about what kind of knowledge is possible – our epistemology; the ‘doing’ of research and our relations with research participants and others; and evaluating qualitative management research. We acknowledge reflexivity as ambiguous and complex and consider how processes of reflexivity address

researcher positionality, identity and power in research. We briefly offer practical examples of ‘doing’ reflexivity in management research to highlight how researchers might consider processes of reflexivity in their own qualitative management research and discuss collective reflexivity, involving research co-producers and users, as areas for future development in reflexive practice. We conclude by summarizing our discussions in the chapter and offering our ‘authorial identity’ (Alvesson et al., 2008: 483) reflections on the chapter we have produced.

REFLEXIVITY: DIFFERENT UNDERSTANDINGS, DIFFERENT PRACTICES

Reflexivity is variously conceived and has different implications for qualitative research practice and outcomes, dependent on the underlying ontological and epistemological orientations of the researcher (Day, 2012; Johnson & Duberley, 2000). For instance, in the context of discussing shifts from modern to postmodern understandings of doing qualitative research, Pillow (2003: 180) states that ‘reflexivity as a methodological practice is dependent on a subject or subjects to reflect on and how the subject is thought is key then to how reflexivity is practiced’. For example, a researcher coming from a modernist understanding of self as singular and knowable will position the purposes and practices of reflexivity quite differently to someone with a postmodern understanding of self as multiple and unknowable (Pillow, 2003). For instance, a researcher with a modernist approach might argue that self-reflexive practices enable the researcher to ‘truly’ know her/his self and, thus, to provide a ‘true’ account of how her/his subjectivity impacted the research process, whereas a postmodernist researcher might acknowledge the challenges of engaging in self-reflexive practices and qualify self-knowledge as

partial and any research process account as limited (Pillow, 2003).

Notwithstanding its different understandings and practices, reflexivity is generally understood as giving ‘attention to the complex relationship between processes of knowledge production and the various contexts of such processes, as well as the involvement of the knowledge producer’ (Alvesson & Sköldberg, 2009: 8). Alvesson and Sköldberg (2009: 9) identify two basic characteristics of what they call ‘reflective mode’ empirical research: careful interpretation and reflection. Because empirical data are ‘the *results of interpretation*’, we need to pay attention to our theoretical assumptions, pre-understandings and the importance of language (Alvesson & Sköldberg, 2009: 9, emphasis in original). Paying attention also involves a process of reflection – the ‘*interpretation of interpretation*’ – involving critical self-exploration not only of how empirical data have been interpreted (and constructed) but also systematic reflection on several different levels, including the researcher, the research community and, more broadly, social, cultural, intellectual and linguistic traditions (Alvesson & Sköldberg, 2009: 9, emphasis in original). As qualitative researchers ‘doing reflexivity’, we aim to ‘bend-back’ on (Archer, 2009) and turn ‘inwards’ towards (Alvesson & Sköldberg, 2009: 9) ourselves and to think seriously about our research practices.

To help us in that endeavour, we draw on the view of reflexivity as being about questioning (Cunliffe, 2011) three aspects of research practice (Day, 2012). First, reflexivity involves questioning our understanding of reality and the nature of knowledge and how alternative paradigms and perspectives can open up new ways of thinking about phenomena (Alvesson et al., 2008). Second, it is about questioning our relationships with the research context, the research subjects/participants and the research data. Third, reflexivity involves questioning what is considered ‘valid’ and valuable research.

Respectively, these questions relate to the ‘thinking’, ‘doing’, and ‘evaluating’ of qualitative research (Day, 2012). In structuring the chapter around these three aspects, which we view as ‘interconnected and mutually related’ (Haynes, 2012: 85), we present and discuss questions posed by others in their writing on reflexivity and illustrate some of the practices, engaged in by ourselves and other scholars, in ‘doing reflexivity’. The questions, which we discuss at appropriate points in the chapter, are summarized in the Appendix.

THE REFLEXIVE ‘THINKING’ OF QUALITATIVE RESEARCH

A way of understanding reflexivity relates to questions about what kind of knowledge is possible – our epistemology – or what Day (2012) refers to as the ‘thinking’ of qualitative methodology. In this discussion, we consider questions about our epistemological position and assumptions, and how these relate to questions of representation and truth.

Questions About Our Epistemological Position and Assumptions

Johnson and Duberley (2000) argue that we need to ensure we do research consistent with our epistemological positions, and maintaining such consistency ‘raises issues about reflexivity’ (p. 177), for instance in being aware and critical of the origins, assumptions and implications of such positions. This form of reflexivity ‘entails the researcher attempting to think about their own thinking’ and how we practise this form depends on our a priori philosophical assumptions (Johnson & Duberley, 2000: 178). Similarly, Cunliffe (2011: 415) notes that thinking about the following two questions influences how we choose to engage with reflexivity:

- What are my assumptions about the nature of reality and who we are as humans?
- What do I see as the nature of knowledge?

Epistemological reflexivity appreciates how the phenomena we study are seen through our ontological and epistemological lens and thus acknowledges our assumptions – about the world and about knowledge – and their implications for the research and its findings. For instance, Johnson and Duberley (2003) discuss how researchers with realist ontological and objectivist epistemological positions engage in what they call methodological reflexivity. However, in this chapter, we focus on qualitative research that conceptualizes social reality as being constructed. Indeed, the concept and practice of reflexivity in qualitative research can be traced back, in part, to social constructionist assumptions of social reality (Cunliffe, 2011) and to the ‘linguistic turn’, which Holland (1999: 466) sees as part of the ‘reflexive turn’, in social science research.

Questions About Representation and Truth

Acknowledging that social reality is constructed and appreciating the way in which language frames our world view, and paradoxically how it enables and inhibits understanding, is a key element in what is sometimes referred to as ‘the crisis of representation’ (Denzin & Lincoln, 2011: 3) or a ‘crisis of truth’ (Cunliffe, 2003: 983) from which reflexivity developed. Cunliffe (2003: 983) identifies ‘a crisis of representation, an emphasis on the constitutive nature of language, and a call for reflexive approaches to research’ as themes which emerged from challenges to mainstream social science research and its absolute truth, objective view of the world. Reflexivity ‘unsettles’ representation (Cunliffe, 2003: 985) by questioning the belief that ‘competent observers could, with objectivity, clarity, and precision report

on their own observations of the social world, including the experiences of others' (Denzin & Lincoln, 2011: 11). Hardy et al. (2001) trace the history of reflexivity from the 1950s–1970s as calls for researchers, undertaking cultural anthropological and sociological studies, to declare and remove biases which were assumed, from an objectivist viewpoint, to distort the 'truth'. As it was believed that a researcher's interests, values and theoretical presuppositions could not be eradicated from their work, reflexivity became focused upon rendering biases visible through personal disclosure, so that audiences could take them into account (Hardy et al., 2001).

Scholars working from poststructuralist and postmodernist positions further developed reflexive approaches (Cunliffe, 2003; Hardy et al., 2001) by undermining assumptions that research subjects existed in any 'real' sense and that researchers could objectively report on their experiences (Hardy et al., 2001: 535). As well as accepting that observations are 'socially situated' and constructed and that accounts of experiences are partial (Denzin & Lincoln, 2011: 12), scholars acknowledged that 'interpretation-free, theory-neutral facts do not, in principle, exist' (Alvesson & Skoldberg, 2009: 1). Rivera and Tracy's (2014) paper on 'Embodying emotional dirty work: A messy text of patrolling the border' is an incredibly powerful example of this reflexivity. We have included an extract which illustrates how the researchers acknowledge their observations as socially situated, constructed and partial:

What does dirty work feel like?

What does researching dirty work – doing 'dirty research' – feel like?

In this essay, we ask and answer these research questions via a qualitative study and writing a 'messy text' (Marcus, 1994) of U.S. Border Patrol agents. Messy texts acknowledge that writing is not a mirror but a way to frame the scene. Messy texts are open-ended, fractured, and emotional. They centralize writers' experiences as pivotal to the knowledge produced.

As illustrated within, dirty work feels confusing, lonely, and courageous. It feels ambivalent, constrained by regulations and job descriptions that do not always seem to make sense given contradictory circumstances, contexts, and communities. And, as a researcher alongside dirty workers, it feels nerve-wracking to watch something that is usually hidden from public view. Of course, this is just the shorthand. Feelings of dirty work do not come in a neat bulleted list, but rather through the rich and embodied narratives of the scene. (Rivera & Tracy, 2014: 202)

In interpreting and writing qualitative reports of such observations, accounts and other qualitative data, we are always '*re-presenting*' (Cousin, 2010: 10, emphasis in original) our own and others' experiences and interpreting these 'from a particular stance and an available language' (Cousin, 2010: 10). Day (2012: 61–2) poses questions about representation and truth:

- In our representations of the social world, what are our underlying assumptions about the production of knowledge – how do we know, and who can claim to know? ... who can make claims to 'know' and represent others using qualitative approaches?

When social reality is conceptualized as constructed, reflexivity acknowledges the situated nature of knowledge (Alvesson et al., 2008). The knowledges we generate, as knowledge producers, are 'limited, specific and partial' (Rose, 1997: 306), and shaped by our particular interests and the specific circumstances in which we conduct the research. Again, Rivera and Tracy's (2014) paper is a powerful example which acknowledges the 'writers' experiences as pivotal to the knowledge produced' (p. 202). To enable us to engage in this form of reflexivity whereby we confront the 'taken-for-granted assumptions which traditionally inform our knowledge claims' (Johnson & Duberley, 2003: 1294), Cassell et al. (2005) offer a series of questions about how the question we develop to 'define' our research influences the kinds of insights we might generate and the 'truth claims' we make.

- How has the research question defined and limited what can be 'found'?
- What findings/insights do I hope to generate from this question?
- On what basis will these findings/insights contribute to 'knowledge', i.e. what kinds of knowledges am I producing?
- How will the resultant knowledges function to shape the world, i.e. what 'truth claims' will I make?

Alvesson and Sköldbberg (2009: 9) refer to 'reflective' (rather than reflexive) mode research and suggest that, in the context of empirical research, it involves taking 'a sceptical approach to what appear at a superficial glance as unproblematic replicas of the way reality functions', while simultaneously maintaining the belief that the interpretation of well thought-out excerpts from this reality can provide a basis for knowledge generation which 'opens up rather than closes, and furnishes opportunities for understanding rather than establishing "truths"'. Thus, making known our thinking, for instance on the nature of the truth claims we are making, enables us to 'situate knowledge reflexively' (Rose, 1997: 315). Indeed, Rose (1997) proposes that the 'crucial goal' of 'situating academic knowledge is to produce non-overgeneralizing knowledges that learn from other kinds of knowledges' (Rose, 1997: 315). An example of this comes from Sharon's PhD thesis (Mavin, 2001) into women academics' experiences in UK business schools. Engaging in reflexivity on her position as a researcher and woman academic when researching her own business school, she wrote reflexive accounts of her own experiences. This reflexive process enabled Sharon to go beyond a surface analysis of the women academics' accounts which could have been overgeneralized to how women undermined other women (e.g. women academics being perceived as 'Queen Bees' by other women). By identifying and exploring the contradictions and tensions in the women academics' accounts and by contrasting and comparing others' experiences

with her own local knowledges, Sharon was able to move theoretically to develop 'female misogyny'. She situated this knowledge within the context of a specific gendered organization where: promotion for women was scarce; where women were constructed as unambitious mothers; where competition between women was hidden; and where women's negative relations with each other were used as a means of reinforcing the gendered hierarchy. Sharon included a chapter entitled 'My Voice' in the thesis and began the chapter with one of her own reflexive accounts. We have included this account and the introduction section to the chapter to illustrate Sharon's process of reflexivity:

My own experience of female misogyny is as a result of being perceived as simultaneously 'a bit on the side' of an academic man and also as 'too ambitious' as I chose to join the research culture of the Business School. Both academic men and women have told me, either as an attack or as a warning, that women in the Business School can be 'too ambitious'.

INTRODUCTION

The aim of this chapter is to contribute original theory to the existing body of knowledge and therefore I begin by highlighting the specific areas where this has been achieved, before moving to discuss them in more detail. Within this chapter I introduce a metaphor to further interpret the narrative texts of women academics and to identify the discourses which play a part in the social constructions of their identity and place in the Business School. This allows the alternative voices of academic women participants to be heard and I amplify the conflicting voices and perceptions as they emerge. I then move to add my own voice to the story, thus locating myself within the thesis. (Mavin, 2001: 214)

Multi-perspective reflexivity practices, in which 'researchers use tensions among different perspectives to expose different assumptions and open up new ways of thinking' (Alvesson et al., 2008: 483), provide a means of understanding and acknowledging the influence of our theoretical perspectives on

knowledge production. Multi-perspective reflexivity questions encourage us to consider:

- What are the different ways in which a phenomenon can be understood? How do they produce different knowledge(s)? (Alvesson et al., 2008: 487)
- How could the research question be investigated differently, e.g. from a different epistemological perspective? What different insights may be made by taking a different epistemological perspective? (Cassell et al., 2005)

Haynes (2012) advises that, as researchers, 'we should try to be aware of how our ontological, social and political positioning affects the work that we do by informing the choices we make about research topics, questions, approaches, methodologies and outcomes' (p. 78). She suggests practical strategies for achieving this, for instance, by writing down any theoretical assumptions and presuppositions we have about the subject of our research, revisiting these throughout the research process, and noting how these may have shifted (Haynes, 2012). Sandra (Corlett) did this in her doctoral research project and presented diagrammatically the shifts in her understandings of different theoretical perspectives, and their implications for the framing of the research aim and focus, as a series of footsteps moving from one epistemological positioning to another (Corlett, 2009). When introducing the figure showing Sandra's movements between and shifts in ontological and epistemological positionings, she wrote:

When considering approaches to research, Crotty (1998, p.216) proposes that '[r]ather than selecting established paradigms to follow, we [use] established paradigms to delineate and illustrate our own'. Crotty's (1998) use of the word 'delineate' suggests a clearer demarcation between established paradigms than my own understandings of them would suggest. The notion of 'following' a paradigm implies movement and I have experienced this through the shifts in my understandings of different perspectives and the strength with which I have asserted particular ontological and epistemological commitments of this research over the course of the study. (Corlett, 2009: 80)

In the following section in the thesis, Sandra outlined 'the rationale for incorporating and rejecting aspects of different epistemological commitments' (Corlett, 2009: 81). For example, Sandra explained how she moved from claiming a social constructivist approach, in the early stages of the PhD project, towards social constructionism to give further attention to relational and contextual processes (of identity construction). She also explained that, whilst she did not share the research goals of critical poststructuralists in 'explor[ing] the power effect of discourses on self-identity or as a platform for political or social activism', she subsequently considered naive her view of identity construction as a power-neutral process. Sandra's awareness of the shifts in her epistemological and political commitments enabled her to clarify the research aim of the thesis and its positioning, which she described, in the section conclusion, as follows:

the term and positioning of this research as relational social constructionist are employed to distinguish it from social constructivist, social constructionist and poststructuralist approaches. Whilst this research approach has elements in common with [these approaches], it diverges away from [them] in important respects relating to its, and my own, 'ontological commitments, intellectual priorities and theoretical preoccupations' (Chia, 1995, p. 579). (Corlett, 2009: 87)

To summarize this part of the chapter, we have discussed debates surrounding reflexivity which focus on the nature of reality and knowledge, and considered questions about our epistemological position and assumptions, including about representation and truth. Reflexive practice involves 'thinking' about and acknowledging how our own theoretical perspectives are interwoven with linguistic and other elements, such as our political agendas and social relations, in ways that shape the knowledge production process (Alvesson et al., 2008; Alvesson & Sköldberg, 2009; Day, 2012). We give more attention to the social and political elements of reflexive practice in the next part, related

to the ‘doing’ of qualitative research, where we pose and consider a series of methodological questions.

THE REFLEXIVE ‘DOING’ OF QUALITATIVE RESEARCH: METHODOLOGICAL QUESTIONS OF RESEARCHER POSITIONALITY

If we see reflexivity as a process of opening ourselves up to scrutiny (Cunliffe, 2003), then this involves questioning the way we do our research (Cunliffe, 2011) and ‘understanding how the process of doing research shapes its outcomes’ (Hardy et al., 2001: 533). Therefore, as researchers, we need to appraise critically our own research methods and engage in ‘methodological reflexivity’ (Cassell et al., 2005; Johnson & Duberley, 2003). This form of reflexivity involves being reflexive about our role and relationships with the research context, research participants, and research data, and about the resulting reports we produce. In other words, our reflexive practice and the reflexive texts we write ‘in some way take into account their own manufacturing conditions’ (Pels, 2000: 6). In our discussion, we explore methodological issues generated by the ‘doing’ of qualitative research and consider questions relating to methodological and method choices and about the researcher’s motivations, role, positionality, identity, power and voice.

Methodological Reflexivity: Methodological and Method Choices

Methodological reflexivity accepts that the researcher makes methodological and method choices, and acknowledges that research methods, as used by researchers, are not neutral tools – each have ‘philosophical baggage’ (Gill & Johnson, 2010: 6).

Therefore, continuing the theme we introduced in the reflexive ‘thinking’ part of qualitative research, we need to be aware of how our philosophical commitments influence our methodological choices (Gill & Johnson, 2010). Reflexive researchers make explicit this baggage to an audience and provide a convincing account of the knowledge ‘manufacturing conditions’ (Pels, 2000). Questions relating to methodological reflexivity include:

- What research method/s is/are used? (Cunliffe, 2011; James & Vinnicombe, 2002)
- What is the purpose of the methods? (Cassell et al., 2005)
- What is the impact of the research method(s) on the research? (Johnson & Duberley, 2003)
- What constitutes ‘data’? How do I interpret the ‘data’? (Cunliffe, 2011)
- What data do I ‘collect’? How do I collect and analyse the data? How do I manage ‘objectivity’ in the data analysis? (James & Vinnicombe, 2002)
- What data have I chosen to include and to leave out in my presentation of findings/interpretations?

Our philosophical assumptions influence our understandings of what counts as data, and how data are ‘collected’, interpreted and presented (James & Vinnicombe, 2002). Reflexive practice acknowledges that data are produced, not collected, and that the research product is fundamentally related to the process of production (May, 2002). The researcher’s personal involvement in data production need not be constructed as bad practice or bias but as a source of data in its own right (James & Vinnicombe, 2002). Indeed, Gabriel (2015: 334) discusses how the reflexive researcher cannot separate the empirical material from the self. Harding (1987), in considering feminist research processes, goes further to argue that ‘the beliefs and behaviors of the researcher are part of the empirical evidence for (or against) the claims advanced in the results of the research. *This* evidence too must be open to critical scrutiny no less than what is traditionally

defined as relevant evidence' (p. 9, emphasis in original). She proposes that we increase research objectivity by acknowledging 'this "subjective" element' (Harding, 1987: 9). This form of reflexivity, exploring the researcher's relationship with the object of research (Harding, 1987), includes becoming conscious of our personal motivations and interests (Cunliffe, 2011; Haynes, 2012; James & Vinnicombe, 2002). Again Sharon's (Mavin, 2001) reflexive process in her PhD thesis is useful to illustrate this form of reflexivity. Sharon was 'expected' to complete a positivist approach to the research and did so via a survey to men and women academics on their experiences of careers in business schools. A change to the supervision team enabled her to move to a feminist standpoint and to focus on the social construction of women academics' experiences. Her motivations were to give voice to women academics, identify the barriers to academic careers and to surface the gendered nature of the cultures of UK business schools in the late 1990s. However, one of the theoretical contributions, female misogyny, significantly challenged her motivations – that women could be 'blamed' for constraining other women's careers was not what she wanted to find. A turning inwards to engage in self-reflexivity led Sharon to rethink the complexity in the women's accounts and her own experiences. She included the following extract in her thesis:

As a researcher I am aware that I am always engaged in living, telling, reliving and retelling my own stories. As an introduction to the analysis of the culture of the Business School and the identities and places of academic women within this culture, there are a number of issues to consider. Firstly, I am aware that at times I interpret the perceptions of women academics as a homogenous group, underpinned by the similarities in their narratives discussed in chapter seven. Secondly, there are places within the analysis where the women give diverse perceptions of their experiences and identities within the Business School and these give rise to a number of contradictions in the analysis, which I highlight as they emerge. Thirdly, I am aware of the processes of categorisation the academic

women go through in their stories and my own comments on this process come later in this chapter. (Mavin 2001, Chapter 8: 220)

Self-Reflexivity: Questions about Researcher Motivations

The subject–object–subject bending-back on the self (Archer, 2009), in processes of 'self-reflexivity' (Cunliffe, 2011) or 'personal reflexivity' (Willig, 2001), involves reflecting on how our research projects are shaped by our interests, values, experiences and political commitments (Willig, 2001). Researchers have posed self-reflexivity questions, relating to the chosen research topic and personal motivations and interests for studying it, as:

- Why am I undertaking the research topic I have selected? What are my personal motivations? What are my personal and political reasons for undertaking my research? What personal experiences do I have related to my research topic? (James & Vinnicombe, 2002: 97)
- What (or who) has prompted the research and why? How is the research shaped by my own personal interest and, if applicable, the interests of a sponsoring organization? Has this influenced the framing of the research question and the context in which the research is carried out? (James & Vinnicombe, 2002: 97)
- What is the motivation for undertaking this research? How am I connected to the research, theoretically, experientially, emotionally? And what effect will this have on my approach? (Haynes, 2012: 78)

Self-reflexivity presupposes that, in undertaking research projects and writing research accounts, we are disclosing something about ourselves and writing a piece of our autobiography (Pels, 2000) and that, as researchers, what we do, say and write 'defines and redefines both ourselves and the texts we produce' (Gabriel, 2015: 334). Therefore, qualitative researchers are encouraged to present honest, self-searching but not indulgent accounts, because the idea of (re-)defining ourselves should not divert all attention away from the

results of the research process itself (May, 2002). Haynes (2012) explains how her doctoral study was motivated both by particular theoretical interests and a desire to better understand herself. Kathryn combined her theoretical interests in identity, motherhood and accounting, and her research project's aim to examine the identity politics of women accountants through their interrelations with experiences of motherhood, with 'some much more personal aims [of wanting] to try to understand, as part of a process of self-discovery, how I came to be myself, as a woman, mother, accountant and academic' (Haynes, 2012: 78). Although reflexive research does not need to be driven by such explicit personal aims, it is important 'to acknowledge and articulate the varied motivations, theoretical and/or personal, underpinning any research, as these are likely to shape the way the research is conceived, carried out, interpreted and produced' (Haynes, 2012: 79). Sandra provides a further example of self-reflexivity in her doctoral thesis (Corlett, 2009) where she: acknowledges her interest and its possible effects on the phenomenon being studied; articulates her position in relation to the research topic; writes herself into the thesis and uses 'I' in her writing; and includes a final (reflections) chapter which considers, alongside theoretical contributions, the effects of the research on herself. For example, in a section in the thesis Introduction, entitled 'My position in relation to the subject', Sandra introduced her interest in the subject of self-identity and considered how her personal experiences may have impacted on the study's focus, its central argument and the key theories it drew on. For instance, Sandra gave an example of tracing back her initial interest in the field of identity to the early stages of her professional experiences some twenty-five years previously, even though 'at that time, I would not have used the term "identity" in trying to make sense of my experiences' (p. 12). In addition to acknowledging when her interests in the topic of self-identity may have been initiated,

Sandra acknowledged that, through the PhD study and its processes of research, 'I am both the researcher and "the researched", as I try to make sense of and reconstruct my self-identity to incorporate this new "role" [as a "researcher"]' (p. 14). As one further aspect of self-reflexivity in the same section of the thesis, Sandra offered explanations for why she may have used particular theories of self-identity or particular authors' works, and focused the study on the interrelations of vulnerability and identity work. For example, she wrote:

I do not want to suggest that I only actively engage in identity work when I change roles, or that it is the job title or 'label' which causes me to reframe my self-identity. However, transitions of different types do seem to feature strongly in my narrative.... Also I do tend to 'position' myself and draw on 'external discursive "social-identities"' (Watson, 2008, p.121) in making sense of who I am. It is probably also for this reason that I have been drawn, in this study, towards Harré and van Langenhove's (1999) positioning theory.

Other academic texts have been important to me in making sense of my own identity work and identity construction processes, and in the design of this research study. At the start of my PhD study, I was influenced by Watson and Harris (1999). I was particularly drawn to the questions for managers raised in their study including the 'ways in which moving into managerial work have involved battles about their sense of identity and how they see themselves' and the 'discrepancies between the demands of the role of manager, the expectations this places on them and some sense of their "real" self' (Watson and Harris, 1999, p. 53). I now appreciate that I was drawn to this particular excerpt as it resonated so much with my own experiences of becoming. I was also struck by the idea of 'battles' about self. Less consciously, this may have been the trigger for the focus within this study on vulnerability. (Corlett, 2009: 14)

Therefore, subjecting the researcher's positionality to critical scrutiny is important in understanding the conditions of knowledge production. We turn now to consider further aspects of what Macbeth (2001: 35) refers to as 'positional reflexivity', for instance relating to identity and power.

Self-Reflexivity: Questions About the Researcher's Role, Identity, and Power Relations with Others

Macbeth's (2001) notion of 'positional reflexivity' (p. 35) encourages us to engage in self-referential analysis to understand how biography, place and the positioning of self and other shape the research process. Our earlier discussion about self-reflexivity involving questions about a researcher's motivations and interests recognizes that research is 'as much the researcher's story as it is the story of organizational participants' (Cunliffe, 2011: 415). Knowing the researcher's place makes the research understandable (Harding, 1987) and, therefore, researchers are encouraged to 'seek ways of demonstrating to their audiences their historical and geographic situatedness, their personal investments in the research, [and the] various biases they bring to the work' (Gergen & Gergen, 2000: 1027). Furthermore, knowing the researcher's positioning in relation to others gives context to the researcher's voice, to their perception of the research problem or dilemma, and enables the audiences' understanding of the findings (Day, 2012). Positional reflexivity, therefore, as a further form of self-reflexivity, encourages us to recognize ourselves as an integral part of the research project (Alvesson et al., 2009). Positional reflexivity can be enabled by considering questions such as:

- What is my (expected) role as the researcher? (Cassell et al., 2005; James & Vinnicombe, 2002)
- What effects does my role have on how the research is conducted? (Cassell et al., 2005)
- What are my relationships with research subjects/participants? (Cunliffe, 2011)

Reflexive research practice considers the self as a 'research tool' (Cousin, 2010; Day, 2012) or 'research instrument' (Bourke, 2014; Haynes, 2011; Munkejord, 2009). Therefore, because we are 'intimately connected to the methods we deploy' (Cousin,

2010: 10) and to the roles we play (Day, 2012), self-reflexivity involves monitoring how 'the deployment of particular research protocols and associated field roles' generate behavioural responses, for the researcher, which impact upon the social settings under investigation (Johnson & Duberley, 2003: 1285). 'Reflexive research methodologies ... acknowledge the ways in which the researcher's self and subjectivity mutually and continually affect both the research process and research outcomes' (Haynes, 2011: 134). Some research methodologies make explicit use of the researcher's subjectivity. See, for example, Haynes' (2011) account of the methodological, epistemological and ontological 'tensions' in '(re) presenting the self in reflexive autoethnographical research' (p. 134), and Munkejord's (2009) 'insider' account of collecting field data. Both researchers explore, amongst other aspects, how emotions emerge continuously and influence the research process, leading Munkejord to propose that, in the practice of reflexivity, emotions have tended to be overlooked. Munkejord explains and illustrates how reflexivity can be used, for instance, as a way of understanding the centrality of researcher emotions to interactions with research participants 'in the field' (p. 156). He discusses how awareness of his own emotions, and particularly his feelings of discomfort in presenting himself as a passive observer in the research setting, led to a 're-evaluation of my "role" within the department' and a change in his research strategy whereby he 'decided to approach the respondents more actively' (p. 157). Munkejord (2009: 157) concludes, 'becoming adaptive in the research process is only possible at the point when emotions enter one's awareness as objects for thought connected to the eliciting situation'.

Day (2012) outlines three ways of understanding the self as a research tool: (1) one's role performance and the dynamic enactment of multiple and potentially conflicting

roles; (2) one's multiple, co-constructed identities, prompting reflection on how, for instance, race/gender/class emerge and are made meaningful through research relationships; and (3) the researcher's positionality within particular theoretical perspectives and methodological practices. For instance, Day (2012) discusses how the researcher may present the self (Goffman, 1959) in particular ways to particular audiences for particular purposes in the field. She exemplifies her discussion with Srivastava's (2006) performance, involving emotional labour, of dynamic, multiple and sometimes conflicting field roles. This view of 'the self as a meaningful research tool that shifts back and forth between multiple, and sometimes conflicting, role performances' (Day, 2012: 71) requires researchers to be reflexive about their field-work roles and identities.

Identity

Again, the researcher's epistemological position and assumptions influence understandings of researcher field roles, and the related concept of identities. For instance, when identity is viewed as an ongoing relational process, reflexive practice makes explicit how the researcher's (and the research participants') identities are (re)formed in the doing of research, within the overall research process (Corlett, 2009; Haynes, 2011) and in more specific research situations, such as interviews (Alvesson, 2003; Bryman & Cassell, 2006; Corlett, 2012). Such a relational and dynamic perspective on identity might be reflected in a question such as 'how are race/gender/ class *made meaningful* in this relationship?' (Day, 2012: 72, emphasis in original) as compared with asking, from an entitative and fixed perspective on identity, 'what impact did the researcher's race/gender/class have on the research relationship?' (Day, 2012: 72). Cousin (2010) draws on Srivastava's (2006) work to argue that understanding identities of

researcher and researched as dynamic, multiple and 'always in flux' (Cousin, 2010: 17) would deter a researcher from claiming a 'master status' positioning (p. 13), for example of working-class, white or black, which some researchers emphasize. In other words, the researcher's positionality in relation to the researched is an ongoing point of debate, underpinned by researchers' different epistemological assumptions, and reflected in questions, for example, about how or indeed whether a researcher from a different class (or other social identity) can represent research participants' experiences. An example comes from Sharon's work with Gina Grandy in which they, as academics in business schools, comment on their reflexive journey in doing research with exotic dancers: 'What would colleagues and students think? Does this research have value to organization studies, business and management or is it just "quirky research"? How does this research threaten professional identities?' (Mavin & Grandy, 2013: 239). In the same paper, Gina talks reflexively of her preparations for the data collection, highlighting her positionality in relation to the researched and the research context:

In preparing for each period of data collection the second author was conscious of the potential power dynamics of clean and dirty and presented herself to exotic dancers as a student researcher rather than a member of the 'intellectual academic elite'. Further, in exploring sex work as a site of study in organization studies this research became very much her own identity project. She struggled with what it means to be a 'woman' and confronted her (dis)comfort with her own sexuality and bodily appearance. During data collection, she was often conscious as a woman of feeling less attractive than the women participants.

In addition, as a heterosexual woman she reflected on how others, that is, dancers, customers and colleagues, perceived her sexuality because of the nature of the research. (Mavin & Grandy, 2013: 238)

Srivastava's (2006) contribution to the debate is to argue for acknowledgement of '*the shades of grey*, and the socio-historical

positioning' (p. 213, emphasis in original) of field identities. She illustrates how identity binaries (in her case, female/male, Eastern/Western, old/young, Hindi-speaking/English-speaking etc.) were drawn upon by herself and her research participants in achieving '*temporary shared positionalities*' and in mediating researcher-participant power relations (Srivastava, 2006: 211, emphasis in original). This understanding of field identities as 'continually mediated constructs' (Srivastava, 2006: 214) might lead us to acknowledge research encounters with participants as a 'negotiation of a shared space' (Cousin, 2010: 17). Bourke (2014) conceives research as a shared space, shaped by researcher(s) and participants. He explains how he operationalizes positional reflexivity through exploring 'intertwined' questions such as 'What role did my positionality as a White man studying issues of race in higher education play? How did I use my positionality in different spaces? Did my positionality influence the interactions I had with student participants?' (Bourke, 2014: 2). Milner (2007) presents a framework designed to raise consciousness of the researchers' own and others' racialized positionality and cultural ways of knowing. The framework, which he proposes is transferable from its context in education research to other disciplines, includes 'researching the self' questions designed to enable the researcher to engage in critical (race and cultural) self-reflection (Milner, 2007: 395). The 'researching the self in relation to others' questions encourage us to 'acknowledge the multiple roles, identities and positions that researchers and research participants bring to the research process' (Milner, 2007: 395). Through positional reflexivity, qualitative researchers can consider the impact of positionality, identity and power in producing knowledge. We now turn to consider in more detail how positional reflexivity, as a form of self-reflexivity, acknowledges the politics of the 'doing' of qualitative methodology (Day, 2012).

Power

The different ways in which qualitative researchers conceptualize power have implications for their reflexive practices (Day, 2012). For instance, Day (2012) critiques power conceived as a possession which shifts between the researcher and the researched, and associated reflexive practices which question who holds more or less power at any given point in time and/or which consider how participants might be empowered. Such assumptions fail to contextualize research relationship power imbalances beyond the researcher-researched interaction in the immediate research setting, or to engage in reflexive analysis of broader relations of power (Day, 2012). A broader contextual understanding of power in the research relationship can be conceptualized by taking a Foucauldian approach whereby 'power is not something that is intrinsically held by persons; it is the effect of discursive struggles over the realm of meaning and production of knowledge ... [and] is distributed throughout social relationships' (Day, 2012: 67). Such a relational understanding of power enables consideration of the ways in which researchers and research participants are 'variously located within relations of power' (Day, 2012: 67). Orr and Bennett (2009) claim that they became 'more attuned' (p. 90) to the political dynamics underpinning their academic-practitioner research project, by engaging in 'an exercise in self-reflexivity' (p. 88) using Cunliffe's (2003) notion of radical reflexivity. They reflected upon and examined their research endeavours by, amongst other reflexive practices, exploring how their co-production of research 'involves the active interweaving and collision of different participant stories' and by 'surfacing and questioning' their relationships, as authors and co-producers, and with the research participants (Orr & Bennett, 2009: 88). For instance, they explain how, in response to Bennett's 'insider' status, Orr 'consciously and deliberately invoked his

outsider status – as a political resource’ (Orr & Bennett, 2009: 97) – in eliciting participant accounts. (For further reflexive practice examples of, and debate about, insider/outsider roles see, amongst others, Bourke, 2014; Day, 2012; and Srivastava, 2006.)

Although sharing epistemological assumptions of research as a process of constitutive negotiation, Rose (1997) might take exception to Orr and Bennett’s (2009: 87) claim to ‘make *transparent* the political processes that underpin our research’ (our italics) as she suggests that such ‘transparent reflexivity’ (p. 305) is impossible to achieve. Cousin (2010) makes a similar point when critiquing the notion of ‘positional reflexivity’ and its suggestion, if unproblematized, that a researcher’s privileged position/standpoint (e.g. feminist) comes with ‘a special pair of glasses’ (p. 11). By drawing on Butler’s (1990) Foucauldian account of performativity, Rose (1997: 311) challenges assumptions, about the researcher’s agency as conscious and knowable and about the ‘context’ or structure of power as visible and knowable, to argue for the impossibility of the search for positionality through transparent reflexivity. Rose’s (1997) argument is founded on the contradiction of understanding differences between the researcher and the researched as distances (for example, as higher or lower, central or marginal, insider or outsider) in a ‘landscape of power’ (p. 312). Rather than the ‘all-seeing’ researcher (p. 316) attempting to ‘map’ difference as distance between distinctly separate and conscious agents in a visible landscape of power, reflexivity becomes a process of ‘tracing’ how difference is constructed through mutually constitutive social relations between the researcher and the researched (pp. 313–14). From this relational understanding of position (Rose, 1997) and of research (Cunliffe, 2003, 2011; Hosking & Pluut, 2010; Rose, 1997), reflexivity acknowledges the ‘political dynamics’ of our research endeavours (Orr & Bennett, 2009: 87) and the ‘inherently political nature’ of our relationships with research participants (Cunliffe, 2011: 414), through which

positionalities, identities and knowledges emerge. In itself, reflexivity is not a means of overcoming issues of power. However, engaging with reflexivity, provoked by the following questions, may enable us ‘to surface issues about the politics of knowledge production and fieldwork’ (Orr & Bennett, 2009: 86).

- What role do positionality, identity, and power play in the process of knowledge production? (Day, 2012)
- What is my power relationship with the people I am researching? (Cousin, 2010)
- Am I researching *with* or *on* people? (Cousin, 2010: 11, emphasis in original)
- How does the relationship between the researchers (and the research participants) influence the research? (Orr & Bennett, 2009)

As an endnote, we acknowledge the issue of power in knowledge production applies equally to the researcher’s relationship with text (Day, 2012) as data (see, for example, Alvesson et al.’s (2008) discussion of reflexivity as textual practice). In their consideration of reflexive practices of writing about research, Alvesson et al. (2008: 483) describe multi-voicing practices which focus on ‘the authorial identity of the field worker’. These practices involve questioning the relationship between the researcher and research subjects and asking how the researcher can speak authentically of the Other’s experience (Alvesson et al., 2008: 483). We now end this discussion by exploring this type of question relating to issues of voice.

Voice

Reflexive practices which make explicit one’s positionality give context to the researcher’s voice (Day, 2012). In response to the crisis of representation (Denzin & Lincoln, 2011), notions of voice, authorship, and authenticity are questioned, as follows:

- Who speaks, if natural facts and social groups are unable to speak for themselves? (Pels, 2000: 2)

- Who is 'author'? Whose is the reflexive voice – the researcher's and/or 'subjects'? How can we recognize the interplay of voices without privileging ourselves and excluding the voices of others? (Cunliffe, 2003: 994)
- Can I speak authentically of the experience of the Other? If so, how? (Alvesson et al., 2008)
- How do I make sense of the lived experience of others? What are the consequences of making sense of and speaking for others? Whose voices does this sense making exclude? (Cunliffe, 2011)

Reflexivity 'systematically takes stock of and inserts the positions and perspectives of *spokespersons* in social-scientific reports about the world. Reflexive texts tend to reiterate the question: Who says so?' (Pels, 2000: 2, emphasis in original). Feminist and poststructuralist research has experimented with reflexive practices to 'forefront "voice" and the construction of our research texts' (Pillow, 2003: 186). For instance, multi-voicing reflexive practices attempt to 'decentre' authors as authority figures by opening up texts to multiple readings and/or by giving research subjects and/or readers a more active role in interpreting meaning (Alvesson et al., 2008). As a practical example in a doctoral study, Williams (2010) extended engagement with some of her research participants, beyond the initial data collection interview, by asking them to comment on her data interpretations as presented in a draft thesis chapter. In the final chapter of her thesis, when reflecting on the reflexive engagement of and debate with the research participants, Williams (2010) wrote:

All three participants affirmed my interpretations, adding comments or insights to particular points through the chapter, which I reflected upon and responded to, making changes or commenting on issues raised in chapter Five. I received positive feedback from Holly for following through on my initial invitation to review my interpretations. Holly commended me on ... sending my interpretations and engaging in a debate with the reflexive feedback I received in response. I also received affirmation from Sophia and Holly on how I had been sensitive to, and inclusive of participants' voices in my methodological choices. ... Sophia in her reflexive

follow up interview commented ... 'I think is a really good validation of your methodological choices because it gives the power to the interviewees'. (Williams, 2010: 283)

In line with the earlier discussion of transparent reflexivity, philosophical assumptions about power influence the qualitative researcher's intentions behind and strategies of using multi-voicing reflexive practices. Explicit articulation of assumptions enable defense of potential critiques of multi-voicing practices. For instance, practically, Alvesson et al. (2008: 488) highlight the limitations of giving 'a voice, let alone an equal voice' to all those involved with a research project and, philosophically, Pillow (2003: 185) contests the idea of 'giving' voice or power.

To summarize our discussions so far, we have considered how processes of reflexivity acknowledge that the researcher's motivation, role, position, identity, power and voice all impact on the 'doing' of qualitative research. We now turn to questions and issues relating to the reflexive 'evaluating' of qualitative research (Day, 2012; Johnson, 2015) and consider the case for criteria that fit the particular research project's philosophical positioning (Johnson, 2015; Johnson et al., 2006).

THE REFLEXIVE 'EVALUATING' OF QUALITATIVE RESEARCH

Johnson (2015: 322) argues for reflexivity to be brought to 'the forefront of any research evaluation so as to enable criterion-logical judgements that fit the philosophical positioning of any research under consideration'. His call for a 'more permissive, pluralistic and reflexive approach to research evaluation' (Johnson, 2015: 320) is founded on the diversity of qualitative management research and its array of different epistemological and ontological stances. Johnson et al. (2006) elaborate this argument for the 'reflexive application of the appropriate

evaluation criteria' (p. 131) and suggest this requires qualitative researchers to: 'subject their philosophical assumptions to sustained reflection and evaluation through their confrontation with possible alternatives; deliberate the implications of their informed choices for research practice; be consistent in their actual engagements with management practices and be clear about how they meet specific but philosophically contingent evaluation criteria' (p. 148). Sandra provides a practical example of this type of reflexive application of 'contingent' criteria (Johnson, 2015; Johnson et al., 2006) to qualitative research evaluation in her PhD thesis (Corlett, 2009). For instance, she discussed the shifts in her understandings of different perspectives and the strength with which she asserted particular ontological and epistemological commitments over the course of study (Corlett, 2009). She considered methodological choices, including in a separate thesis section entitled 'implications of methodological decisions for this study' (p. 116). At various points in the thesis she reflected on how she had maintained a focus on her stated objective of 'tak[ing] a consciously reflexive approach throughout the research process' (p. 12). Finally, she detailed how she believed she had met philosophically contingent evaluation criteria which, in her case, involved complementing Lincoln and Guba's (1985) evaluative framework with other criteria appropriate to her narrative study. In opening discussion on the evaluation criteria, Sandra wrote:

This, as with any other research account, is a 'rhetorical construction' (Watson and Harris, 1999) and a crafted and shaped piece of writing (Watson and Harris, 1999; Watson, 1994; Golden-Biddle and Locke, 2007). So how can I persuade the reader that the research is trustworthy and its findings are 'worth taking account of' (Lincoln and Guba, 1985: 290)? (Corlett, 2009: 108)

This question is similar to others posed by scholars who reflexively consider the criteria for judging qualitative research.

- How does one put into practice the reflexive techniques and address methodological issues in a way that results in 'valid', good-quality social research? (Day, 2012: 61)
- How can I engage in reflexive 'theorizing' and 'explanation'? What is 'useful' knowledge and how can I produce it within a reflexive frame? (Cunliffe, 2003: 997)

Day (2012: 76) proposes that reflexivity problematizes 'the taken-for-granted use' of validity as a means of evaluating qualitative research. Like Johnson (2015) and his colleagues (Johnson et al., 2006), Day argues for the application of research project-specific evaluation criteria, by drawing on Cho and Trent's (2006: 319) proposition of a 'recursive, process-oriented view of validity'. As a practical example of inclusion of project-specific evaluation criteria, Williams (2010) explains why, given her concern for plurivocality (as discussed above), she used Seale's (1999) addition of authenticity to Lincoln and Guba's (1985) evaluation framework in her PhD study: 'Seale suggests the addition of authenticity ... brings the trustworthiness criteria closer to an appreciation of plurivocality' (Williams, 2010: 282). Not all qualitative scholars agree with the use of contingent criteria or, indeed, any 'definition' of qualitative criteria (see, for example, Symon & Cassell, 2012: 204 for further details of the 'criteriology debate') and advocate universal criteria frameworks, some of which include reflexivity. For example, Tracy's (2010: 840) universal end goal model for quality in qualitative research incorporates 'self-reflexivity about subjective values, biases, and inclinations of the researcher(s)' as a means/practice for achieving sincere and ethical research. Nevertheless, evidencing reflexivity as part of the 'doing' or writing up of qualitative research does not guarantee the quality of theory development and knowledge production (Day, 2012; Gabriel, 2013, 2015). Reflexivity needs to go beyond 'a box-ticking exercise' (Gabriel, 2015: 333), for instance "Did I question my

assumptions?” Ticked ... “Did I surface my values?” Ticked’ (Gabriel, 2013), as such a reductionist approach will not guarantee ‘good’ quality qualitative research. We propose that Sharon’s research with Gina Grandy (Mavin & Grandy, 2016), on developing ‘A Theory of Abject Appearance: Women elite leaders’ intra-gender “management” of bodies and appearance’, avoids such reductionist reflexive tendencies. The process of reflexivity involved critical discussions with each other to question the fundamental assumptions we had made in interpreting the women’s accounts, for instance did we just find what we wanted to find? As a result we did further work to re-analyse the data by the sectors the women leaders worked in and included this in the paper. We also included the interview questions that the women’s accounts were in response to. Thus we were able to highlight the quality of our research approach and more strongly argue for our theorization of Abject Appearance as emerging across the women’s accounts, regardless of organizational contexts. We also engaged in reflexivity as women researchers in-relation-to our women participants and included the following in the paper:

Like Sarah, many of the women elite leaders commented on women’s weight in their accounts. We also identified with the notion of women’s fat bodies being a source of disgust and attraction when in positions of power, as well as a site for women’s intra-gender relations. We reflected on our identity work associated with our own thin-fat-thin-fat bodies in-relation-to other women both inside and outside the work place. (Mavin & Grandy, 2016: 13)

This discussion of the reflexive ‘evaluating’ of qualitative research, and its introduction to the criteriology debate, completes our consideration of the three aspects of reflexivity. However, before concluding the chapter, we consider a further contemporary debate, about reflexivity as an individual and/or collective process, as the basis for identifying future developments informed by emergent reflexive research practice.

FUTURE DEVELOPMENTS: REFLEXIVITY AS COLLECTIVE PRACTICE

The concept of self-reflexivity and its ‘self-referential characteristic of “bending-back” some thought upon the self’ (Archer, 2009: 2) may convey the assumption of an individual activity. However, we agree with Gilmore and Kenny (2015: 55) that the prevalent assumption that self-reflexivity is ‘the responsibility of the lone researcher’ limits its understanding and practice. We have already referred to Orr and Bennett’s (2009) co-authored reflexive paper, produced following a ‘recursive’ process of reflexivity involving repeated critical exchange between the two researchers (p. 86). Gilmore and Kenny (2015) call for further innovative and meaningful methods, and detailed accounts of the practice, of collective reflexivity. They propose a ‘reflexive pair interview’ method involving ‘two (or more) “critical friends” working together’ (Gilmore & Kenny, 2015: 73). This collective approach was found to facilitate ‘a deeper reflection on the research process and in particular to our own selves-as-researchers’ (p. 73). Acknowledging the limitation that they carried out the pair interviews subsequent to their (individual) fieldwork, Gilmore and Kenny (2015) recommend use of the method as ongoing practice as a research project progresses. Examples of developing and employing collective reflexive processes and methods, as ongoing practice, arise from Sharon’s research with women elite leaders (Mavin & Grandy, 2016; Mavin et al., 2015) where the three research assistants completed individual reflexive templates as well as personal research diaries on their experiences of interviewing and then came together to discuss and consider the impact on the data collection. Sharon gives details about how the research assistants were impacted emotionally when conducting the interviews and how the co-authors responded emotionally in their re-readings of the data transcripts (Mavin & Grandy, 2016: 3).

Collective discussions about these ‘reflexive experiences’ guided them towards the research focus and enabled them to become ‘reflexively aware of the body as a site for identity work’ (p. 3). Furthermore, the collective reflexive practice they engaged in helped surface how they were ‘connected to the research, theoretically, experientially, [and] emotionally’ (Haynes, 2012: 78) and supports the view that reflexivity involves questioning emotions as well as assumptions (Gabriel, 2015; Munkejord, 2009). On a different project (Mavin & Williams, 2012), the same group of four researchers individually completed analysis of media texts, identified key discourses in the data and then completed an individual reflexive template. They then came together in pairs to discuss their findings, and to agree similarities and differences in the discourses and their reflexive templates. Finally, the two pairs came together to discuss the individual and paired reflexive templates and again agree similarities and differences in the discourses. These examples illustrate how collective reflexive methods, practised through dialogue with others, enabled individual researchers’ thoughts, feelings, doubts, dilemmas and possibilities to be surfaced and knowledge claims to be unsettled and settled, thereby facilitating a ‘turning back on oneself’ (Lawson, 1985: 9).

Beyond co-researchers and co-authors, examples of collective reflexive practice involve research participants (Corlett, 2012; Riach, 2009) and research users. For example, building on Riach’s (2009) exploration of participant-focused reflexivity in the research interview where participants may ‘consciously consider themselves in relation to their own production of knowledge’ (p. 360), Sandra illustrates how conceiving research as a dialogic process ‘with’ others may enable critical self-reflexivity and learning for research participants (Corlett, 2012). Attending to participant-focused reflexivity enables participants, as users of our research, to shape its direction and to evaluate its

theoretical and practical contributions. An opportunity for future development of collective reflexivity in management research comes from Brandon (2016), who engages users in participatory health research (PHR) (see rwire.co.uk). PHR has gone beyond models of service user consultation through the positioning of service users as experts in their own circumstances. This is a fundamental relocation of power towards service users as they become ‘co-producers’ of research (Realpe & Wallace, 2010). Therefore, moving from research participants in management research to user-led, co-produced research projects builds on relational understandings of research, and of researcher/researched positionality, which opens up opportunities for further development of theory and practice of reflexivity as collective practice.

CONCLUSION

In this chapter we have discussed understandings of research reflexivity, as processes and practices involving the reflexive ‘thinking’, ‘doing’ and ‘evaluating’ of qualitative management research. Although we have presented discussion of these reflexive processes and practices in distinct parts of the chapter, we see them as ‘interconnected and mutually related, [and] not necessarily separate and discrete facets of reflexivity’ (Haynes, 2012: 85). We have argued that epistemological assumptions influence reflexivity practices and the researcher’s positionality on issues relating to representation and truth, to the researcher’s role and power relations with others, and to criteria for evaluating qualitative research. However, Tomkins and Eatough (2010) are critical of coupling reflexivity with one’s overall epistemology because of the risk of missing out, in practice terms, on the richness and diversity of reflexivity theory. In response to their critique, we hope the chapter has provided some insights into the debates surrounding

Table 23.1 Reflexivity in qualitative research

<i>The reflexive 'thinking' of qualitative research (Day, 2012)</i>	<i>The reflexive 'doing' of qualitative research (Day, 2012)</i>	<i>The reflexive 'evaluating' of qualitative research (Day, 2012)</i>
<i>Questions about epistemological position and assumptions</i> • What are my assumptions about the nature of reality and who we are as humans? (Cunliffe, 2011) • What do I see as the nature of knowledge? (Cunliffe, 2011) <i>Questions about representation and truth</i> • In my representations of the social world, what are my underlying assumptions about the production of knowledge – how do I know, and who can claim to know? ... who can make claims to 'know' and represent others using qualitative approaches? (Day, 2012) • How has the research question defined and limited what can be 'found'? What findings/insights do I hope to generate from this question? On what basis will these findings/insights contribute to 'knowledge', i.e. what kinds of knowledges am I producing? How will the resultant knowledges function to shape the world, i.e. what 'truth claims' will I make? (Cassell et al., 2005) • What are the different ways in which a phenomenon can be understood and how do they produce different knowledge(s)? (Alvesson et al., 2008)	<i>Methodological and method reflexivity questions</i> • What research method/s is/are used? (Cunliffe, 2011; James & Vinnicombe, 2002) • What is the purpose of the methods? (Cassell et al., 2005) • What is the impact of the research method(s) on the research? (Johnson & Duberley, 2003) • What constitutes 'data'? How do I interpret the 'data'? (Cunliffe, 2011) • What data do I 'collect'? How do I collect and analyse the data? How do I manage 'objectivity' in the data analysis? (James & Vinnicombe, 2002) • What data have I chosen to include and to leave out in my presentation of findings/interpretations? <i>Self-reflexivity questions about researcher motivations</i> • Why am I undertaking the research topic I have selected? What are my personal motivations? What are my personal and political reasons for undertaking my research? What personal experiences do I have related to my research topic? (James & Vinnicombe, 2002) • What (or who) has prompted the research and why? How is the research shaped by my own personal interest and, if applicable, the interests of a sponsoring organization? Has this influenced the framing of the research question and the context in which the research is carried out? (James & Vinnicombe, 2002) • What is the motivation for undertaking this research? How am I connected to the research, theoretically, experientially, emotionally? And what effect will this have on my approach? (Haynes, 2012) <i>Self-reflexivity questions about researcher role, identity and power relations with others</i> • What is my (expected) role as the researcher? (Cassell et al., 2005; James & Vinnicombe, 2002; Johnson & Duberley, 2008) • What effects does my role have on how the research is conducted? (Cassell et al., 2005) • What are my relationships with research subjects/participants? (Cunliffe, 2011)	<i>Questions about criteria</i> • How do I put into practice the reflexive techniques and address methodological issues in a way that results in valid, good-quality social research? (Day, 2012) • How can I engage in reflexive 'theorizing' and 'explanation'? What is 'useful' knowledge and how can I produce it within a reflexive frame? (Cunliffe, 2003)

- How could the research question be investigated differently, e.g. from a different epistemological perspective? What different insights may be made by taking a different epistemological perspective? (Cassell et al., 2005)

Questions about positionality, identity and power

- What role do positionality, identity and power play in the process of knowledge production? (Day, 2012)
- What is my power relationship with the people I am researching? (Cousin, 2010)
- Am I researching *with* or *on* people? (Cousin, 2010)
- How does the relationship between the researchers (and the research participants) influence the research? (Orr & Bennett, 2009)

Questions about voice

- Who speaks, if natural facts and social groups are unable to speak for themselves? (Pels, 2000)
- Who is 'author'? Whose is the reflexive voice – the researcher's and/or 'subjects'? How can we recognize the interplay of voices without privileging ourselves and excluding the voices of others? (Cunliffe, 2003)
- Can I speak authentically of the experience of the Other? If so, how? (Alvesson et al., 2008)
- How do I make sense of the lived experience of others? What are the consequences of making sense of and speaking for others? Whose voices does this sense-making exclude? (Cunliffe, 2011)

Developed and extended from: Alvesson et al. (2008); Cassell et al. (2005); Cousin (2010); Cunliffe (2003, 2011); Day (2012); Hardy et al. (2001); Haynes (2012); James and Vinnicombe (2002); Johnson and Duberley (2003); Orr and Bennett (2009); Pels (2000).

the theory and practice of reflexivity and has opened up opportunities for critical self-scrutiny of research practice, through the questions posed and collated in the Appendix and through the practical examples of different processes of individual and collective reflexivity from our own and others' work.

Alvesson et al. (2008: 497) conclude that, just as 'knowledge more generally is a product of linguistic, political, and institutional influences, so too is reflexivity. ... what we – as members of a research community – know to be reflexivity is shaped by practices carried out by researchers in producing texts which are accepted as being reflexive'. We acknowledge we have given a 'situated' and partial account of reflexivity theory and practice, informed by our epistemological assumptions founded on social constructionism and poststructuralism, and by the reflexive practices in which we have engaged. Furthermore our broader research interests, for instance in the area of identity, may have influenced the attention we have given to some debates and questions, such as the role of identity and power in processes of knowledge production. Also, as committed as we are to reflexivity and researcher positionality, we do not see reflexivity as 'a universal cure-all' (Day, 2012: 82) for the challenges involved in conducting qualitative management research. Indeed, excessive reflexivity may, for instance, reduce our practice to paralysis or lead us to self-indulgence and narcissism (Weick, 1999). Nevertheless, we see the value of reflexivity in its ability to bring epistemological, methodological and criteriological challenges to the forefront as a means of recognising how we, as qualitative researchers, shape the research we do, the knowledge we produce and its subsequent political effects.

Reflexivity in research can be uncomfortable but, building on Gina Grandy, Ruth Simpson and Sharon's views (Grandy et al., 2015: 347), we see 'that our richest and most illuminating research encounters are those that make us feel uncomfortable. If we

acknowledge the discomfort and reflexively work through it ... we argue that as researchers and practitioners we garner unique insights into the complexity of social reality'. Therefore, we continue to advocate for reflexivity and researcher/researched positionality and end with two final questions, adapted from Cunliffe (2011: 416), to encourage critical self-scrutiny of our individual and collective research practices and processes:

- Where do my/our ideas on reflexivity fit?
- Are any of these approaches [and questions] appropriate for my/our research or how can I/we find my/our own approach?

APPENDIX A: THOUGHT PROVOKING QUESTIONS ABOUT REFLEXIVITY IN QUALITATIVE RESEARCH

As you read the questions in the table 23.1, critically self-reflect on these overarching questions:

- Where do my/our ideas on reflexivity fit?
- Are any of these questions appropriate for my/our research/or how can I/we find my/our own approach? (Cunliffe, 2011: 416)

Muted Masculinities – Ethical and Personal Challenges for Male Qualitative Researchers Interviewing Women

Fahad M. Hassan, Caroline Gatrell
and Carolyn Downs

Interviews, like any other interaction, always take place in a 'gendered context' – the context of either gender similarity or gender difference.... The question is therefore not *if* gender makes a difference but, rather, *how* does gender matter? (Williams & Heikes, 1993: 283, emphasis added)

INTRODUCTION

A rich array of guidance exists regarding the ethical dilemmas experienced among women interviewing women, and by women interviewing men, in qualitative research. By contrast (albeit with important exceptions such as Ortiz, 2005; Broom, et al., 2009), the range of methodological discussions about how men may best manage the ethical complexities of interviewing women is narrow. This chapter contributes to understandings around gender, ethics and qualitative interviewing by addressing the ethical questions and interpersonal dynamics which occur

when men interview women. In so doing, it considers the question raised by Williams and Heikes, above, on '*how*' gender matters in qualitative research.

Specifically, the chapter focuses on a UK study on motherhood, part-time work and professional careers, for which Fahad Hassan was the principal (male) investigator. This role involved Fahad in the sourcing and interviewing of 13 highly qualified British Pakistani and White British mothers who were working part-time in senior, professional roles. In designing and conducting such research, Fahad, who is from Pakistan and married with children, and his two female co-investigators (Caroline and Carolyn, White British and also married with children) were faced with new challenges (and limited guidance) regarding the ethical approach of a research project in which a male researcher would interview female interviewees on a potentially sensitive topic involving personal lives.

GENDER AND QUALITATIVE INTERVIEWS

Inspired by the concerns of Oakley (1981) and Graham (1983) about the need to ‘shatter the silence’ of women’s voices (Graham, 1983: 135), a wealth of advice exists on the ethics and researcher experiences of woman to woman interviewing, particularly within a feminist context. Such guidance foregrounds women’s experience as a priority and often conveys dissatisfaction with quantitative paradigms (which are seen historically to render women’s lives ‘invisible’, Edwards & Ribbens, 1998). A feminist ethics of equity and the potential benefits of rapport between female interviewers and their interviewees has been much debated.

In addition to the above literatures on women interviewing women, a smaller but growing body of research reflects upon the ethical aspects of cross-gender interviewing. The majority of these literatures examine ethics from the perspective of women interviewers researching men. The consequent ethical research designs are frequently interpreted as embracing the well-being and safety of the female interviewer, alongside assumptions that male power dynamics might disadvantage female researchers. For example, Reinharz (1992: 42) describes women interviewers as often ‘studying up’ when researching men. Reinharz suggests that men will be less forthcoming than women respondents when it comes to sharing emotional experiences with women interviewers. She also expresses concerns that female interviewers might demand less of male than female interviewees, due to potential gendered power differentials between women researchers and male respondents. McKee and O’Brien (1983: 156) reflect upon the need for women interviewers to frame their interview schedules and questions carefully when interviewing men, so as to avoid the ‘unnecessary complications’ of potential sexual harassment. Arguably, while it is advisable for women

interviewers to take precautions regarding personal safety, such guidance could also be seen to raise ethical concerns about equitable treatment of male interviewees. Gatrell (2006) reflects on the ethical dilemmas confronting woman researchers concerned with managing their own safety while trying to treat all research participants fairly, applying standards such as reciprocity (Oakley, 1981) equally to everyone and assuming that the extent of interviewee self-disclosure will not necessarily relate to gender.

What is often missing from such important discussions around gender and qualitative interviewing, are analyses of the ethical challenges posed for male researchers interviewing female respondents. How might men interviewing women ensure that women’s voices are heard? (An important question for our research in which we sought to prioritise women’s voices.) How might men ensure that female interviewees feel comfortable and safe in the interview situation, and what issues do male researchers face when seeking to recruit female participants?

Below, drawing upon a research log kept by Fahad as he progressed his study into professionally employed mothers working part-time, we describe how he experienced the recruitment of participants and the conducting of interviews. We explain how the research design and ethical approaches were adapted in order to meet the requirements of both researcher and interviewees. We share and reflect upon the problems we experienced, as well as how we negotiated these.

We begin by outlining in more detail what the research project was about. We then explore how the research design was crafted to take account of the ethical dilemmas facing a male researcher seeking to interview a sample of women on a potentially sensitive topic. In this regard, we give an account of how Fahad chose Ortiz’s (2005) concept of muted masculinity as a source of guidance. We conclude with a discussion on how gender matters in qualitative interviews, arguing

that ethical sensitivity in qualitative research would be enhanced if male researchers undertaking qualitative interviews were to share and reflect upon their experiences wherever possible.

THE RESEARCH TOPIC: PART-TIME WORK AMONG PROFESSIONALLY EMPLOYED BRITISH PAKISTANI AND WHITE BRITISH MOTHERS

The research was designed to build upon a wealth of research on women and employment following the gender equality legislation of the 1970s (discussed in Crompton, 1997; Evetts, 2000; Hochschild, 2001; Blair-Loy, 2003; Gatrell & Cooper, 2008). As Gatrell (2005) observes, research centring on how women manage motherhood and careers has flourished. Debates around maternity and employment are central to a range of sociological, psychological, feminist and management literature (Epstein et al., 1999; Evetts, 2000; Hochschild, 2001; Gatrell & Cooper, 2008; Radcliffe & Cassell, 2013).

A significant element within this canon of research is the work of Blair-Loy (2003), who argues that, while part-time working may often seem like the only option available to professional mothers combining career with motherhood, such working patterns often lead to women being undervalued in organisations. Part-time work is consequently detrimental to women's career advancement. The argument made by Blair-Loy (2003) is important because statistical data (ONS, 2013: 1) reveals a stark difference between participation of men and women in part-time work. The UK Office for National Statistics notes that, while there have been dramatic increases in the numbers of women in work over the previous thirty years, the proportion of women working part-time has remained reasonably steady at 42–45% between 1983 and 2013 (ONS, 2013: 1). Furthermore, the numbers

illustrate that most of the part-time workers are mothers of young children.

With certain exceptions (e.g. Gatrell, 2007; Haynes, 2008), the wealth of quantitative data on part-time working amongst women is not matched by a detailed analysis underpinning reasons why the proportion of women working part-time remains fairly constant, despite improvements in the availability of childcare and increasing numbers of organisations offering family-friendly policies. Possibly, the relative lack of a qualitative, research-based understanding of motherhood, career and part-time working lends strength to unfair beliefs that mothers working part-time are less committed to their paid work than full-time workers (as argued by Hakim, 2000). It has been observed how such claims perpetuate, within organisations, the under-valuing of part-time women workers with children, even if such women are highly qualified, diligent and deeply committed to their employment (Gatrell, 2005). Given the relative limitations of quantitative research exploring the lived experience of professional women working part-time, and the associated organisational tendencies to under-value this group, it seemed important to look qualitatively into the underpinning values, attitudes and behaviours of professional mothers who are adopting part-time work as an active strategy for managing the complexities of combining career with motherhood.

In a desire to understand in-depth the experiences of professionally employed mothers working part-time in the UK, we focused on two groups: White British and British Pakistani professional women with children. Significantly, there are very low numbers of British Pakistani women working in a professional capacity compared to other groups of British professional women. British Pakistani women are the largest proportion of economically inactive women in the UK, with 60% economically inactive as compared to 20% or fewer women of other groups (www.ons.gov.uk/ons/rel/census/2011-census-analysis/

ethnicity-and-the-labour-market), and those who are economically active mostly work as packers, bottlers, canners, fillers and sewing machinists (<https://www.economist.com/news/britain/21568733-hidden-explanation-britains-surprising-job-numbers-bangladeshi-and-pakistani-women-are>). The UK Office of National Statistics also reports (ibid.) that 49% of British Pakistani women who are economically active work part-time, with 20% of them working less than 15 hours a week. These figures illustrate the scarcity of British Pakistani women working in a professional capacity.

British Pakistani professionally employed women are important not only because they are under-represented and under-researched, but also because they feel under-valued at work even when working full-time (Arifeen & Gatrell, 2013). (White British professional women are likely to feel most under-valued should they embark on part-time working having previously worked full-time (Gatrell, 2005).) The lack of research (especially regarding British Pakistani women) suggested a need to explore the experiences of both groups regarding part-time work. The study is, arguably, unusual in seeking to give voice in particular to highly qualified, ethnic minority British Pakistani professional mothers who opted for part-time work as a means of combining career with motherhood.

Where the study may be unprecedented in its approach, however, is in having a non-British, Pakistani male leading the study of the trajectories of career and motherhood among part-time professional British Pakistani and White British mothers. Below, we reflect on how gender ‘matters’ in qualitative interviews (Williams & Heikes, 1993). We show how, in crafting the research design, close consideration was given regarding how the ethical principles of prioritising women respondents’ voices could be pursued. In so doing, we focus particularly on the ethics of gender and power in cross-gender interviews, potential reciprocity between male

interviewer and female interviewees (Oakley, 1981; Edwards & Ribbens, 1998) and the use of ‘muted masculinities’ as a vehicle for reflecting upon gendered power relations between researcher and the researched.

However, we then go on to reflect upon how a lack of guidance on male to female interviewing in qualitative research may have contributed in producing some unexpected (and sometimes frustrating) outcomes. These unanticipated outcomes obliged us to adapt and reconsider the ethical approach regarding gendered and cultural expectations of interviewees, safety of interviewees and, especially, recruitment and access to the potential research participants.

Ethics, the Research Design and the Principal Investigator

The complex nature of the research topic required a phenomenological approach to ensure that the lived experience of participants was at the centre of the research on all occasions. Phenomenology may be described as a qualitative research technique that seeks to make explicit the implicit structures and meanings of human experience (Atkinson, 1972). This research needed to understand the implicit constraints on the careers of professionals who were also mothers; such constraints leading them to opt for part-time work as a means of combining maternity with employment. This approach was based on the views of Adam et al. (2005), who maintain that, despite equal opportunities legislation and policy, many discriminatory practices still exist (e.g. firms not employing younger women who might become pregnant). Given that existing discrimination against working mothers may not be explicit but implicit, Adam et al. (2005) emphasise the need for in-depth, qualitative studies among a small sample to understand the reasons behind such discrimination. The lives and lived experience of the women in the sample were complex and multi-faceted, requiring a phenomenological

approach, engaging with mothers in-depth (Stone, 1972). For these reasons, data was collected from mothers using face-to-face, in-depth interviews. In recruiting mothers, we sought women who had as a minimum a first degree qualification, and who were employed part-time in a professional capacity, mirroring Gatrell's (2007) study on mothers and part-time employment. All the research participants had thus opted for part-time work as a means of combining their career with motherhood and came from various professions, e.g. medicine, law, higher education, accounting, marketing, information technology, management and engineering.

As the research design progressed, we worked to develop a robust ethical framework which could address how gender differences between researcher and interviewees might 'matter' in the qualitative interviews. We were especially concerned (given our intention that women's voices should be prioritised) with the observation by Oakley (1999) and others (Ortiz, 2005) that it is important for qualitative researchers to consider the effect of their own gender when designing research methodology. We thus reflected closely on the ethics of potential gendered power differentials in male to female qualitative interviews. Attempts to achieve potential reciprocity between male interviewer and female interviewees formed a core part of the research design. Oakley (1999) posits that researchers have an ethical responsibility to pay close attention to interviews as both exploring gender issues and as gender scripts in themselves. Gatrell (2006: 244, emphasis added), in her research on women interviewing men, suggests that '*it seemed important to consider my position in relation both to cross-gender, and single sex interviewing*'. Gatrell's (ibid., emphasis added) suggestion is consistent with Rose (1985: 77), who asserts that no qualitative researcher could sufficiently claim himself or herself *neutral* because '*there is no neutrality*'. Therefore, it is argued that all qualitative researchers ought to be aware of the extent of their biases

(gender, insider/outsider status and ethnicity), and the impact of those biases on the research process to appreciate what they do.

It was, therefore, important for Fahad to develop understanding of his 'researcher context' (gender, ethnicity and insider/outsider status) as a qualitative researcher in line with the suggestions of Ortiz (2005) and Gatrell (2006). Fahad's position is as follows: he is a father; a male, non-British, Pakistani qualitative researcher who planned to interview professional British Pakistani and White British mothers who have/had opted for the part-time work with the intent of combining career with motherhood.

Cross-Gender Interviewing: Male Interviewer and Female Interviewees

Oakley (1981) and Ribbens (1994) underline the ethical importance of making qualitative interviewees feel comfortable with the research process. They indicate that, as a means of prioritising women's voices, researchers must encourage the development of rapport as part of an ethical approach to qualitative research with female subjects. Williams and Heikes (1993) observe how the vast majority of qualitative researchers use a 'same-gender' approach to interviewing due to the belief that they may achieve 'rapport' with less difficulty than if they were interviewing the opposite gender. Rubin and Rubin (2011) and Lohan (2000) observe how women interviewing men is a common preference perhaps because male research participants perceive women interviewers to be more attentive to emotions and the details of personal life, enabling men to display emotions feeling less embarrassment than if asked to share such feelings with a man.

In comparison to same-gender interviewing and female to male interviews, we have noted that it is relatively uncommon for male qualitative researchers to conduct face-to-face in-depth research interviews with

female interviewees to discuss personal and emotional issues. However, there are some notable exceptions to this, in particular studies by Ortiz (2005), Broom et al. (2009) and Peyton and Gatrell (2013). Our principal ethical concern was to address how the gender of the researcher might impact on the interview process and whether this might compromise the foregrounding of women's voices. Ensuring that female participants felt comfortable and enabled in Fahad's presence was the priority, with the notion of 'rapport' being an ideal to which we aspired. Siedman (2013: 13, emphasis added) warns that '*Males interviewing females can be overbearing*', and, bearing this advice in mind, we looked for a means by which we might minimise any sense of power differential between male interviewer and female interviewees in the sense described by Oakley (1981) and Reinharz (1992).

As an ethical approach for managing the interview process, Fahad chose Ortiz's (2005) concept of 'muted masculinity' as a model for reflection and a source of guidance. Muted masculinity is a gender management strategy which seeks to go beyond assumptions that gender matters (and might be problematic) in male to female interviews. Rather, it tackles the question raised by Williams and Heikes (1993) about '*how does gender matter?*' seeking to address how gender differences may be acknowledged and managed for the benefit of researchers and the researched in male to female interviews.

Fahad thus drew upon Ortiz's (2005) concept 'muted masculinity' to help promote a sense of equity between himself and his women interviewees, which we hoped would accord status to the voices of women interviewees. The explicit purpose of 'muted masculinity' as a gender management strategy is to avoid the display of hegemonic masculinity (in which men retain dominant roles in society) in male to female qualitative interviews. In our interpretation, muted masculinity further promotes and enables researcher reflection on the interviewee/interviewer

relationship from a gender perspective (Ortiz, 2005, adopted this stance for a long-term research study on the lives of the wives of professional male athletes). The rationale of Ortiz's concept of muted masculinity was reconstruction of his gender display as being 'less' masculine than most of the male professional athletes because the wives of male professional athletes were quite familiar with hegemonic masculinities. They often 'disapproved' of the display of hegemonic masculinity by their husbands, yet may have felt constrained regarding discussion of personal experience. Ortiz (2005: 270) maintains that he muted his masculinity by using 'various dramaturgical strategies' involving speech, appearance and behaviours, including mannerisms, demeanour and facial expression:

as an ethnographic strategy, this method (muted masculinity) of doing a non-hegemonic version of masculinity involved both my body image and self-image. I was aware of and was able to manage and display the type of masculinity that would be defined as appropriate by these couples. Muted masculinity involved the degenderization and regenderization of my male self. (2005: 270–271)

For the purposes of his interviews with employed mothers, Fahad sought to draw upon the concept of 'muted masculinity' as a means of thinking around how he might prioritise women's voices, 'muting' his masculine identity for the purpose of gaining rapport with participants during qualitative interviews (Ortiz, 2005). As noted above, Ortiz advocates a dramaturgical approach, in which mannerisms, language and embodied behaviours are muted. We demonstrate below, however, how Fahad found his experience of adopting such 'muted' behaviour different in practice from that of Ortiz because he did not, in the event, need to draw upon the dramaturgical techniques. However, the gender management strategy of 'muted masculinity' was useful in facilitating explicit recognition of the masculinities of the lead researcher throughout the research process.

The adoption of 'muted masculinity' was not the only arena in which Fahad's

experience departed from what had been anticipated in the research design. Perhaps due to the intense nature of the sensitive topic and his identity as a male, qualitative interviewer, some issues arose for which he was unprepared – in particular, the difficulties faced by a male researcher in recruiting and retaining female subjects. Given that ethical approaches to qualitative research foreground the well-being of researchers, as well as the researched (McKee & O'Brien, 1983), it was also important for Fahad to reflect on how he was affected by the research process. Such reflection was achieved through his research log, facilitating discussion regarding the ethical dilemmas, for a male researcher, of collecting data from British Pakistani and White British mothers. It is Fahad's experiences from his research log which we now share.

CONDUCTING THE RESEARCH: RECRUITING RESEARCH PARTICIPANTS IN MALE TO FEMALE INTERVIEWS

A significant proportion of qualitative studies on mothers rely upon informal channels, often via snowballing, to produce a sample willing and available to discuss often personal and sensitive issues around motherhood and family. Perhaps such informal approaches might also contribute to a sense of well-being and safe space among and between interviewers and interviewees in situations where both parties, even if previously not known to one another, are female and at least share contacts in common (Gatrell, 2005).

While the use of informal channels might have been ideal, this did not seem at first to be an option for Fahad because when he began his research, none appeared to be available to him. As a result, he embarked upon his search for research participants through formal channels, writing invitation letters to universities and various Chambers

of Commerce, Women's Organisations and Research Centres. The result of placing requests through such 'formal' channels was either 'no' or a polite 'unavailable' response. Where reasons were given for declining to be interviewed, these centred on discomfort with the male gender of the Interviewer, which was mentioned in the 'research invitation'. (The ethical principle of this research required that we explicitly mention the gender of the Interviewer to avoid taking the interviewees by surprise.) The mentioning of the Interviewer was also aligned with our intention of providing 'open and complete' information about the research project to the interviewees, seeking to 'decrease the ambiguity that surrounds the research interviews' (Cassell, 2005: 167). This difficulty in accessing a sample caused great anxiety to Fahad. Nevertheless, his experience was in accordance with the observation of Rubin and Rubin (2011) on cross-gender interviewing, especially regarding male to female interviews. They maintain that '*participants may be reluctant to allow interviewers access because of assumptions about the researcher based on his or her gender*' (p. 181). As an English speaking, Pakistani interviewer (though without British nationality), Fahad shared a common cultural background with some of his proposed research participants. However, his male gender also set him apart from both the British Pakistani and White British mothers and, arguably, rendered him an 'outsider' in both contexts. Fahad's sense of himself as an outsider accords with the suggestion of Dwyer and Buckle (2009), who posit that '*Whether the researcher is an insider; sharing the characteristic, role, or experience under study with the participants, or an outsider... including her or his membership status in relation to those participating in the research, is an essential and ever-present aspect of the investigation*' (Dwyer & Buckle, 2009, p. 55).

This initial attempt to use 'formal' channels showed that Fahad had 'outsider researcher' status, due to his male gender,

which contributed to his initial failure to recruit any respondents. As result of this failure, Fahad was obliged to reconsider the use of informal channels in order to recruit research participants. As he began to explore such informal channels, Fahad became even more aware of his ‘outsider’ status as potential interviewees turned down his invitation. Significantly, when first invited, the potential research participants showed interest. However, when they realised that they would be discussing with a man their life history, career aspirations, personal interpretation of motherhood and their emotions after switching to part-time work, their initial enthusiasm faded. Many of those invited to participate in the research through informal channels expressed ‘reservations’ about agreeing to an in-depth, face-to-face discussion on an emotionally charged, possibly ‘embarrassing’ topic in front of a male researcher. As one invitee explained:

I would participate, but I don’t know how to manage. It’s very emotional. It is hard. (An Invitee)

While ‘rapport’ and the prioritising of women’s voices had been identified as a key component for ethically appropriate research, this could not be achieved until Fahad actually secured an interview!

It thus became apparent to us that we had chosen a ‘hard to reach’ group of people for this study – though perhaps for different reasons from the usual ones.

Hard to Reach Groups

In the case of our study, the interpretation of ‘hard to reach’ research subjects was different from the usual use of this term, as the notion ‘hard to reach’ is more often associated with socially marginalised groups. Thus, although the research participants for our study proved hard for the male principal investigator to reach, they were different from the definition of ‘hard to reach’ groups as provided by Freimuth and Mettger (1990),

who define hard to reach subjects as ‘chronically uninformed, disadvantaged, have-not, illiterate, mal-functional, and information poor’ (Freimuth & Mettger, 1990: 323). By contrast, we sought research participants who were highly educated, successful and well-informed professionals who were hard to reach for different reasons, primarily, because Fahad was a man and apparently an ‘outsider’, at least in relation to the personal issues experienced by mothers. As one woman stated, during a telephone conversation prior to her interview:

It is difficult for you to understand. It is difficult to understand for any outsider. (First Interviewee of the study)

Perhaps the explicit discussion about Fahad’s ‘outsider’ status as a male interviewer may have facilitated the recruitment of this interviewee, who then discussed with him the suffragette movement and women’s struggle for equal rights in England. That conversation paved the way for the first interview.

‘Muted Masculinity’ as a Strategy of Gender Display of Male Interviewee in Cross-Gender Interviews

Having found the research subjects ‘hard to reach’, Fahad was obliged to try to meet potential participants via informal channels, meaning that personal and creative efforts were required for rapport building (Broom et al. 2009). One of Fahad’s few ‘informal contacts’ was a White British professional mother who switched from full to part-time work as a strategy for combining her career with motherhood. She was his neighbour. They usually met at that school gates, dropping off or collecting their children. She knew the topic of the research and they engaged in chat related to the significance and relevance of the topic to her own situation. The neighbour showed interest when Fahad invited her to participate in the study.

For the next six to seven weeks, however, whenever they met, she indicated that she was 'too busy' and trying to find 'some suitable time'. In the meantime, Fahad's efforts to recruit research participants from 'formal' channels were proving unsuccessful. He had no option but to wait. The neighbour explained that she was 'reluctant' to give an interview on such a sensitive topic because of the gender differences. However, she gradually perceived Fahad's routine of dropping his daughter off at school as 'different' from the stereotypes of Pakistani males.

The potential interviewee's mention of perceiving Fahad as 'different' from the stereotypes of Pakistani males opened up the possibility, for Fahad, of drawing upon Ortiz's (2005) 'display of muted masculinity' to build up rapport (Ortiz, 2005). It is interesting to note that in comparison with Ortiz (2005), Fahad's display of muted masculinity did not involve 'dramaturgical strategies'. While he *was* careful about the language and mannerisms he used in the interviews, Fahad found he really did not need to 'perform' any sort of dramaturgical version of 'muted masculinity' before or during the interviews. All he needed to do was to be himself, and to be open about his caring role with his children. Prior to beginning the research project, Fahad was used to hiding his 'parental emotions and expression' from his daughters and other family members because the cultural norms for Pakistani men would be to foreground an unemotional, work-oriented rather than family-oriented display of (non-muted) hegemonic masculinity. It is unusual for Pakistani men to be primary carers of dependent children (and to be open about this, if they are). However, Fahad did not attempt to hide that he was, at times during the project, providing full-time care for his girls. Having met his neighbour and other women at the school gates, Fahad began to be more relaxed about his identity as a Pakistani father of two school age daughters who believes strongly that 'women should have an equal chance throughout life with men for personal development, social

mobility and respect', and is 'working hard to give them such opportunities'.

One of the personal unexpected benefits for Fahad of 'muted masculinity' which he noted in his research log was being open about his carer role. This facilitated Fahad to 'express his joy' in parenting his daughters. Such openness is uncommon among Pakistani men, who are under pressure to display 'hegemonic masculinity' in which performances and negotiations of 'emotional self-control' are considered as an attribute (Connell, 2005). Developing his own interpretation of 'muted masculinity', therefore, Fahad did not attempt to hide the emotions he felt as a parent and (during interviews and pre-interview discussion) empathised with participants instead of hiding his emotions (as he believed they may have expected from especially a Pakistani male interviewer). The common role of parenthood, and the unusual fact of Fahad's being involved in his daughters' everyday activities, enhanced the rapport between the interviewer and interviewees.

One day, the first interviewee's daughter invited Fahad's daughter to a 'summer party'. Fahad was also invited to attend, along with other parents (mostly mothers). He went to the summer party with his daughter and it was good fun. The participants at the party were 'truly international' and in such a gathering it was possible to discuss different aspects of the various cultures present. This gave Fahad the opportunity to explain the 'type' of muted (non-hegemonic) masculinity in which he believes and practices, which seemed very different from the 'hegemonic masculinity' of stereotypical Pakistani men which other party-goers might expect.

The following week, the first interviewee agreed to an interview at her home. Drawing on the ethical principles which we had been established, Fahad considered that the 'safety' issue must be taken seriously and handled with care, especially in cross-gender interviewing where female participants may feel vulnerable (Lee, 1997). The first interview therefore took place in the interviewee's

kitchen whilst her husband was preparing supper. The environment was relaxed and safe. Fahad took safety measures seriously for all participants, making sure to pursue the ethical principles of the research in trying to ensure that interviewees felt as safe as possible, as suggested by Gatrell (2006). Fahad thus offered all the interviewees complete freedom to choose their preferred venue for their interview and indicated that everything would be arranged at the convenience of the interviewee and without question.

The impacts on the research process of following this particular ethical principle were that the time and effort taken to complete the interview schedule was much lengthier than had been anticipated. First, all the research participants chose their own houses or offices for interviews. It was good for the quality of the data because they felt ‘safe’ in their own chosen venue for interview. However, it took a long time to interview 13 people. It had been intended to apply the ‘snowball’ technique for recruiting potential research participants, but this did not work because of the issues related to cross-gender (male to female) interviews, and sensitivity of the research topic. Every interviewee was thus independently approached and recruited, and this involved quite extensive travel across the UK. Fahad travelled to 10 different cities for 12 interviews: Lancaster (two interviews), Morecambe (one interview), Preston (one interview), Oldham (one interview), Manchester (one interview), Trafford (one interview), Derby (one interview), Birmingham (one interview), London (two interviews, although one interviewee later withdrew from the study), and Edinburgh (one interview). The following table presents demography and brief profiles of the research participants.

The research was time consuming not only in terms of travelling, but sometimes interviews were rescheduled because of ‘unforeseeable’ reasons relating to the comfort and convenience of research participants. One of the interviewees lived in Birmingham.

She booked a time slot on one Thursday between 12.30 pm and 2.00 p.m. Travelling from North West England, Fahad reached Birmingham about 11.30 a.m. by bus. He took another bus to reach the nearest bus stop to her home, and then took a taxi. When he reached her home, her husband came out of the house, telling Fahad that she would not be available for interview because relatives had arrived at the home without prior notice. The husband insisted that, as a Pakistani male, Fahad should understand that parents and relatives do not need to inform the family before visiting. He also indicated that Fahad ‘must’ understand the responsibilities of his wife (preparing food etc.) in such a situation. In terms of the cultural context, Fahad did understand, but had nevertheless travelled a long way. However, he was also bound by the ethical principle of prioritising the comfort and convenience of interviewees. He thus felt he had little option other than to ‘smile’ and leave. While this might be the approach adopted by many researchers, this situation was perhaps especially challenging for Fahad, given the difficulties he had faced in recruiting his research sample.

Fortunately, perhaps because of the manner in which Fahad had prioritised her comfort and convenience, the Birmingham interviewee phoned later, explaining how sorry she was. Due to Fahad’s understanding and courtesy regarding the cancelled interview she agreed on a second date and time for the interview. This time, the venue was the house of her parents, where her mother took care of the children. The interviewee appeared to speak freely and openly. She shared her invaluable experience of the process of switching to part-time work from full-time work, combining her career with motherhood as a British Pakistani professional mother in a male dominated profession.

Furthermore, although Fahad soon discovered the difficulties in recruiting mothers due to his male gender, he had assumed that the recruitment of British Pakistani women might be more challenging than that of the

P/T R* = Reason for part-time

WS* = Work status

Sector* = Employment sector

R&T = Research and teaching

CB* = Child birth and care

CA* = Child adoption and care

PD* = Professional development

P/T* = Part-time

F/T* = Full-time but worked part-time at one stage of professional care

L&D* = Learning and development

White British mothers, in accordance with Brah (1993) and Wigfield and Turner (2012), because they belong to a faith-based community (see also Brackertz et al., 2005: 37). In practice, while it was hard to recruit any mothers at all, there were perhaps fewer problems in engaging the White British women than the British Pakistani respondents. However, the reasons given by British Pakistani women for uncertainties about taking part in the research were not those that had been anticipated. In the event the main, and unexpected, barrier among such women proved to be their concern with gaining their husband's approval in order to feel comfortable about being interviewed. This concern could not be questioned, due to the ethical principle of putting the comfort and cultural traditions of respondents before all else. This came of something as a surprise given that of 5 out of 6 British Pakistani women research participants were more educated, and had been earning significantly more than their husbands when they were working full time. Yet all of the women wanted to obtain their husband's approval and act according to their cultural tradition. One of these interviewees lives in London and withdrew from the study after the stage of data analysis because her husband withdrew his approval of her participation in the study. Despite the great disappointment that came with losing important data from this member of a hard to reach group, no attempt was made to question this decision, due to the ethical principles of the project.

Reciprocity

Interestingly, while Fahad did feel he had achieved rapport with those he interviewed, he did not experience a sense of 'reciprocity' within interviewees – once they had established that he was empathetic, and closely involved in the day-to-day care of his own daughters, the mothers he was interviewing did not ask any further questions or show interest in how Fahad managed his

commitments to work and family. Rather, in a manner similar to cross-gender interviews conducted by Ortiz (2005), Broom et al. (2009) and Gatrell (2006), Fahad noted that the interviewees 'preferred to preserve the interview as space to talk about their own issues' (Gatrell, 2006: 245), instead of a reciprocal information sharing event. Once the interview began, it seemed that interviewees wanted to be listened to with interest and without interruption, regardless of the gender of the interviewer.

DISCUSSION

This chapter has considered the complexity of applying, in practice, ethical principles in research where there are cross-gender qualitative research interviews (male interviewer and female interviewees). While research ethics are frequently discussed, this is commonly in relation to female to female, or male to female interviewing. Here, by contrast, we have reflected on how gender mattered across a range of cultural contexts and what ethical approaches we needed to consider in male to female interviews. We have outlined how initial research strategies had to be adapted as the research progressed, and having reflected on these adaptations, we now reflect on what we have learned.

MUTED MASCULINITY AND MANAGEMENT OF THE RESEARCH PROCESS

First, having intended to adopt 'muted masculinities' according to the framework developed by Ortiz (2005), Fahad found a way to adopt the principles of muted masculinities by simply being himself. This was because the interview preparation process and reflection on the first interview had revealed that although he was an 'outsider' in terms of

gender, ethnicity and nationality, his status as child carer and career-oriented professional connected him with the interviewees in a manner which had not been anticipated. Fahad found, in particular, that the expression of parental emotions, being known as an active father through the routine of dropping his children off and picking them up from school, were regarded by other mothers as 'un-hegemonic masculinity'. Arguably, Fahad's relationship with his daughters (once participants came to understand this) overrode the gender differences which constrained recruitment. From a personal perspective, the use of the learning log and subsequent discussions aided the development of the muted masculinities and assisted in thinking through how to manage researcher anxieties and research problems as they arose. Fahad felt he benefited personally from such reflections. Having been a 'typical hide-emotions-from-daughters type of Pakistani father before starting this research', he has changed his 'type of fatherhood'. In his notes, Fahad observed how:

I used to 'hide' that I cook for my kids, but now I do not feel 'shame' anymore to tell people about cooking and enjoying the school sports day of my children. It is possible that cooking, attending sports days and 'green assemblies' etc. are entirely opposite to a typical Pakistani father, but I simply do not hide this change. I share the feelings of parenthood truly and honestly with my interviewees, usually after the interview, but also through pauses, facial expression and an emotional display of parenthood that connected the interviewees and me.

Rapport and Safety

Second, while we had interpreted 'rapport' as including a sense or reciprocity, this was not the case. Fahad experienced interviews as predominantly 'interviewees' events' providing a space where the women could explore without interruption their issues related to career, motherhood and part-time work. Fahad felt connected with interviewees

because as an 'emotion expressing father' they found him to be 'a bit different to typical males'. Despite the difficulties of recruiting research participants, the in-depth, open and personal information offered by the interviewees on the sensitive issues around their interpretation and practice of motherhood; the significance of career in their life and the impact of part-time work on career and motherhood proved very motivating for Fahad. The first interviewee expressed a sense of relief in sharing her 'struggle and success' with someone in an open and non-judgemental environment (Gatrell, 2006).

How Does Gender Matter in Qualitative Interviews?

Although Fahad's male gender did not seem to affect the conducting of interviews negatively (though it did constrain recruitment), it raised an important point to be considered in all research endeavours with participants who identify with a group based on a shared experience such as gender. This issue confronts both researchers who are members of the group they are studying and those who are not, for there are costs and benefits to each status.

Based on the above reflections, Fahad's experience of cross-gender research interviews has shown that rapport building and safety of interviewees (and interviewers) are central tenets of male to female interview events. Perhaps being open about emotions is also helpful for male interviewers seeking to perform 'gender' appropriately during in-depth interviews. Arguably, based on the rich cross-gender interviews conducted as part of this study, men can interview women (even women from hard to reach communities) and gain rich data.

We would argue that cross-gender interviewing is not problematic by default. We agree with Ortiz (2005), Gatrell (2006) and Brook et al. (2009) that interviewees need to be listened to with interest (Brook, 2011),

empathy (Ortiz, 2005), non-judgementally and without interruption, whoever is conducting the interview (Gatrell, 2006). Nevertheless, the field of qualitative research could benefit greatly if those male researchers involved in cross-gender interviews share their learning. Such an approach would lead to the development of fresh perspectives in the field of cross-gender studies and will enable, in the future, better and informed research design regarding ethical approaches to sensitive issues in cross-gender research.

Writing through the Body: Political, Personal, Practical

Amanda Sinclair and Donna Ladkin

INTRODUCTION

What does it mean to write ‘through the body’? How does the materiality of your body, your perceptions and responses, affect who you are as a writer, what is important for you to write about and how you go about writing? And how can you bring more of your embodied knowing – your hunches and gut feel, your tastes and senses – to your research, writing it in ways that are vivid and enlivening for you and your readers? In this chapter we explore these questions and argue that attending to the memories, emotions and physically anchored learning that bodies carry enables researchers to learn ‘that which was unknowable and unimaginable’ using more conventional writing formats (Richardson & St. Pierre, 2005: 963). We believe, and venture here, that writing through the body is a political act for a researcher, one that is particularly suitable for qualitative researchers who often seek to give voice to the overlooked but crucial

subjectively experienced meanings of phenomena.

We also aim to be practical – not to lose our bodies and your bodily responses under a weight of theorizing. We faced a conundrum in writing this chapter. While a handbook contribution is expected to provide an extensive theoretical and research review, our focus and our own experience demanded that we write this chapter differently. We have sought not just to write *about* ‘writing through the body’ but to place our bodies and our feel for your likely bodily responses front and centre *in the way* that we have written. We’d like to invite you – we can’t control your reaction so it’s really just an invitation – to read this chapter with your body as well as your mind.

The following anecdote from Donna’s experience provides an example of the kind of bodily intelligence we’ll be exploring in the chapter:

One of my PhD students, Chris, was having enormous difficulties writing up his thesis. Although he

had done the fieldwork and delved into the literature to understand where his study was positioned theoretically, whenever he sat down to write he just couldn't get started. 'I have to have the whole argument in my head before I start writing it,' he explained, 'and I just don't know the whole argument yet. I have to keep thinking about it.' Although I encouraged him to just 'start writing', months went by and all he produced were scratchings and incoherent paragraphs. It was only when the deadline for his registration began to loom that something shifted for him. 'With the pressure of the deadline, I suddenly realised I just HAD to start writing. And the strangest thing began to happen.... the more I wrote the more I began to understand what I wanted to write. It happened that way round – by writing I understood what I wanted to write, rather than the way I thought it worked – knowing what to write and then scribing it down'.

Chris had assumed, as many of us do, that he had to 'know' what he knew before writing. But this way of understanding writing, as something that follows rather than precedes or accompanies knowing, ignores how the physical act of writing itself provokes sense-making. It is often only through the physical motion of engaging hands and fingers with the mental 'ideas' that what we know is able to take form in written words. Empowering ourselves to write well includes listening to our bodies and what they know about what we are trying to say.

So, what bodies are these – poised at computers on opposite sides of the world, writing this chapter? We are two women academics who share an interest in leadership, as well as yoga and physicality. Amanda is Australian with ancestors from Northern Europe. Shortish and with a history of feeling a bit overlooked, her sense is that she needed to be bigger or more provocative to be heard. This possibly explains some of her subsequent behaviour and her career, which has often involved challenging conventional notions of leadership. Donna is American by birth and British by naturalization and of African American, Native American, French and German heritage. Making her home in a different country, she is particularly sensitive to

the way in which culture impacts on what is deemed 'important'. Understanding knowledge as situated, contingent and based on who is in power has been a lived reality of her life. Perhaps as a result of her own situated-ness, she has a reputation for requiring her students to reflect on 'how' they know, as well as 'what' they know.

One of the many things that drew the two of us together was a belief in the potentially redemptive qualities of the physical and the sensuous. We believe people, including researchers, are at their most empowered and inventive when feeling connected to the delights, pleasures, surprises and frustrations of being a physical as well as mental body. Let's test that idea out by inviting you to 'check in' with your own body, wherever, and however it is right now:

Take a moment to notice how you feel at this moment. Are you feeling sluggish, or do you feel awake and curious? Where do you most 'feel' your body? For instance, are you most aware of tension in your jaw – or instead are you aware of a general feeling of warmth or coldness in your limbs? Take a moment to notice your belly. What are the sensations there? How are your chest, ribs and heart areas feeling? Note any awareness you might have of tightness or heaviness. Are you clenching your jaw or hunching your shoulders? Just notice those impressions without deciding they are good or bad, right or wrong. Tapping into the wisdom of the body requires listening to it in all its states, rather than judging the way it is.

Enjoy a slow, luxurious breath in. Notice your chest rising, or even your abdomen expanding if your breath travels down into the lower regions of your chest cavity. Breathe out, noticing if you've made any judgements about yourself, your breath or our instructions. Hunch up your shoulders and let them fall, adding a sigh as you breathe out. Notice your posture – is there anything you can do to put your body at greater ease? How do you feel as a result of bringing your attention to your body in these ways?

Involving your body in simple practices like those described above opens the door to an embodied way of reading and writing. Increasing amounts of research from diverse

sources – from philosophers and phenomenologists, feminist and critical theorists, scholars of the creative and performing arts as well as neuroscientific researchers – suggest that bodies play crucial but neglected roles in apprehending the world and in linguistically and cognitively mediated processes of sense-making (Cunliffe & Coupland, 2011; Meriläinen et al., 2015). For example, phenomenologists such as Maurice Merleau-Ponty (1945, 1968) and cognitive scientists such as Francisco Varela (1993) insist that ‘the body’s way of knowing the world is primary, prior to cognition’s role in selecting and interpreting’ (Ladkin, 2013: 325). As psychoanalytically informed theorists also show, bodies and bodily responses offer ways of tuning into what is noticed less consciously, those dimensions of experience that our self-appointed rational or polite minds may censor at cost to our deeper understanding (see for example Vachhani, 2012). Embodied ways of sensing and understanding are indispensable in enabling us to focus attention; to find ‘flow’ or a state of absorption and creativity (Csikszentmihalyi, 1990); and to uncover deeper understanding and wisdom.

In line with these understandings, we encourage you to stay ‘in your body’ as you read this chapter. Notice how your breath changes when reading certain sections. Be aware of paragraphs which result in feelings of tiredness or disinterest, and others that quicken your pulse. What can your own bodily reactions teach you about the rhythm and shape of writing that enlivens? How might you put what you experience into your own practice as a qualitative researcher?

As well as exploring such practical dimensions, the chapter begins by delving into the political agenda behind omitting the body and its wisdom from so much academic writing. We believe that consciously engaging the body in the process of conducting research and writing is a political act particularly appropriate in undertaking qualitatively based research. Interrogating why so much

academic writing is disembodied and the purposes this serves is a good platform from which to encourage you to consider disrupting those conventions. In the second section of the chapter we offer our own narratives and experiments with consciously ‘writing through the body’. Rather than suggesting our experiences provide recipes for approaching this territory, we wish to tempt or provoke you into exploring your own opportunities and challenges in inviting your body in. The third part of the chapter is devoted to describing some practical activities both ‘on’ and ‘off’ the page, practices you might already engage in for other purposes but which we hope will help you change the way you think about and approach your research and writing practice.

THE POLITICAL: DISRUPTING THE APPARENT ERASURE OF BODIES IN ACADEMIC WRITING

Why have bodies been omitted from academic writing and what are the consequences of that omission? To begin to answer these questions, let’s consider the features of privileged management and organizational writing; the kind you read in the *Academy of Management Journal* and other high-status, high rejection rate journals where most researchers aspire to publish. A primary criterion for the validity of such text is that authors and their bodies, with all their prejudices and predilections, are expunged from the text. Conventions concerning the ‘proper structure’ for journal articles, rules concerning referencing and substantiating claims, serve to constrain the writing into a predictable form. Even journals with a reputation or mandate to challenge and critique conventional management knowledge are often surprisingly un-experimental when it comes to the writing. Though there are, of course, exceptions, bodies are largely uncommon

subjects of managerial research, and researchers' bodies and sensory responses seldom appear in their written accounts.

These omissions are not accidental. The 'standardization' of academic writing is an act of power. Keeping writing cerebral and governed by restrictive norms of form and vocabulary are mechanisms through which power and authority stay in the hands of editorial and other gatekeepers. They are the processes by which a discursive political economy is erected, policing what is written into discourse and how. Although it can be argued that such norms were established to maintain clarity and transparency for other researchers to comprehend, and perhaps replicate, much contemporary academic writing no longer meets these criteria. Rather, these taken for granted academic conventions of writing often involve loss: of vividness, of immediacy, of embodied responses among writers and readers.

You might find yourself thinking that the loss of such vividness is a small price to pay in order to achieve the hallmark of 'good' academic research: objectivity. Joining many qualitative researchers, we want to disrupt the taken for granted view that academic knowing is objective and expressed as a 'voice from nowhere'. We write this chapter from the perspective that all knowledge is situated and mediated through our physical forms. For qualitative or interpretive researchers especially, 'there is no place to stand outside of the social world that allows a view of truth unmediated by human language and embeddedness in circumstance' (Schwartz-Shea & Yanow, 2012: 98). Writing – its form, content and absences as well as presences – is shaped by cultural and disciplinary forces which themselves limit what can be known. Knowledge systems exert discipline over their members about how new claims to authority are made. As academics, our role is not just to be bound by, and dutifully reproduce, such systems. It is to critique and challenge them, to experiment with radically different discourses and ways of writing (Richardson, 1997). Further though, the act of writing itself

can be understood as a method of inquiry. The writing *is* the mode of inquiry, and how we engage with the body as we write determines what we find as researchers (Schwartz-Shea & Yanow, 2009). For example, our bodily sense of what is important may encourage us to not leave out what we don't understand: thus 'not flinching from where the writing takes one emotionally or spiritually' (Richardson & St. Pierre, 2005: 965).

Why might writing through the body be especially suited to qualitative research? As this volume shows, qualitative research is interested in capturing, reflecting and inspecting the subjectively and sensuously experienced world of organizations. It often problematizes the supposed gaps between researcher and researched in that qualitative researchers' interpretations of the research field are formed by their interests, past experiences and intuitions in more marked ways than quantitatively based researchers, who test research hypotheses from a distance. 'Themes' which arise from data sets are often grounded in bodily based recognitions of patterns or 'felt' disruptions in what one is analysing. Suggesting that data can be 'objectively' ordered is a remnant from the positivistic paradigm and an assumption ill-suited to most qualitative research.

Feminist theorists have also exposed the gender politics that have often underpinned academic writing. Some have argued that what presents itself as objective writing is actually what has been privileged as masculine writing. In this view, writing has always had a body – a manly one. For example, Jane Hindman observes that 'academic writing is masculinist: represented and taught as if it were coherent, methodologically sound, articulate, consistent, democratic (or at least impartial and consensual) and most importantly, rational' (2002: 98). Prescriptions for good writing have reflected notions of embodied masculinity: forceful, spare, muscular. In contrast, bad writing is often viewed as excessive, inappropriately intimate or confessional.

As counterpoints to masculine, disembodied accounts, feminist writers also offer extensive and rich experimentations in 'writing through the body' (Metcalf, 2003). Concerned with how male-centric modes of theorising 'disappear' women's experiences, their embodied identities and sexualities, women writers and researchers have advocated palpably different relationships between body and consciousness, text and knowledge. For example, in Beverly Metcalfe's exploration of Sylvia Plath's poetry and Luce Irigaray's writing, 'the body of the writer plays an important role in the textual product' (2003: 6). Putting the body into the writing is a form of productive resistance, creating new textual spaces to explore typically masked aspects of feminine consciousness, eros and sensuality.

So Why Don't Researchers Experiment with Writing Differently?

The obvious response is that for the most part, universities, employers, journal editorial boards, supervisors, only value one legitimated form of writing. People who are junior in academia have to emulate the rules. They don't have power to disrupt established norms, or so the argument often goes. But Foucault's work shows us that we all have power, indeed, disturbing norms of writing or writing in innovative ways may be one of the ways we can resist oppression and create greater freedoms for others through our writing (see also Grey & Sinclair, 2006).

Our hunch is that a deeper reason why researchers often collude with disembodied, normative writing is to do with securing identity. Our selves are constructed through writing, and, especially for researchers, learning to write is a means of performing a validated self (Ivanič, 1998). According to this view, one of the main tasks for a research student is learning the language sufficiently well to sound authoritative. Through writing within

the dominant discourse, fears about one's value are allayed or at least deferred. By obeying writing rules, a future is made knowable and one's position in it more secure.

What is the alternative to constructing one's identity by staying within these traditional forms? Educator Jane Gallop suggests that in order to make our writing mat(t)erial 'we must gesture to our bodies, and our lives' (1988: 4). This can be accomplished, she suggests, by marking our bodies' presence, calling to the surface associations my thinking process passes through, such as those connected with my gender, race, class or sexual orientation as I write. This is a process of 'self authorizing', bringing the truth of embodied knowing to what is written. Amanda remembers the excitement when she first encountered Gallop's writing, a paper entitled 'The Teacher's Breasts' (1995). As she relates in the next section of this chapter, it was one of a few pieces of writing that recognized the body not as a bystander, but as author, disrupter and transformer of academic knowledge.

What's going on in your body now? Sit back now and move your gaze to something external like the view out the window. Allow your shoulders to drop and the body to be as comfortable and relaxed as it can be at the moment. As you read the sections above about writing, power and identity, how has your body reacted to different sections? Have you felt a slight quickening of the breath and alertness of posture as some ideas and sentences 'hit home' or resonate with your own experience? Alternatively, which paragraphs have been met with a numbing of bodily response – perhaps as others work is referenced and our writing has obeyed conventional academic norms? Tune into what your body might be telling you about your appetite for the next section.

THE PERSONAL: OUR EXPERIENCES OF BRINGING OUR BODIES TO RESEARCH AND WRITING

Bodies and embodied responses are, we have suggested above, important subjects of study

in organizational research, but further, can act as agents of creativity and innovation in understanding and writing our findings. In fascinating research exploring investment bankers' relationships with their bodies, Alexandra Michel shows that while bankers' minds are terrifyingly willing subjects of organizational socialization and norms, 'the body cannot be socialized completely' (2011: 325). Michel's findings confirm that bodily responses can override the otherwise slavish tendencies of our minds to conform. Further, bankers who listened and paid attention to bodily responses, including breakdown, performed better over the long term. These individuals were assessed as being more creative and flexible in their roles, less prone to 'meltdowns' and generally rated as being more successful. Michel recommends future research explore 'sensitizing individuals to the body's creativity' (2011: 357).

That bodies and physicality could open up new understandings of leadership was a possibility that Donna and her co-editor, Steve Taylor, were keen to explore in their edited collection *The Physicality of Leadership: Gesture, Entanglement, Taboo, Possibilities* (Ladkin & Taylor, 2014). Chapters in the book reveal that rather than being passive carriers of understanding and knowledge, bodies are inextricably entwined with the enactment of leadership. For instance, Mary Phillips's (2014) account of Star Trek Captain Jean-Luc Picard's suppressed sexuality in contrast to the Borg Queen's blatant eroticism highlights the 'taboo' territory of sexual dynamics in the workplace, which Bathurst and Messervy's subsequent chapter explores in the real-life example of Bill Clinton's US presidency (Bathurst & Messervy, 2014).

Donna and Steve also sought to encourage ways of writing *about* physicality that enabled it to be 'experienced as more than a "concept" but as a kinaesthetic apprehension' (Ladkin & Taylor, 2014: 5). In her own chapter 'In through the nose, out through the mouth', Donna tells the story of her coaching work with an accounting executive,

which partially involved helping him breathe differently. The chapter includes some of Donna's notes after coaching, which describe her observations about and responses to his hunched posture, averted gaze and hesitant voice. As she writes about him and her own responses, as well as intermittently directly addressing the reader, her writing itself helps to create somatic connections: we slow down and breathe more deeply, we feel the pressures of workplaces and then the tenderness and care that is required for us all to survive them. Similarly, and in another very moving chapter, 'Open your heart', Steve writes about his experience inviting students to open their heart in exercising leadership. His writing – in both its content and the way he writes with spare prose – helps us feel the students' fear and courage that are inevitably part of opening our hearts. The writing itself resists playing the 'status games' that so often get in the way.

Amanda's writing about bodies in leadership commenced with her observation of the paradox of the visibility of leader bodies being largely invisible in research writing (Sinclair, 2005a; see also Ladkin, 2013). Bodies seemed to matter in leadership but were not written about in research. The capacity to physically dominate – to be tall, athletic or to have an imposing voice – gave certain male leaders an edge. Many women and minority leaders struggled to deliver this 'look' of leadership. She initially wanted to simply write *about* this – the presence and power of bodies in leadership but their absence from leadership scholarship. As she did so, however, her intent and approach *in* the writing changed – from writing conventionally about the body and its absence to becoming more experimental. Reflecting on her writing journey, Amanda can discern phases through which her writing migrated from a more cognitive approach of making intellectual sense of what she was researching, to wanting her own bodily sensations and those of potential readers to guide her, as she describes below.

Phase 1: My own body as a problem: In this initial stage, my body in relation to writing felt like an obstacle to be overcome. My body couldn't be tied to the desk long enough to write. I never had enough time away from childcare and domestic responsibilities to satisfy the academic ideal of the researcher. I fitted in bits of writing around other roles and identities, being opportunistic in what I wrote and finding publication opportunities where I could.

Phase 2: Noticing and drawing attention to bodies in my writing about leadership: While researching the absence of women in leadership, I noticed and began writing about how men's bodies were often pivotal to the herculean construction of male leadership. Yet that herculean construction was invisible. Meanwhile, women and other leaders who did not conform to the able-bodied, white heterosexual stereotype of tall manliness were subject to a barrage of advice. I began documenting the ways women leaders hide, de-sexualise, maternalise, masculinise or make benign their bodies. I became more alert to the 'clothing rules' women learned: only one piece of 'statement' jewellery, minimal cleavage, navy suits not red, heel heights neither too tall (seductress) nor flat (lesbian). Women were told they should worry about how they look but shouldn't look like they are worrying about how they look; to do so would appear self-obsessed or narcissistic.

Phase 3: Advocating for attention to bodies in research: Acknowledging the different 'body rules' for male and female leaders, I was also keen to research the positive contributions of bodies, and care for the bodies of others, in leadership. For example, in 'Body possibilities in leadership' (Sinclair, 2005a), I wanted to show bodies not just as problems but potentially a key enabler of good leadership. Following the work of feminist scholars, I also wrote about bodies in management teaching, suggesting that learning might be enhanced with an embodied pedagogy (Sinclair, 2005b; see also Bell & Sinclair 2014).

Phase 4: Experimenting with ways of writing about bodies that were not theoretical, but that resonated with people's experiences of being bodies: Accessing academic scholarship on bodies, I found much of it – well – disembodied! I embarked on a range of experiments trying to capture more of the body in the writing. In the first of these, 'Placing self' (Sinclair, 2010), each page of the article contained an upper section or 'top self' and a lower section or 'bottom self', following a device used by

novelist J.M. Coetzee (2007). While the 'top' text was written in the voice and language of academic discourse, the 'bottom' text gave voice to the more child-like, censored and needy part of me. My argument was that leaders benefit from reflexive identity work, mapping feelings, doubts and vulnerabilities that are expressed bodily rather than cognitively. I wanted to try and demonstrate it in the writing as well as write about it. Writing that piece felt exposing. Although the editor, David Collinson, was encouraging, I can't escape the feeling that other readers were embarrassed, at least made awkwardly silent, by it.

Phase 5: Further experimentation: writing the stream of embodied perceptions and sensations that are an unspoken part of leadership: From my own experience and from working with leaders, I knew there was an embodied subtext of experience and self-talk that accompanies leaders wherever they are: 'I am so tired I don't know how I am going to stay awake for this evening meeting', 'that dodgy knee is agony when I sit for long periods in those chairs', 'how does person X continue to project so perky and confident an image when his marriage is going down the toilet?' In 'A material dean' (Sinclair, 2013), I wanted to capture the viscosity and immediacy of this stream of embodied reactions – the humour, petulance, gut reactions interwoven with enacting leadership, but which are rarely acknowledged. I hoped the reader would tune into their own embodied reactions; to have their stomach turn as they read about the formal dinner where the fish was slightly off and to re-experience similar occasions where the food matches the indigestible tone of the event. My own Dean wanted to read this article and requested a copy (perhaps to check it wasn't slanderous). To his credit, he admitted he could relate to the feeling of his heart sinking as he walked into a meeting and hearing a particular strident voice holding forth.

Phase 6: Putting the censored body and its sensations into an account of leadership to exemplify how bodies are part of constructing a convincing leadership persona: In 'On knees, breasts and being fully human in leadership' (Sinclair, 2014), I wanted to go even further in bringing the body's contribution to enacting leadership into focus. Using the occasion of an interview for the CEO position of a large construction company, I aimed to capture in the writing moment-by-moment, physically anchored feelings for the main characters (2 CEO candidates and the company founder). For each, their bodies were the carriers for history and memories, vulnerabilities and fears. I was also,

as with 'A material dean', trying to engage the reader, to make it hard for them not to think about their own painful knee or embarrassment about aspects of their body. I wanted to invite from the reader their bodily experiences of previous interviews where the job requires a performance of leadership which is a long way – for most of us – from doubt-ridden, embodied feelings of inadequacy. After reading the piece a colleague volunteered that it had prompted him immediately to remember his discomfort walking after damaging one of his feet, and the implications of this on his confidence and capacity to travel and do his job. It is that kind of recognition of how the body is foundational to the experience of 'doing leadership' which I'd hoped the chapter would foster.

Phase 7: Encouraging mindfulness and the value of 'being present in the moment' in the practice of research, writing and leadership: Over the past ten years or so, I have begun researching and writing about mindfulness and especially its application in leadership. My interest in mindfulness has grown out of my yoga and meditation practice. Though it began – and is often positioned as – a practice on the edge of my work to help gain perspective and relieve stress, I realized that mindfulness might be more fruitfully practised at the heart of how we are in our day-to-day being of work and leadership. Initially, my interest in mindfulness, I think, struck many as being opposed to my interest in bodies. It is commonly thought that the body becomes irrelevant when one is being 'mindful'. However, it is the body, its sensations and the breath that are the most common and reliable ways to access mindfulness or awareness of the present moment. Conveying how this works through writing is difficult. I found that the usual language and discourses of academic writing just didn't work. I found myself sabotaged by my internal critic labelling me 'confessional' or criticizing me in the voice of colleagues: 'too personal' and 'where's the evidence?' The writing had to be different. I had to allow other forms of authority to be present. I had to allow the writing to come from a different place in me: sensations, gut and heart. I know by my body's response when a patch of writing is flaccid or predictable. There is a tingle of excitement when it's not. What feels right in the writing is what feels fresh, beguiling (I can never use 'beguiling' without remembering my mother – it was a favourite of hers). What feels right in the writing is what is worth pausing for, savouring. What words might land in a place where the reader can feel it, act on it, be lifted, sustained or moved by it? These are embodied responses that I am seeking to value in writing.

Embodied responses are always worth noticing – if not following – in writing. The body provides clues about whether a piece of writing feels true or 'felt' (Ladkin, 2013). Our bodies also encourage us to take the reader's perspective and put a value not just on imparting ideas but doing so in ways that surprise or energize. Life is too short to condemn others to boring writing. It is too short for our own hard-won research to remain un-read. So, how might we write with, from and through the body?

THE PRACTICAL AND PHYSICAL: WAYS OF WRITING WITH THE BODY

Why don't you have a bit of a stretch now? If you are sitting and it's possible to, get up and raise your arms as high or as wide as they will go. As yoga practitioners, both of us recommend the benefits of stretching for life in general, not just for writing. As an embodied practice for writing, stretching and consciously breathing allows the blood to more freely circulate and facilitates the moving of oxygen around the system. Such breathing and stretching creates a virtuous circle, in which you can be more alive and also be more sensitive to what is enlivening you. Best of all, stretching can be done wherever you are. When you've returned your attention to this page, notice how your body is now feeling.

In this final section of the chapter we offer some practical suggestions concerning *how* you can write through the body. Though not a definitive list, they are practices and activities which have changed and (we hope) helped our writing.

Practices on the Page

In the contemporary context, it would be more accurate to title this section 'Practices on the screen' rather than 'Practices on the page', as so much academic writing now takes place directly on to computer screens through keyboards rather than on to material paper. (Indeed, this chapter is taking shape on a computer screen in Australia and one in

the UK.) However, let's stay with the page for a moment, and notice the impact of its materiality on the writing process. In fact, let's experiment with a key 'practice on the page' right now.

Freefall writing

Find an actual piece of paper and a writing implement – a pen or a pencil. Also, find a way of setting a time limit of 5 to 10 minutes. Write at the top of the sheet of paper, 'I remember...'. Start the timer and now just WRITE whatever is prompted by those words, for 5, 7 or 10 minutes. It is very important that as you write you don't stop and edit what you've written. Don't go back to correct grammatical mistakes or spelling. For whatever time you have set yourself, just write. If you can't figure out what more you want to say in relation to the theme, 'I remember', just write, 'I can't think of anything more I want to say' and the embodied feelings around that until something else arises.

After your allotted time of writing in this way, reflect on your experience.

- How was it different from your experience of writing through a computer keyboard?
- Did you notice any changes in your breathing, your posture or body as you wrote in this way?
- What did you notice about what you wrote, itself? Did this process take you to places you had not anticipated?

A number of authors who teach creative writing, such as Natalie Goldberg (2005), Judy Reeves (2010) and Barbara Turner-Vesselago (2013), advocate the benefits of writing directly onto material paper. Among other advantages of this practice, handwriting establishes a different rhythm than the staccato action of typing through a keyboard. It may feel more fluid or more awkward. Either is good, potentially inviting something different from you or from a different place in you. For some, handwriting can evoke childhood, or a sense of not being good at

something. For others it can feel unruly, disruptive or freer. Julia Cameron describes this necessary stage in writing as the 'suicide of "nice" self' (1994: 7). Handwriting and the instruction not to go back and correct what you have written allows what you are writing to move forward uninhibited by critical voices requiring you to 'get things right'. When typing it is tempting to start correcting and perfecting, but this usually results in writing which stays safe and predictable. Instead, write fast, longhand. Use up all the paper, draw and squiggle if you like. Don't be tidy. Don't pause to edit. Go 'fear-ward' (Goldberg, 2005). If you feel your heart in your mouth or your stomach churning, keep writing.

This activity, known as 'Freefall Writing', is a bodily based practice Donna uses frequently, especially when she is writing an article and is not sure what needs to be said next. As she describes it:

In those instances I write 'What this article is trying to say is ...' at the top of the page and allow myself to write. I frequently discover a kernel of insight that I just can't unearth by 'thinking' about what I want to say. The bodily process of writing seems to allow things I don't 'know' rationally to emerge. Additionally, the longer I keep 'writing freefall', the quality of the material invariably improves. In my experience, a good deal of 'garbage' gets vented in the first three or four minutes of writing – all of the things I think I 'should say', or 'should know' – but the real gems come after those first few minutes. So setting your timer for ten, rather than five minutes – or for twenty, rather than ten minutes, can be very beneficial. Don't worry if while you are writing there is a critical voice haranguing you to stop because what you are doing is a waste of time. In my experience, I certainly waste enough time staring at an empty screen or wrestling the 'perfect sentence' to the page (or screen) when I'm writing 'normally'. Ten or twenty minutes of freefall writing is rarely a 'waste of time'; it is much more likely to be a liberation.

Stream of consciousness writing

As well as 'freefall writing', others, such as Julia Cameron (1995), advocate the benefits of starting each day with 'stream of

consciousness' writing. Cameron calls these 'Morning Pages', and they are the equivalent of morning stretches for writers. Like freefall writing, they are done in longhand without stopping to correct or edit what has been written for a certain period of time or over a certain number of pages (Cameron suggests three). Unlike freefall writing, they are not focused on a particular topic, but instead aim to capture a less processed version of 'where you are' as you are writing them.

Sometimes writing stream of consciousness or freefall with the non-dominant hand can reveal new insights and directions for writing. In the *The Power of Your Other Hand* (2001), Lucia Capacchione describes how one's non-dominant hand can unmask insights the body knows, but which the mind inhibits from arising. Although, or perhaps because, slower, non-dominant hand writing is less at the mercy of the rational mind, insights become available which one doesn't rationally 'know' well enough to be able to articulate in writing.

Both of these practices recognize the entanglement of body and mind in the writing process. They frequently tap into unconscious knowledge and understandings held in the body which the rational mind cannot access by just churning around itself. The physical practice of moving the hand across the page (rather than tapping into a keyboard) often allows a different, less censored part of us to be expressed. After a session of 'freefall writing' or 'morning pages', Donna often finds herself reflecting, 'I never knew I knew that!' For Amanda, handwriting often invites a more transgressive or courageous voice – the one that says 'dare I say that?'

'Sketchbooks' and journaling

As an another 'on the page' practice, Amanda always has handwritten notebooks 'on the go' which contain a mixture of reflections and notes about things she is reading, writing or planning. These notebooks are dated and she refers back to them when writing or doing research. They have a loose index on

the front page where she lists what's in them – a key reference she made notes about, a set of teaching experiences or an article she was preparing at the time. In writing this chapter, Amanda went back through these notebooks and found quotes, sources and reflections about writing that helped her surface her own and others' prior wisdom about writing with bodies. In her research of composers, Donna found many musicians carried these 'sketchbooks'. Beethoven, for example, used to put everything into them: shopping lists, accounts, oh, and the odd bar of the Eroica Symphony!

What is it that is useful about these physical books with their handwriting, rather than a laptop? First, they each have a particular colour and 'look' which is an aid to remembering what is in them and why one bundle of insights, memories and experiences might be relevant to current writing. Second, the books can be written anywhere: in bed, the park, at the beach or on the train. They can be carried easily and they have a looser shape and feel that lends itself to recipes being added or reminders or observations that have no special status as 'work'. They don't have to 'earn their keep' as significant but can be sketchy and inconsequential.

Both of us also incorporate journaling (ideally in longhand) in our leadership teaching. In the 10-week MBA Leadership subject that Amanda teaches, students are encouraged to write in journals that are for their eyes only. While for students the idea of writing by hand about what's going on is often seen as a bit wacky or self-indulgent, the best response is not with argument but with the encouragement to treat longhand writing as simply a case study in trying something novel. They are invited to notice any defences or discomfort that may arise and if something different emerges on the page.

Allowing the body into the writing in the ways described above can enable some filters of the rational mind to be bypassed. Embodied knowing can often be 'taboo',

a reservoir of less polite and more unruly desires, emotions or truths. But it also knows what 'matters', and in this way can fuel writing of power, whether that writing is for the academy or for wider audiences.

Further, and depending on what kind of writing we are engaged in, body practices like those described here can enable greater creativity and freedom. For example, studies of improvisation by jazz musicians suggest that in order to be creative we need to find ways of turning down the volume of the critical, evaluative parts of our brain that say 'you can't do that' or 'that sounded terrible, you are making a fool of yourself!' The way in which good musicians give themselves permission to experiment is to be in their bodies and to feel the flow and pulse of music. Similarly, for other composers and visual and performing artists who value spontaneity, the challenge is to get out of their heads and allow their senses to guide them.

Now, you may be quietly – or not so quietly – grumbling to yourself there's no room for all this creativity and longhand in academic research! The next section offers suggestions for activities which will support a more embodied approach to writing, however disembodied your field of research is or committed you are to your customary way of writing.

Practices off the Page

Noticing embodied responses

What excites and enlivens your body when you are not writing? One of the important aspects of writing from the body is to take clues about important subjects for research from wider experiences that move or surprise you. This was the impetus for an article Donna wrote: 'Leading beautifully: How mastery, congruence and purpose create the aesthetic of embodied leadership practice' (Ladkin, 2008). She describes:

While attending a concert in which Bobby McFerrin was interacting with the audience, I became aware of just how engaged I was – and how engaged the other 5000 people in the Royal Albert Hall also seemed to be. McFerrin had a mostly middle class, white, British crowd clapping and stomping their feet in a most uncharacteristic way! This experience was the impetus for a subsequent body of work exploring the aesthetic dimension of leadership, and the body's role in both producing and experiencing charismatic leadership (Ladkin, 2006) and authentic leadership (Ladkin & Taylor, 2010). The point here is that during every day experiences, our bodies are telling us what enlivens us, as well as what puts us to sleep.

Moving, stretching, walking

Writing can be deeply claustrophobic where, for example, on the fifteenth draft you find yourself back writing the identical sentence you jettisoned three versions ago. Among the best antidotes to 'stuckness' is to do something physical. It doesn't have to be elaborate to deliver benefits: try hunching your shoulders up and releasing them, slowly turning your head from side to side while consciously breathing, or clenching and relaxing your jaw. Simple physical 'moves' help 'move' our writing: by helping us connect to feelings we had missed; by permitting ourselves more looseness and freedom; or by reminding us of the 'big picture' of our lives, appreciative of having the space and opportunity to write.

This kind of embodied writing engagement is also fostered by attending to the sights, sounds, smells and feelings evoked by the physical world. What is your way of re-connecting to your materiality and that of the world around you? For Donna it is walking. Attending to the walk – the colours of trees and flowers, the sounds of grumbling truck engines or chattering birds, the smells of cut grass, the feel of the feet as they reliably convey us across a field – is crucial. The rhythm of walking itself, as well as the way it brings you into contact with the wider world in its intricacies, offers inspiration and perspective when I'm feeling 'locked in' as

a writer. While walking, Donna advises not to consciously ‘think’ about the writing. The benefits are in walking rather than using it as a way of just taking the whirring mind ‘out’, where it can whirl in the presence of fresh air.

Sometimes tearing oneself away from the writing can feel hard. In editing this chapter, Amanda has come to precisely this point here, saying ‘If I just have 10 more minutes with this I should be able to work out the perfect form of words here!’ More often than not the 10 minutes turn into 30 and the piece is no further forward. Immersing oneself in something physical is the necessary circuit breaker. For Amanda, this might also be a walk, or going for a bike ride or a swim if it’s summer. Alternatively, it may be pulling a few weeds out of the garden, digging over the compost or having a conversation with her chooks (who don’t care about writing but have other wisdom to share).

The important point is that writing which is alive, vivid and inspirational is informed by body-based sensitivity and apprehension. Inviting the body into writing happens both in the act of writing itself, and in the ways we move, breathe and notice when we aren’t typing on a keyboard or holding pen in hand.

YOU, YOUR BODY AND YOUR WRITING

Those of you reading this chapter (and having made it this far) will probably have absorbed – or had drummed into you – norms and conventions about how (academic) writing *should* be done. Our desire has been to unsettle those assumptions and to encourage you to engage with the intelligence of the body as well as the mind. There are many ways of writing with, from and through the body and we hope some of our examples inspire you to notice and experiment with your own bodily processes in writing.

Catching the wisdom of embodied knowing and bringing it into words on the page is not an easy achievement. Frequently, in the

writing of this chapter, we have said to one another, ‘but how do we convey that visceral notion in words?’ Writing the ‘body’ of this chapter has itself been an embodied process, despite the fact that our bodies are separated by thousands of miles. Our own bodies have infused the writing, enabling each of us to help the other see, and sometimes ditch, ‘naturalisms of style and attitude’ that too often don’t add much (Richardson & St. Pierre, 2005: 975). We’ve let go a lot of footnotes. We’ve jettisoned a lot of capital ‘R’ research, guessing that you probably do lots of reading of that kind of writing already. Our own embodied tunings have prompted us to shorten sentences, remove adjectives, to de-clutter and be direct. As we swapped drafts, we invited the other ‘body’ to ‘kill our darlings’ – the ideas and bits of writing that we had become rather attached to but which turned out to be not so original or useful. Perhaps we should have killed more!

We know, and we know you know, the temptations of reproducing the customary discourses and disembodied languages of your disciplines. You may get published! But there are enough examples of embodied writing that, one way or another, have won audiences, and equally importantly, have elicited deeper insight, even thrill and enjoyment. Good writing – powerful or surprising writing that has the capacity to change the reader’s understanding of the world – comes from writing daringly through our bodies.

Intersectionality and Qualitative Research

Jenny K. Rodriguez

INTRODUCTION

Intersectionality is one of the most influential advances in the theory, research, and practice of gender and diversity scholarship. It is considered an instrumental tool to study the reciprocities of gender and other categories of difference and how these are created, reproduced, and perpetuated as part of systems of power and inequality that sustain privilege and disadvantage in everyday life (Anthias, 2005; Phoenix, 2006; Winker & Degele, 2011). A foundational argument posed by intersectionality is that gender by itself is insufficient to determine either a superordinate or subordinate position; instead, we must look at how social identities as well as socially constructed markers of group membership influence beliefs and experiences of gender and are used to allocate power (Hurtado, 1989: 833; Shields, 2008). Building on this foundation, intersectionality is now used to understand multiple subordinate-group identities in order to show that gender processes ‘intersect with and are shaped by race and class

processes, as well as other forms of inequality and exclusion’ (Acker, 2012: 214).

The treatment of intersectionality in research has been framed by the exploration of ‘the relationship among multiple dimensions and modalities of social relations and subject formations’ (McCall, 2005: 1771). The combination of intersectionality’s interest in understanding systems of power, inequality, and oppression, alongside the orientation of qualitative research in understanding fluidity instead of fixed or ‘true’ meaning, makes intersectionality very suitable for adopting qualitative research approaches. Some scholars (e.g. Hancock, 2007a; Bowleg, 2008) have hinted that qualitative research methods are more suitable for intersectional work as they support intersectionality’s primary aims of critiquing and disrupting understandings about people’s experiences through the focus on multivocality, knowledges, and the politics of empowerment (Hancock, 2007b).

In this chapter, I focus on the use of intersectionality in qualitative research, discussing

its opportunities and challenges, and providing examples of intersectional work primarily across disciplines in the social sciences and the humanities that have used qualitative methodologies and methods. Following this introduction, the first section discusses intersectionality, focusing on its meaning and scope, and how this has shaped understandings of what an intersectional approach is. A second section discusses the notion of ‘qualitative intersectional research’, identifying ways in which intersectionality as a research paradigm can be embedded in qualitative research. A third section discusses the practical aspects of conducting qualitative intersectional research. This discussion is framed in relation to issues pertaining to research design, intersectional analysis and interpretation, and intersectional reflexivity. The final section concludes the chapter identifying the contribution of intersectionality to qualitative research, and identifying future directions in the use of qualitative research methods in intersectional work.

INTRODUCING INTERSECTIONALITY

Intersectionality refers to a critical insight that emerges from how the reciprocal construction of categories of difference shapes the identities and experiences of individuals and groups (Collins, 2015). More concretely, it could be exemplified by highlighting the diverse experiences of individuals and groups; for instance, if we were to explore white women’s experiences of oppression and Asian women’s experiences of oppression, while we could argue that both might experience sexism, white women’s oppression is linked to privilege by virtue of being white, whereas for Asian women oppression is likely to be linked to migration and intergenerational experiences (Few, 2007). Underpinning intersectionality is the understanding that disadvantage, inequality, and oppression operate within multiple, converging, or interwoven systems of power relations (Carastathis, 2014a). The

term was coined by Kimberlé Crenshaw in 1989 and emerged from a historical narrative about race and gender traced back to the eighteenth and nineteenth centuries in the US (Hancock, 2013). In particular, Crenshaw’s work builds on ideas posed by Black, Chicana, Latina, and other women of color feminists and activists during the 1970s and 1980s (e.g. Gloria Anzaldúa, Angela Davis, Patricia Hill Collins, Audre Lorde, Chandra Mohanty, Cherrie Moraga, as well as Barbara and Beverly Smith, Demita Frazier, and other members of the Black lesbian feminist group, the Combahee River Collective). They argued that their experiences of oppressions were interlocked but ignored and invisibilized by structural systems due to a separate focus on gender and race.

Crenshaw (1989, 1991) expanded on this idea in the field of law studies, arguing that there was limited understanding of the experiences of disadvantage and marginalization of Black women as a result of the prevalence of single-issue analyses that informed judicial decisions. She argued that the prevalent model in employment discrimination litigation had major conceptual limitations because despite Black women experiencing discrimination ‘in ways that are both similar to and different from those experienced by white women and Black men’ (Crenshaw, 1989: 149), the framework did not allow for the possibility of these experiences to be used by Black women to obtain social justice. The complexity of this argument is summarized by E. R. Cole (2009), who noted that Black women could have (a) similar experiences to those of White women on the counts of gender, and those of Black men on the counts of race; (b) different experiences to each of these groups as they could experience double discrimination from the combined effects of discriminatory practices based on gender and based on race, which neither White women nor Black men would experience simultaneously; and (c) experiences specific to their status as ‘Black women’, that is, not the sum of gender and race but rather something unique to the subjective and structural articulation of being ‘Black women’.¹

Following the development of intersectionality in theoretical, conceptual, and empirical terms, intersectionality is used as a critical alternative to identity politics that considers differences both within and between groups (Prins, 2006). There is an implicit assumption that the intersection of categories of difference positions individuals and groups in particular theoretical points and that adopting an intersectional approach allows for a more comprehensive exploration of those theoretical points to understand experiences of disadvantage and marginality, and contest dominant understandings of gender processes.

There are diverse understandings of intersectionality; some scholars refer to it as a theory, others as a construct or heuristic device, and others as a reading strategy for feminist analysis (Davis, 2008). Crenshaw (1991) has used the metaphor of a crossroads or traffic at an intersection to illustrate intersectionality, arguing that diverse factors flow from different directions and only by looking at the interconnection of these factors is one able to understand causes, characteristics, and consequences of events that happen at the intersection. When taking the crossroads metaphor to try to understand multiple and simultaneous subjectivities and inequalities, Grillo's (2013) explanation provides much insight. She notes that:

Each of us in the world sits at the intersection of many categories: She is Latina, woman, short, mother, lesbian, daughter, brown-eyed, long-haired, quick-witted, short-tempered, worker, stubborn. At any one moment in time and in space, some of these categories are central to her being and her ability to act in the world. Others matter not at all. Some categories, such as race, gender, class, and sexual orientation, are important most of the time. Others are rarely important. When something or someone highlights one of her categories and brings it to the fore, she may be a dominant person, an oppressor of others. Other times, even most of the time, she may be oppressed herself. (p. 17)

Methodologically, there have been interesting developments in the use of intersectionality and the longstanding 'quantitative versus qualitative' debate has also pervaded intersectional

work (Bowleg, 2008). On the one hand, the importance of being able to 'demonstrate' discrimination and disadvantage has meant that quantitative approaches could be seen as more effective to translate intersectionality approaches into concrete actions. On the other hand, we could argue that understanding marginalized groups is inherently a qualitative question because while quantitative approaches might help us to demonstrate some instances of discrimination or unequal treatment, which provide useful insight that could inform outcomes, they do not fully explain or help us to understand the more complex dimensions of systems of privilege and oppression, such as how individuals experience them in their daily lives and how shifts in power, privilege, disadvantage, and inequality occur. For example, reflecting on what explains the gender divide between Blacks and the racial divide among all Americans, Simpson (2007) notes that 'many social science researchers have relied on survey data, much of which is inadequate for answering these questions [...] because issue cleavages among Black Americans are difficult to locate using surveys' (p. 152).

QUALITATIVE INTERSECTIONAL RESEARCH: KEY ASPECTS

In order to delve into the use of intersectionality in qualitative research, a good starting point is to acknowledge that while 'intersectionality' can be difficult to grasp because it does not refer to a single thing but to a set of things interconnected in ways that are not readily visible, this provides an excellent opportunity to craft research projects flexibly and inclusively. Given its understanding as, among other things, theory, epistemology, paradigm, epistemic sensibilization, methodology, and method (Hancock, 2007a; Geerts & Van der Tuin, 2013; Roth, 2013), there is much scope for researchers to focus on alternative explanations about lived experiences. As such, developing qualitative intersectional research

requires thinking about (a) how we understand social categories of difference, (b) what we want from intersectionality, and (c) how we operationalize the intersections between social categories of difference. In this section, I expand on these three points, explaining key issues to consider and providing examples:

Understanding Social Divisions

Understanding social divisions starts off with the question: *What is our position about how the intersectionality of social divisions happens?* Intersections are normally understood as operating as either additive or constitutive processes. As an additive process (also known as the unitary approach), categories of difference are seen as having distinct social properties. For example, an additive exploration would consider how gender (being female), ethnicity (being Black), and sexual orientation (being lesbian) would each impact the life of a lesbian Black woman. Conversely, using the understanding of intersections as constitutive processes (also known as the multiplicative approach), the interaction between social categories is at the center of the work. For example, a multiplicative exploration would consider what it means to be a lesbian Black woman from a perspective that assumes that the experience is shaped by how the individual is never ‘a woman’ or ‘a lesbian’ or ‘Black’ but rather the identity and social position is always about the simultaneous intersection of the three categories.

Both understandings have been criticized. Despite being widely used in policy-making, the linearity of the additive approach fails to consider how one social category impacts the next and ignores that identities are dynamic, shifting, and multiplex constructions (McCall, 2005; Yuval-Davis, 2006; Hillsburg, 2013). The multiplicative approach, on the other hand, although seen to convey more genuinely the ethos of intersectionality, is considered difficult to operationalize given that it is unlikely that a research project will be able to account

for the complexity it entails (Hillsburg, 2013). Nevertheless, a multiplicative approach is helpful because it shows how categories of difference are intertwined and mutually constitutive. It makes visible dynamics that had generally been overlooked in gender scholarship; such as the way social locations (that include gender but are not only or centrally about gender) emerge from the way a particular status is created within social structures to perpetuate systems of privilege and disadvantage (Andersen & Collins, 2015).

Understanding the Purpose of Intersectionality

After positioning ourselves in relation to the way the intersections operate, we must pay attention to intersections themselves. This is about understanding the form that intersectionality will take in a research project and answers the question: *What should intersectionality help us to highlight?* This is relevant because the way we theorize social divisions is not only determined by how we understand these divisions but also what we want the intersections to show in context (Yuval-Davis, 2006). Davis (2008) has noted that central to intersectionality are questions such as ‘how race is “gendered” and how gender is “racialized”, and how both are linked to the continuities and transformations of social class’ (p. 71).

Crenshaw (1991) has referred to three ways in which the intersectionality theme can be understood that highlight particular points: structural, political, and representational intersectionality. *Structural intersectionality* refers to the ‘multilayered and routinized forms of domination’ (p. 1254), those that emerge as unintended consequences of existing social structures created to organize and support different social groups. Crenshaw (1997) exemplifies this theme by alluding to ‘the way in which rape crisis centers in poor minority or immigrant communities must address rape survivors’ homelessness, unemployment, poverty, hunger, distrust of

law-enforcement officers, and perhaps their lack of English-language skills as well, often hindered by funding agency policies premised on the needs of middle-class whites rape survivors' (p. 250). Using the same example, we could also highlight the way in which structures of support for rape victims have systematically excluded male rape victims.

Crenshaw (1997) frames *political intersectionality* as how feminist and antiracist politics have helped in the marginalization of issues facing Black women because 'frameworks highlighting *race* and those highlighting *gender* are oppositional and contradictory' (p. 250, Emphasis in original). This theme is normally linked to the exploration of public policies and how/whether intersectionality is embedded in their articulation (what is included and how it is framed) and in the way policy-related outcomes are defined (how/whether the outcomes reflect the issues linked to individuals' overlapping identities). For example, analyses of gender equality policy in Europe (e.g. Lombardo & Verloo, 2009a, 2009b; Verloo, 2013) have focused on political intersectionality to highlight the failure of policy frameworks to account for diverse actors and their intersecting and interconnected experiences.

Two interesting examples that show the complexity in design that allows the exploration of political intersectionality are the works of Verloo and Lombardo (2007) and Borchorst and Teigen (2010). Verloo and Lombardo (2007) propose critical frame analysis, a reflexive methodology, to 'enable the researcher to give visibility to processes of exclusions that exist in the formulation of policy discourses' (p. 38). They argue for (a) not using definitions to allow for fluidity of meaning in constructs used, (b) using sensitizing questions to analyze policy documents, and (c) developing coding before the analysis to allow for freedom and flexibility in the interpretation of variations. They see this methodology as helpful to researchers to assess and detect inconsistencies in relation to the correspondence within a policy text between

the problem diagnosed and the prognosis or solution to it. Borchorst and Teigen's (2010) work analyzes gender and integration policies in Scandinavia, adopting a multi-layered approach that explores the micro (every day), meso (movements and organizations), and macro (national policy-making) levels. Their argument is that within these levels, dynamics, institutions, and actors interact and shape political agendas in distinct ways, and so provide more insight into 'how inequalities and their intersections are relevant to political strategies' (Verloo, 2006: 213).

Finally, *representational intersectionality* alludes to the cultural construction and 'depiction through text, language, images, media, of groups and individuals in society' (Jordan-Zachery, 2013: 108). This theme puts importance on the way intersectional imaginaries are created, which not only feeds on stereotypes but also explains symbolic exclusions and boundaries from categories of people in particular narratives about work and employment (Mavin et al., 2010; Holtzman & Sharpe, 2014). This is the most under-researched theme and one for which there is significant potential in order to understand how 'the everyday' shapes institutions, structures, and practices. Most discussions have focused on the analysis of media artifacts – e.g. Boyle and Brayton's (2012) analysis of masculinity in a Hollywood film – and in particular the analysis of race in films, such as Peña Ovalle's (2011) discussion of how the work of Latin women in Hollywood films is framed by a legacy of racialized and sexualized imagery.

More analysis is needed, however, on the experiences of individuals and groups as a result of these media imaginaries. For instance, in a piece for THUMP (Okereke, 2014), an electronic music and culture channel from Vice Magazine, Kele Okereke, singer of the British indie band Bloc Party, wrote about the challenges connected to his identity as a gay Black man in a music scene that was predominantly dominated by straight White males. He also alluded to his 'lack of lineage' due to the limited exposure of 'people

like him' in the scene. In his piece he asked: 'Can anyone remember the last time a major British music magazine put a non-white face on its cover?' This type of question, which speaks about how individuals and groups are affected by representational intersectionality, is one of the issues that remains largely under-researched as most works focus on representations themselves, not on their impact and how they lead to exclusion.

Analyzing the issue raised by Okereke using representational intersectionality, we would ask ourselves questions such as: How are specific identities framed in popular music? What role do the media play in the production and diffusion of particular identities in popular music? How are dominant and marginalized identities negotiated through different types of music and what consequences does this have on individuals and groups working in this field? Crenshaw (1997) notes that race and gender images readily available in our culture converge to create particular narratives considered appropriate for a specific group; analyzing these questions would be helped by a sociocultural framing that looks into how racialized and sexualized rhetoric is constructed in media and society. Similarly, the analysis should explore the impact of the systematic exposure of specific identities, and their consequent legitimization in the collective popular imaginary (Holland et al., 1998) for those in marginalized and dominant positions.

Following this discussion, Table 26.1 explains these themes and their key questions and provides examples of works using qualitative research methods (also see Table 26.2 for a detailed explanation of the specific approaches and methods adopted by some of these works).

Operationalizing Intersectionality

The empirical operationalization of intersectionality is perhaps the most challenging aspect in research terms. In operationalizing intersectionality, we look at two main questions: *How*

do we make work intersectional? And how do we make categories of social difference operational for our research in a way that (a) captures the intersections and (b) captures how the intersections of the categories play out in societal structures of power, privilege, and oppression? In methodological terms, the first question goes to the root of the epistemology of intersectionality. Going back to Simpson's (2007) idea, the uniqueness of intersectionality as a framework requires an alternative epistemology, which Collins (2001) has termed a 'Black feminist epistemology' and she sees as 'consistent with Black women's criteria for substantiated knowledge and with our criteria for methodological adequacy' (p. 256). This epistemology would be characterized by four criteria:

- 1 *Using lived experience as a criterion of meaning* – She argues that this form of knowledge 'allow[s] for subjectivity between the knower and the known, rest[s] in the women themselves (not in higher authorities), and [is] experienced directly in the world (not through abstractions)'. (p. 259)
- 2 *Using dialogue in assessing knowledge claims* – This refers to prioritising oral traditions in the knowledge validation process through the active participation of all individuals.
- 3 *Embedding the ethics of caring in the knowledge validation process* – This is related to valuing personal expressiveness and connectedness; it relies on acknowledging individual uniqueness, the appropriateness of emotions in dialogue and the capacity for empathy.
- 4 *Exercising ethics of accountability* – This refers to making people accountable for their knowledge claims; linked what is said to the personal credibility of an individual 'as an ethical human being'. (p. 265)

Using Collins's (2001) ideas and taking advantage of the flexibility of intersectionality to account for meanings, articulations, and shifts in the way individuals make sense of their social categories of difference and those of others, the importance of crafting cannot be stressed enough (see Cunliffe, 2011). Crafting is about taking intersectionality's interest in the features and quality of

Table 26.1 Intersectionality themes using qualitative research methods

<i>Theme</i>	<i>Understanding</i>	<i>Important questions</i>	<i>Examples of scholarly work</i>
<i>Structural intersectionality</i>	Institutional and structural elements that shape racism, sexism, and classism. 'How individual's legal status or social needs marginalize them as their identity statuses converge' (Shields, 2008: 304).	'How and when does racism amplify sexism? How and when does class exploitation reinforce homophobia? How and when does homophobia amplify racism?' (Verloo, 2006: 213).	Dottolo and Stewart (2008) Kvasny et al. (2009) Boogaard and Roggeband (2010)
<i>Political intersectionality</i>	The role of feminist and antiracist politics in marginalizing disadvantaged groups. 'Political organising (within social movements) and political processes (adopted by governmental and other organisations)' (Fish, 2008).	'How and where does feminism marginalize ethnic minorities or disabled women? How and where do measures on sexual equality or on racism marginalize women? How and where do gender equality policies marginalize lesbians?' (Verloo, 2006: 213). 'How can knowledge produced about multiple inequalities contribute to tackling discrimination? What are the political costs and barriers to producing such knowledge?' (Fish, 2008). 'How do specific groups generate political attention to their claims and shape political discourse?' (Borchorst & Teigen, 2010).	Verloo and Lombardo (2007) Lombardo and Verloo (2009a) Lombardo and Verloo (2009b) Borchorst and Teigen (2010) Lombardo and Agustín (2012) Verloo (2013) Cruells López and Ruiz García (2014)
<i>Representational intersectionality</i>	Material and symbolic production of social divisions that devalue individuals and groups within popular culture. Multiple stereotypes in cultural presentations (e.g. films, adverts, soap operas, music, theatre, paintings, displays, etc.) to fix representations of dominant and marginalized groups.	How are individuals and groups depicted in the media? How are individuals and groups included in or excluded from particular social categories in collective imaginaries? What unique and specific narratives do representations of individuals and groups that shape the legal, institutional and structural frameworks that affect them?	Butz (2008) Gill (2009) James (2011) Bünz (2012) Chapman (2015)

experiences of disadvantage, discrimination, and oppression as a starting point for decisions about design, methodology, and method. In the operationalization of intersectionality, the analytical foci should include: (a) identities of individuals and groups considered 'different', (b) the categories of difference, (c) processes of differentiation, and (d) systems of domination (Dhamoon, 2011).

In that respect, qualitative methodologies, especially those that provide the space for the simultaneous collection of detailed individual, group, and contextual data, would be particularly useful. I expand on this last point in the next section of this chapter.

The second question is about the operationalization of categories, which would determine the methodological decisions about

Table 26.2 Examples of intersectional research using qualitative methods

<i>Authors</i>	<i>Research question(s)</i>	<i>Intersectional focus</i>	<i>Sample/Sampling</i>	<i>Methods</i>	<i>Data analysis</i>
Adamson and Johansson (2016)	'How is embodiment mobilized or retired in constituting the credible professional? How does this occur through intercorporeal interaction in different work settings? How can an embodied intersectionality framework further our theorization of professional embodiment' (p. 3).	Embodied intersectionality framework, professional credibility	26 practicing counseling psychologists (23 women and 3 men) in Russia recruited through email, via professional websites and snowballing.	Life-story interviews	Narrative analysis
Adib and Guerrier (2003)	How is the intersectionality of gender, race, ethnicity, nationality, and class articulated in the narratives of women at work within operative level jobs in the hotel industry?	Gender, nationality, race, ethnicity, and class	15 hotel management students from a London university returning from a compulsory one-year industrial placement where they worked as 'receptionists, waitresses, chambermaids and reservation staff as well as in duty management in hotels in the UK and abroad' (pp. 420–421).	Semi-structured interviews	Narrative analysis
Amrute (2016)	'Is being good at programming fixed in certain kinds of bodies?' (p. 14).	Race and class	50+ Indian men and women programmers on temporary work visas in Berlin, Germany, and 32 German, British, Australian, American, and Indian managers and programmers, all recruited at offices, via mutual contacts and at trade fairs.	Ethnography: individual and group participant observation, shadowing, and interviews	Ethnographic coding
Atewologun et al. (2016)	What identity-heightening episodes trigger meaning-making of intersecting senior, gender, and ethnic identities among British Asian and black women and men in their interactions with clients, subordinates, and superiors?	Gender and ethnicity	24 Black Ethnic Minority British nationals (12 women and 12 men), self-nominated for the study following an announcement of 'a study on senior minority ethnic men and women's identities promoted internally in a large UK public sector organization and a Big-4 Professional Services Firm' (p. 228).	Critical incident technique with daily diaries and interviews	Abductive analytical approach of narratives
Barnum and Zajicek (2008)	What gendered and sexualized representations of race (gendered race) and racialized representations of gender and sexuality (racialized gender) are present in visual media?	Race, gender, and sexuality	Diesel clothing advertisement campaign 'Nature: Love It While It Lasts'.	Purposeful sampling of a case study	Content and structuralist/semiotic analysis

Bell and Nkomo (2001)	What are the career experiences of Black women executives? Did they experience discrimination in their organizations? How did they perceive their roles? What were the obstacles they experienced? What were some of the joys of being in those positions? And how did their experiences differ from White women? (p. 11).	Gender, race, class, and professional identity	Black and White women in top/executive jobs in the New York Tri-state area and the Charlotte/Atlanta region, recruited via women's professional organizations and snowballing.	Life history interviews	Narrative analysis
Block and Corona (2014)	What is the racialized and gendered positioning of young migrants in increasingly diverse urban spaces in European societies?	Social class, race, ethnicity, and gender	Four young Latino boys living in Barcelona, Spain.	Interviews	Thematic progression
Boogaard and Roggeband (2010)	How does the mutually constitutive relationship between structure and agency operate in the social production of inequality at the intersection of multiple social identities?	Gender, ethnic identity, and organizational identity	Dutch Police Force (about 5000 employees) and 25 women and men from majority and minority groups.	Multi-situational case-study: direct observation, focus groups, organizational database data	Thematic coding, and inter-group and intra-group comparisons
Borchorst and Teigen (2010)	Does the intersectionality approach stand alone when structural aspects of inequality are in focus, or is it important to address different dimensions of inequality separately? How are multiple grounds of marginalization, oppression, and privilege in relation to class, gender, and ethnicity tackled (or not) in public policies?	Gender, ethnicity, and class	Policies of gender equality and integration in Denmark, Norway, and Sweden.	Document analysis	Historical institutionalist analysis
Boyle and Brayton (2012)	How does 'expendability' relate with masculinity, physical labor, and aging?	Masculinity, ageing, class, muscularity, and race	Action-adventure film <i>The Expendables</i> (2010).	Film as text	Textual analysis
Bünz (2012)	What images do display exhibitions of prehistorical subjects convey? How are people (women, men, children, and elderly) presented? What stories are told? How can they be understood? (p. 98).	Gender, race, and appearance; subordinate and hegemonic femininities	The permanent exhibition <i>Prehistories 1</i> at the National Historical Museum in Stockholm, Sweden.	Observation	Visual narrative analysis and textual analysis

(Continued)

Table 26.2 Examples of intersectional research using qualitative methods (Continued)

Authors	Research question(s)	Intersectional focus	Sample/Sampling	Methods	Data analysis
Butz (2008)	What interlocking privileges reveal young hardcore punks' advantageous subject positions? To what extent do these adolescents reflect on the privileged backgrounds they come from? 'Do they acknowledge the advantages that go along with their allegedly-normative status as white male Americans? How do they deal with them and do they succeed in establishing a credible contra-position?' (p. 131).	Race and class	Three punk song lyrics.	Contextual close reading	Semiotic deconstruction analysis
Carrim and Nkomo (2016)	How do processes of racialization, gendering, and culturalization create and reinforce particular social locations in society and in the workplace? How do identities and categories interact and how do the institutionalized processes and systems by which they are formed, shaped, and reshaped over time operate? What role do sociohistorical political and cultural contexts play in managerial identity?	Racio-ethnicity, gender, and culture	13 South African women descendants of <i>passenger</i> Indians working in 'senior and top managerial positions from various South African organizations' (p. 264).	Life story interviews	Grounded theory approach to thematic analysis
Chapman (2015)	What are the norms of agency relating to veiling as experienced by Muslim women living everyday lives in northern European contexts? How do these women negotiate gender identity through their accounts and discussions of the veil?	Gender identity, Muslim veil	38 second-generation Muslim women in the UK and Denmark recruited via employment faith networks, places of education, mosques, and community projects in Copenhagen and London.	Individual and group interviews	Thematic analysis
Cruells López and Ruiz García (2014)	How and why has the <i>Indignados</i> (indignant or outraged people) movement in Spain incorporated intersectionality among inequalities?	Class, gender, sexual orientation, and gender identity	Nine individuals and two groups of activists attending 13 assemblies of the <i>Indignados</i> (indignant or outraged people) movement taking place in Barcelona and Madrid, 32 documents, and information from digital networks and assembly/movement websites.	Document analysis, semi-structured interviews, group discussion	Frame analysis

Diamond and Butterworth (2008)	How do adolescent and young adult women develop their sexual orientation? What processes of sexual questioning do these women experience? What ongoing changes, developments, and self-reflections do the women experience regarding sexual attraction, behavior, and identity?	Sexual orientation, sexual identity, and gender identity	Four young sexual-minority women of a sample of 89 women who were participants in a 10-year longitudinal study of sexual identity development (first study published in 1998).	In-depth interviews (each woman interviewed 5 times over 10 years)	Narrative analysis
Dottolo and Stewart (2008)	'How did Black and White men and women who attended a racially integrated high school construct racial identities? Was the process different for Black and White participants? Specifically, how do both Black graduates and Whites express awareness of institutional power when discussing racial identities? Does gender matter in the discussion of racial identity?' (p. 351).	Gender, race, racial identity, and social class	38 middle-aged Black and White men and women high school graduates.	Interviews	Thematic analysis
Essers and Tedmanson (2014)	'How do female Muslim entrepreneurs of Turkish descent experience the highly polarized context of Muslim/non-Muslim relations in the Netherlands, and how does this experience impact on their multiple identities?' (p. 354).	Gender, ethnicity, and religion	15 Turkish entrepreneurs in The Netherlands recruited through migrant businesswomen networks and snowballing.	Semi-structured and life-narrative interviews	Narrative analysis
Essers et al. (2010)	How are gender and ethnicity implicated in Muslim women's entrepreneurial activities and experiences?	Gender, ethnicity, and religion	20 Muslim (Turkish/Moroccan) businesswomen in The Netherlands recruited through special interest organizations for entrepreneurs, networks of immigrant women, and snowballing.	Life story interviews	Narrative analysis
Gill (2009)	In what ways is sexualization gendered, racialized, and classed?	Sexualization, gender, race, and class	Adverts 'in mainstream media – terrestrial television, general interest newspapers and magazines, and "outdoors" advertising (on billboards, bus shelters and other public spaces)' (p. 139).	Visual and content analysis	Visual discourse analysis

Table 26.2 Examples of intersectional research using qualitative methods (Continued)

<i>Authors</i>	<i>Research question(s)</i>	<i>Intersectional focus</i>	<i>Sample/Sampling</i>	<i>Methods</i>	<i>Data analysis</i>
Halinyjo and Jonker (2016)	How is intersectionality recognized in hijab discrimination cases brought before the Norwegian, Swedish, Danish, and Dutch equality bodies?	Gender and religion	Documentation (e-mails, letters, and reports on telephone calls from complainants) pertaining to 14 legal cases of discrimination.	Document analysis	Qualitative content analysis, theory-guided analysis
Healy et al. (2011)	What are the experiences of Caribbean, Bangladeshi, and Pakistani women working in health, local government, and higher education in the UK?	Gender, ethnicity, and religion	50 people in public sector organizations (15 managers or experts [7 white, 8 BME] and 35 women) from Caribbean, Bangladeshi, and Pakistani backgrounds.	Interviews	Narrative analysis
James (2011)	How do Black men appropriate stereotypical White gay masculinity and/or non-American, non-White femininity?	Cultural appropriation, gender, sexuality and class	Music videos by contemporary Black male hip-hop artists.	Visual analysis	Visual discourse analysis
Johansson and Śliwa (2014)	'How do gender and foreignness, either separately or combined, affect these women's experiences in their workplaces, and in the broader academic environment? How and in which organizational contexts do gender and foreignness emerge as significant categories?' (p. 18).	Gender, foreignness	31 foreign women academics in business schools in the UK recruited through personal contacts, public staff information available from university websites, and snowballing.	Narrative interviews	Narrative analysis
Johansson and Śliwa (2016)	'How does language intersect with other processes of differentiation to produce particular social and organizational positions? What enabling or restricting effects of language are experienced and articulated by Polish migrant workers in the UK?' (p. 297).	Language, nationality, and in/exclusion	5 Polish migrants (2 women and 3 men) in the UK recruited through personal contacts and cold calling.	Life history interviews	Narrative analysis
Ko et al. (2013)	What are the life stories of women of color in physics, astrophysics, and astronomy?	Gender and race	23 women of color who worked in physics, astrophysics, and astronomy	Interviews (41 written and 10 oral)	Narrative analysis
Kwasny et al. (2009)	How does the intersection of gender, race, and class identities shape the experiences of Black female IT workers and learners in the US?	Gender, race, and class	Classroom cohort of 12 Black women attending their first IT courses at a community technology center and the classroom facilitator, and 123 Black women IT professionals.	Interviews (informal 30 mins and 90 mins), and observation	Thematic coding

Lee and Brotman (2011)	How do Canadian refugee policies, social institutions, and dominant discourses contribute to the sociopolitical construction of sexual minority refugees?	Migration and sexuality with a specific focus on identity, refugeeeness, and belonging	28 interviews with sexual minority refugees and their advocates in Canada recruited following 'six to eight months of community networking and knowledge exchange with key stakeholders in the community' (p. 252).	Community-based methodology, semi-structured interviews	Content analysis
Lloyd-Jones (2009)	How does an African-American woman administrator at a predominantly White university pursue the achievement ideology despite experiences and challenges that emerge from her race and gender? (p. 608).	Gender, race, and social class	Single case study of one African-American woman working as a senior-level administrator in the Southwestern United States, and archival records.	Semi-structured interviews and in-depth interviews	Open coding thematic analysis
Logie et al. (2011)	What are the experiences of stigma and discrimination, and coping methods of HIV-positive women from marginalized communities?	HIV, gender, race, sexual orientation, and sex work	104 HIV-positive women from marginalized communities in five cities across Ontario, Canada recruited 'via word of mouth and flyers in community agencies, including AIDS service organizations, LBQT community centers, and ethno-specific social/health service agencies serving women of diverse ethno-cultural origins' (p. 4).	Focus groups (12 English, two French, one Spanish)	Thematic analysis
Lombardo and Agustin (2012)	'What are the implications of the framing of intersectionality in the EU for the quality of gender equality policies?' (p. 483).	Gender equality, sex, racial and ethnic origin, disability, age, religion, and sexual orientation	42 EU documents on gender equality policy within the European QUING project, covering three policy issues: gender-based violence, intimate citizenship, and non-employment.	Document analysis	Frame analysis using standardized-question coding
Love et al. (2015)	How do Black women from varying generations articulate their perceptions about race?	Gender, race, age, and generational difference	183 Black women from three generational groups (27 millennials, 71 Gen-Xers and 85 Baby Boomers) in the US.	In-depth interviews, focus groups, and online survey	Thematic analysis, descriptive analysis, and memoing

<i>Authors</i>	<i>Research question(s)</i>	<i>Intersectional focus</i>	<i>Sample/Sampling</i>	<i>Methods</i>	<i>Data analysis</i>
McConnell et al. (2016)	How do oppression, privilege, and power operate within counterspace settings, even for individuals with marginalized identities? How are challenging processes, particularly direct relational transactions, in dynamic transaction with each other to shape setting outcomes? How does intersectionality shape participants' experiences of the festival setting?	Gender, sexuality, and race	43 women attendees at the Michigan Womyn's Music Festival (Michtfest) (attended by 3000–5000 women) recruited by approaching them during the festival, posting fliers around the festival, and snowballing.	Case study Interviews, online survey, and ethnographic participation (journaling and research team discussions)	Content analysis
Moorosi (2014)	What is the impact of a leadership training offered to practicing school leaders in South Africa?	Gender, race, and social class	287 participants from South African provinces that participated in a leadership development programme, 27 participants (e.g. school principals, deputies, heads of department) from schools and a training center, and evaluation findings from the leadership development program.	Survey Shadowing Interviews Observations	Thematic analysis
Narváez et al. (2009)	'How did respondents understand, organize, and script their self-descriptors (identities, statuses, and roles)? What meanings were ascribed to descriptors related to sexuality, gender, and ethnicity? How did they understand the interactions among self-descriptors and the interactions between self-descriptors and social contexts? How did respondents, through these interactions, create norms and behaviours that allowed them to cope with, to adapt to, or to contest the scripts implied by mainstream social environments (such as work, family, and church)?' (p. 72).	Sexuality, gender, and ethnicity	41 interviews of 524 respondents recruited using a purposive sampling strategy from 274 venues such as coffeehouses, public parks, bars, bookstores, special events, social or interest groups, and community organizations.	Ethnographic immersion Interviews	Narrative analysis using thematic coding

Nightingale (2011)	In which ways does the embodied performance of gender, caste, and other aspects of social difference collapse the distinction between the material and the symbolic in the production of social inequalities?	Gender, caste, and class	Individuals in the Mugu District of northwestern Nepal linked to community forestry management.	Ethnography	Narrative analysis
Nishida (2016)	How do disabled people – who often do not share their marginalized disability identity with their family members and other surrounding people – initiate and proceed with their political development? How is political development experienced by disabled people who occupy multiple marginalized identities?	Race, ethnicity, gender, sexuality, class, age, education, family immigration status, and disability	7 participants who identified and are recognized as disability rights and/or disability justice activists within and beyond disability communities.	Life story interviews	Thematic coding analysis
Peña Ovalle (2011)	What does the emphasis on physical mobility tell us about the intersection of performance, racialized sexuality, and visual culture?	Gender, race, sexuality, in-betweenness, and racial mobility	Archival material (e.g. studio publicity, film reviews, and contractual negotiations) pertaining to the careers of five Latina Hollywood stars.	Archival method	Textual analysis
Prins (2006)	To what extent have life trajectories been marked by our early childhood experiences with the ethnic and cultural 'other'? 'What kind of lifestyle would each of us produce? How had our lives been affected by axes of difference and inequality such as gender, ethnicity, class and religion?' (p. 278).	Gender, ethnicity, class, and religion	25 Dutch and 20 Moluccan men and women who were the researchers' former primary school classmates.	Life-story narrative interviews	Narrative analysis
Ringrose (2007)	How are issues of race and racism being addressed in the curriculum and pedagogy of a Canadian School of Women's Studies? How do students experience a feminist antiracist curriculum, and what processes do they go through in negotiating the discourses circulating in the classroom?	Class, race, gender, and sexual identity	25 undergraduate students attending a course on 'women's diversity'.	Participant observation of larger class and small group discussions, and interviews	Foucauldian discourse analysis

Ruiz Castro and Holvino (2016)	What 'markers' or 'indicators' of gender, class, and race-ethnicity do employees and managers construct as important through discourse, interactions and reported experience in a Big Four accounting firm in Mexico?	Gender, class, and race-ethnicity	37 managers and staff members (19 women and 18 men) from two core business areas (Auditing and Taxes) and two administrative areas (Business Development and Administration and Finance) in a Big Four accounting firm in Mexico. Participants were selected through a stratified random sampling method and recruited by invitation via a gatekeeper.	Organizational case study, semi-structured interviews, and documentation analysis	Grounded theory approach to thematic analysis. Micro-analytic readings of everyday practices
			Managers in the Human Resources Department. Data from an internal employee satisfaction survey.		
Showunmi et al. (2015)	How do intersecting ethnic and gender identities shape British white and minority ethnic women's constructions and enactment of leader identities? How do minority women make sense of their own leadership experiences?	Gender, ethnicity, religion, and class	Researcher fieldwork diary. 110 African, African-Caribbean, and South Asian women and 20 White women leaders recruited through the UK's Race for Opportunity (RfO) Champion Network using a maximum variation sampling technique.	Focus groups and interviews	Thematic analysis
Valentine et al. (2009)	How do young people negotiate and experience their identities in two different national contexts with differing integration policy frameworks? What are the unintended effects that integration policy can have on refugees' and asylum seekers' feelings of national belonging and identification?	Identity, belonging, and place	Young Somali refugee and asylum seekers (aged 11–18) living in Sheffield, UK and Aarhus, Denmark, representatives from local bodies dealing with asylum issues, various Somali education and community projects, and Somali community spaces (e.g. homework clubs).	Participant observation and in-depth interviews	Narrative analysis

Vardeman-Winter et al. (2013)	'How do publics perceive their intersecting identities create barriers to complying with new health guidelines? In what ways do publics perceive discrepancies between their needs for information about new health policies and the policymakers' agendas? How do publics perceive their intersecting identities are represented in mediated communication about new health guidelines?' (p. 394).	Gender and race	31 women from diverse racial backgrounds recruited via researchers' contacts and networks, and snowballing	Interviews and three focus groups	Narrative analysis and thematic analysis
Willis (2012)	What are the experiences and impact of young LGBQ people of witnessing homophobic discussions and exchanges in Australian workplaces?	Age and sexual orientation	34 young people (18–26 years) workers in Australia, recruited through 'advertisements circulated through electronic postings on LGBQ and youth-related websites, email notices circulated through youth health and welfare providers, and hard copy notices displayed in LGBQ social and community venues' (p. 1595).	Online interviews, face to face interviews, and a qualitative web-based questionnaire	Thematic analysis (open and theoretical coding)
Wright (2016)	What are the experiences of heterosexual women and lesbians of working in the male-dominated construction and transport industries in the UK? Can women derive support from interactions with male and female colleagues?	Gender, sexuality, and occupational class	38 women working in professional and non-professional occupations in the construction and transport industries in the UK. 16 women in construction trades. Key informant experts on the employment of women in non-traditionally female work. Participants were recruited 'through women's professional networks; trade union groups for women and lesbian, gay, bisexual and trans (LGBT) members; and employer-established staff networks' (p. 352).	Multi-group methodology. Semi-structured interviews, focus groups	Thematic coding analysis

Figure 26.1 Categorical complexities

Adapted from: McCall, 2005

how to best capture the qualities attributed to the issues in study. The most influential framework dealing with the operationalization of categories is McCall's (2005). She identified three categorical complexities: anti-categorical, inter-categorical (or categorical) and intra-categorical. Figure 26.1 summarizes these approaches.

The previous discussions have addressed the key features of qualitative intersectional work. In the next section, I present considerations relevant to conducting intersectional research.

CONDUCTING QUALITATIVE INTERSECTIONAL RESEARCH: CONSIDERATIONS ON THE RESEARCH PROCESS

Conducting intersectional research is interesting and has much emancipatory potential for the lives, experiences, and circumstances of participants and researchers. However, it is also complex and frustrating. I have hinted already at the lack of a distinct intersectional methodology and this is perhaps the most pressing issue linked to conducting intersectional empirical

work (Nash, 2008). Reflecting on what I have discussed so far in this chapter, I will summarize the three key methodological issues linked to the use of intersectionality in qualitative research: research design, intersectional analysis and interpretation, and intersectional reflexivity.

Designing Qualitative Intersectional Research

At the design level, the scope of intersectional work should consider distinctions made between the study of interlocking oppressions and the study of intersectionality. This is a very fine distinction but one that is relevant insofar as ‘interlocking systems need one another, and in tracing the complex ways in which they help to secure one another, we learn how women are produced into positions that exist symbiotically but hierarchically’ (Razack, 1998: 13). This alludes to the lived experience and the way hegemonic systems construct individuals, which was not inherent to intersectionality in its original inception.

In thinking about what it means to conduct qualitative intersectional research, it is important to have clarity of what approach drives the research project in intersectional terms; for instance, are we adopting a subjectivity-centered approach and focusing on identities and subjectivities or are we adopting a systemic view and focusing on interlocking oppressions and how these operate within structures and institutions? The focus on differences in structural positions appears more useful to highlight how relations of power are embedded in processes, structures, and institutions, as opposed to a focus on subjectivities, which mainly highlights differences in identities (Collins, 1990; Dhamoon, 2011; Rodriguez et al., 2016). For example, in their exploration of intersections of gender, racioethnicity, and class in a professional service firm in Mexico, Ruiz Castro and Holvino (2016) framed their analysis situating their interview data in relation to the sociocultural features of the Mexican context. In practice,

this translated into looking at disadvantage not just as a result of categories of difference intersecting but also emerging from cultural scripts and the particular markers of inequality they produce.

Davis (2008) notes that intersectionality facilitates that distinct theoretical projects come together and collaborate in a mutually beneficial way. In that respect, perhaps the important considerations in relation to a research design stage are the particular assumptions under which intersectional empirical research operates. Hancock (2007b) alerts us to three central ones:

- 1 Examining complex political problems and processes requires a focus on more than one category of difference.

This in essence means that a study is intersectional when the aim is to reveal differences through the analysis of more than one category (Mooney, 2016). The choice of categories and how categorization is done to distinguish different forms of social differentiation is central to intersectional research (Christensen & Jensen, 2012), yet it is also contentious due to the challenge of identifying ‘what are the differences that make a difference?’ (Lewis, 2009: 207). Intersectionality analysis denaturalizes and politicizes categorical relations (Weldon, 2006), and while this is precisely one of its major strengths, this also comes with important questions about which categories to prioritize and how many categories to focus on. Winker and Degele (2011) have noted the challenge of realizing socially relevant categories of inequality methodically and comprehending them empirically.

There are two contrasting points: limited categories, which can lead to essentialism, and unlimited categories, which can lead to infinite regress (Ehrenreich, 2005; Rosenblum, 2009). Essentialism goes against the grain of intersectionality, yet in order to be able to manage analysis, researchers must reach a point where they are comfortable

enough to say ‘these categories are sufficient to explain instances of inequality’. This brings the issue of which categories are to be prioritized; what Ehrenreich (2005) terms the battle of oppressions and others (e.g. Martinez, n/d; Yuval-Davis, 2012) have discussed as the ‘Oppression Olympics’: the competition between groups for the ‘title of most oppressed’ (Martinez, 1993: 23) and the establishment of a hierarchy of competing oppressions in order to identify the most disadvantaged group. Being mindful of this, the selection of categories should be consistent with exploring the intersections of social categories or constructs that are relevant to the lived experiences of marginalized and privileged groups (either at the individual, organizational, or structural level).

- 2 Developing an integrative analysis of the interaction between individual and institutional levels of the research question.

This refers to what could be termed a multi-level approach and pertains to how categories are chosen and how they are positioned in analytical terms. Given the complexity of everyday experience and how both identities and positioning shift and change as part of the groups that individuals see themselves belonging to, groups that others classify individuals as being part of, as well as groups that individuals might strategically engage with, the notion that no categories are ever enough seems realistic. However, as Dean (2010) has noted, there is the risk of ‘a potential endless process of multiplying identity categories indefinitely’ (p. 119); the issue of infinite regress is also important at the level of analysis because particular identities can be subdivided into further distinctions, which leads to ‘an infinite loop of identities’ (Rosenblum, 2009: 40).

Hancock (2007b) notes that all categories matter equally and the relationship between them is an open empirical question. Similarly, each social division has a different ontological basis, which is irreducible to other social divisions (Anthias &

Yuval-Davis, 1983). In this respect, intersectionality lends itself to crafting precisely to allow capturing the diversity in processes, structures, and systems of privilege and oppression that operate not only in relational terms but also within institutional arrangements. For example, Collins (1990) proposes that intersections and their dynamics and consequences are better understood if the analytical focus is on how individuals experience and resist oppression at three levels: (a) the level of personal biography, (b) the group or community level of the cultural context created by race, class, and gender, and (c) the systemic level of social institutions. Similar multi-level approaches are proposed by Holvino’s (2010) simultaneity framework, and Choo and Ferree’s (2010) process-centered, group-centered and system-centered analyses.

- 3 Using multiple methods in order to place attention on both empirical and theoretical aspects of the research question.

The use of different methods has been advocated to embrace the multiplicity studied by intersectionality (McDowell, 2008). However, this is not a straightforward task; reflecting on her research practice, Jordan-Zachery (2007) poses the question of which methodology and methods would serve the purpose of ‘telling the story of a marginalized community’ (p. 257). Qualitative interviewing and narrative analysis appear to be preferred by researchers conducting intersectional work. B. A. Cole (2009) notes that ‘narrative [is useful to intersectionality work because it] can illuminate often hidden complexities while seeking to avoid simplistic generalizations and essentialisms’ (p. 563). For example, Bell and Nkomo (2001) conducted life history interviews to contrast the experiences of gender, race, and class of African-American and White women, and E. R. Cole (2008) used an archive of oral history interviews with feminist activists engaged in coalitional work, which she analyzed using

narrative analysis. Other examples include Willis's (2010) online interviews, face to face interviews, and a web-based qualitative questionnaire to explore how lesbian, gay, bisexual, and queer deal with homophobic encounters in the workplace.

Nevertheless, despite the widespread use of interviews in intersectionality research, there are some methodological challenges in their use. Discussing their experience using in-depth interviews in the exploration of intersections of race, class, and gender, Cuádras and Uttal (1999: 157) identified three dilemmas. The *first* was how to address social structural issues if the sample did not include representatives from comparative categories. They linked this dilemma to who and how many people should be included in a study. Their recommendation is that sampling should not follow a prescribed approach but instead be emergent. The *second* was how to speak about race, class, and gender when respondents did not explicitly articulate these in their interviews. They linked this dilemma to the risk of over-interpretation, for example, using micro-sociological data to make macro-sociological claims. They concluded that even when individuals may not raise issues pertaining to specific categories, interrogation of the data could still be conducted to see how social categories may have shaped their accounts. The *third* was how to analyze multiple dimensions of individual biography and social structures simultaneously. They linked this dilemma to the location of individual accounts within a sociohistorical and socioeconomic context. They concluded that a way to address this was to consider temporality and shifts in narrative, asking themselves questions about what was invoked and by who, as well as venturing into possible explanations in identifiable differences.

Thinking about method, the coherence between method and sampling also needs consideration. Researching diversity requires attention to diversity at the level of sampling in order to capture the dynamics intersectionality sets out to explore. In her work

exploring the classed and gendered articulation of meanings of 'being lesbian' and the intersection of racism and heterosexism in the lives of black and minority ethnic gay men and women, Fish (2008) has highlighted the importance of using inclusive definitions in research design as well as different sampling methods to facilitate inclusion of diverse groups. Reflecting on her own research on the LGBT community, she notes that many Black and minority ethnic (BME) LGBT people may not use terms such as lesbian or gay to describe themselves, which might result in their exclusion from intersectional research that focuses on the experiences of this group. For example, Essers et al.'s (2010) study of Muslim immigrant business women in the Netherlands combined special interest organizations for entrepreneurs, women's immigrant networks, and snowballing to access participants. This allowed them the possibility of accessing a broader, more diverse sample base.

In some cases, a combination of methods (either qualitative or a combination of both qualitative and quantitative) has proven effective; for instance, Showunmi et al. (2015) combined focus groups and interviews to explore gender, class, and ethnicity in the leadership experiences of British women. There are also examples of multi-method approaches; in her analysis of legislative practices linked to racialized and gendered hierarchical structures to explain claims of marginalization of congresswomen of color, Hawkesworth (2003) combined textual analysis of interview data with a case study of welfare reform. Reflecting on the methodological challenges of investigating the processes of racing-gendering, she noted that '[it] requires methodological innovation to make visible that which traditional methodologies have rendered invisible' (p. 530). The benefits of multi-method approaches can be seen in the analytical richness they bring; for example, Munro (2001) explored class, gender, and race in trade unions combining interviews, questionnaires, surveys,

Figure 26.2 Two-step hybrid approach to analysis

Source: Bilge (2009: 5–7)

observations, and documentary material. This supported the presentation of a multi-level intersectional analysis that included the organizational, workplace, occupational, and individual levels. Conversely, Hankivsky and Grace (2015) have asserted that the use of mixed methods in their intersectional research on education and HIV allowed them to design their study in a way that was not explicit in published literature.

In addition, methodologies that facilitate deconstruction have also been used; for example, Jordan-Zachery (2007) noted that the use of discourse analysis allowed her ‘to challenge the “truth” as accepted by many concerning what it means to be a black woman’ (p. 260). Other works have proposed the use of existing frameworks to support intersectional work; for example, Campbell (2016) has used Dorothy Smith’s institutional ethnography to make visible relations of knowing between researchers and participants.

Similarly, Tatli and Özbilgin (2012) have proposed using Bourdieu’s theory of cultural, social, and symbolic forms of capital to develop an emic approach to intersectional analysis. They see Bourdieu’s theory as providing a useful way to position difference within an integrated historical, institutional, and socioeconomic analytical framework.

In analytical terms, ‘narrative production and analysis is a well-worn method for intersectionality scholars’ (Alexander-Floyd, 2012: 20), which is consistent with the role of narrative in the articulation of identity and identity positioning. Furthermore, given the interest in how categories of difference intersect to establish and reinforce social relations of power and domination, the use of thematic analysis and multi-level coding is prioritized. For example, Bilge (2009) developed an analytical strategy that she termed the ‘two-step hybrid approach’, which brought together intersectionality and inductive research

methodologies, and relied on combining inductive thematic analysis and a deductive template approach (Figure 26.2 presents a visual summary of this approach).

Following discussions in this section, Table 26.2 provides more details on examples of qualitative intersectional work mentioned in this section and elsewhere in this chapter. In the next section I expand on some of these issues by discussing intersectional analysis and interpretation.

Analyzing Intersectionally and Developing Insightful Intersectional Interpretations

Analysis and interpretation of data intersectionally is the most important aspect of intersectional work. As an epistemological framework, intersectionality allows for different conceptualizations to emerge in order to respond to different circumstances, so the focus should not be on sticking to categories but rather to focus on the interaction between them. Weldon (2006) has noted that intersectional scholars see single categories as meaningless if looked at apart from one another in isolation, because they do not have autonomous effects. This builds on the idea that social categories are not descriptive categories of identity applied to individuals but rather emerge as devices that foster group inequality (Collins, 1997). Therefore, a basic starting point in the analytical focus of intersectionality is on questions that ‘demonstrate the flaws of a race-only or gender-only approach’ (Hancock, 2007b: 250); this can be accomplished by researchers asking themselves questions to help them to reflect on the intersectional nature of experiences, structures, processes, and institutions associated with their data. Matsuda (1991) has proposed a method she terms ‘ask the other question’, which she sees as central to developing intersectional analysis to address the interconnection of all forms of subordination:

When I see something that looks racist, I ask, ‘Where is the patriarchy in this?’ When I see something that looks sexist, I ask, ‘Where is the heterosexism in this?’ When I see something that looks homophobic, I ask, ‘Where are the class interests in this?’ (p. 1189)

Similar efforts have been proposed by other scholars. For example, in her discussion of intersectionality in psychological research, E. R. Cole (2009: 171–176) proposes three questions that should guide intersectional analysis: (1) *Who is included within this category?*, (2) *What role does inequality play?*, and (3) *Where are there similarities?* The first question deals with the interdependency of categories. The second addresses the nuanced ways in which categories are positioned within hierarchies of power and privilege. The third focuses on commonalities across categories that might appear as very different. I would also include in this last question the commonalities found in experiences of being dominant or subordinate, which Tatum (2000) notes are found ‘even when the sources of dominance or subordination are different’ (p. 11).

In sum, it is essential to choose qualitative approaches that help to explore nuances in the lived experience and make visible the privilege and marginalization inherent to intersectional work. For example, the way racialized gender is experienced by a Black British female academic is different to how it is experienced by an African-American female academic (on account of different lived experiences, structural, cultural, institutional, and macro and micro societal level dynamics). As such, data analysis should consider processes of telling and articulating narratives that reveal axes of power and identity practices; this is, rather than thinking about gender and race, it is the notion of racialized gender what would allow alternative narratives to emerge (Holvino, 2010). Additionally, even when we ask questions to participants that aim to capture the intersectional nature of their experiences, this is in itself not a guarantee that participants themselves will invoke intersections in explicit ways.

This highlights the need for flexibility in order to capture emerging meanings and constructs. Narrative and discursive approaches are particularly suitable as they (a) are not fixed prescriptive approaches, (b) focus on bringing to light experiences and meaning-making of the lived experience, and (c) allow for the detailed attention to both what is explicit and implicit, hence facilitating exploring visible, not-so visible, and obscured intersections. Conversely, the prevalence in the use of thematic analysis signals how this flexibility can be achieved by qualitative researchers and is evident in particular works that have adopted this method (see Table 26.1). Bowleg (2008) warns about the risk of conducting superficial analyses and highlights the importance of appreciating the historical and structural dimensions of the social location of participants at the intersection of categories of difference. She argues that the interpretive task for intersectionality analysts is related to deriving meaning from the observed data and interpreting it 'within a larger sociohistorical context of structural inequality that may not be explicit or directly observable in the data' (p. 320) in order to avoid obscuring data that might be more implicit than explicit. In a similar vein, Hindman (2011) hints at flexibility that allows placing attention to under-acknowledged forms of marginalization beyond the usual categories of difference, for example how privilege is exercised within minority groups.

In terms of intersectional interpretation, Lykke (2010) has argued that it is possible for intersectional frameworks to change qualitative writing and this is a task that researchers should focus on. The development of insightful intersectional interpretations is about (a) identifying the dynamics of relationships (negative, positive, and neutral) and (b) using a distinct epistemic vocabulary. For example, Styhre and Eriksson-Zetterquist (2008) suggest that the epistemological fluidity of intersectionality requires that concepts such as multiple, multiplicity, assemblage, and the rhizome are embedded in intersectional

work. As an analytical strategy, intersectional frameworks provide new angles of vision on social institutions, practices, social problems, and other social phenomena associated with social inequality (Collins, 2015). It is therefore important for intersectional interpretations to be mindful of temporality because these institutions, practices, and problems shift over time, reframing dynamics and transforming inequalities. This means that in analytical terms, intersectionality challenges us to think about cumulative advantage. As Purkayastha (2013) has noted, in attempting to understand how prolonged experiences of marginalization shape people's experiences, we face the challenge of being able to capture the longitudinal effects of marginalization beyond a description of a particular point in time.

Being Intersectionally Reflexive

Collins (2000) has discussed the challenge of moving on from essentialized views of privilege and oppression, noting that 'while many of us have little difficulty assessing our own victimization within some major system of oppression [...] we typically fail to see how our thoughts and actions uphold someone else's subordination' (p. 475). She uses the examples of White feminists' claim of gender oppression without acknowledgement of their white-skin privilege and African-Americans' analyses of racism that view poor White women as symbols of white power to argue that different groups would always identify as fundamental their oppression and either overlook or classify others' as less important. This echoes similar discussions (e.g. Spelman, 1988; Burman, 2003) about essentialist feminist theories and the ways in which difference is enabled. For instance, Burman (2003) has noted that the way discussions of difference are approached normally operate 'in the name of helping or supporting "others", that is others less fortunately situated than "ourselves"' (p. 294).

Reflexivity refers to how the researcher constantly examines her/his actions and role

throughout the research process and scrutinizes them in the same way as the rest of the data (Mason, 1996: 6). This is linked to Haraway's (1988) notion of 'accountable positioning', whereby we acknowledge that social research has an inevitable attachment of subjects, subjectivities, emotions, and unexpected responses inherent to human nature that shape how knowledge is constructed and produced, and where both researchers and participants are active agents (Mauthner & Doucet, 2003; Browne & Nash, 2010).

Drawing on these ideas, the notion of intersectional reflexivity has been put forward (e.g. Jones, 2010; Jones & Calafell, 2012; Rodriguez & Ruiz Castro, 2014) to refer to the researcher's acknowledgment of their own intersecting identities, both marginalized and privileged, and the use of self-reflexivity to understand them. Jones (2010) has noted that

Reflexivity is uncomfortable because it forces you to acknowledge that you are complicit in the perpetuation of oppression [...] Reflexivity has got to hurt. Reflexivity is laborious. But while it may be laborious for me to 'go out of my way' to intervene in how I perform privilege, I must also recognize that it is a privilege to not have my performance always already marked as marginal. (p. 124)

In order to engage in intersectional reflexivity, researchers must ask themselves: 'How does who I am, who I have been, who I think I am, and how I feel' (Pillow, 2003: 175) affect the way in which I see, address, construct, interpret, and present research (Harding, 1986, 1991, 1997)? Using their fieldwork notes, Rodriguez and Ruiz Castro (2014) conducted an intersectional analysis of their research practice. Their analysis consisted of a reading of their fieldwork notes to (a) identify problematic moments where they identified dynamics of privilege and oppression during exchanges with participants, and (b) unpack what happened by discussing codes and dynamics of power; that is, which identity categories were invoked and to what effect. Their coding of fieldwork diaries focused on instances where social categories

of difference were invoked by themselves or by participants. Their conclusion points to the researcher self as a site of agentic intersectional multiplicity, where intersections are deployed strategically throughout the research process in order to navigate it.

Despite appearing similar to reflexivity, the aim of intersectional reflexivity goes beyond that of constant self-examination and looks to address the ways in which research practice could lead to intersectional subordination and disempowerment (Crenshaw, 1991). Given that intersectional research would focus on systems of inequality and unequal power relations that sustain them, the relationship between participant and researcher needs to be scrutinized with a view of challenging dynamics within the research process that might exacerbate the positioning of participants and the researcher within those systems and relations. Crenshaw (1988) notes that challenging hegemonic interests can only be done by those who identify with those dominant interests because 'people can only demand change in ways that reflect the logic of the institutions that they are challenging' (p. 1367). As such, the onus is mainly on researchers, who through their scholarship operate within hegemonic academic discourses, to challenge the dominant ideologies within research practice that generate or perpetuate intersectional subordination or disempowerment.

CONCLUDING REFLECTIONS AND FUTURE DIRECTIONS

Intersectionality presents us with several complexities. On the one hand, it is difficult to operationalize and apply, yet remains a very attractive proposition due to how insightful and illustrative it can be. On the other, despite capturing categories and their significance, it remains largely provisional (Carastathis, 2014b) due to shifts and evolution over time and space. Still, as Collins (2015) has argued,

‘intersectional frameworks provide new angles of vision on social institutions, practices, social problems, and other social phenomena associated with social inequality’ (p. 3). They do this by calling our attention to the essentializing of differences (Jordan-Zachery, 2007) and promoting a closer attention to the multiplicity of local knowledges (Haraway, 1988). That in itself makes it a worthwhile endeavor.

As I struggle to make sense of intersectionality in my own qualitative research practice, something that keeps me going is reflection on intersectionality’s potential to be emancipatory. As a feminist scholar, this is at the forefront of my work. There are three distinct things intersectionality contributes to qualitative research:

- 1 It addresses the limitations of feminist and gender scholarship by providing an approach that recognizes and deals with the exclusion of individuals and groups who experience multiple marginalization.
- 2 It subverts binaries in social categories, instead supporting the theorization of identity in a more complex, fluid, and interconnected way.
- 3 It expands the exploration of situated knowledges and highlights how difference is (re)constructed within them.

While there is no clear-cut way to design and undertake intersectional research, the considerations laid out throughout this chapter are intended to help qualitative researchers to craft intersectional work. Intersectionality’s concern with the diversity of subjectivities makes it an important site for qualitative research. Through the use of qualitative methods, we can explore how categories of difference mutually create and are created as part of processes and structures within systems of power. This adds insight into and exposes differences in broad categories, e.g. ‘women’, ‘Blacks’ (Nash, 2008), which is essential to expand on the argument that the experience of difference is neither universal nor consistently circumscribed by gender (Nightingale, 2011: 155). At the same time, categories ‘cannot be tagged on to each other mechanically [because] they are

enmeshed in each other and the particular intersections involved produce specific effects’ (Anthias & Yuval-Davis, 1983: 62–63). Conversely, qualitative methods not only allow for the crafting finesse required to capture these dynamics, but also provide the space to explore the fluidity of differential situatedness (Yuval-Davis, 2011). This is linked to what Lewis (2009) has highlighted as problematic areas for feminist scholarship, namely ‘complex ontologies; the idiosyncrasies of experience; and multidimensional epistemologies’ (p. 203).

In terms of future directions, it is essential for intersectionality scholarship to expand its use of qualitative research methods to address some of its methodological criticisms. For example, Levine-Rasky (2011) has argued that intersectionality needs to expand to include more work that focuses on intersections of dominant identities (e.g. whiteness, economic privilege, masculinity). The underlying issue to this task is to articulate the meaning and fluidity of these categories and their intersections – as I have argued, this is at the core of qualitative research methods. In addition, the issues that matter to intersectional scholars, such as how knowledge, diversity, and equality operate in interconnected dialectic ways, and the role of particular positions and how they are linked to differential social, economic, and political power, require further insight. Thinking about the practical outcomes that intersectional work looks to achieve, for example, how non-hierarchical notions of difference are incorporated in understandings of disadvantage, discrimination, inequality, and oppression, and how these inform policies and actions toward equality, requires the kind of reflexive thinking that is particularly facilitated by qualitative methodologies.

There are specific areas of qualitative inquiry that provide the most potential for development of intersectional work: participatory action research, critical ethnography, visual methodologies, and longitudinal designs that adopt multi-level and cross-level analyses. The use of *participatory action research* is an ongoing area of development in

intersectionality work (e.g. Heiskanen et al., 2015) and its value lies in its direct link with the emancipatory aim of intersectionality by providing the opportunity for researchers and participants to collaboratively engage in the articulation of relevant categories of social difference. There is also much potential in the use of *critical ethnography* to unpack the situatedness of the lived experience, positioning oneself and taking one's place within the larger conversation alongside the voices of those with marginalized identities (Ropers-Huilman & Winters, 2010). This would help in developing more critical self-reflection about our sociohistorical and cultural positioning, and how this impacts the way we engage with intersectionality in relation to our own difference and that of participants (e.g. Dei et al., 1997; Boylorn, 2014; Sibblis, 2014).

Visual methodologies would also offer the opportunity for researchers to enrich intersectional work, for example through the analysis of social media and visual displays (e.g. Bünz, 2012). The use of these methods would help to develop what we could term intersectional semiotics through the use of visual communication or a mix of modes of communication (multimodality) to explore, among other things, intersectional representations. Finally, it would be useful to develop more *longitudinal qualitative designs that adopt multi-level and cross-level analyses*. Longitudinal designs (e.g. Diamond & Butterworth, 2008) help to explore shifts in social identities and institutional and societal contexts as well as how these intersect and relate to interlocking systems of privilege and oppression over time and space, and across organizational boundaries and geographical borders. This is fundamental not only to understand the fluidity of intersectionality and its dynamics but also to explore the roles and interactions of multiple stakeholders within a setting or context.

I hope to have presented in this chapter a compelling case for the opportunities and potential that qualitative research methods have to align with the opportunity presented to us by intersectionality to address what

Haraway (1988: 580) has identified as a key problem in feminist scholarship: 'to translate knowledges among very different – and power-differentiated – communities [...] in order to build meanings and bodies that have a chance for life'. In qualitative research methods we find practical tools that we can use to situate, analyze, and interpret dynamics of intersectional disadvantage and inequality; those are the tools that can help us to dismantle the master's house.

Note

- 1 The failure of feminist theory to include race has been noted in the context of how Black women and women of color have historically been absent from dominant feminist discourses, and how white feminists' own racialized and classed positioning has prevented them from understanding the simultaneity of oppression experienced by Black women and women of color (Hurtado, 1989). Intersectionality could then be firmly positioned as a contribution from Black feminism, which is important to note because it explains why many foundational works allude to the experiences of Black women and women of color. It is important to clarify, however, that this does not mean that intersectionality should only be used to study these groups: we all lead intersectional lives!

ACKNOWLEDGMENTS

I would like to acknowledge the important contribution of participants at the conference 'Interrogating Intersectionality: What's missing and what's next' (Simmons College, Boston, USA, 29 June–1st July 2013) and at the symposium 'Practices of Intersectionality' (Radboud University Nijmegen, The Netherlands, 27 March 2014) whose insightful discussions helped me to shape the ideas discussed in this chapter. I would also like to thank Stephen Procter for his close reading and valuable feedback, which helped me to improve the ideas presented in this chapter, and Gina Grandy and an anonymous reviewer for their editorial comments on earlier versions of the chapter.

Access and Departure

Chris Land and Scott Taylor

INTRODUCTION

At one stage whilst writing this chapter we began negotiating organizational access to collect data. We had funding in place. We had what we thought were some interesting research questions and ideas. We clearly articulated our intentions to a series of gatekeepers, promising not to disrupt the work being done within the organization. We provided assurances that we would discuss our analysis with respondents when complete. We like to think we are relatively skilled at gaining access to do research. And, of course, we really wanted to do the research.

And our series of requests was rejected. In one case we were unable even to speak to organizational gatekeepers directly and were rebuffed by an external public relations company that handled all requests for access to the company founder. This left us with several options: keep going by asking for access elsewhere at other, perhaps less intrinsically interesting (Stake, 2005) organizations;

return the research funding and abandon the research; find data ‘outside’ the organizations that would allow us to develop our ideas; or adopt covert methods and try to enter the organizations by, for example, applying for a job there.

Each of these possibilities exemplifies the continuous opportunities to reconsider or give up that are produced by negotiating access if it is approached as an iterative, non-linear, dynamic process (Peticca-Harris et al., 2016). Our frustration at this recent experience, combined with our reading of recently published accounts of access negotiation, brought us back to our ongoing attempts to understand the processes of entering and leaving the organizations that we try to collect data in or from. Previously, we have written about the political and ethical constraints placed on research when we make promises of individual and organizational anonymity during access negotiations (Taylor & Land, 2014). There we argued that blanket promises of anonymity, whilst conforming to institutionalized

procedures for ethical research practice, may in fact create barriers to engaged research and the realization of our wider moral obligations as academics, specifically our responsibility to inform and contribute to social and political debate. This chapter builds on that argument to unpack the common conception of access as a time-bounded, instrumental activity. Here, we look in more detail at how, why and to what ends researchers seek access, and finally consider how research can continue in the absence of access, or at least in the absence of 'access' as it is conventionally understood: formally agreed permission, granted by organizational gatekeepers, to openly collect data. As we do this, we review both historical and contemporary contributions to understanding access and emphasize the temporally situated nature of what constitutes ethical practice in negotiating access.

We are keen to include a discussion of how to research without access in this chapter because failing to gain access is always a risk with social research and, we would argue, an increasing one in certain areas (such as slow qualitative research or politicized critical management research). Our own experience, and the experiences of others, suggests that researchers are being confronted with more barriers to access, and therefore more challenges to collecting the kind of data that have formed the basis of many qualitative studies of management and organization. There are, we think, multiple facets to this. First, there are simply more people working in the field of management and organization studies who are requesting access to organizations – more established researchers, more doctoral researchers, and more undergraduate and masters' students seeking access to organizations for their dissertation research. This is not a new dynamic. Established academics were complaining about relatively large numbers of post-graduate students making access more difficult in the 1980s (Buchanan et al., 1988, p. 55) and student numbers have grown significantly since then. Second, as we have argued (Land & Taylor, 2010), some of the

most interesting organizations that researchers seek access to have the most compelling reasons to deny entry to collect data. Companies with a value proposition based on their brand, or on a high-profile reputation for organizing ethically, for example, find reasons to deny access because of the very activity that makes them interesting to us, even when individual and corporate anonymity are promised. For example, one organization we unsuccessfully tried to access recently has based much of its branding activity on organizational self-representation as a radical, anarchistic upstart in an industry dominated by large conglomerates. Whereas multi-national corporations in the industry are regularly challenged in the media for their ethically problematic products and marketing campaigns, the implicit, and often explicit, value claim is that the company we wanted to research is more ethical, more authentic and less exploitative. As marketers in the company regularly mobilize a language of democratic, counter-cultural organizational and alternative managerial practices, our suspicion is that their reluctance to being researched was founded on a concern to control media representation and public discussions of their company and organizational practices.

Third, and perhaps paradoxically, we observe an increasing amount of publicly available information surrounding organizations, mostly as a result of the Internet's facilitation of self-publication and social media activity through means such as Facebook and Twitter. This makes it easier, as we argue below, for access to be denied for two linked reasons: first, when gatekeepers tell us we can already find online what we need to know to write about the organization, implying that nothing is hidden; and second, because gatekeepers equate researchers with those who write critically or negatively about organizations online. Again, this is not exactly new. Almost 40 years ago, in one of the most cited pieces written on organizational access, Buchanan et al. (1988) advised researchers not to mention 'interviews' or

‘publication’ when approaching organizations. For the managers they negotiated with, such words conjured up images of exposés in newspapers, something quite removed from the realities of academic research and publishing. Instead, they chose to ‘tell potential respondents that we want to learn from their experience by talking to them and that we will write an account of our work, which they will see’ (Buchanan et al., 1988, p. 57). For the increasing number of brand-based organizations in which social reputation is crucial, the potential risks are even greater today, suggesting that access to that part of the economy is increasingly difficult.

As described above, at one stage in our current research project we found ourselves in the position of having no access whatsoever ‘inside organizations’. A complete lack of access presents, we think, significant problems for the conduct of meaningful social research that aims to represent the experience of work and to analytically locate that experience in relation to wider political, economic, social and cultural changes. We can, of course, decide to ‘give up and move on’ (Peticca-Harris et al., 2016), as we and many others have on various projects, leaving an incomplete piece of work to gather dust on a shelf or gradually go out-of-date on a hard drive. However, we think there are more creative ways to deal with denial of physical access to organizational space, approaches that researchers have perhaps been too quick to dismiss. These alternatives can certainly involve time-consuming engagement with institutional research ethics committees and frameworks. These internal institutional-professional gatekeepers may prevent researchers from even leaving campus and result in a different, perhaps even more frustrating, form of access denial. Notwithstanding, if social research in management and organization studies is to continue in the varied forms that it has taken, then it is incumbent on researchers to continue to be creative in thinking through *how* we gain access, *why* we want access and *what* it is that

we want to access. To do this, we argue that it might be useful to take inspiration from the social research community working outside higher education, such as investigative journalists or documentary makers, and to argue for alternative approaches to access, both institutionally and in published writing.

To work through these issues, the rest of the chapter is structured as follows. First, we revisit classic contributions to the issue of access. We suggest that most of these focus on the practical ‘how’ of accessing and departing, or what Buchanan et al. (1988) refer to as ‘getting in’ and ‘getting out’ of the field. Researchers are encouraged to read these accounts as ‘tales of the field’ (Van Maanen, 1988), and to feel a comforting kinship that assuages the suffering many feel they have experienced at the hands of awkward or obstructive gatekeepers and respondents. Second, we ask ‘why’ researchers would want to gain access to organizations. Whilst this question can be answered with the obvious ‘to do research’, this raises a broader question of why we want to conduct research at all. Some academics may be driven by the imperatives of career, promotion, research assessments and performance measurement, but we think most researchers, and especially those with a more critical approach to studying management, work and organization, are motivated by a desire to understand the lived realities of work, to locate those realities within a wider social context, and to communicate that understanding to a wider audience through writing and teaching. Indeed, this is the ambition for social scientists laid out more than 50 years ago by C. Wright Mills in *The Sociological Imagination* (Mills, 1959). Such research requires a deep understanding of the practice and experiences of those working in organizations: a reality that is rarely captured well in publicly available, corporate publications, anonymous blogs written by aggrieved ex-employees, or by quantitatively analysed survey tools that abstract both experience and context to a narrow range of discrete variables.

This raises two further related issues. First, writing about work and organization is an inescapably political process. Merely wishing to represent particular sets of interests, groups, members or particular types of organizations is a political act. The choice of whether to use research to give voice to senior management at De Beers, or to give voice to the miners working for that organization in Botswana or South Africa, will generate very different representations of the company and its business practices. It is both a political and an academic decision, guided by what has been written previously, and what the researcher deems to be of wider significance and importance in their field. When academics are blocked from accessing specific research sites, or from exploring contentious topics, whether by organizational gatekeepers or by institutional ethics committees, this is already a political act, shaping what can be seen and what can be said within academic discourse. As Jacques Rancière has argued, *contra* Althusser, one of the key functions of the police today is not to interpolate, or hail, a subject that will recognize themselves in the call, but to shift attention *away* from what might unsettle the dominant political distribution of the sensible – what can be seen and what can be said – by encouraging us to ‘move along! There is nothing to see here!’ (Rancière, 2001, p. 22).

This in turn suggests another, perhaps more profound question of what an ‘organization’ actually is, and thus *what* the research is seeking access *to*. Our third focus in this chapter is therefore to examine something that is largely overlooked in methodological discussions of access: what we are trying to access. In this section, we argue that access often assumes a physical space, with live actors moving around in it. This may be too narrow a conception of what it is we are trying to access as qualitative researchers. Here there are two sub-themes. First, we consider the nested and contentious nature of social relations within organizations, drawing on Carmel’s (2011) idea of ‘social access’, to argue that gatekeepers and key respondents we approach can actually

prevent us accessing some groups within an organization at the same time as affording access to other social groups. Second, we look to social media as a source of qualitative data in the virtual sphere where the formal boundaries of an organization can leak and data can spill over into public discourse, for example through blogging. Finally, we consider what can be done in the event of a complete failure to access an organization. Here we review the argument for covert research and describe an innovative method of provoking engagement from within organizations practised by British documentary film-maker Louis Theroux.

Throughout, we draw on key contributions to understanding access from within organization studies published in journals (e.g. Alcadipani & Hodgson, 2009; Carmel, 2011; Cunliffe & Alcadipani, 2016; Irvine, 2003; Irvine & Gaffikin, 2006; Karjalainen et al., 2015; Peticca-Harris et al., 2016), the ‘confessional tales’ (Van Maanen, 1988; Whyte, 1964) most often published as appendices to book-length ethnographies (e.g. Kunda, 1992), and recent debates in social science methods and methodology on access. It has been conventional to claim that little has been published on access (Alcadipani & Hodgson, 2009). This is not the case any more, especially if we look to reflexive methodological writing in the wider social sciences. The challenge today is not to find published material on negotiating access; rather, it is to understand the methodological implications of how and why we seek access, or fail to achieve it, which can stretch from the start of the research process to the end and beyond, with implications for all aspects of what we write.

HOW TO GAIN ACCESS: CLASSIC AND CONTEMPORARY TALES OF THE FIELD

Every research methods textbook contains a chapter, or part of one, with guidance on negotiating access and finding data. As an

activity, it inevitably forms part of every qualitative empirical study, whether data is naturally occurring or generated by the researcher. Doctoral and new researchers are often asked about their plans for gaining access, first by supervisors and subsequently by anyone listening to research plans. In this version of the debate access is, first and foremost, a practical concern.

One of the most commonly cited contributions to our understanding of organizational access was published almost 30 years ago. David Buchanan, David Boddy and James McCalman (1988) reflected on their trials in gaining access to study technological innovation in organizations. This book chapter is remarkable for its longevity and influence. The title and discussion frame access as a linear process of 'getting in, getting on, getting out, and getting back' that starts with first contact and negotiating access, moves on through how researchers need to conduct research by getting on with their respondents, before moving on to departure from the field (with the possibility of returning later for follow up research). As a frame this discussion suggests that data collection is temporally bounded to the middle two sections of the process. Perhaps echoing early anthropological accounts of entering and leaving the field, researchers are encouraged to think of the organization as a foreign land, spatially and culturally separate from the academic workplace. Data collectors have to think of ways to blend in with the locals, always remaining cognisant of the need to make a clean break, in order to analyse the data collected in as objective a way as possible.

This approach is an echo of the methods used to collect respectable and robust datasets to inform mid-twentieth-century ethnographies in management and organization studies. Melville Dalton (1959) and Donald Roy (1952) in the US and Tom Lupton (1963) in the UK are most often cited as pioneers of anthropological methods to explore modern organization. All three write of how easy it was to a) find a job in an interesting organization

and b) 'lose themselves' in the work, community and experience. Researchers always, as far as we know, departed the field with data in hand to work with and write up whilst located in a different organizational context: the university (see also Whyte, 1964). This was not always a clean or complete detachment. Lupton, for example, told stories of inviting respondents to the university to hear him present an analysis of their working lives, creating a living form of respondent validation and satisfying his own wish to be inclusive. Buchanan and colleagues, in contrast, advise keeping a distance between analysis and the presumably more prosaic concerns of the researched. They suggest writing a descriptive account of what was researched to share with the respondents, and to treat this as a 'base document' to be used later when preparing academic manuscripts. Strongly recommending that academics do not share draft research articles with respondents, their own practice was to ask respondents what kind of report they wanted, treating the structure and focus of the requested report as offering 'further insights into current management preoccupations and interests' (Buchanan et al., 1988, p. 64). Somewhere in between these two approaches lies the work of Irvine and Gaffikin (2006) who, in a key contribution that helped revive this debate, note the importance of published research being meaningful, faithful and interesting to those from whom or around whom data were collected.

These accounts of fieldwork are located at an essentially practical level. They do not relate the process of negotiating and maintaining access to the nature of the research itself. This raises two issues for us. First, like managerial preferences for particular types of report on a research project, negotiations over access can be a source of data in themselves (Land & Taylor, 2010). Second, the very idea of accessing data that is 'out there' in the field carries certain epistemological commitments. The first of these issues is well illustrated in Karen Ho's (2009) ethnographic study of Wall Street investment banks, in

which she was ultimately unable to gain the full access she had hoped for as a working investment banker. Instead, her book begins with the processes of trying to gain access to, and then find employment in, these organizations. Her inability to gain full access as an investment banker thus becomes a crucial source of information about the professional cultures of banking and their maintenance of an exclusive, elite status for employees, encouraging distance and isolation from outsiders. In a similar vein, Simon Carmel, echoing Schwartzman (1993), notes that ‘the very processes of gaining access are likely to demonstrate aspects of the culture being studied’ (2011, p. 552) so that a discussion of such should be an essential part of any ethnographic study (see Karjalainen et al., 2015, for a similar argument in relation to large knowledge intensive companies).

Rather than glossing over, or ignoring, questions of access, in these accounts ‘getting in’ is used as a valuable source of information about the forms of exclusion that constitute distinct organizational ‘insides’. This carries significant potential for unpacking the wider political processes of *organizing* that constitute, but are often absent from accounts of, specific *organizations*. For example, Judy Wajcman (2004) has criticized ethnographic perspectives in science and technology studies, and specifically actor–network theory, for privileging an ontology of presence when accounting for the organization of innovation or scientific research in a laboratory. Whilst careful attention to the concrete activities of humans and non-humans in a laboratory setting can tell us much about how science is actually done, and progresses our knowledge beyond participants’ own accounts of scientific method, what it cannot do is tell us about the wider social processes that constitute the laboratory in the first place, including those processes that systematically exclude particular types of actors from this setting. For example, an ethnographic study of a male dominated scientific institute could tell us about how those men do science, but not how

the institute itself is constituted by extensive processes of social organization, stretching from the family, through education, and into recruitment and organizational development, that simultaneously reproduce cultural gender norms and exclusionary practices. This social inequality has site-specific impacts, but these are invisible if we are only studying the organizational dynamics within the research site itself. As in Ho’s study discussed above, the explicit use of access as data can shed light upon such practices, though this depends as much on the identity and body of the researcher, as it does on their training or skills as a researcher, a point that brings into question the very idea of an objective knowledge of ‘organization’ and suggests a more situated form of knowing.

The most common ways of speaking about access carry distinct epistemological commitments, treating ‘access’ as if it were a process of gaining entry to a physical space, ‘out there’ somewhere. The question of when and where ethnographic research starts, and the methodological commitments of understanding ‘access’ in terms of data that is ‘out there’ in the field, is developed by Taylor (2015), who argues that these tales contain implicit epistemological commitments. These are drawn out in Taylor’s thoughtful reflection on longitudinal qualitative data collection processes and their particular challenges. She argues that negotiating access to organizations for a temporary research presence, such as that of classic organizational ethnographers, implies an objectivist perspective. For example, the commitment to returning to the university to gain distance and objectivity regarding the field (Whyte, 1964), or the idea of validating data by seeking confirmation from respondents on the accuracy of descriptive work (Buchanan et al., 1988), both seek to overcome the subjective entanglement of the researcher *in* the field through development of an external perspective. The implication is that qualitative work requires distance and objectivity in order to produce value-free knowledge that is somehow more

'rigorous' than a more explicitly situated account. Research participants provide data, which the analyst then takes away to assess, explain and develop theory from. The other end of the continuum that Taylor proposes finds researchers negotiating access for more collaborative, less hierarchical, more subjectively representative purposes. The epistemological framework of a research project may thus frame how access is negotiated, to what end, and what the outcome of the research can or cannot achieve. This is a quite different and more thought-provoking way to think of access. It moves beyond 'access' as an interesting story, or an additional data source, to seeing access as a means of clarifying how the knowledge produced from the research may be bounded in its political potential.

Taylor's observations and argument are present in a different form in Cunliffe and Alcadipani's (2016) examination of access. They propose three perspectives on access: instrumental, transactional and relational. Each of these approaches to negotiating and maintaining access is located according to how closely the researcher and researched engage with each other, each other's working contexts and the purpose of the research. An instrumental approach, for example, is closely bounded by the researcher, with the sole purpose of getting in and getting out, with data in pocket. A relational approach, on the other hand, is founded on a 'fluid relationship between researcher and research participants characterized by integrity, trust, and mutuality' (p. 7; see also Irvine (2003) on the issue of trust and confidentiality). The need for reflexivity is especially prominent in this latter approach, to ensure that the politicized nature of access as an ongoing, non-linear process is recognized.

A second contemporary contribution to this developing debate (Peticca-Harris et al., 2016) explores the 'how' of research access from an ontological perspective that is fundamentally practice-oriented. These authors weave their experiences as participants on a North American doctoral programme to

provide a reflexive account of negotiating access for fieldwork and propose a more dynamic way of seeing research in which researchers continually interact with potential informants, academic institutional settings and their selves. Researchers are encouraged to continually 're-strategize' in the face of challenges such as denial of access or realization that a field does not in truth exist in a meaningful sense and is therefore unable to be researched. This is a considerably more purposeful set of reflections than Taylor's, in the sense that there is an underlying instrumentality to the reflections and how they are conceptualized. Access here, reasonably given the situated nature of the reflection in a doctoral programme, is a means to an end, and therefore subject to a less politicized, more bounded reflexivity.

The practice of epistemological reflexivity in relation to access is further extended in Crowhurst and Kennedy-Macfoy's (2013) introduction to their *International Journal of Social Research Methodology* special issue on gatekeepers. They note how contributions to their special issue all locate gatekeepers as central to the conduct of research, and therefore as 'equally deserving of both methodological and theoretical reflection' (p. 457). In the reflexive accounts the editors curate here, gatekeepers emerge from a conventional objectivist perspective (cf. Taylor, 2015) to become complex social actors who are in part constituted by researchers in the field. In particular, power relations are proposed as key to understanding both the 'how' of research access and what its negotiation means for the conduct of empirical work. As researchers we can, and perhaps should, reflect on how our identities are inflected by our construction of gatekeepers and entrances to research sites, and which entrances are more open to us. For example, in his work on hospital emergency rooms, Carmel (2011) found that he was able to quickly establish connections with the predominantly male junior doctors, perhaps due to a similar middle-class, masculine identity, but that this in turn made it harder

for him to establish similar relations of trust and open communication with the nurses. Finally, Crowhurst and Kennedy-Macfoy (2013) acknowledge that the how of negotiating access for social research is changing as a result of social media use. They argue that individuals and institutions are much more difficult to identify, or define as gatekeepers, when data are hosted by social networks and websites. This is an issue we return to towards the end of this chapter.

WHY TRY TO GAIN ACCESS: THE ETHICS OF NEGOTIATING ENTRANCE AND EXIT

Epistemological and ontological reflections, and the practice of reflexivity, also point to another way of thinking about access, addressing why we as researchers try to negotiate entry to organizations. The accounts reviewed above suggest three purposes: curiosity about a private or partially hidden culture; instrumentality (i.e. to collect data in order to produce knowledge); and to inform political action or change. Most researchers would probably present answers to the why question in terms of curiosity, either empirical ('what really goes on in there?') or theoretical ('is that how organizations and management really work?'). This is the respectable rationale within our professional community for trying to gain entry to organizations, and one on which we can also build access negotiations with gatekeepers. Instrumentality also features, and is occasionally referred to. Sometimes this can take the form of a pragmatic instrumentality; many of the dissertation supervision meetings we have with undergraduate or postgraduate students centre on who they know that would allow them access to collect data. Negotiating access in the sense of identifying why we want to gain access to data or informants is clearly only partly an intellectual or methodological process.

Equally, the practice of research ethics does not exist only as a methodological or intellectual concern in relation to access. As we note below, it became more difficult and less acceptable to conduct covert research during the 1970s and 1980s. Most of the decline in use of this research method can be attributed to the development of university research ethics committees (Institutional Review Boards in North America). We have heard many stories of comical, sometimes farcical, verbal or written exchanges between researchers seeking approval and members of these committees. Qualitative research, open-ended or ethnographic fieldwork in particular, seems to cause trouble when colleagues and university managers are asked to give the host institution's blessing to a research design. These interactions could simply be categorized as the unnecessary intrusion of inflexible bureaucratic rules into a professional process, but Monaghan et al. (2013) offer a more nuanced interpretation. They argue that the superficial rationality and reasoned format of research ethics committees disguises a frustrating, decontextualizing unreason. The 'ethics creep' they observe in these committees has significant consequences for the researcher's emotional wellbeing, and in its implications that social research is untrustworthy, especially qualitative inquiry. The primary institutional concerns of ethics committees seem to go far beyond the immediate concerns of ethical research conduct, focusing on more managerial issues of legal liability and institutional reputation.

To give an example of this, one of us supervised a doctoral research project exploring drug use in the workplace. Whilst the concept of 'drugs' in the study was drawn so widely as to include alcohol, nicotine and caffeine, even a more restrictive focus on illegal narcotics would still have encompassed a large proportion of the adult UK population (Smith & Land, 2014). Despite this, and based largely on misunderstandings of the size of the population the study was drawing upon, the university research ethics committee took

a full year, from a three-year PhD project, to grant approval, and even then required such significant changes to the process for recruiting respondents that access was made much more difficult than it should have been. Whilst some of the reasons offered for the committee's reluctance seemed to be honest concerns with researcher safety and respondent anonymity, these were based on an almost complete lack of knowledge concerning the size of the population for the study, and an almost wilful disregard of the breadth of the operational definition of 'drug'. In attempting to clarify the committee's expectations, conversations with a non-academic administrator, who functioned as a de facto gatekeeper to the committee, suggested that the main concern was that if the research were to explain why drug use occurs at work, this could be seen as condoning such behaviour and thus bring the university into disrepute. Indeed, a concern for the university's reputation was part of the research ethics committee's remit, so this was, apparently, a legitimate concern.

However, this 'concern' only makes sense if there is an elision of the distinction between explanation and understanding, on the one hand, and approving of, or condoning, on the other. We are increasingly used to seeing such a slippage in mass media reporting on terrorism, which regularly equates explanation with moral justification and is concerned first with condemning terrorism, and only secondarily, if at all, with understanding it. This type of confusion, on the part of the committee, was compounded by their apparent ignorance of even basic sociological facts concerning the size of the target population and context of drug use in the UK. Whilst our own estimates placed the population for the study in the millions, the responses of the ethics committee suggested that they thought the researcher would be working with a tiny population who probably all knew each other. Given that most members of the ethics committee were not working in the social sciences, and that the secretary/gatekeeper had a professional background in catering management,

these misapprehensions may be understandable, but that makes them no less mistaken. Sadly, our access to the research committee in our own institution was so problematic that it took a full year just to get the permission to recruit respondents. Leaving aside the farce that a concern with the ethical treatment of human beings nearly derailed a research council funded project, and with it a researcher's extremely promising academic career, this example shows how access today, at least in UK higher education, does not depend entirely on the researcher's motivations. The 'why' of access must also account for the sometimes contradictory motivations of institutional bodies such as funding councils and ethics committees, as well as their specific blind spots and areas of ignorance.

WHAT ARE WE TRYING TO ACCESS? CULTURES, ORGANIZATIONS, EXPERIENCES

As noted above, ethics committees can have difficulty understanding what social researchers are trying to gain access to. In proposals, researchers often promise anonymity to individuals and organizations, partly as a means to protect employees and institutions from harm. This principle has become an almost obligatory commitment to the point of thoughtless reflex, but has recently been challenged both as a principle and as a practical pledge (Tilley & Woodthorpe, 2011). As we have argued elsewhere, the automatic assumption of anonymity as a norm for organizational research is particularly problematic when the status of 'subject' is extended to an organization. It is underpinned by an anthropomorphic extension of human rights to an organization that is both ontologically and politically problematic (Taylor & Land, 2014; cf. Bakan, 2005).

There are two main issues that arise here concerning the ontological status of 'the organization' to which access for research

is sought, both relating to the question of whether an organization is a coherent entity. As we noted earlier, the language of access and ‘getting in’ works on the basis of a spatial metaphor of organizations that conceives of them as relatively coherent and bounded physical entities. This may have made a certain sense when researchers were thinking mainly of large-scale industrial organizations behind walls that could be approached as a foreign land, but today the organization is more often conceived as a network, or value-chain, comprised of varying links, only some of which may be underpinned by traditional stable employment contracts that assume physical co-presence within a single location. Some organizational members will be sub-contracted, self-employed or employed by intermediaries such as agencies providing temporary work. In other cases, value productive activities include ‘work’ undertaken outside paid employment, encompassing prosumers or co-creators (Zwick et al., 2008), as with Facebook, where users actually produce the media content and employees only manage the platform (Beverungen et al., 2015). Similar examples would be Uber or Airbnb, which neither own the primary capital used to deliver services – cars and property – nor directly employ the front-line service delivery workers – car and property owners (Srnicsek, 2016). In such a context, the very idea of ownership and who is inside or outside the organization, and thus who or what the researcher needs to gain access to, is much less stable than simple metaphors of ‘getting in’ might suggest.

The second point applies to even the most stable, physically co-located organization. Most ethnographic researchers are concerned with organizational cultures, but the literature has long recognized that organizations are not single, unitary cultures but fragmented or plural (Martin, 1992). Organizations are nested social systems, and gaining access to subcultures, or sub-groups within these, is always and necessarily a political process of gaining ‘social access’, not only physical

access. To gain effective social access means establishing some sort of rapport and trust with key actors and groups but, as Carmel (2011) notes, successfully negotiating social access with one group might actually impede social access with another group. To take a very simple example, if the main gatekeeper and sponsor for access is a senior manager, then those further down the hierarchy, or trade union representatives, are likely to be mistrustful and suspicious of the researcher. This goes beyond ‘getting in’ or even ‘getting on’ in the organization, suggesting a need to ‘get around’ in the organization, moving between social groups (Carmel, 2011). Whilst this makes sense from a conventional ethnographic perspective that seeks to map out the various cultures and structures of interaction that make up the everyday achievement of organizing, it falls back on the objectivism that Taylor (2015) has critiqued. It assumes that the researcher both should, and can, move neutrally between social groups and account for them all objectively. A contrasting view would suggest that researchers necessarily enter organizations as politically engaged actors, already located within the social context of the organization, and within the wider social context of which it is a part.

This last point takes us back to our earlier arguments against the promise of unreflective anonymity. Organizations can be represented as powerful social actors and held up as exemplars or villains in political discourse. By automatically assuming anonymity of case organizations, researchers take themselves out of public debates over organization and its effects. This public discourse has been amplified by the ease of communication that the Internet and social media have enabled. As such, we would suggest there are strong arguments in favour of identifying *some* research sites and *some* individual participants. For example, identification may contribute to a researcher’s obligation to be accountable to a funder in disseminating research as widely as possible to facilitate impact. Participants may

also request to be named, perhaps to claim an act that they are proud of. Finally, Tilley and Woodthorpe (2011) note the distinction between anonymity and confidentiality, and in particular the possibility that the former does not guarantee the latter. Again, this is particularly salient in research that makes use of data from social media and the Internet.

EMERGING FROM 'FAILURE': THE CONSEQUENCES OF DENIAL OF ACCESS

Peticca-Harris et al. (2016) set out useful and thought-provoking strategies for the researcher confronted with closed doors and lack of access. Ultimately, a lack of entry to an organization or lack of participants willing to share their experiences of work and management may lead us to switch topics, abandon a project or come to terms with failure. This is, in some ways, a positive attitude towards lack of access, a form of 'moving on' in which the researcher accepts the death of the project, to explore what else is practicable or possible. The research idea may resurface in a different form, the reading might be useful elsewhere, and perhaps the conversations with gatekeepers will result in an invitation to collect data on something else.

Karjalainen et al. (2015) also explore denial of access in their open discussion of a partially 'failed' project. They gained access to two large consultancies to collect data on work-life boundaries, but were then denied by a further three. Two things emerge from their reflection: first, how time and energy consuming access negotiation can be; and second, how rich the process can be if treated reflexively and analytically. They conclude that access negotiations, especially negotiations that are superficially unsuccessful, must be understood as methodologically and empirically valuable. This point is echoed by Cunliffe and Alcadiyani (2016) in their observation that 'the experience of gaining

and maintaining access can itself tell us a lot about practices, processes, and power in the organizations we want to study'.

However, we also think that a flat denial of access may also open up further possibilities for researchers. After a long period of categorization as unethical or unnecessary, fresh arguments have been made recently in favour of covert research. Calvey (2008) provides the strongest argument for covert methods in the negotiation of access to fieldwork settings, noting that there is a 'submerged tradition' of this practice that is often neglected. He argues that research ethics approval processes unreflectively separate covert and overt methods. In this process, 'covert' has taken on connotations of unreasonable or even illegal deception. In addition, gaining informed consent from participants has often come, according to Calvey, to mean adherence to an instrumental, formulaic process which neither respects nor honours subjects. He also notes that the boundaries between 'data' and 'not-data' are inevitably blurred for qualitative researchers hanging around in organizations, implying that we all practise a degree of covert-ness. This in turn means that qualitative social research occupies a continuum of overt/covert, rather than a location on one side of a dichotomy.

Calvey's argument for covert research focuses on the quality of data. However, he also raises 'public interest' justifications for collecting data in this way, citing Goffman's (1961) study of asylums and Dalton's (1959) analysis of the moralities of management practice. Both studies are highly influential and still regularly cited in our field; neither would exist without the option of conducting research covertly. This tradition continues in some studies of work and organization, in for example Jenny Chan and colleagues' work on Foxconn, in which she undertook paid employment in the company in order to examine its employment and management practices, without informing the company officially (Ngai et al., 2016). In such cases there is a strong argument that information

on unethical employment practices should be collected and analysed for the public good, and that this trumps the rights to privacy of a fictional subject, the corporation. Covert research should therefore be considered more regularly, where appropriate, with the encouragement of research supervisors, ethics committees and methodologists writing in textbooks and collections like this. It is also worth noting, with Calvey (2008), that being covert is often part of a researcher's practice when conducting research close to home in universities. We can see this most clearly in recent autoethnographies of higher education (e.g. Parker, 2013; Sparkes, 2007). This approach to collecting data is clearly covert, inasmuch as most members of the organization around the researcher have not been appraised of the fact that they are being defined as respondents in a research project. It also raises interesting ethical questions concerning the grounds on which an employee might legitimately be prohibited from speaking about their own work experiences.

There are of course dangers to conducting research covertly. Within the profession, some colleagues will continue to think of covert research as inherently unethical, unreasonably deceptive and as a betrayal of respondents. Some journals may refuse to publish analysis based on covert research, and it could be a significant risk for early career or doctoral researchers. Outside the academic setting, covert research may be critiqued as unreliable. It clearly demands strong, clear, professional, collegiate, institutional support, before and during fieldwork.

Our second alternative to denial of access comes from outside the academy. Methodologists sometimes note the similarities between what qualitative researchers do and how investigative journalists work. Such a comparison can, we think, be helpful in relation to the practicalities of collecting data. British documentary maker Louis Theroux has been exploring specific subcultures for many years, often focusing on peculiarly American communities, in an attempt

to shed light on their wider host culture. Watching Theroux's films as a researcher, the level of organizational and individual access he accomplishes is striking. Many of the communities he enters are constitutionally secretive, 'dirty' in a sociological sense, or illegal. Despite this, Theroux is able to negotiate time with community members, and to film them explaining how they live and why they follow the belief systems they do.

Despite his experience and skill, however, Theroux has been unable to access one community, the Scientology organization. Legally categorized as a religion, Scientologists are notorious for their reluctance to permit 'outsiders' (i.e. non-believers) into the physical and social spaces where belief is practised. The film team specifically wanted to avoid interviewing ex-believers or making a documentary about their failure to gain access, both common fallback positions when organizational doors remain firmly closed (Theroux, 2015). Theroux decided to develop a third approach, which he calls 'negative access', based on recent developments in film-making and recent Scientology responses to critical accounts.

First, Theroux avoided the convention of interviewing ex-members by instead filming re-enactments of their experiences within the organization. This directed role-playing allowed Theroux and his subjects to explore questions of responsibility and discipline more closely than in an interview format. Role-play is, interestingly, a well-established but very neglected research method in the social sciences (Robinson, 2004; see Johnson (1994) for a classic and insightful use of the method). However, this was just the initial stage of the 'negative access' negotiation. Scientologists have developed an approach to what they understand as attempts to make critical or negative accounts of their organization. It involves them attempting to 'turn the tables' on the researcher or journalist, by making a negative or critical film about them and their work.

Theroux realized that he could work with the interactions created through the

Scientologists' attacks on him to provide layers of emotional and moral depth to his understanding of the organization and thus its representation in film. This, it seems to us, is an intriguing way of gaining access to the experience of an organization, without actually entering its buildings or negotiating formal access to it. As a further alternative when denied access, we think it is worth considering. Provocation of the kind that Theroux practices will of course bring dangers to the researcher, particularly if the organization or community being provoked is powerful. However, as an approach, carefully used, it might also result in more politically engaged research by generating unusual insights into powerful organizational forms.

CONCLUSION

In this chapter we have sought to examine the process of research access in terms of *how* we gain access, *why* we need access and *what* researchers are seeking access to. By presenting some of the practical, ontological, epistemological and ethical challenges of securing access to research sites, we have tried to highlight the non-linear, contested and institutionally specific nature of 'access' for academic researchers. In this we have emphasized the ways in which a reflexive engagement with this process can provide new sources of data, and encouraged an ethical and political responsibility for our relations with those we research and the wider publics that our research addresses, especially in how we represent our relations with the former to the latter in our accounts of doing research.

In the final section we also considered what to do when access, conventionally understood, is blocked. Here we think that it is important for social researchers to recognize that changing organizational forms and new technologies of communication can provide both new research tools and new ways

of understanding and analysing what 'organization' is, where it lies and how we might gain access to it. We have also suggested that further debate is needed concerning issues around anonymity in organizational research, and over what institutional ethics committees think about social research and the responsibilities of a university to the wider public good. If academic research is to remain relevant to the world outside, then academic researchers may need to engage with other traditions of research, including more covert forms of investigation, regularly deployed by investigative journalists, or the kinds of 'negative access' suggested by documentary makers. A formal rejection of access by organizational gatekeepers need not mean the end of a research project. With some creativity and reflexivity, even an outright refusal of access can be a valuable source of data and can open up alternative avenues of investigation that may, ultimately, be more informative than having a single gatekeeper hold the door open for you.

Perhaps, like Kafka's unlikely hero in *The Castle*, we will never gain access through the front door, and may never feel that we really made it into an organization at all. However, there are many ways into an organization, and organization spills over into many other locations, as when workers and officials from Kafka's castle leak out into the streets, homes and bars of the surrounding town. In this sense, the tale of our own struggle to find an organizational entrance and map its many connections may prove as informative as being granted easy access to what the organization's gatekeepers want us to see.

Choosing Participants

Mark N.K. Saunders and Keith Townsend

INTRODUCTION

This chapter is concerned with the challenges of choosing participants for qualitative research. The choice of ‘choosing participants’ for the chapter title, rather than ‘selecting a sample’, is important for three reasons. First, it signifies that the focus of the chapter is wider than just the techniques for selecting samples, including challenges such as accessing participants and justifying and reporting their choice. Second, the use of the term participant, rather than the frequently used alternatives of ‘case’ or ‘element’ (Saunders et al., 2016), emphasises that we are concerned with choosing people who in almost all cases will be asked if they consent to participate. Finally, the phrase highlights implicitly that albeit occasionally, it may be possible to choose all potential participants in a target population rather than a sample (Saunders, 2012).

Usually within qualitative research in business and management, our choice of research

participants involves choosing and gaining access to a small sub-group or sample from a larger target (that is, bounded) population comprising the potential participants who are the focus of our research (Miles et al., 2013). Our choice and the subsequent gaining of access are, invariably, fraught with problems and subject to challenges. Although ideally we may wish to collect data from particular participants, this will depend upon being able to gain access to these people. Even for participants within organisations where physical access to collect data has been granted, there will still be a need to maintain this access and engender cognitive access with each participant. Additionally, the time and financial resources we have available for our research may also constrain the data we will be able to collect and subsequently analyse, again highlighting the necessity to choose a sub-group of participants (Saunders et al., 2016).

Our chapter takes as its starting premise that the research aim and objectives inform the research design (Brinkmann & Kvale,

2015); in other words that our research method, and as part of this the research participant or participants that we chose, need to enable the research question to be answered (Saunders et al., 2016). Within this we recognise that for more orthodox qualitative research relying on propositional knowledge from the literature, research questions will usually be reasonably well defined. In such situations, the characteristics of potentially suitable participants are relatively easy to establish. In contrast, for more emergent qualitative research such as that where the research idea is derived from naturalistic settings (Patton, 2015), these are likely to be more open, even though there will still be research questions. For such emergent research, the characteristics of suitable participants are likely to need to be, at least in the early stages of the research, defined more broadly and driven subsequently by emergent theory.

In writing this chapter we have, whilst recognising the plurality of philosophical positions and heterogeneity evident in qualitative research in business and management (Johnson et al., 2006), adopted a broadly pragmatist philosophy. Our aim is to highlight and discuss a number of potential challenges that we consider qualitative researchers, whatever their philosophical position, may need to consider when choosing participants. In so doing we hope to offer knowledge that can be of utility to the practice of qualitative researchers. Within this stance we conceptualise useful knowledge as that which facilitates successful action through creating solutions to problems, informing future practice (Dewey, 1997 [1908]; Saunders et al., 2016). To this end we highlight four challenges (problems) associated with choosing participants and indicate potential credible, well-founded and reliable solutions that can inform practice (Wicks & Freeman, 1998).

Taking a processual view, we commence with the challenge of gaining access to potential participants and associated organisational issues and pressures for methodological rigour

(Van De Ven & Johnson, 2006). This is followed by a consideration of the challenge of choosing one or more suitable participants who can provide what Alvesson and Ashcraft (2012, p. 240) refer to as 'reliable gateways' into the practices of business and management. Within this we consider the utility of different non-probability and probability sampling techniques, focusing in particular on the former. Our third challenge concerns how many participants will be sufficient for the research to be considered authentic and credible by its consumers (Baker & Edwards, 2012). In discussing this we consider both the planning and reporting of qualitative research, considering expert opinion and empirically grounded advice, and question the appropriateness of the apparent 'gold standard' (Guest et al., 2006, p. 60) of data saturation. Our fourth challenge concerns the reporting and justifying of participant selection and meeting the expectation of transparency within this (Robinson, 2014). Interwoven through these four challenges is the need to act ethically and ensure participants' rights are respected. Our chapter closes with a summary of the challenges raised, which we believe all business and management researchers need to take heed of when choosing participants.

THE CHALLENGE OF GAINING ACCESS

Collection of primary data in qualitative business and management research almost invariably depends on first gaining, and subsequently maintaining, access to participants. Within the literature, access is considered at three levels: first, the gaining of physical, or in the case of Internet mediated research virtual, access to organisations, groups or individuals; second, the subsequent maintenance of this access; and third, achieving cognitive access with each participant (Saunders et al., 2016). Although considered in research methods and methodology texts, these aspects of gaining access are, as we discuss

in our fourth challenge, rarely reported in journal articles. Yet for all research these levels of access are crucial as, if permission to collect data is denied, the choice of participants is immaterial.

As researchers in business and management, our position is weak compared to organisations, groups and individuals from whom we are seeking to collect data (Lee, 1993), as we have relatively little to offer in return. Organisations and groups are likely to receive numerous requests for such access, rarely agreeing to more than a few, if any of these. Our request to gain physical or virtual access to collect data is therefore one of many they receive and, even if considered, may fail to interest the gatekeeper or broker who controls such access, resulting in a refusal. Such refusals can be for a number of reasons related to the perceived value of the work to those granting access, the time required of participants, the sensitivity (however defined) of the topic to the gatekeeper and potential participants and associated issues of confidentiality, and perceptions about the researcher's credibility (Arksey & Knight, 1999; Saunders, 2012). In addition, organisations or groups may find themselves in situations where, owing to external events unrelated to their perceptions of the research or the researcher, they are unable to offer access.

Such difficulties with gaining physical access result in many business and management researchers adopting (although unfortunately few explicitly report) an opportunistic approach (Buchanan et al., 2013 [1988]) to gaining access. Access to organisational gatekeepers is, usually, brokered through friends and colleagues (Okumus et al., 2007; Saunders, 2012) and can be thought of, in sampling terminology, as gaining access to the target population that will be the focus of the research (Kervin, 1999) from which participants will be chosen. Although the granting of such access invariably includes an element of chance (Okumus et al., 2007), it is to a large extent dependent upon the quality

of the researcher's networks, careful preparation both in terms of understanding the specific organisation or group and their likely requirements of a researcher, and being able to explain clearly how the research design will be applied in their particular context. Initial discussions with friends and colleagues are, combined with information derived from secondary sources such as organisations and groups' web pages, likely to be helpful in this regard. These discussions may also highlight the need for potential compromise in the research design.

The potential need for compromise when gaining physical access highlights a particular challenge emphasised by the on-going rigour and relevance debates. These point to a need for business and management research to be both theoretically and methodologically rigorous, and at the same time embracing the world of practice and being of practical relevance (Hodgkinson et al., 2001; Wensley, 2011). Organisational or group requirements to grant access can lead potentially to the researcher compromising on methodological rigour (Van De Ven & Johnson, 2006), in order to be able to collect data. This conflict is summarised by Buchanan et al. (2013 [1988], pp. 53–4):

Fieldwork is permeated with the conflict between what is theoretically desirable on the one hand and what is practically possible on the other. It is desirable to ensure representativeness in the sample, uniformity in interview procedures, adequate data collection across the range of topics to be explored, and so on. But the members of organisations block access to information, constrain the time allowed for interviews, lose your questionnaires, go on holiday, and join other organisations in the middle of your unfinished study. In the conflict between the desirable and the possible, the possible always wins.

Access from the researcher's perspective is a continuous process, rather than an initial or single event (Marshall & Rossman, 2011; Okumus et al., 2007). Indeed, McDonald et al. (2009) remind us that even in funded and supported industry-based research

'access' does not assure 'on-going access', it is rather an 'incremental continuum' (Walford, 2001). Such physical or virtual access, particularly for emergent research, can be iterative and incremental. Access commences when we first gain permission to carry out an initial exploratory part of our research. As the research focus and questions are refined and become more precisely defined, we seek further access to undertake other aspects. In other designs, including both emergent and orthodox qualitative research, we may need to collect data over a period of time emphasising the importance of an on-going relationship with participants. Consequently, once physical access to an organisation has been achieved, this on-going relationship with participants, and organisational gatekeepers, needs to be maintained.

Despite physical or virtual access having been negotiated, it is still usually necessary (other than for covert research) to gain acceptance and informed consent (cognitive access) from participants other than those with whom physical access was negotiated. Wherever a potential participant refuses to take part, this may reduce the likelihood that we can collect the data we need to answer our research question (Robson, 2011). Leverage saliency theory (Groves & Couper, 1998), although originally developed in relation to survey research, can also offer useful insights to gaining cognitive access in qualitative research methods (see Cachia & Millward, 2011). It reveals that although some aspects of potential participants' decisions to consent are outside the researcher's control, others, such as the giving of advanced notice, incentives, university sponsorship and relevance of the topic, can increase the likelihood of the participant consenting. In particular, it emphasises the importance of personalising the request to take part, offering convincing assurances of anonymity and addressing each participant's 'idiosyncratic concerns' (Groves et al., 2000, p. 299). Requests to take part may therefore have different outcomes

depending upon the degree to which each potential participant's specific concerns are addressed, and aspects with which they identify positively can be leveraged (Maynard et al., 2010), without them being coerced.

Research ethics rightly highlights the importance of not using coercion, and the importance of providing potential participants with the opportunity to make an informed choice regarding whether or not to take part, emphasising that deception in any form is rarely considered acceptable (Bell & Bryman, 2007). Yet, we note that gaining informed consent can in contexts such as researching corruption or illegitimate or covert practices reduce the likelihood of participation (Myers, 2013). In such situations, Punch (1986) argues, deception may be acceptable where data are not accessible by other means. However, whilst informed consent is, in most contexts, crucial to the collection of data, it remains of limited utility unless participants are able and willing to provide data that will enable the research question to be answered. Indeed, it can be argued that collecting data from participants that is of no value to the research is unethical as it is wasteful of their time. This leads to our next challenge, how to choose participants who can provide data that will enable the research question to be answered.

THE CHALLENGE OF CHOOSING ONE OR MORE SUITABLE PARTICIPANTS

Within qualitative business and management research, one or more participants are chosen on the basis that the data they will provide will be sufficient to enable the research question to be answered. In other words, the data will provide reliable gateways into the practice of business and management. This means the chosen participant or participants need to be suitable to our research (we will consider the challenge of how many participants are sufficient in a subsequent section!). Suitability,

in relation to participants, is often used to refer to how those chosen and the data collected from them represent a larger population to which they belong (Becker, 1998). However, for some ontological positions (and research questions) such representation may be considered an inappropriate concept. It also has distinct and differing connotations depending upon whether non-probability or probability sampling techniques are used (Saunders et al., 2016). Although we recognise probability sampling techniques are used infrequently in qualitative research, we still consider it worthwhile to mention them briefly. We note it is rarely feasible to either collect data from sufficient participants to meet assumptions for statistical analyses or appropriate to use such analyses, other than in certain complex mixed methods research designs (Nastasi et al., 2010). However, it is still possible to collect data for qualitative analyses from participants chosen at random (Brinkmann & Kvale, 2015). Within this section we therefore begin by considering, albeit briefly, the differences between probability (random) and non-probability (non-random) sampling techniques and their utility in qualitative business and management research. We then focus on non-probability techniques and, in particular, on the challenge of deciding which characteristics are relevant to choosing potential participants, and the associated sampling techniques to choose participants that can provide reliable gateways to the data.

Non-Probability and Probability Sampling and Representation

For both non-probability and probability sampling techniques, the challenge is to choose one or more participants that will enable us to answer our research question. Where the focus is on gaining understandings and insights that enable information rich (Patton, 2015) rather than statistical explanation, non-probability sampling techniques are likely to be used and qualitative data collected. Using

one or more of these techniques, individual participants are chosen on the basis of the researcher's judgement regarding their likely utility. They may therefore comprise, for example, participants considered extreme, unusual, critical or typical, as opposed to being similar to the target population.

In using non-probability sampling techniques, either on their own or in combination, we actively choose the participants to include in our research, the choice of participants being driven by a non-positivistic epistemology. By choosing certain participants, we are excluding all other potential participants in our target population. As a consequence, some of the target population will have a chance of being chosen as participants whilst others will not. In both orthodox and emergent designs, choice of participants is rarely entirely pre-specified; selection of participants evolving after fieldwork has begun and, often, being conceptually (theory) driven (Miles et al., 2013). Participants will be chosen for a range of reasons such as gaining new insights into phenomena, enabling phenomena to be assessed in a new manner, or to support the development of new understandings from which (dependent upon the research question) new theories may be developed (Miles et al., 2013). Where such theoretical generalisations are developed, they are based on analytic generalisability, reasoned judgement being made regarding their transferability to other situations. Invariably, the use of non-probability sampling techniques precludes generalising statistically about a target population, although we note that quota samples are used (primarily in quantitative survey based research) as a substitute for a probability sample, where a sampling frame is not available (Baker et al., 2013).

As intimated earlier, probability sampling techniques can be, although rarely are, used in qualitative research. Whilst some (e.g. Miles et al., 2013) note their use can add credibility where the number of potential participants chosen purposively is too large, it can also be argued such techniques are

epistemologically incompatible with qualitative research (Eby et al., 2009). Probability sampling techniques are normally used to select participants where the focus is gaining understandings and insights that are statistically generalisable to a target population. Sufficient participants are selected at random to represent the target population, the sampling technique or techniques being adopted to ensure those chosen are as similar as possible to that population. Random selection eliminates the researcher's judgement from the actual choice of individual participants. Subsequently, collection of quantitative data from comparatively large numbers of participants allows statistical inferences to be made.

Probability sampling techniques select each participant from a sampling frame (complete list) of all potential participants within the specified target population. If it is not possible to obtain or create such a list, then such techniques cannot be used, as it will not be possible to specify the probability of each participant within the target population being selected. The utility of data collected from a probability sample depends, in part, upon the accuracy with which the participants selected represent the target population (Barnett, 2002). It also means that if, for example, the data are collected from a sample of employees (participants) from one organisation (the target population), although it is possible to generalise theoretically beyond the target population, we should not generalise statistically to other, or indeed the total population of all, organisations. However, given the relative lack of use within qualitative research, we will not consider these techniques further.

Non-Probability Techniques

Within the literature a wide range of non-probability sampling techniques are identified; Miles et al. (2013), for example, list 16, whilst Patton (2015) outline 40. Each offers predetermined selection criteria for

participants, the challenge being to use those that are most relevant to the research question. Those techniques that are often used in qualitative research can be grouped into three types: purposive, volunteer and haphazard; alongside a fourth, quota sampling, which is used primarily in quantitative research. We summarise those most widely used by qualitative business and management researchers in Table 28.1.

Purposive techniques, where participants are selected on the basis of the researcher's judgement regarding relevance to answering the research question, are the most widely used in qualitative research (Miles et al., 2013). These techniques bring to the forefront the challenge of choosing a participant or participants who will enable the research question to be answered. Like the other non-probability sampling techniques, they are normally used to choose a small number of participants who will, hopefully, be particularly informative. Equally though, the ingenuity and flexibility of good researchers allows these challenges to be addressed in innovative ways that progress the data collection process (see Ellem, 2009; Price & Townsend, 2009).

Heterogeneous and homogenous sampling techniques are used to select a small group of participants, rather than just one. Heterogeneous, or maximum variation, purposive sampling relies on the researcher's judgement to first identify relevant diversity characteristics as criteria and then choose participants that meet these criteria to provide maximum variation in the data collected. These variations are argued to represent the strength of this technique, as any patterns that emerge from the data are likely to represent the key themes and should allow them to be both described and explained (Patton, 2015). In contrast, homogenous sampling relies upon the researcher's judgement to identify one particular relevant group or sub-group and then choose participants from within. The data collected from participants is therefore likely to be similar, allowing for both

Table 28.1 Utility of frequently used non-probability sampling techniques

<i>Type</i>	<i>Sampling technique</i>	<i>Nature of participant(s) chosen</i>	<i>Potential relevance to a research question</i>
Purposive – choice of participants	Heterogeneous	Diverse characteristics, maximum variation	Participants reveal or illuminate key themes
Based upon the researcher's judgement	Homogenous	Similar characteristics, limited variation	Participants reveal or illuminate depth, minor differences apparent in key themes
	Theoretical	As needed on basis of developing categories	Participants cumulatively test emerging theory
	Typical case	Normal or usual, not definitive	Participant(s) provide an illustration, rich account
	Critical case	Crucial to what is being researched	Participant(s) important or can make a point dramatically
	Extreme case	Extreme or unusual	Participant(s) reveal the most relevant to understanding the more typical
	Opportunistic	As revealed	Participant(s) allow new leads to be followed
	Politically important	Salient and connected	Participant(s) attract attention (excluded to avoid undesired attention)
Volunteer – choice of participants	Snowball (chain)	Similar, identified by existing participants	Participants are difficult to identify
Based on those who offer to take part	Self-selection	Strong feelings about research questions, self identify to take part	Participant(s) willing to devote time
Haphazard –choice based on convenience of access	Convenience	Unclear, other than willingness to take part	Participant(s) readily available, easy to access, save resources

greater in-depth exploration and minor differences to be more apparent.

Theoretical sampling represents a special case of purposive sampling, particularly associated with Grounded Theory, in which participants are chosen cumulatively to support inductive theory development (Corbin & Strauss, 2015). The researcher relies upon her or his judgement to decide initially from where to choose participants, rather than what to choose them for. Subsequent participants are chosen to inform and test concepts that appear relevant to the emerging theory and evolving storyline that is being derived from simultaneous collecting, coding and analysis of the data.

Other forms of purposive sampling (Table 28.1) address the challenge of choosing either one or a small group of participants with specified characteristics for a variety of distinct purposes. Typical case purposive

sampling relies on the researcher's judgement to identify participants who, within the context of the research, can be characterised as normal or usual and used for illustrative purposes. As such, the participant or participants chosen may be considered representative, although not in a statistical sense. In contrast, critical case sampling relies on the researcher's judgement to select one or more participants on the basis that they are important to answering the research question or can be used to make a point dramatically. Patton (2015) offers a number of clues that suggest a critical case. These relate to whether a potential participant is crucial to the operation of what is being researched or, alternatively, can provide a vibrant illustration. In addition, they can be chosen to provide supportive evidence of the possibility of something occurring. In contrast, extreme case purposive

sampling relies on the researcher's judgement to choose one or more unusual or extreme participants on the basis that such data, when collected, will offer more insights that can be used to answer the research question. This is derived from the premise that findings from extreme cases will be relevant to understanding or explaining more typical cases.

Opportunistic purposive sampling acknowledges how, within qualitative research, the unexpected can occur, for example new leads arising once research is underway. As such it relies on the researcher's judgement to recognise and decide regarding whether or not to take such opportunities. Miles et al. (2013) note that choosing additional participants opportunistically can benefit inductive theory building. We consider that openness to the unexpected and potential new leads is important more widely within qualitative research, particularly within abductive approaches. In contrast, politically important purposive sampling relies on the researcher's judgement regarding anticipated politically sensitive issues and associated outcomes when deciding whether to include or exclude one or more prominent potential participants.

Snowball sampling is the first of two techniques where the researcher chooses participants from those who either volunteer or are volunteered to be part of the research (Table 28.1). It relies on existing participants to identify further potential participants, and so is considered particularly useful where the target population and thus potential participants are difficult to either physically locate or, alternatively, identify. Initially the researcher relies on her or his judgement to choose an initial participant. That participant identifies other participants from the same target population and supports the gaining of access. Each in turn identifies further potential participants who are similar to themselves, resulting in what is likely to be a homogenous sample (Lee, 1993). Our second volunteer technique, self-selection sampling, occurs when, in response to the research being publicised, one or more potential participants

self identify and volunteer to take part. Those who do are likely to have stronger feelings or opinions about the research and consider it important or interesting. Providing such potential participants are considered suitable, the researcher's judgement regarding which media (be it online or traditional) to use to advertise for potential participants will determine the characteristics of those likely to volunteer.

Haphazard sampling occurs when one or more participants are chosen without any obvious reasoning that relates to the research question, the most common form being convenience sampling. This involves the researcher in choosing participants because they are readily available or convenient to access. Although some research texts argue that using this form of selection, whilst saving money and effort, does so at the expense of data and credibility (Miles et al., 2013), we contend this may not necessarily be so. Where the target population of potential participants contains little variability, choosing one or more participants on the basis of convenience rather than some other form of non-probability sampling is unlikely to have a major impact (Saunders, 2012). In addition, a target population that may be 'convenient' to access, perhaps due to an existing relationship, may still meet other criteria judged more relevant to answering the research question.

THE CHALLENGE OF HOW MANY PARTICIPANTS WILL BE SUFFICIENT

Throughout this chapter we have been careful to refer to both a 'participant' (singular) and 'participants' (plural). This is because for some qualitative research questions one participant can be sufficient (Becker, 2012; Patton, 2015). The challenge of sufficient participants comprises two inter-related aspects. The first relates to the planning (design stage) of qualitative research, when it is often necessary to have some idea

regarding how many participants are likely to be needed to enable the research question to be answered. The second occurs during data collection and analysis and relates to the number actually being sufficient to both provide the depth and breadth of salient information to answer the research question and be credible to others. In general terms, the number considered sufficient therefore depends on a balance between the research purpose, saliency of data obtained, what is considered numerically credible by the researcher's community, and the researcher's epistemological and ontological positions (Saunders & Townsend, 2016).

Advice regarding our first aspect, how many participants are likely to be needed within qualitative research is, compared to that for quantitative research, limited. Some texts, emphasising the open-ended and often exploratory nature of qualitative research, argue that data collection should continue from further participants until saturation (Morse, 1994) or information redundancy (Lincoln & Guba, 1985) is reached. Even putting aside arguments that saturation may not be an appropriate way of establishing sufficiency (discussed later), such advice is problematic when it is necessary to have an idea of the number of participants who are likely to need to be chosen at the design stage.

Few authors, and none we could find within business and management, offer empirically based advice regarding when saturation is likely to be reached. One of the most widely cited studies (Guest et al., 2006) draws on a study of 30 Nigerian and Ghanaian women with HIV, commenting that 6 to 12 interviews should be sufficient to reach saturation with a relatively homogenous population. Similar numbers are reported by Francis et al. (2010) and Marshall (1996) in studies of saturation using medical leaders, practitioners and patients, these ranging from 13 to 15. More generally, Onwuegbuzie and Leech (2005) advise the number should not be so small that it is difficult to obtain data saturation and yet not too large to make in-depth analysis

difficult. Kuzel (1992) notes the number required for saturation is likely to differ depending on whether the target population (and the participants to be chosen) is homogenous or heterogeneous, with others highlighting the number will also differ between research strategies. Morse (1994), for example, advises between 30 and 50 participants for ethnographic studies, whereas Creswell (2007) suggests between 20 and 30 participants for a Grounded Theory study.

Whilst some consider saturation to be a 'gold standard' for establishing whether the number of participants is sufficient in qualitative research (Guest et al., 2006, p. 60), others consider it inappropriate. They argue that where saturation is not reached, this means that the phenomenon has yet to be fully explored, not that findings are invalid (O'Reilly & Parker, 2013). Choosing additional participants and collecting data until saturation is reached implies the number needs to be sufficient to reveal or illuminate key themes, implying a need for analytic generalisability. Yet this is not appropriate for research questions such as establishing whether something is possible, or providing a rich account of the particular (Baker & Edwards, 2012). For such research questions a single participant, carefully chosen, may well be sufficient (Merriam, 1995; Passerini, 2012). Others (for example, Baker & Edwards, 2012) note that different disciplinary communities have different norms regarding the number of participants considered sufficient for qualitative studies. Our own review of over 240 empirical articles using interviews in organisation and workplace studies revealed less than 4 per cent mentioned using data saturation (Saunders & Townsend, 2016).

More general advice regarding the likely number of participants regarded to be sufficient for qualitative research is also limited, consideration of the issue being buried away (Baker & Edwards, 2012). Summarised in Saunders (2012) as between 4 and 12 participants for homogenous and between 12 and 30 for heterogeneous groups, much of this advice

comprises opinions, albeit drawing on experience. This is surrounded by methodological and practical caveats alluding to differences between groups, different research strategies and complexities, and the research question. Whilst noting the impossibility of expressing precise numbers prior to inception, such advice also recognises a need to often provide an indication when planning. To this end, Adler and Adler (2012) note that whilst the number of participants can vary from 1 to a 100 or more, they advise between a dozen and 60 for a qualitative research project. This concurs with our own advice based upon our review of organisation and workplace published research practice (Saunders & Townsend, 2016). Drawing on what has been deemed acceptable by editors and reviewers, we suggest that when planning such research, initial estimates of 30 participants if analysing as a single group and 50 if analysing as multiple groups are likely to be credible. We also offer a broad overall norm of between 15 and 60 interview participants. We recognise that for some qualitative researchers the suggestion of such norms might be considered controversial. However, from our pragmatist philosophy, we consider such norms can be helpful providing they are considered as guidance offering insights rather than providing regulations to be followed. The actual number of participants will be dependent upon the research question, saliency of data and the researcher's epistemological and ontological positions. Consequently, a single qualitative interview can be sufficient and credible for some research purposes (Saunders & Townsend, 2016).

THE CHALLENGE OF REPORTING (AND JUSTIFYING) PARTICIPANT SELECTION

Much of the advice and guidance reviewed in the previous section emphasises a need for transparency by reporting and justifying participant numbers in qualitative research.

Although a few researchers, notably Janesick (2000), contend that a preoccupation with justifying method can detract from the story being told, the majority consider it important. They argue such reporting will help the sufficiency of participants and authenticity and credibility of the research to be evaluated (Curtis et al., 2000; Lincoln & Guba, 1985), where appropriate allowing others to adopt the design as a basis for similar studies (Baker & Edwards, 2012). Such justification, it is argued, can take the form of data saturation, citing previous similar studies, or referring to expert opinion (Francis et al., 2010; Guest et al., 2006; Marshall et al., 2013).

Despite this perceived importance, two studies from School Psychology (Safman & Sobal, 2004) and Health Sciences (Collins et al., 2006) reveal only 60 per cent of research articles reviewed reported the number of participants, these rarely providing justification. In relation to information systems, Marshall et al. (2013) note that for those studies reporting the number of participants, justification was either by superficial reference to data saturation or omitted entirely. Furthermore, Onwuegbuzie and Leech (2007, pp. 115–16) comment: 'many qualitative researchers seemingly select the size of their samples in an arbitrary fashion'.

Our own research (Saunders & Townsend, 2016) reveals, in relation to qualitative interviews, over 80 per cent of organisation and workplace researchers provided at least some indication of their number of participants, over three-quarters stating the precise number, as part of a more detailed description of participants' characteristics. Invariably for some, particularly ethnographic, studies it was not possible to state a precise number, although for these a detailed description of process was still offered as part of the method. However, only half of the organisation and workplace studies stating the number of participants provided some form of justification, all doing so either implicitly or explicitly by relating the number of participants chosen to the study purpose. Other (additional) forms

of justification, such as data saturation, citing expert opinion or previous research, were used rarely, being reported in fewer than 5 per cent of studies. This was not something we had anticipated, believing that researchers would justify the number of participants selected in some manner. Hence, we raise the need to both report and justify the number of participants as our fourth challenge, as yet partially unmet by many qualitative researchers within business and management research.

DISCUSSION

Within this chapter we have taken a processual view to highlighting challenges when choosing participants in qualitative research. We have focused our attention on four key challenges within the process: gaining access to data; choosing suitable participants (principally using non-probability sampling techniques); determining appropriate participant numbers; and reporting and justifying the participant selection. Qualitative research as an experience and as a means of understanding phenomena can be richly rewarding and informative. It does, however, present the researcher with a range of challenges, each of which can be overcome with planning, contingencies and flexibility from the research team. Researchers should set out at the start of their project 'planning the worst, yet all the while hoping and working for the best possible outcome' (McDonald et al., 2009, p. 134).

Gaining access can be a challenging process, but, importantly, it is also an on-going process. A range of informal and formal networks may play a role in gaining access and the researcher must tread warily, adhering to both institutional and professional standards of ethical research practice. Importantly, negotiating access is not a one-time activity. Researchers must continually negotiate access throughout the research period, recognising that maintaining strong relationships

can provide the researcher with the opportunity to return for additional data collection at a later stage.

Within business and management qualitative research we generally utilise non-probability sampling techniques. One consequence of this is that whilst some in a target population will have the opportunity to be selected, others will not. Although this means statistical generalisations cannot be drawn, such generalisations have never been an aim of qualitative research. Qualitative research allows us as researchers to dig deeply and understand business and management phenomena, purposive techniques tending to be the most widely used to choose participants (Miles et al., 2013). Yet non-probability sampling techniques are an area that those who oppose qualitative research may point to as a methodological weakness. Whilst such techniques are rigorous, those used need to be documented clearly.

A common question within the wider qualitative research community is 'how many interviews are enough?' (Baker & Edwards, 2012), yet answers to this common question are rare and often imprecise. This is the nature of the qualitative research process; and for some researchers the suggestion of an even broader overall norm might be considered controversial, or perhaps sacrilege. Yet, organisations which plan to commit resources to research projects will often seek an indication regarding the likely resources required. Hence, it is important that the researcher has a plan including an idea of the potential number of participants before they begin to collect data. However, in reviewing advice comprising both guidance and norms, we re-emphasise that these are derived from what has been deemed acceptable by others such as editors and reviewers (Saunders & Townsend, 2016). We also re-emphasise that the actual number of participants for a research study is dependent upon research purpose, saliency of data and the researcher's epistemological and ontological positions, and that for some purposes one interview can be sufficient.

When asked why articles are rejected, journal editors commonly point to problems with the method (Clark et al., 2006; Daft, 1995). Whilst clear description, more detailed explanation and justification can assist in this area, it may create a problem of space for the author. Qualitative researchers need to ensure there is an ample justification and explanation of the participants chosen without sacrificing the quality of the data presented.

Whilst many qualitative researchers appear to make sample size selections in an 'arbitrary fashion' (Onwuegbuzie & Leech, 2007, p. 116), it is also possible that many plan very well based on published research. Methods sections of published journal articles offer little detail in terms of explaining and justifying the selection of participants (Saunders & Townsend, 2016). At best they tend to comprise general statements of process and limited details of participants when publishing. We are of the view that the qualitative research community needs to provide more. Acknowledging there are alternative arguments, we consider it crucial to know how data are collected and analysed as a means of, first, providing some greater credibility and integrity around the process for both scholars and practitioners, and second, providing tacit training for new and emerging scholars in the field. We suggest therefore that qualitative researchers should as a minimum provide a clear description of their participants; how and why they were selected and the number; and, of course, how they enable the research question to be answered.

CONCLUSION

Within this chapter we have outlined four challenges faced by qualitative researchers in business and management when choosing participants. The first of these was the challenge of gaining access to potential participants, which highlighted both organisational issues and pressures for methodological rigour. The second, the challenge of choosing

one or more suitable participants, highlighted the advantages and disadvantages of widely used non-probability sampling techniques. Our third challenge examined the question of how many participants will be sufficient for the research to be considered authentic and credible. We noted the variability in participant numbers likely to be considered credible, highlighting that this would depend on the research purpose, saliency of data collected and the researcher's epistemological and ontological assumptions. Our fourth challenge, reporting and justifying participant selection, emphasised the need, despite potential space constraints, to report research more clearly and more fully. Interwoven through these four challenges is the need to act ethically and ensure participants' rights are respected.

More research on understanding and explaining the reporting and justification of participant selection will allow better informed project planning, greater transparency of the research process and, overall, a better level of credibility and authenticity to qualitative research. Qualitative researchers in practice tend to use the expectations of the business and management community – previous experience, expert opinion and replication of previous studies – as justification for their research. We would encourage authors, whatever the basis of their decision-making, to meet our final challenge and report clearly the number of participants chosen, providing a reasoned justification for the decisions made throughout the data collection process.

Qualitative Research across Boundaries: Indigenization, Glocalization or Creolization?¹

Giampietro Gobo

INTRODUCTION

Contemporary qualitative research is questioned by non-academic and/or non-Western epistemologies, although far less so than quantitative methods. The challenge directly concerns the tacit cultural foundations of traditional qualitative research, which still embodies (in its methods) an ethnocentric, and sometimes colonial, attitude.

Due to the initial European colonization (see Gobo, 2011), and later the Anglophone domination during the twentieth century (see Alasuutari, 2004; Fielding 2014; Hsiung 2012; Ryen 2011), worldwide qualitative methodology is almost entirely constituted by research methods (focus group, in-depth interview, ethnography, visual methods, discourse and conversation analysis, etc.) invented by the Western middle-class academic culture.

This particular local/indigenous, methodological culture was then globalized, becoming dominant in almost all forms of inquiry

around the world. This phenomenon led to a sort of ‘methodological genocide’ of non-Anglophone qualitative research traditions: many local research traditions (e.g. in Austria, Norway, Italy and so on) and their outcomes (not translated into English) disappeared and were erased from local memories and methodological textbooks. However, the paradox is that many contemporary methodological articles are ‘reinventing the wheel’, that is, re-stating what was already found 80–90 years ago by these deleted local research traditions.

Though already global, conventional qualitative research methods still embody the Western indigenous knowledge from which they originated, and they share the limits of globalization evident in many other fields, from economy to politics, from marketing to culture and social life. In fact, when exported and applied in marginal Western cultures (to which poorly educated people, lower classes, cultural peripheral communities, and so on, belong), to migrants

(see Flick & Röhnisch, 2014), Afro-American communities (see McDougal III, 2014), and obviously in non-Western research contexts (Ryen, 2000), these research methods run into cultural difficulties.

For this reason, a growing need to find post-colonial methodologies and non-ethnocentric methods, and to develop culturally flexible, conventional, qualitative research methods, is challenging contemporary research procedures and practices. Researchers wanting to pursue this alternative can choose from at least three methodological directions: indigenization, glocalization or creolization.

After a description of some challenging non-Western epistemologies and a review of some cultural difficulties concerning the main traditional qualitative methods, the three methodological directions will be scrutinized in regard to their advantages and intrinsic limitations. The first direction (indigenous methodologies) will be considered out of date because the local/indigenous no longer exist after the glocalization processes that have invested the entire world (Robertson, 2013). The remaining alternatives to the colonial and ethnocentric Western conventional qualitative research methods are glocalization and creolization. Both are useful, even if creolization seems to be the alternative that is more respectful of cultural traditions, methodologically flexible and fruitful.

CULTURAL DIFFICULTIES WITH QUALITATIVE METHODS

Cross-cultural difficulties with survey and quantitative methods have already been extensively described in the literature (see Gobo (2011) for a review). Less attention has been paid to cultural difficulties with qualitative methods. Because the latter are more flexible than the former, they have been widely considered less ethnocentric. This is not the case. They still embody some common-sense assumptions, tacit conceptions or ideologies

belonging to the societies in which they arose. Hence, they encapsulate specific epistemologies which conflict with the epistemologies in use among the participants investigated. In what follows, several examples taken from different non-Western contexts will be presented in order to describe the limitations of traditional qualitative methods.

Buddhist Epistemology in Management Research: Problems with Interviews in Taiwan

The context of the first example is Taiwan, a small country culturally ruled by Buddhist principles.

Buddhist epistemology is based on the eightfold noble path, the middle path and different (from the West) conceptions about cause–condition–effect, space (context) and time (see Shen & Midgley, 2007). These assumptions shape the ways in which phenomena are understood. For example, ‘problem avoidance’ in management studies is often described by Western psychologists as a pathology from which individuals suffer, and which has a neurotic impact on entire organizations (Shen & Midgley, 2015, p. 171). By contrast, in Taiwan, problem avoidance is rarely labelled ‘pathological’. Rather, if it is mentioned at all, it is seen as being part of the search for organizational harmony that is typical of some Eastern cultures (Shen & Midgley, 2007). Organizational harmony is usually discussed in entirely positive terms by Eastern writers.

If, in this context, the intention is to use the (Western) interview method (see Gobo (2011) for a detailed description of the tacit knowledge and communicative skills entailed by it), some difficulties can be easily predicted. In fact:

[t]he culture in Taiwan encourages a deep respect for age, authority and organizational harmony ... While surreptitious sabotage is possible (Ho, 1997), the open voicing of disagreement is usually viewed

as threatening harmony, which should be avoided. Even the open recognition of problems is generally avoided for fear that pointing to a problem could be construed as blaming someone. (Shen & Midgley, 2015, p. 188)

Consequently, Shen and Midgley recall that 'it was difficult for individuals to mention problems or issues because they feared that they would be seen as challenging the hierarchy, or threatening the coherence of the organization' (2015, p. 188).

Epistemologies of the South: The Mapuche People and the Truth as Opinion

Some Latin American communities share basic cultural beliefs quite different from the North American (Western) ones. In order to advocate the former, De Sousa Santos (2014) urges abandonment of the hegemonic Western-centric epistemologies and meaning systems which are 'cannibalizing' the epistemologies of the South. The latter show how basic schemas of Western thought (on which qualitative methods are based) clash with the reasoning of Latin American participants.

An example of the latter is provided by the Mapuche. González Gálvez (2015) spent 15 months of fieldwork with rural Mapuche people in Elicura, a small valley in southern Chile. He found that they believe in 'the singularity of personal experience', which is strongly connected to the conception of people as unique entities. This implies a specific idea of reality:

[i]f, in Foucault (1970) truth appears as something beyond persons and univocal, to which each person has the same access, for the rural Mapuche, who lack that principle, truth appears as something strictly personal, generally formed by multiple lines of ongoing personal experience. Importantly, these lines are not necessarily expected to converge. If that occurs, it would be due to an overlapping of experiences and/or persons (similitude of being), and not necessarily because there is something 'out there' allowing this to be the case. (González Gálvez, 2015, p. 154)

As Alberto, a native Mapuche, said to the author: 'what you think is what you think, and nobody can mess with that. Each person owns his thoughts'. What each person experiences is unique, and no other person can replicate it. Consequently, the Mapuche people claim that the very process of being-in-the-world, developed by each person, forms reality. So they believe in the appearance of the *witranalwe* (the spirit of a deceased human being like a brother or a son).

However, the rural Mapuche assumption of personal experience's truthfulness implies an ontological gap that cannot be explained relativistically, but is instead a challenge to any kind of external ontology. Far from subjectivism and objectivism, it is radically respectful of the singularity and autonomy of persons.

Chinese Epistemology: Difficulties with Interviews, Fieldnotes, Coding, Discourse and Conversation Analysis

Traditional qualitative research methods take for granted the basic cognitive procedures on which they are based. However, these interpretative procedures are closely bound up with the features of Western thought. This emerges only through comparison with other epistemologies, like the Chinese one.

Traditional social science research in China has 'mainly been speculative without strict requirements for empirical data from the field or a rigorous procedure. It used philosophic contemplation and logic deduction for theory production and verification' (Chen, 2015, p. 1). In spite of the various indigenous efforts by Chinese scholars, qualitative research in China is, by and large, a Western-imported product (Chen, 2015). And, as such, traditional qualitative research is constantly challenged by the main features of Chinese epistemology.

Holistic thinking versus analytic thinking

Chinese scholars have inherited a cultural way to see the world as hazily, holistically and aesthetically beautiful. With the ‘unity between nature and the human’ doctrine, Chinese people usually see the world in unitary manner: ‘unlike the atomized world view such as the Christian or the scientific tradition in the West (Hoban, 2002), Chinese holistic view sees everything as interrelated, and nothing is in isolation from each other’ (Chen, 2015). The Western qualitative research mainstream requires analyses that disaggregate data and examine each word, phrase and sentence meticulously. This appears to be an excessively ‘hairsplitting’, ‘dissecting’ and ‘destructive’ analysis, because the doctrine of mean and harmony is neither clear-cut nor fixed. This manner of thinking is especially evident in Taoism, which believes that Tao (the Way) has no name and that classification is meaningless because haves and have-nots are constantly changing into each other, like yin and yang: ‘this may explain why some of our students are not used to the idea of reflexivity, which injects the researcher as an object for meticulous scrutiny’ (Chen, 2015, p. 8). Consequently, quite a number of the students found themselves unable to adapt to the overly analytic style of qualitative research. Some said that they found it very hard to cut texts into pieces and label them with codes, categories, properties and dimensions, ‘because it has lost the beauty of the whole, the haziness and the poetic, which we Chinese people cherish most’ (Chen, 2015, p. 7).

Imagery thinking versus conceptual thinking

In taking fieldnotes, some students preferred to use literary language to describe a scene: for example: ‘A man as tall as a horse came into the dining hall with a girl, who was hanging on his arm as a little bird rests upon

a man’ (Chen, 2015, p. 8). They thought that this kind of metaphorical language was better able to capture the spirit of the scene with aesthetic beauty than the drier, factual, concrete descriptions (required by Western qualitative research tradition) which can only show the appearance of people.

Moral dimension

Besides being holistic, knowledge in the Chinese cultural tradition is also value-laden with a moral bent. It is very different from the Western tradition of seeking objective understanding from the outside. Rather, it is mostly inward looking. In the Chinese language, the meaning of ‘knowing’ refers not only to perception and comprehension but also to moral conscience. Knowledge is imbued with morality, the highest good, in order to perfect oneself through constant introspection for the betterment of one’s family, one’s nation and the world.

Action orientation and concrete thinking versus abstract thinking

According to the Chinese cultural tradition, knowledge is both understanding of the world and action to change the world for the better.

The action orientation of knowledge is illustrated in such well-known doctrines as the ‘Unity of Knowing and Doing’. Knowing and doing are not divorced from each other. Knowing is the beginning of doing, and doing is the fulfilment of knowing.²

Informant consent

Because Chinese culture attaches great importance to personal relations, some protocols that may work in the law-governed Western society are not applicable in China. For example, the ‘informed consent’ form is considered an oddity in Chinese society. It would be contrary to common sense to ask a participant for a signature while the researcher should take full responsibility. Faced with the form, the participant would be scared away, thinking that s/he was making a life-or-death

commitment with unknown consequences. Indeed, Chen states: 'no university in China has required such a form yet' (2015, p. 7).³

Finally, unlike in mainstream Western methodology, some students said:

[t]he significance of researching a small sample is not to generalize its findings to a large population, but to impact the readers, to move them. It's like the Buddhist saying, 'One moon reflected in thousands of rivers; so long as there is water in a thousand rivers, there are a thousand moons'. (Chen, 2015, p. 8)

Difficulties with Focus Groups in Thailand and Visual Methods in Mexico

Eastern and Southern epistemologies challenge the cognitive processes at the basis of traditional (Western) qualitative research methods. The following examples, taken from Thai, Mexican and Guatemalan research contexts, show how focus groups and visual methods are not culturally neutral techniques, but instead closely related with the societies in which they were invented.

Tacitly embedded in the focus group method, invented in the US (during the Second World War) jointly by a European (Paul F. Lazarsfeld) and an American (Robert K. Merton), are specific individualistic ideas about ordinary social relations and society: it should be democratic; people are free to express and share their opinions; individual and personal beliefs are respected; and so on. But how many democratic societies exist in the world? Are focus groups possible in authoritarian or non-democratic societies? Can this American method be exported without its original social and cultural conditions?

In regard to her field experience in Thailand, Chareerat Intarachamnong writes:

[It is] difficult to achieve core concept of focus groups in Thai environments ... The researcher has difficulty in creating free situations of discussion. The barrier is national traits/characters (existing

also in other Eastern societies). The 'Kreng jai'⁴ and/or 'Seniority' (respect for elderly people) values make every participant not fully release ideas to the group, because they feel like they are 'showing off'. If a participant asserts ideas contrary to the group, the others feel that s/he is aggressive or discrediting other participants. Especially if this happens with senior people, it can damage the atmosphere. This preaches to the essence of Thai society. I've found this even for marketing focus groups, which situation turns into a group interview instead of a focus group, because people are shy to express ideas. (personal communication, 13 January 2016)

Also, photographing and filming people (i.e. visual methods) are often awkward issues among some populations (e.g. in some Maya villages in Chiapas – Mexico or in Guatemala). As every travel guide warns, photographs and filming are not allowed due to the belief that they will capture the participants' soul. If the researcher leaves the village with the photograph, then the participant's soul goes with them. Hence, there also exists a colonial methodology legacy within visual methods.

Hawaiian Epistemology: Expanding Western Ideas of Empiricism

In a very interesting essay, Aluli-Meyer (2008) has outlined the Hawaiian epistemology. In it, spirituality and knowing are intertwined. Hence, the understanding of a social phenomenon, situation or action is based on a range of senses wider than the five bodily ones of empiricism (vision, hearing, touch, taste and smell); other bodily and spiritual senses are included in order fully to understand the phenomenon under study. As the author explains,

the separation of mind from body is not found in a Hawaiian worldview ... intelligence and knowledge are embedded at the core of our bodies – the stomach or *na'au* ... the site both for feeling and thinking ... *Our mind is our body. Our body is our mind.* And both connect to the spiritual act of knowledge acquisition. (p. 223)

There is a different conception of action and its motives in Hawaiian epistemology:

Hawaiians at one time believed in the causative agency of intention. *Thought creates*. This is why it was seen as negative to even think of hitting a child. Negative thoughts then had negative consequences ... the idea that thought creates and intentions shape the observable world ... is now recognized and discussed in depth by indigenous scholars, quantum physicists, mothers, and social scientists ... Our thoughts create reality. (p. 222)

INTERSECTIONALITY AND SITUATIONALITY

The examples reported should be contextualized and not generalized. In other words, not all Taiwanese share, follow or are affected in the same ways by Buddhist principles; not all Chinese people have difficulties with analytical reasoning; not all people living in Chiapas think badly about photography and video; and so on.

'Intersectionality' is a notion first developed in 1989 by the American civil rights activist and leading proponent of critical race theory, Kimberlé W. Crenshaw. It is based on the idea that differences and discriminations overlap with or *intersect* with social identities in different ways: various biological, social and cultural categories, such as gender, race, class, sexual orientation, religion, age, nationality and other sectarian dimensions of identity, often simultaneously interact at diverse levels. This means that there is no singular experience of an identity. Consequently, the most important role is played by the participants' *position* within the sets of power: this position is defined and re-negotiated by multiple axes of differentiation and discrimination.

For example, a white woman can be discriminated against when she relates with white men; however, in a work context where white people are dominant, she can have several advantages compared to a black woman employee. Nevertheless, the white woman

may be discriminated against if she works in an organization run by black people. Political movements headed by black women contested the idea that women form a homogeneous category with essentially the same life experiences. This argument arose from the realization that white middle-class women do not represent the feminist movement as a whole (Davis, 1983). Feminists recognized that the kinds of oppression experienced by white middle-class women are different from those suffered by black, poor or disabled women. They consequently examined how gender, race and class combine to 'determine the female destiny' (hooks, 1984). Their conclusion was that people are subject to diverse forms of subordination within society (McCall, 2005) and the social setting (the situation) plays the main role in producing the discrimination.

INDIGENOUS METHODS: DO IT BETTER?

This brief review of difficulties encountered by traditional (Western) qualitative research methods underlines that these globalized qualitative methods should be amended. A researcher who wants to take up this challenge has three main options: indigenization, glocalization or creolization. Let us start with the first one.

During the past 15 years, awareness of the need to decolonize methodology has become intense. Since the pioneering work of Deloria (1969) and especially since the watershed publication of Smith (1999), the frame of social justice methodology has been growing among researchers seeking actively to recognize the injustices of the past and present in research practices (Evans et al., 2009; Nicholls, 2009). Indigenous methodologies (IM) and participatory action research (PAR) have been presented as ways to overcome methodological colonialism, as kinds of research by and for indigenous peoples using

techniques and methods drawn from the traditions of those peoples.

Kaupapa Māori

The most systematic model is *Kaupapa Māori Research*, an aboriginal research pattern theorized by Linda Tuhiwai Smith, Leonie Pihama, Taina Pohatu, Russell Bishop, Kuni Jenkins, Cheryl Smith and others (see www.rangahau.co.nz/about/). *Kaupapa* means different things simultaneously: philosophy, principle, basis, theme, topic, project, plan and proposal. There are eight main methodological principles of Kaupapa Māori: self-determination (*Tino Rangatiratanga*), cultural aspiration (*Taonga Tuku Iho*), culturally preferred pedagogy (*Ako Māori*), socio-economic mediation (*Kia piki ake i ngā raruraru o te kainga*), extended family structure (*Whānau*), collective philosophy (*Kaupapa*), treaty of Waitangi (*Te Tiriti o Waitangi*) and growing respectful relationships (*Ata*). These principles are inspired by six main ethical values: *Aroha* (respect), *Kānohi Kitea* (meeting with people face to face), *Manaaki Tangata* (collaboration and reciprocity), *Mana* (caring), *Māhaki* (sharing knowledge) and *Tikanga* (guidelines on what is 'right').

These methodological principles and ethical values are very interesting and informative. Smith (2005) presents *Kaupapa Māori* as opposed to *indigenous research*, because the former is transformative and serves as a model of social change and transformation that privileges *Māori* knowledge, aspirations, empowerment and emancipation. By contrast, *indigenous research* is merely a cognitive and naturalistic enterprise.

However, many of the *Kaupapa Māori* concepts are to be found also in feminist, postmodernist and transformative (action research) methodological approaches developed in the 1980s and 1990s by (mainly) Anglophone scholars.⁵ What is it in *Kaupapa Māori* that cannot be found in those Western

qualitative approaches? The disappointment increases when we pass from the Māori methodology to its methods, because *Kaupapa Māori* 'uses a number of quantitative and qualitative research methods that are also commonly used within other methodologies' (www.rangahau.co.nz/method/). In its 'exemplar' (reported in www.rangahau.co.nz/exemplar/), research on a project on the 'Historical and Contemporary Understandings and Expressions of Māori Sexuality' was conducted with focus groups and 20 interviews. In other words, specific Māori research methods do not exist, but 'only' adaptations of Western/colonial research methods to the Māori cultural and social context, to the principles of *Kaupapa Māori* research, and to the Māori participants' epistemology.

The Mmogo-Method™

Different is the case of 'Mmogo', a Setswana word denoting interpersonal relatedness, co-ownership, togetherness, co-construction and/or interpersonal threads (Roos, 2008). The *Mmogo-Method™* is a projective visual data-gathering method. It consists of clay, beads, straws and grass sticks manipulated into three-dimensional shapes by participants in order to produce associations related to their personal and collective experiences (see Figure 29.1). Through an open-ended research question, the researcher invites the participants to visually express their experience of a specific subject. This is followed by a collective discussion of their visual presentations. The *Mmogo-Method™* was formalized and patented by Vera Roos, a white Afrikaans researcher who developed it (in southern African contexts) from the observation that when conducting research in cross-cultural environments, traditional data collection methods such as questionnaires are limited in the desired data that they produce. Similarly, interviews and focus groups deliver little to no rich data in research that strives to discern the experiences, feelings

Figure 29.1 The *Mmogo-Method*TM

and perceptions of participants of which they themselves may not be aware or which may be hard to verbalize.

The *Mmogo-Method*TM is a rare case of an indigenous method. Another exception is *Dingxing Yanjiu* (investigative research), an approach distinct from qualitative and quantitative approaches, with Chinese socialist characteristics, and practised by former Chairman Ma Zedong and others before and after the ‘liberation’ in 1949 (see Hsiung, 2015). It is quite different from typical qualitative research because it has a very strong political agenda with predetermined assumptions, while qualitative research is more of a naturalistic inquiry, and also because traditional qualitative research was introduced into China only in the 1990s.

**INDIGENOUS METHODOLOGIES
WITHOUT INDIGENOUS METHODS:
WHY THIS?**

Apart from these exceptions (as far as I know), most of the literature on IM gives a

great deal of space to their epistemological assumptions (see a collection of them in Denzin et al., 2008), but not very much to technical proposals, which should be markedly different from the dominant colonial methods. Also, the increasing number of Western qualitative researchers (working with or within NGOs, engaged in action research and intervention projects), and the related growing literature on how to create connections and social capital in order to succeed in data collection (see Boggiano et al., 2015 for Vietnam) or be accepted as an indigenous insider by the participants (see Suwankhong & Liamputtong, 2015 for Thailand and Australia), propose doubtless useful suggestions, tips and recommendations for postcolonial fieldwork. However, in the end, these IM rarely convey technical innovations (Travers, 2009) and still heavily use colonial and ethnocentric methods in their research. Why is this so?

First, scholars who advocate and promote IM conduct quite limited discussion on specific methods, because they believe that many of the traditional qualitative methods could ‘work well with research involving

indigenous people' (Schneider & Kayseas, here Vol. 2, Chapter 9). In other words, the endeavour to indigenize qualitative research methods ends up with slight adaptations or minor revisions of existing Western qualitative methods. This minimalist perspective (which resembles more what I consider to be glocalization – see below – than indigenization) is proposed, for example, by Kovach when she states that 'indigenous methodologies and qualitative research at best form an insider/outsider relationship' (2009, p. 31). In other words, indigenous research methods exist both 'inside' and 'outside' traditional qualitative research methodologies. Following Kovach, what pass as IM are only traditional qualitative methods based on story-gathering methods (like the talking circle and/or research sharing circle, which gives everyone a chance to speak uninterruptedly, case method, narrative research and certain ethnographic interview methods). Also according to Chilisa (2012, pp. 31 and 230), even questionnaires and surveys can be adapted to an indigenous methodology, re-phrasing questions and terminologies in order to match the participants' knowledge systems, languages and experiences. However, this was precisely the interactional and interviewer-centred survey already proposed by the American surveyist Rensis Likert in the 1930s (see Gobo & Mauceri, 2014).

This is rather paradoxical, because a culture is usually recognized as being local or indigenous when it produces something specific and unique: a special cuisine (see Miller, 2008), a particular music, an unusual ceremony or distinct forms of knowledge (epistemologies). Consequently, it should also produce specific knowledge practices and research methods, as happened in medicine when specific epistemologies and worldviews produced specific approaches and methods which embodied specific local cultural features: homeopathy (Germany), naturopathy (Scotland and Germany), chiropractic (Canada), osteopathy (US), traditional

Chinese (China), anthroposophy (German), Ayurveda (India) and Tibetan (Tibet).

A second explanation of why non-Western epistemologies are rather fruitless in regard to methodological innovation has been put forward by Denise Gastaldo (University of Toronto), referring to Latin America:

It's my impression that in places where there is so much to be done, people don't spend much time thinking about methods, which are seen as 'just a tool'. Also, I believe French scholarship has been very influential in Brazil – ideas matter; methods are for North Americans ... there are 'indigenous' methods, but people don't realize they are local. I would say the whole tradition of PAR following Freire's cultural circles (and Fals Borda's work), Theater of the Oppressed,⁶ etc. are seen as a mix of intervention and research, which many times are not clearly understood historically (e.g. many think of PAR as a North American invention). Colonization is very strong. A lot of methodologies are considered rigorous because they are Anglo-American. (personal communication 23 January 2016)

What Is by Now Local?

What Is by Now Indigenous?

A third (complementary) explanation concerns the disappearance in the contemporary age of local. Hence perhaps impossible today is the survival of solely indigenous thought, of exclusively local practices (including research). It was not always so. Certainly active in the past were non-Western secular forms of investigation into the thoughts of people, their behaviours, opinions and feelings. For example, we can find a prototype of mystery shopping⁷ in personal investigations by the caliph Harun al-Rashid, belonging to the Abbasid dynasty that reigned from 785 to 809 in Baghdad (at that time one of the biggest and most prosperous cities in the world). He was a master of disguise able to masquerade as a merchant, a fisherman, a buffoon, etc. in order to meet and listen to his people in a way not mediated (affected) by his authority. Peter the Great (1682–1725) did likewise. Motivated by the intention to modernize Russia and make it the greatest power

in Eastern Europe, he chose to disguise himself to observe new techniques in both military and administrative organization. He travelled in disguise, especially in England and Ireland, at that time very advanced countries in terms of their Navy.

The same applies to other non-Western methods like the ‘compassionate approach’, ‘mindfulness or contemplation methods’ and ‘Buddhist meditation’, which have recently attracted scholars in the fields of neuroscience (Varela & Shear 1999), social problems (Sivaraksa et al., 1999), higher education (Galtung, 1999) and medical education (Remen, 1999), generating interesting methods and techniques (Giorgino, 2015). They could indeed represent opportunities to decolonize methodology.

However, the local seems to disappear in favour of glocalization. The latter raises some still unanswered questions such as: Who are the indigenous? Who is not indigenous? Who can speak on behalf of indigenous peoples and communities? Do pure indigenes still exist? Is indigeness a fixed identity or an intersectional one? What is authentic (the anthropological reflection on the politics of authenticity is wide)? What is more important, the quality of research or its ethnicity/indigeneity (see Atkinson & Ryen, 2016)?

In her discussion of research ethics and the Confucian worldview, the Chinese educationist Lee (2014) enquires whether an East–West polarization is really necessary. She suggests a middle way. In management studies, Indian Mathur (2014), instead of rejecting Western research, proposes a variety of inquiry approaches, and Atal (2014), an Indian sociologist, stresses the need to make exogenous elements suit local requirements, which strongly recalls the concept of ‘glocalization’. It seems important to avoid iconoclastic attitudes to Western research methods, seen as the devil compared to the goodness of the indigenous ones. As Chen (2015, p. 2) writes:

[q]uantitative research was first introduced into China in the early 1900s to assess urban poverty

and the experiences of the underprivileged as a critique to traditional elite knowledge (Chiang, 2001, quoted from Hsiung, 2015, p. 89; Lam, 2011, quoted from Hsiung, 2015, p. 89). After 1949, both quantitative and qualitative approaches were severely criticized for their imperialist connections and urban-centered bourgeois orientation (Hsiung, 2015, p. 89). In the late 1980s with the open-door policy, quantitative approach was reintroduced into China as ‘scientific’ and ‘objective’. Such ‘positivist’ research was at first almost a refuge or a liberating force for a group of intellectuals who had suffered hugely under bruising political movements that had subjected social sciences to ideological purposes. (R. Hayhoe, personal communication, 15 March 2015)

Glocalization

Roudometof (2015a) has well clarified the different interpretations of the term ‘glocalization’. Robertson (1992, p. 173) first introduced the concept of ‘glocalization’ into the social-scientific discourse. Thereafter, he refined it in order to respond to his critics (e.g. Radhakrishnan, 2010; Ritzer, 2003). While accepting some criticism, in his monist perspective, Robertson (2013) stated that today only *glocal* exists (no longer either *global* or *local*). The *glocal* is the final outcome of the historically long struggle between the global and the local in which both lost. According to Robertson, contrary to the general uptake view, in the end globalization does not produce uniformity (even if this was its original colonial aim), but differences and fragmentation of the world into a multitude of *glocal* realities, although they have the mould of global. Like the Hindu deities, they have essence and multiple realities. Today glocalization is (the result of the failure of) globalization, which has lost its hegemonic project. With a different emphasis, Alexander (2003) sees glocalization as a globalization refracted through the local. In terms of the metaphor of refraction,

the local is not annihilated or absorbed or destroyed by globalization but, rather, operates

sybiotically with globalization and shapes the telos or end state ... The result is heterogeneity (e.g. pop music or organizational technique or religion, and so on). Glocality is defined as experiencing the global locally or through local lenses (which can include local power relations, geopolitical and geographical factors, cultural distinctiveness, and so on). (Roudometof (2015a, p. 11)

According to Meyrowitz, ‘we now live in “glocalities”’. Each glocality is unique in many ways, and yet each is also influenced by global trends and global consciousness’ (2005, p. 23, quoted by Roudometof, 2015a, p. 11).

Also Ritzer (2003) agrees that pure global and pure local no longer exist. Perhaps (conventional) pure local used to exist but, with the advent of capitalism, it disappeared after having lost the struggle with globalization. In fact, isolated realities (e.g. remotest or culturally pristine tribes) are rare. When the local disappears, what is left is glocal, because local and global are mutually exclusive.

Glocalization as Subtle Colonialism

However, Ritzer (1993, 2003) balances Roland Robertson’s optimistic vision by highlighting some more negative aspects of glocalization. Contrary to Robertson, Ritzer maintains a dualist perspective (Roudometof, 2015a, p. 6). Hence, globalization is a general process with two ideal-typical outcomes: *grobation* and *glocalization*. The former (centred on *growth*) is a form of hard imperialism (Americanization) pursued by nations, corporations and organizations when the same product is delivered, in the same way, around the world.

The latter is a soft and subtle colonialism, a *top-down* adaptation to the local, still maintaining an unbalanced relation with the latter, which remains subordinate. In other words, the glocal overcomes the local.⁸ Glocalization principles have been implemented by some international managerial styles, worldwide organizations, religious enterprises (e.g. Soka

Gakkai, a Japanese Buddhist religious movement), cross-cultural business and marketing, commercial strategies of companies like Coca-Cola, Mattel (with multicultural Barbie dolls – see Varney, 1998, pp. 162–4), Procter & Gamble, Starbucks, Nike and McDonald’s. This last is probably the most cited case because McDonald’s has adapted its original menu to meet customer wants in different countries (see Ram, 2004, pp. 13–15; Vignali, 2001, pp. 99, 104–6).

Within this framework, there are interesting attempts in social science methodology which I would classify as glocal research methods.

Sampling and Recruitment in Confucian Contexts: The Korean Case

The nature of Confucian societies presents potential conceptual and epistemological gaps between Western methods and their implementation in non-Western contexts. For example, traditional Korean values, which still have an important role in the society and management systems, are expressed in the form of five basic principles: 1) respect for elders, 2) respect for honour, 3) collectivism, 4) family, and 5) the dominance of three kinds of personal connection: blood networks, regional networks and school networks (Jung, 2007). According to these principles, we can discover how random sampling is a Western culturally driven method: ‘indeed, whilst purposive sampling by personal network can be criticized for “cherry picking”, allowing the researcher to hand pick respondents for ease, it perhaps fitted somewhat more naturally with Confucian mores and expectations rather than attempting to recruit unknown individuals who lie outside networks’ (Park & Lunt, 2015). In fact, in her research, Sunghye Park had difficulties in recruiting both senior civil servants (for hierarchical reasons) and, generally, persons outside her direct personal

network, because it is difficult to penetrate the Confucian-ordered societies. Unlike the elite, civil servants who began careers as middle level managers were easier to recruit because the researcher belonged to this group. Of course, these cultural and social constraints can undermine (as noted above) the representativeness of the sample, and researchers should do their best to fill up all the quotas (see Park & Lunt, 2015, for details).

The Group Interview in Thai Contexts

We saw above why focus groups are unsuited to inquiry in Thai research contexts. As Chareerat Intarachamnong puts it:

[t]he way out for this will be the 'group interview', in which the researcher asks the questions separately and individually to the participants ... [The] Delphi method is another technique which may suit Thai; also EDFR (Ethnographic Delphi Futures Research), which was developed by Thai academics to create 'Criteria' in order to avoid collective face-to-face situation[s] ... The discourse interview is a very suitable technique for Thai society or Eastern cultures in my opinion. Because there is no confrontation between key informants; Eastern people are not comfortable in facing opposite opinions and we try to avoid conflict. Basically, Thai and Asian people have a lot of compassion ... for me, the discourse interview is the best technique in the world to collect data. It suits our culture to talk one to one: no confrontation, no conflicts, and no private information to tear out? (personal communication, 13 January 2016)

These adaptations could be considered fine in a glocalist perspective. The question is this: could we go further and overcome the subtle colonialism embodied in glocalization?

'Inter-Localized Methodology' and Creolization as Alternatives

The concept of 'glocalization' is too economic/market meaning and theory-laden, and it still carries a subtle colonialism.

However, as we just saw, the indigenization of methodology is also an outdated project: almost nothing is indigenous anymore. While on the one hand, following Haraway (1988), thinking is always local, embodied in a specific context and connected to a specific place because there is no such thing as a 'god-trick' and 'the view from nowhere [has become] a view from somewhere', on the other, embracing a historical perspective, then nothing is really local or indigenous. Each and every product that we usually define as local has always come from another place. Everything has been imported in a particular historical moment: potatoes from Peru, tomatoes from Central America, vines (probably) from the Caucasus, apples from Central Asia, silk and peaches from China, and so on. All the things that we today consider local have, in reality, come from another place and been mixed up. This could explain why the main features of the Hawaiian epistemology are also traceable to the Buddhist or Taoist ones. Epistemologies are more trans-local than we admit. For example, the idea that the human being is tripartite in body, soul and spirit can be found among the Ancient Greeks, the early Christians until almost AD 1000, and contemporary Inuits, peoples inhabiting the Arctic regions of Greenland, Canada and Alaska.

The same applies to shamanism. Although the word 'shaman' probably originates from the Tungusic Evenki language of *North Asia*, shamanic medicine is widespread in Mongolia, China (Hmong people), Indonesia, North and South Korea, Japan, Siberia and North Asia, India, Nepal, Tibet and Central Asia, Taiwan, Vietnam, *Europe* (from Finland to Italy), Circumpolar (Eskimo Inuit and Yupik cultures), *North America* (native Americans), *Mesoamerica* (Maya of Guatemala, Belize and southern Mexico), *South America* (Kuna of Panama and Colombia; Tapirapé and Shuar people of Ecuador and Peru; several tribes living in the Amazon rainforest of Brazil; Mapuche of Chile, Aymara people of Andes and Altiplano

regions of South America in Bolivia, Peru and Chile; Fuegian peoples of Tierra del Fuego), Papua New Guinea, *Australia* (various aboriginal groups), and *Africa* (Dogon people of Mali; Zulu, Nguni of Southern Africa; Nuba of Sudan; Bantu of Zimbabwe, Zambia, South Africa and Botswana).

In light of these descriptions, 'indigenous' is more a political category than a theoretical one.

If global per se does not exist, because everything global has something local inside it, then perhaps also glocalization is nonsense: there is never an encounter between global and local. There is always an encounter between two locals, two indigenous cultures (e.g. the North American and the Thai) that may understand and accept each other, in an intercultural dialogue, or else the former prevails over and colonizes the other. An 'inter-localized methodology' (Gobo, 2011, p. 433), based on an encounter between two (local) cultures, could produce a new outcome, based on 'dialogicality' and symmetry, without any hegemonic claims.

This encounter can be called 'creolization', an 'unpredictable new creation', as theorized by Edouard Glissant (1928–2011), a Martinican (French West Indies) writer, poet and literary critic, one of the most influential figures in Caribbean thought. In Glissant's view, creolization is a new constitution, not a simple modification or significant variation of the existing one, but a really different, substantial mix of original parts. There exist creole cultures and creole languages (through the pidgin – see Hymes, 1971 and Salikoko, 2001) like *Chavacano* in the Philippines, *Krio* in Sierra Leone, *Tok Pisin* in Papua New Guinea, *Papiamentu* in the Netherlands Antilles, *Belgranodeutsch* in the neighbourhoods of Belgrano in Buenos Aires, *Fanakalo* in South Africa, *Chinglish* and more than 50 others (<https://en.wikipedia.org/wiki/Pidgin>).

'Creole', alongside other popular terms like 'hybrid', 'syncretism', 'transcultural' and *mestizae* (for an overview, see Burke (2009, pp. 34–65) and for an example, see Ritzer (2011); both quoted by Roudometof (2015b, p. 2)),

recalls the well-known idea of fusion or cultural hybridity. As Roudometof writes:

[t]he contribution of Latin American scholarship to the revitalization of these ideas is considerable. It is from within that region that the terms transculturalism, *mestizae* and creole emerged and eventually transferred into the discourses of North Americans and Europeans. The idea that intercultural mixed peoples (*métissage*) offer the key in legitimizing Latin American identity is a notion originally put forth in 1891 by José Martí in an article entitled 'Nuestra America'. *Métissage* was viewed as a distinctive trait of a culture founded upon a mixture of the native population with different immigrant groups. In the 1940s Fernando Ortiz developed this notion further in order to articulate the concept of transculturalism. Calcini (1995) has furthered Ortiz's ideas and expanded them into the idea of cultural hybridity. Eventually, the concept of transculturalism gained a foothold not only in the fields of literary studies but also in the social sciences (for examples, see Antor et al. (2010); Stockhammer (2012)). (Roudometof, 2015b, p. 3)

There are many cases where the incorporation of (individual and cultural) otherness becomes a new cultural feature (see, for some of several examples, Boccara (2002) on the ethnogenesis of the Mapuche, or Jolly (1992) on the politics of inauthenticity).

Creole carries the idea of equal status between cultures, equilibrium, blend, balance. Exemplars of creolization (outside methodology) are world and ethnic music, blues, jazz and ... the Fulla doll.

The Fulla Doll

In 2004 or so, Barbie dolls had all but disappeared from the shelves of many toy stores in the Middle East. In their place, there was Fulla (see Figure 29.2), a dark-eyed doll with, as her creator put it, 'Muslim values'.

Fulla roughly shares Barbie's size and proportions, but steps out of her shiny pink box wearing a black abaya and matching head scarf. She is named after a type of jasmine that grows in the Levant, and although she has an extensive and beautiful wardrobe

Figure 29.2 A Fulla doll

(sold separately, of course), Fulla is usually displayed wearing her modest ‘outdoor fashion’.

Fulla’s creator, NewBoy Design Studio, based in Syria (now in United Arab Emirates), introduced her in November 2003, and she quickly became a best seller throughout the region. It is nearly impossible to walk into a corner shop in Egypt or Jordan or Qatar without encountering Fulla breakfast cereal or Fulla chewing gum or not to see little girls pedalling down the street on their Fulla bicycles, all in trademark *Fulla pink*. ‘This isn’t just about putting the hijab on a Barbie doll’, brand manager Fawaz Abidin said in 2005. ‘You have to create a character that parents and children will want to relate to. Our advertising is full of positive messages about Fulla’s character. She’s honest,

loving, and caring, and she respects her father and mother’. Though Fulla will never have a boyfriend doll like Barbie’s Ken, Abidin said, a Doctor Fulla and a Teacher Fulla will be introduced soon. ‘These are two respected careers for women that we would like to encourage small girls to follow ... If this doll had come out 10 years ago, I don’t think it would have been very popular ... Fulla is part of this great cultural shift’.⁹

CREOLIZING METHODOLOGY

Although, apparently, the Fulla doll has nothing to do with methodology, it illustrates what a creole research method could be.

Among different methodological solutions (global, glocal or indigenous) there is space for a creole methodology in which research methods originating in different parts of the world (even if we know that most are from Europe and US) can hybridize. There is a growing set of methods (not only methodologies and epistemologies) that are neither really indigenous nor simply colonial: new ways of sampling, collaborative drawing-based inquiry in Australia (Morgan et al., 2009), interviewing techniques (in Argentina) with cards printed with key research concepts related to the body (Sutton, 2011), and others. There follow some interesting examples.

Buddhist Systems Methodology

In their action research described above, Shen and Midgley created a *Buddhist systems methodology* (BSM): ‘unlike many Western action research approaches, which require participants to start by identifying problems or problematic situations, the BSM uses Buddhist concepts that are closely associated with the practice of harmonious living’ (2015, p. 170). The principal strength of the BSM is that it reinterprets the phenomenon in terms that are culturally familiar to, and deeply valued by, people in Taiwanese Buddhist organizations and introduces a route to identify problems, critique the status quo and consider how things ought to be done, using familiar Buddhist concepts that are closely associated with the practice of harmonious living; avoiding the use of less familiar Western systemic action research concepts that can be interpreted as threatening organizational harmony (p. 188).

Methods for Interpreting Silence (and Not Solely Verbal) in Interviews: The Japan Case

As Kawabata and Gastaldo well summarize:

[t]he ways individuals communicate vary across cultures (Gudykunst & Ting-Toomey, 1996;

Gudykunst et al., 1996). Gudykunst et al. (1992) suggest that individualistic cultures, such as the US and Canada, use direct and explicit messages to convey meaning, while collectivist cultures such as Japan use indirect and implicit expressions. People in Western cultures focus on explicit communication while viewing silence as merely background (Kim, 2002). (2015, p. 6)

Silence has not been fully appreciated in qualitative research, where it is often considered as a problem and viewed as representative of failure on the part of the interviewers:

[i]n the West, for example, people think that communication is essentially a verbal activity and tend to feel somewhat uncomfortable when others are silent (Newman, 1982). In contrast, in Japan, silence is valued and considered a communication strategy. Rather than indicating a lack of information, it is a culturally grounded part of communication (Nakai, 2002). (Kawabata & Gastaldo, 2015, p. 1)

These features developed from the collectivist imperative because, in a collectivist society, people need to develop communication strategies to preserve group cohesion and solidarity rather than prioritizing individual interests (Hofstede, 1991). For these reasons, it is also argued that Japanese people would ‘prefer to be silent than utter words such as “no” or “I disagree”’ (Nakane, 1972, p. 35). As in Taiwan and, generally, in Buddhist contexts, ‘the avoidance of such open and bold negative expressions is rooted in the fear that it might disrupt the harmony of the group’ (ibid.). Even feelings of defiance or anger can be expressed through silence (Lebra, 1987).

Reflecting on her research experience interviewing Japanese day labourers (one of the most excluded groups), Makie Kawabata found that their silences reflected social expectations in Japanese society, one of which is ‘the less said, the better’. Accordingly, she found that:

[s]ilence is not necessarily a sign of interviewees’ inability to express their thoughts but could be used purposefully to make their stories authentic ... some participants were evasive when they responded ... using expressions like ‘several things’

or 'complicated reasons' to manifest reluctance to speak frankly. Some participants responded vehemently and created tense and awkward moments, which is a way for people to mask their true feelings. In Japan, expressing personal feelings in formal conversation is discouraged because emotions are a sign of weakness and men, in particular, are taught to be strong (Sugihara & Katsurada, 1999) and negative feelings create disharmony (Markus & Kitayama, 1991) ... day laborers became silent or assumed a tense and uncooperative tone of voice when they were in disagreement or discomfort, instead of saying, 'I don't agree with you' or 'I don't feel comfortable talking about this issue'. (Kawabata & Gastaldo, 2015, p. 5)

Kawabata and Gastaldo state that 'without considering participants' silence in interviews, researchers may not only have problems understanding and interpreting meaning but could also create ethical problems when conducting interviews with marginalized populations' (2015, p. 6). The authors note that qualitative research assessment criteria should be considered as a manifestation of Anglo-American academic culture. They illustrate ways in which silence can be used in data analysis and how to treat it in order to reveal the underlying meanings of silence in research conducted in non-Western settings.

CONCLUSION

Amid calls for 'alternative discourses' (Alatas, 2011), in the past 15 years IM have been proposed as an alternative to Western colonial methodologies. However, when applied, IM often end up using Western research methods (focus group, interview, ethnography, Delphi method, drawings, projective techniques, photo taking, and so on).

Inquiring into the reasons for the gap between the fertility of 'decolonizing methodology' theory and the barrenness in producing really indigenous techniques, we have come to the conclusion that the latter are (in the contemporary age) a mirage, because the purely local no longer exists and almost nothing is still indigenous.

Consequently, the two real alternatives to hard methodological colonialism seem to be *glocalization* and *creolization*. Most of the methods applied in non-Western research contexts pertain to one or other of these two possibilities. If glocalization still carries a soft colonialism, the creolization of research methods could be a valid option, as it has been in music, culture and language. The encounter between two (local) methodological cultures can produce an inter-localized methodology, a new outcome (fusion, hybrid, syncretic, transcultural, *mestizo*) based on dialogicality, symmetry, without any hegemonic methodological claims, like the yin and yang, two integrated parts of the same reality.

According to:

Audre Lorde's (1984) dilemma, found in postcolonial theory classes: Can you dismantle the master's house (i.e. imperialism, colonialism, etc.) with the master's tools? Answer: *yes and no*. All outward realities are first inward impressions and thought patterns. A new consciousness must be forged to approach old issues. False dualities of master/slave must also be reconfigured. (Aluli-Meyer, 2008, p. 231)

Notes

- 1 The core ideas of this chapter have been presented at the *New Tricks of Our Trade: Overcoming Parochialism*, 28th biannual Nordic Sociological Association conference, University of Helsinki, 12 August 2016. I warmly thank the President Sirpa Wrede, for the invitation.
- 2 This has also been recognized by early ethnomethodology with the notion of the 'reflexivity' of members' accounts. Ethnomethodology states also that our observations do much more than simply describe a situation (Schwartz & Jacobs, 1979). Moreover, Western approaches born in the 1970s like 'cooperative research', 'participatory action research', 'action science', 'process consultation', 'empowerment' and 'intervention research' start from the assumption that knowledge and intervention are part of the process itself of the researcher's cognitive structuring: hence, every analysis is already an intervention and every intervention is also an analysis.
- 3 Similar problems with 'informant consent' have been noted in Tanzania, Kenya and Indonesia (see Ryen, 2004).

- 4 'Kreng jai' means being aware of other people's feelings and showing politeness, respect and consideration towards them.
- 5 The same criticism can be addressed to other scholars' proposals. For example, Kirkness and Barnhardt's (1991) relational axiology, embodied in the '4 Rs framework' (respect, relevance, reciprocity and responsibility), for conducting research with aboriginal communities, more recently highlighted also by Wilson (2008) and Chilisa (2012).
- 6 The *Theatre of the Oppressed* was invented in the early 1960s by the Brazilian theatre practitioner Augusto Boal. He was influenced by the work of the educator and theorist Paulo Freire. Originally, it was a method to make people more aware about social conflicts. In its European interpretation, the *Theatre of the Oppressed* was used to work on intra-personal conflicts, exploring the inner person (loneliness, helplessness, confusion, unease) and his/her hidden oppression. Boal's techniques use theatre as a means to promote personal, social and political change.
- 7 *Mystery shopping* (or *mystery consumer* or *secret shopper*) is a method used externally by market research companies, watchdog organizations or internally by companies themselves to check quality of service, compliance with regulations or to gather specific information about products and services. The mystery consumer's specific identity and purpose is generally not known by the establishment being evaluated. Mystery shoppers perform specific tasks such as purchasing a product, asking questions, registering complaints or behaving in a certain way, and then provide detailed reports or feedback about their experiences.
- 8 There is a new cultural phenomenon which represents interesting revenge by the local on the global. It has been called *lobalization* (Chew, 2010): locally manufactured cultural products (e.g. pass-off menswear in China) are packaged and circulated in a locality in the guise of prestigious imported products. The practical significance of this global cultural dynamic is that 'lobal' products are beginning to spread around the globe and that they can negatively impact on global original-brand manufacturers and also local creative industries.
- 9 For an update on this phenomenon, see Bado and Sachs Norris (2015).

ACKNOWLEDGMENT

I am also grateful to Denise Gastado (University of Toronto), Chareerat Intarachamnong (Kasem Bundit University, Bangkok), Pierangelo Peri (University of Trento) and Victor Roudometof (University of Cyprus, Nicosia) for their remarks. In addition, the comments and suggestions made by anonymous reviewers were extremely helpful.

Conducting and Publishing Rigorous Qualitative Research

Alexandra Rheinhardt, Glen E. Kreiner,
Dennis A. Gioia and Kevin G. Corley

INTRODUCTION

What constitutes ‘qualitative rigor’ and how do scholars attempt to achieve it within their research approaches? With the growth of qualitative studies in research on management and organization, this twofold question has received increasing attention over the years. Unlike much quantitative research, qualitative efforts often lack structured guidance or standardized ‘templates’ that prescribe consensus conventions for data collection and analysis (Pratt, 2008). This was well illustrated when two authors of this chapter (Denny and Glen), who are not only both grounded theorists, but colleagues who each developed approaches to achieving qualitative rigor with their many collaborators over the years, sat down to discuss their views on conducting systematic, rigorously executed qualitative research and found some notable differences in both their assumptions and processes. Their means of arriving at a common end – high-quality qualitative

research – differed, even though both have been engaged in grounded theory studies that frequently center on identity-related issues. The deeper they delved into explaining the rationales and motivations behind their own research processes, the more apparent it became that a wide variety of options exist when conducting rigorous qualitative research. This prompted further dialogue among all the authors of this chapter surrounding the many divergent inductive methods used by some prominent organizational scholars.

Rather than attempting to systematically analyze and summarize the dizzying array of procedures employed in extant qualitative work, we have opted to engage in a three-pronged approach of our own attempts to understand the notion of qualitative rigor. First, we provide a brief overview of some classic efforts to achieve rigor in conducting, analyzing, and presenting qualitative research. For many readers, this overview will serve as a refresher of the tactics that

have been incorporated into our field's methodological efforts. Second, we touch on our own backgrounds and how we arrived at this chapter. Throughout, we will delineate some of the key commonalities and differences among the research approaches we use. We believe that the refinements that have resulted through our cumulative 60-plus years of research can add some value to others' work. Third, our main focus derives from the generous input we received from our contemporary peers who also conduct high-quality qualitative research. Specifically, we approached 25 scholars who have been recognized for their superior qualitative work with a request for their responses to open ended questions about how they go about doing rigorous qualitative work. We first asked what conducting rigorous qualitative research means to them; then we asked how they work to convince readers that their studies have been rigorously conducted. Of the 25 researchers, 17 responded – with replies ranging from a few paragraphs to a few pages – providing a broad scope of rich input that we think will be valuable to both novice and experienced qualitative scholars. We do not advocate for any 'single best approach' for achieving rigor, but rather celebrate the plurality of opinions regarding the very meaning of qualitative rigor and the myriad ways that successful qualitative scholars of organization and management engage in their craft.

We have derived four overarching themes that encompass many of our informants' most insightful comments. We focus on commentary in response to the following questions: 1) What is qualitative rigor? 2) What are common challenges to conducting rigorous qualitative research? 3) How do accomplished qualitative researchers achieve rigor? 4) How can rigor be instilled in the sampling, data collection, and analysis phases of qualitative studies? Because the latter question has received more previous attention, we will focus more extensively on the former three themes. We have augmented colleagues' thoughtful quotes with some brief

'metacommentary' (see Gioia et al., 2010) in concluding each section.

A TRADITIONAL VIEW OF QUALITATIVE RIGOR

As I search the literature, I find that everyone agrees evaluation is necessary but there is little consensus about what that evaluation should consist of. Are we judging for 'validity' or would it be better to use terms like 'rigor' (Mays & Pope, 1995), 'truthfulness', or 'goodness' (Emden & Sandelowski, 1999), or something called 'integrity' (Watson & Girard, 2004) when referring to qualitative evaluation? Then there is the question, can one set of criteria apply to all forms of qualitative research? (Corbin & Strauss, 2008, p. 297)

This sentiment – from one of the leading guides for qualitative research – reflects the dilemma that often dogged the early years of qualitative research. The essence of qualitative research lends itself to many descriptive terms, yet the uniqueness of each undertaking leaves one grasping at numerous straws. We reflect upon this state of affairs and contemplate qualitative rigor as we and many of our contemporaries consider the features that enable qualitative research to flourish in the realm of organizational science.

Of course, any consideration of qualitative methods in the social sciences must include Glaser and Strauss' 1967 classic treatise, *The Discovery of Grounded Theory*. The methodology they put forth identified factors that have been adopted by many qualitative research scholars, even those not doing grounded theory work (Corley, 2015). More specifically, Glaser and Strauss called for constant comparison, theoretical sampling, applicability, and credibility to be incorporated as procedural elements of qualitative studies. With a focus on credibility, they posed three ways in which a study could be judged. These included: 1) an appropriate level of detail/description to ensure plausibility to the audience; 2) a sufficient amount of information describing data collection and

analysis procedures to adequately support the researcher's conclusions; and 3) an overview of the types of data used by the researcher.

Beyond *The Discovery of Grounded Theory*, we also note the foundational contribution of Lincoln and Guba's *Naturalistic Inquiry* (1985) in their effort dedicated to the concept of trustworthiness, a key outcome of the pursuit of rigor. Perhaps still as relevant today as it was when written, the qualitative researchers' fundamental concern lives on regarding the need to persuade audiences into accepting one's study as plausible, meaningful, and worthwhile. Lincoln and Guba identified four key criteria in their conceptualization of trustworthiness, which have been used by many subsequent qualitative researchers. Indeed, these criteria of credibility, transferability, dependability, and confirmability were each cited to varying degrees in their discourse on rigor by the contemporary scholars we contacted.

We also acknowledge Hammersley's (1987) work on validity, precision, and reliability; Morse et al.'s (2002) effort on rigor; Creswell's (1998) focus on credibility and trustworthiness, and Bruner's (1991) concern with verisimilitude. Because our intention is only to present an overview of classical work related to rigor, we will note that there are many other resources available. For the new and/or inquisitive qualitative scholar, the above can serve as a guide for where to begin when starting your research journeys.

CONVERGENCES AND DIVERGENCES

Of course, with such a plurality of approaches to conducting qualitative research in a rigorous way, there are bound to be interesting and useful similarities and differences among them. Although a comprehensive analysis of all approaches would be well beyond the scope of this chapter, we came to believe that a relatively brief comparison of how we ourselves – the

authors of this chapter – approach rigor could be useful. The two approaches in question are what has come to be known as the 'Gioia methodology' (Gioia et al., 2013),¹ developed in work with a number of colleagues over many years, and the 'Tabula Geminus' or 'twin slate' approach associated with Kreiner (2016) and his colleagues.

Two important considerations prompted the inclusion of components of our own approaches within this chapter. We wanted to be reflexive about the fact that all four authors of this chapter study cognition and identity-related research and have been associated with the Penn State Management & Organization department – which has a long history of qualitative scholarship – and that such a commonality might overly narrow our worldview on defining rigor (Gioia and Kreiner are faculty colleagues at Penn State; Corley came out of the Penn State PhD program; and Rheinhardt is currently in the Penn State PhD program). Although we were aware of each other's effort to conduct solid qualitative research with requisite 'rigor', it was also evident that Gioia, Kreiner, and Corley had bootstrapped different paths to achieve rigor in producing credible research. Despite our multiple paths, we were all guided by procedures that enabled us to conduct and write up rigorous research. Of course, there are also similarities in our approaches, as well.

Second, deliberating our varying approaches sparked the notion that this effort would be far richer if we refrained from limiting the content to only our own inputs and opinions. Therefore, we consulted with our colleagues in the field to help identify considerations they embrace to ensure rigor. That rich input is presented in the subsequent section so that we can more deeply understand the multiple ways that our peers engage in rigorous research. Thus, the views we provide throughout can serve as models for reference, although we acknowledge that there are many additional processes and procedures that could serve a similar purpose.

WHAT IS RIGOR?

As noted above, we contacted qualitatively oriented scholars who have published multiple times in top management journals. Our inquiry opened with the question, ‘What does conducting rigorous qualitative research mean to you?’ Perhaps not unexpectedly, consistent, monovocal responses were rare; rather, a variety of themes emerged from which we were able to develop some categories for appreciating not only the commonalities, but also the nuanced differences in responses. We sensed that by locating these responses within a series of themes, an informative structure would evolve that could facilitate both understanding and reflection. Although we articulate these themes below, we begin with an apt metaphor to set the stage for the conduct of qualitatively rigorous inquiry; Davide Ravasi noted to us, ‘The kind of rigor expected from a qualitative researcher is perhaps closer to the rigor expected from an investigative journalist or a detective, rather than an engineer or scientist’.

Ravasi has captured a major theme (which we further develop throughout this chapter) centered on the notion that while the qualitative researcher strives to deliver indisputable understanding, these efforts do not hinge on strict standards that are uniformly imposed across all scholars and studies. Instead, to achieve rigor, the researcher employs means that ensure they remain true to the informant by accurately capturing all that is relevant and significant to the informants’ descriptions. In essence, rigorous research protocols can and likely should vary on a case-by-case basis, as is further explored in the following section.

The Big Tent Approach

We termed our initial category the ‘big tent approach’ (see also Tracy, 2010) as it was based on the realization that (to mix metaphors) while one shoe does not fit all, a big

tent can house many. With this understanding, our informants expressed the acceptance of expansive flexibility as rigor is pursued by adhering to criteria that are specific to the focal research endeavor. Spencer Harrison captured this notion in offering that ‘rigor is less about following prescriptions and more about justifying decisions with the underlying goal being to add depth and nuance to the theoretical picture that is emerging’. Therefore, fitting the process into a previously used or preconceived methodology does not connote rigor, as each study is unique and therefore likely to require at least some degree of customization. Sally Maitlis further reiterated this need for flexibility as she noted, ‘How I ensure rigor, and even what rigor means, varies a lot with the kind of study I am doing’. Indeed, in our own discussions on methodology, we realized that we have never followed exactly the same process with any two of our own studies – that each one requires some adaptation as the theory emerges and evolves. With this in mind, our contributors recognize that it is not commonality that defines rigor:

Readers should probably recognize that, 1) Different types of qualitative research (as it is commonly understood) have different objectives and so different criteria for quality likely apply, and 2) There is no one best way to conduct research or one template that should be forced onto what is essentially a highly creative task. (Kathy Eisenhardt)

Our colleagues also acknowledged that beyond rigor being guided by the type of study, so too does it depend on one’s epistemological stance (or what someone perceives as knowledge about a phenomenon). In light of this, a continuum of views exists with those believing in measurable objective truths at one end of the spectrum, extending to those believing that all knowledge is socially constructed at the other end. Thus, the individual’s lens through which we view the world will undoubtedly contribute to our perceptions of rigor. As one of our colleagues aptly explained:

There are some people out there who do qualitative research who do not believe that there is an objective reality. So my answer to your question is that I think if you sat down and looked at qualitative research you would find a whole array of ways that people try to construct rigor – from ‘I didn’t even try’ to a nearly quantitative analysis from qualitatively collected data. (Steve Barley)

There is undoubtedly value in recognizing that qualitative rigor needs to be painted with a broad brush approach allowing for the varying nuances and dynamics each study presents. With that said, there are several considerations that are worthy of notation and therefore can be applied to a multitude of studies. Although these will be discussed below, we find it worth mentioning now that two of our respondents, in addressing the meaning of rigor, discussed its antithesis or, more specifically, *what rigor is not*. Upon reflecting upon their comments, we too understood the significance of their identification of characteristics that have at times been confused as traits associated with rigor. For that reason, we include this input to shed light on the traps that often tug at qualitative researchers as they pursue their efforts:

Qualitative research is not rigorous just because it follows a structured, rigid protocol for data collection and analysis; it is rigorous if it is transparent about the unexpected, surprising observations that led you to reorient your focus, the twists and turns that the project took as your observations challenge your initial research interests and working assumptions. It is not rigorous if it tries to minimize surprises; it is rigorous if it remains open to surprising, unexpected observations, and uses them as a way to reorient data collection and analysis, and sharpen emerging interpretations. (Davide Ravasi)

Rigor then is not just in the eye of the beholder, nor in some ‘stock’ criteria a researcher brings to her data collection and analysis; it’s an emergent and somewhat social process of establishing and conveying credibility. (Jennifer Howard-Grenville)

As Davide and Jennifer suggest, the secret of rigor does not rest in a blueprint that is plotted at the onset of a study, neither is it located in a prescribed formula neatly tucked away in a handbook. Rather, in establishing rigor,

the researcher must often engage in what is a messy and iterative process. Expanding upon this notion, while qualitative studies are often labeled as inductive research, they at times, and perhaps more commonly, follow an abductive approach. More specifically, this may involve an explicit incorporation of extant theory within the analysis process, allowing for emerging findings to be compared with theoretically based and predicted results.

We embrace many of the expansive perspectives that our colleagues offer in attempting to define qualitative rigor with the understanding that the actual definition largely rests in the uniqueness of the particular study and the distinctive practices of the researcher(s). By no means, however, should this vagueness be interpreted as a basis for roughshod research, as specific standards will be delineated which indeed ensure rigor.

Specific Standards for Rigor

Some of our participants reflected upon the importance of maintaining a pureness within qualitative studies in citing the need to encompass trustworthiness and verisimilitude as criteria under the rigor umbrella. This is acknowledged by Raghu Garud, who claimed, ‘I have been influenced by the notion of trustworthiness as proposed by Lincoln and Guba and verisimilitude proposed by Bruner’. And, although Lincoln and Guba (1985, p. 290) did not offer a direct definition for the concept of trustworthiness, they had suggested that ‘the basic issue in relation to trustworthiness is simple: How can an inquirer persuade his or her audiences (including self) that the findings of an inquiry are worth paying attention to, worth taking account of?’ Bruner followed a path similar to Lincoln and Guba’s in providing a practical analysis of verisimilitude: ‘Unlike the constructions generated by logical and scientific procedures that can be weeded out by falsification, narrative constructions can only

achieve “verisimilitude”. We view verisimilitude as providing the most accurate and believable account possible given the subjectivity of the data one has to work with.

In addition to the prior perspectives on trustworthiness and verisimilitude, our colleagues expanded the dialogue by providing their insightful understanding as follows:

For me, rigorous inductive qualitative research is, at least in large part, research that does minimal violence to experience – that is, research that reflects the worldview of your informants. (Michael Pratt)

To me rigorous qualitative research is characterized by what in Italian we refer to as ‘intellectual honesty’: not concealing evidence that may question your provisional interpretations, deliberately looking for sources that may question these interpretations, striving to account for discrepant evidence, rather than sweeping it under the carpet. (Davide Ravasi)

Without explicitly addressing verisimilitude, Pratt implies that the qualitative researcher who embraces it seeks to provide an account that successfully represents informants’ versions of reality without unduly imposing their own (the researcher’s) views onto the informant and/or their analysis. This, of course, is an inherent tension in qualitative research – representing the scope of diversity in informants’ lived experiences while simultaneously synthesizing those experiences into themes that are transferable to other domains.

Rheinhardt adds her thoughts on what rigor entails:

As a newcomer to the qualitative field, I consider two domains when I think of rigor. In the briefest terms, I refer to these as the rough and the polished. The rough is composed of resulting raw data and observed processes that researchers thoughtfully synthesize into understanding. This begins with effective research design, a holistic approach to relevant data collection, well-thought out choice of data sources and interview protocols, and carefully considered analytical procedures. The polished comes in when putting all the nit and grit into word. By the time I reach this point there is the sense that a meaningful story has been uncovered

and now must be translated into a rational, logical, and interesting tale.

Rheinhardt has considered our colleagues’ collective views to arrive at the recognition that rigor can be viewed along a continuum, with conceptions of rigor varying from one qualitative scholar to the next but with points of overlap among them. Furthermore, and despite this lack of consensus, it is her view that rigor is best achieved when threaded through every phase of a study, from start to finish; from the design of an interview protocol and selection of informants to the final written account that faithfully adheres to informants’ accounts while providing a compelling story.

CHALLENGES TO RIGOR

Interestingly, despite not being directly queried, ‘challenges to rigor’ emerged as a central theme that was significant to a number of our colleagues. The fact that this issue arose suggests that regardless of the many advances that have developed in qualitative research processes over the years, some of the obstacles threatening the perceived value of qualitative studies live on. For instance, our informants discussed several general concerns facing those who practice qualitative research:

I always find a method section very difficult to write. A colleague described this as a section on ‘creative re-construction’ and most qualitative researchers seem to agree with the impossibility of qualitative research following a tight design and the logical application of clean principles. Rigor tends to overemphasize rationality, logic, procedure, technique and give an impression of objectivity and neutrality as well as theory-data separation. (Mats Alvesson)

I have to acknowledge a growing personal dissatisfaction with much of the noise and fury about rigour in qualitative research. While I fully agree that our research should be accurate, methodologically precise and auditable, I am concerned

with creeping positivism that is implicit in much of this discourse. The review process of leading management journals encourages us to hide the subjectivity and interpretation that is at the core of insightful qualitative research ... Could we ever be allowed to say 'the insight for explaining my data emerged in a dream' or 'occurred while having a shower' or 'arose in a heated debate on a completely unrelated topic'? (Roy Suddaby)

Our colleagues have keenly observed that what our field's top journals consider to be the criteria for achieving rigor through writing is often antithetical to the actual production of rigor through data collection and analysis. In other words, attempting to satisfy a standard can ultimately deter us from achieving rigor because qualitative research often tends to be messy and at times disjointed, whereas journal standards tend to be rooted in a desire for that which is tightly specified and/or linear.

To add to this concern regarding traditional reviewing assumptions, Sarah Tracy suggested, 'One of my ongoing goals as a qualitative researcher is to redecorate the mainstream publishing houses from the inside out, so that interpretive and iterative research may offer their rich insight in these places'. We share these views merely to offer one perspective on how qualitative research is too often perceived in organizational research. It is not our goal to offer a critique of the current state of inductive research, but rather to provide our (the authors) and our colleagues' with input on what constitutes qualitative rigor and how it can be imbued into our studies.

Data to Theory Connections

As is apparent by now, qualitative data is rarely anchored in standardized procedures. At the same time, we recognize that data provide us with a rich understanding of commonalities that are linked to how and why events and experiences come about. The art of illustrating the critical connection between data and theory can indeed be difficult, as any 'formulas' to apply are general guidelines at

best. Sally Maitlis explained that 'Showing rigor through data is another complicated matter. I often provide extensive data tables to show the sorts of quotations and other data that underpin different themes'. We were provided with further elaboration on how the audience can be guided beyond this data/theory connection obstacle, however, with thoughtful analysis and dialogue that culminates in meaningful theory.

When writing up qualitative data the challenge is to provide a clear path from the data to your theoretical contribution. This means walking your reader through the process that you went through as you analyzed your data in a clear and accessible way. Your reader should not need to take anything on faith but should be able to see the complete process from raw data to theory (whether it is a process model or a typology of some sort). This often means the use of tables and other innovative ways of displaying multiple samples of your data in a relatively concise manner while providing a clear narrative of how you worked your way from the raw data to your generalized observations. You can never, of course, show that your analysis is the 'right' or 'only' analysis but you can provide enough detail and enough of a clear and convincing story that your reader accepts that your story is possible and rooted deep in your data. (Nelson Phillips)

I try to convey rigor by showing plenty of data (I am using Golden-Biddle and Locke's showing/telling distinction here). I personally have a preference for showing data within the text of a paper. I have never been much in favor of data tables. In fact, when I read a paper I want the findings section to speak for itself; supplementary data tables are fine but I often only look at them at the end. If it's important, it needs to be in the text. And if it's important, it needs to read as credible and tied in with other aspects of the findings. So, I tend to want to write a 'story' in the findings section, with lots of showing, but then of course the challenge is to weave in 'telling'. (Jennifer Howard-Grenville)

To cap this off, we agree that continuous detail throughout one's written account is necessary to adequately lead one's readers from the data to theory. This process is largely dependent on personal preferences and a study's dynamics as we and our colleagues enact our belief that there is no one right or best way. A convincing paper can

incorporate data tables or other forms of visual aids or, on the other hand, simply logically thread both data and theory together throughout.

Presentation

As qualitative researchers, we understand that our data often loses something in translation whenever researchers do not use direct quotes. The question becomes, ‘how do we translate the richness of the informant’s experience in a manner that is both true to life and tells an interesting story?’ Perhaps most importantly, the data presentation must be believable, which is addressed in the following sentiments:

The challenge, of course, is that we still rely on the written word to convey our work and frequently qualitative researchers have at their disposal all sorts of richer/voluminous forms of data that are hard to reduce to some parsimonious words ... So, that is a challenge for us as a field to figure out how authors can rigorously convey the nature of their setting when it’s not conducive to summarizing in quotes. (Jennifer Howard-Grenville)

I think one of the biggest challenges of writing up qualitative research is to balance the narrative (to inspire your reader) with the evidence (to convince your reader) ... This is, I think, the ‘art’ of writing up qualitative studies and is inseparable (and indistinguishable) from the act of theorizing itself. (Nelson Phillips)

This dual-fold dilemma of deciding what to show and what to tell has been a thorn in the sides of many researchers. At times, it is almost as if one is left struggling to mold valuable data into vernacular that is inherently limited. Specifically, presenting evidence that is in non-traditional form (i.e. data that is not already in writing) represents a challenge.

The authors of this chapter consider paper structure to be fundamental to scholarly presentation. Both Gioia and Corley believe it is preferable to limit their theorizing from the data in the Findings sections of their papers, choosing instead to focus the reader on a data

structure that illustrates the progression from raw data to coded data. It is typically later that their theoretical models appear with interpretations of the meaning of the data, again matching with the data structure presented earlier. They argue that by presenting their raw data in its ‘pure form’ prior to theorizing, their theories are indeed more ‘grounded’ in the particular experience of their informants. Conversely, Kreiner and his colleagues typically (a) provide a model earlier to serve as a map by which they guide their readers and (b) weave in commentary and theorizing throughout the Findings section rather than waiting until the discussion section. The justification is that this process allows for a steady continuum of interpretation to balance what Golden-Biddle and Locke called ‘showing’ (the raw data) and ‘telling’ (the interpretation of those data), as well as a way to integrate existing theory with the details of the study’s findings.

Criteria for Achieving Rigor

Just as all qualitative studies are unique, so are some of the criteria on which researchers rely to achieve rigor. Our colleagues offered insights about elements they have noted in others’ high-quality qualitative research – as well as steps they have personally taken to ensure that their studies are rigorous, as well as methods they have used so that readers appreciate the rigor of their study and sense that the findings are credible. We were able to align many of their self-imposed criteria into more general themes of credibility, transparency, transferability, reflexivity, and depth and volume of data.

Credibility

Credibility, though not explicitly defined, was mentioned by Lincoln and Guba (1985, p. 296) as a criterion for establishing trustworthiness. They claimed that ensuring one’s

findings are credible represents a twofold task: 'first, to carry out the inquiry in such a way that the probability that the findings will be found to be credible is enhanced and, second, to demonstrate the credibility of the findings by having them approved by the constructors of the multiple realities being studied'. We find it interesting that each of our informants who indicated that credibility was key to achieving rigor focused on the delivery of their presentations. Perhaps they were operating on the presumption that data and interpretation are sound and thus the communication of the same inspires acceptance by the audience. Jennifer Howard-Grenville captured this notion by noting, 'To be credible, I tend to look for markers such as whether the context and the findings are described richly enough that I as a reader have a sense of how things fit together and how things "work" in that setting'. Our colleagues further expanded on the notion of credibility:

Credibility involves making the chain of evidence that supports your interpretation of the data as clear as possible ... But the credibility of interpretation should be addressed without a litmus test such as the number of interviews conducted and the presence of data tables. Credibility is a form of narrative persuasiveness. It is a judgment left to each reader and not the outcome of a formulaic process. (Scott Sonenshein)

I think the best way to convince reviewers/readers that my findings are credible is to write in such a way that they are drawn to the same conclusions that I am making in the paper ... I don't think credibility comes from tacking on a theory every time you give a quote to show its connection; rather, it comes from showing how the quote teaches us something new or elaborates theory in an interesting way. (Elaine Hollensbe)

Transparency

Because they do not rely on statistical tests or standardized procedures to assess and demonstrate the rigor of their studies, qualitative scholars often turn to transparency to

convince readers that their interpretations are plausible. Inductive researchers convey this rigor by providing detailed descriptions of the steps they took, from data collection procedures to final analyses. This transparency encourages readers to trust both processes and conclusions. Inasmuch, we treat transparency like an opening of the shades so that readers can envision the entire detailed research process, including important decisions made along the way and justifications for those decisions. Our respondents further develop this notion of transparency by noting that:

Despite many different approaches, the common pattern in the highest quality research is transparency and credibility. It's best to completely explain what you did and why you did it. This is especially important when there is not one standard 'template' for doing qualitative research. (Scott Sonenshein)

Most basically, I try to be really clear about what I did, why I did it, and where it led ... It is virtually impossible and I think generally inadvisable to take the reader through every analytic twist and turn (including the U-turns) that together make up the path to our findings, and which can all too easily become the path from rigor to rigor mortis for both the author and reader. But I always try to lay out the key pieces of the analytic process in my methods sections, and increasingly to acknowledge its non-linear and iterative nature (in case they do decide to try it at home). (Sally Maitlis)

Undoubtedly, the qualitative scholar is often consumed with this balancing act. What is meaningful and what is tedium? Perhaps the best route one can lay out is the path from beginning to end, less all of the ill-advised detours that lead one temporarily off course.

Volume and Depth of Data

It is apparent that strong qualitative data, or that which is purposively or theoretically sampled, supports one's story and enhances the believability of the written account, is essential to achieving rigor within a study. Depending on the study, however, it can at times become difficult to corroborate the

crucial elements we have discovered. Perhaps as significant as sample selection is the quantity, frequency, and diversity of the data that a qualitative researcher collects and utilizes. With regards to the former, Nelson Phillips suggests, 'The most common approach, in my experience, is to have way too much data in order to be able to unequivocally say you have enough'. Other of our colleagues expanded upon their criteria regarding data as follows:

As well as sampling for comparison (purposefully), it is important for rigor to collect data to saturation on each sampling key unit. This means collecting enough data from enough sources, and preferably multiple sources, enabling coverage of different perspectives for triangulation. (Ann Langley)

What I try to look for to make the study rigorous is I want to make sure that we are working with a lot of observations ... So this means that I'm going to follow the same people, or better yet, multiple people, over many, many days, ideally 6 months to a year. If you look at my papers, you will actually find that some of them contain counts of interaction patterns or counts of behavior that took place, when they took place, how they took place, and how often they occurred. For me that is a kind of empirical rigor. (Steve Barley)

Not only is having a sufficient amount of data necessary, but also including multiple and divergent data sources that produce convergent findings will likely benefit the perceived trustworthiness of one's results. Several of our informants address this dilemma by offering their approaches to making data more compelling, as follows:

My research is typically longitudinal, much of it conducted as if in real-time supported by data gathered from multiple sources that include archival materials, various kinds of text, interviews seeking real-time prospective and retrospective sensemaking, and my own ethnographic observations of the situation. (Raghu Garud)

When I look at others' papers (and I'm sure I'm guilty of this myself!), I see they have, say, collected interview data, done some observation or shadowing, and collected archival data. But 9 times out of 10 the findings section is entirely 'driven' by evidence from interview quotes. Why?

Because those are often the most direct/most readily captured snippets of data. But it sure is nice when an author also shows how the other aspects of their corpus of data were used, and brings these in to the findings section directly. That gives the reader a sense that ... authors have a really rich grasp of their setting and are conveying it more holistically through multiple sources. (Jennifer Howard-Grenville)

From these insights, we can infer that not only is having multiple data sources important for establishing a study's credibility, but also discussing these sources and how they contribute to one's findings can be equally significant.

Reflexivity

To ensure that the significance of researcher reflexivity is understood, we begin by referencing Charmaz (2006, p. 188), who suggested that reflexivity encompasses:

The researcher's scrutiny of his or her research experience, decisions and interpretations in ways that bring the researcher into the process and allow the reader to assess how and to what extent the researcher's interest, position and assumptions influenced inquiry. A reflexive stance informs how the researcher conducts his or her research, relates to the research participants and represents them in written reports.

The significance of reflexivity was addressed by Mats Alvesson, who offered, 'On the whole, I'd say that a high level of demonstrated reflexivity in research text is key for a credible study and I try to work with this', prior to further expounding:

Most notions of rigor deny complexity and ambiguity. I emphasize reflexivity and interpretive awareness. Attention is then given to how one does something with empirical material, thinking about fair but also interesting and novel aspects. Most good studies allow for several interpretations and it is important not just to let one's preferred framework guide work, but be open for the possibilities of thinking in new ways. (Mats Alvesson)

We found this to be of particular interest as there appears to be the suggestion that rigor

and reflexivity are somehow contradictory in nature. Furthermore, this thought was not entirely an outlier, as Suddaby noted:

So, while I am very much in favour of precision and discipline in our method and strongly believe that we need to be able to describe our methods accurately and transparently, I often feel that in order to comply with positivist standards of research, we end up doing so in a way that is not authentic or honest. And, after all, isn't honesty and authenticity what rigour is all about? Is there a way in which we can be true to our craft and still embrace bias or celebrate subjectivity? (Roy Suddaby)

We sense that this perception of reflexivity and rigor being antithetical largely hinges on differences in functionalist and interpretivist paradigmatic assumptions. The confusion arises as to the applicability of the term rigor. Klag and Langley (2013, p. 161) address this potential tension in their paper on making 'conceptual leaps' where they recognize that, 'During the conceptual leaping process, the bricoleur can embrace both "magic" and "science" (or imagination and discipline) as two parallel and important paths to acquiring knowledge'. Or more specifically, moving from data to theory often requires taking a leap that is not always an exact science, but rather can be entwined in ambiguity and creativity. Writing reflexively then would necessitate researchers to provide an honest account of how they moved from point A to point B, perhaps including how they themselves influenced (or 'biased') their findings. Thus, from an interpretivist perspective, writing in some of the 'magic' that took place throughout the research, along with the 'science', into the final account may best be considered as a means of strengthening rigor rather than detracting from it.

Transferability

Transferability is often considered a key component in achieving rigor in qualitative studies, and by some even to be the qualitative analogue of the quantitative-oriented

criterion of generalizability. Lincoln and Guba (1985) expounded upon this notion, asserting that transferability is a critical element in establishing trustworthiness and thus it is the researcher's responsibility to provide a thick description so that readers can begin to understand how the findings and insights gleaned from one study might be applicable to other contexts (thus increasing the usefulness of the study for the broader field). Given that many qualitative scholars select extreme samples and/or unique settings to study, transferability can sometimes be a challenging task, though one that is highly important to address, as indicated by the below remarks:

A critical concern with readers of qualitative process work is the question of generality or 'transferability'. I always include at the end of papers a section on 'boundary conditions' which although it may not have that precise title, examines the idiosyncratic features of the case that might have contributed to producing the findings and that draws on published literature to suggest contexts where similar explanations might be relevant. I find this a very interesting section to write as it can really add to the theoretical contribution and interest of the paper. (Ann Langley)

For single case studies, I try to reassure reviewers about two things. First, about the theoretical relevance of my setting, or, in other words, that the specific processes we observed (e.g. designers developing new concepts) reflect a more general phenomenon of theoretical interest (e.g. prospective sensemaking). Second, about the appropriateness of the site, or, in other words, that the site I selected represents an 'ideal' setting to study this particular phenomenon, because of its particular visibility, availability of data, etc. (Davide Ravasi)

Two major insights are available from the forementioned offerings. First, it is essential to separate the pits from the cherries; or in other words, if something within a study is probably not transferable, clearly say so. This will help avoid comingling and confusion, which could leave the reader questioning the overall value of the study. Second, when something is transferable, lead the reader down the path so that they clearly see how what is said is applicable away from the

framework of your story. Kreiner calls this ‘leaving a trail of bread crumbs’ for the reader and instructs his students to make sure that many elements of the paper show readers how to transfer the findings. Providing examples of other organizations, occupations, or contexts in which the findings transfer can go a long way in ‘selling’ the reader on the applicability of the grounded theory.

RIGOR IN SAMPLING, DATA COLLECTION, AND DATA ANALYSIS

The above discussions center on qualitative researchers’ interest in ensuring that their data analyses are conducted rigorously and/or that their written presentation conveys rigor to the reader. Although these are key to the broad scope of qualitative rigor, there are prior steps that should be embarked upon earlier in the study. In this regard, our informants have offered a set of practices that they have utilized in their own work and which we present as a series of tips and techniques to be considered by qualitative scholars when engaging in the sampling and data collection phases of one’s study.

Sampling

The selection of informants and/or data sources constitutes the foundation of rigorous qualitative research. This was highlighted by Ann Langley, who said ‘Rigorous research design means making sampling choices that enable the researcher to collect sufficient and appropriate data to answer the research questions adequately’. Another of our other colleagues provided his own perspectives:

Because inductive research requires methodological flexibility, I think rigor cannot be simply built into the design of a study alone. I think sample selection is key: does the sample offer the possibility of unique theoretical insights that align with the research question? (Spencer Harrison)

Our contributors offered an important distinction in that unlike our more quantitative-oriented counterparts, qualitative researchers often employ purposive as opposed to random sampling. This allows for a more criterion-specific analysis, rather than a broader and often less meaningful population-wide understanding. This is important, as including those with divergent views often contributes to a study’s rigor.

Iteration and Saturation

Many researchers stress the idea that qualitative research is not a linear process. Rather than methodically progressing from sampling and data collection to data analysis and then to writing, many qualitative scholars blur the lines between these ‘phases’ and instead use a process of iterating as discussed below.

Specifying ‘iterating’: My sense, as a reviewer, is that many qualitative researchers, especially first time qualitative researchers, think that inductive methods follow a pretty linear process of: sample selection, interviewing (along with gathering archival data), transcription, and coding. For me, that misses the point of the method. Inductive methods are meant to be flexible and to allow researchers to track down important dynamics as they emerge in gathering the data. If someone says something really interesting that is theoretically relevant, I need to adjust my protocols, maybe adjust my sample, and read more of the existing literature to fine tune my understanding of what is happening. If I wait until ‘coding’ my data, it’s too late to track down these ideas – I’ve missed my chance. So I try to be more open about what I’m doing when I talk about iterating. (Spencer Harrison)

Moreover, a key issue with qualitative work is deciding on whether to gather more data and how much of it to gather. Similar to other phases of the research process, our colleagues advocated that data collection decisions (including the amount of data to be collected) are – and should be – made on a case-by-case basis that reflects the type of study being conducted, the research questions asked, and the themes emerging from the data.

When other scholars ask me ‘how do I know if I have enough interviews for my qualitative study?’ I tend to reply ‘how do I know if my piece of string is long enough?’ – in other words, the answer is always ‘it depends what you are trying to do with it’. I have seen published studies with few interviews, and others with over a hundred. I have seen published studies that rely on ethnographic methods (immersion, observation, field notes) and no formal interviews. To me there is no number for ‘what is enough’ because it depends what the authors are studying and trying to find. (Jennifer Howard-Grenville)

A related sampling issue is the use of early and emerging data as informing additional data collection efforts. More specifically, rather than predetermining all sampling and data collection elements, many qualitative scholars allow their data to play an integral role in guiding their study. This allows researchers to pursue interesting themes that emerge in their data, regardless of prior considerations.

I refine my sample and protocols to explore what I am finding in my data. I often go ‘off road’ during interviews. My goal is to figure out what is important to the people I am studying. (Michael Pratt)

In addition, I take my cues from the data and follow up on interesting leads in subsequent data collection, rather than separating data gathering and analysis. (Elaine Hollensbe)

The above discussion is reflective of a primary theme in inductive research, i.e. that the data is far more than the starting point of analysis as it plays a crucial role in guiding one’s study. Novice scholars will benefit by recognizing that data is telling – suggesting new and/or different sources should be procured, how and when past theory is relevant and applicable, as well as when the point of saturation has been reached.

Coding

Coding is a process integral to the analysis of data and it is often the single most time-consuming element of one’s research project.

More specifically, Mike Pratt said, ‘I end up reading and coding my interviews multiple times. I want to really, really know my data’. Two things can be garnered through his observation. First, an extended coding process assures the researcher that they own their data in a sense that interpretation is exhausted, resulting in a coherent understanding that is ready to be shared. And second, coding is a fluid process involving continual updating and revisions as new themes or trends emerge. Rather than offering a ‘how to’ guide for coding, we find value in providing several approaches that our respondents conclude have aided them in achieving a rigorous analysis.

In most of my studies the core of the analysis is based on the coding of a body of text. I am increasingly convinced, however, that systematic coding of data is just as much a way to generate theory (by highlighting the building blocks of a model) as to verify intuitive interpretations that often pre-exist the coding efforts. The least I can do is to carry out the coding as precisely as I can, by reading and re-reading each transcript or each text several times; recoding when necessary; being meticulous about whether I do have robust evidence for provisional interpretations or not. (Davide Ravasi)

In our exploration of emotion in top team strategy meetings (Liu & Maitlis, 2014), the part that demanded more to achieve rigor was coding individuals’ expressed emotions and their strategizing processes. For the emotions, we first developed a detailed coding scheme incorporating facial, body, vocal and verbal cues, and then used this to code, frame-by-frame, the expressed emotions of each person whenever she or he spoke. Unusually for the research I do, we even had two people independently code these emotions to ensure rigor in our identification of them. (Sally Maitlis)

It is beneficial to supplement our colleagues’ thoughts by discussing the coding processes we (the authors) employ. We begin with the understanding that coding is not constrained to a standard scheme but can assume rather different appearances even among scholars pursuing similar methodological and research

endeavors. More specifically, under the Gioia methodology, Gioia and Corley have adopted a multiphase process of analysis in which freestanding 1st-order codes (often informant utterances) are uncovered in an initial, open-coding phase; then relationships among these codes are explored in subsequent axial-coding phases of analysis aimed at formulating 2nd-order theoretical themes (see Gioia et al., 2013). Conversely, the *Tabula Geminus* or ‘twin slate’ approach outlined in Kreiner (2016) utilizes a simultaneous open/axial-coding approach in which both ‘levels’ are identified simultaneously (i.e. 1st-order codes and 2nd-order themes) and noted in a coding dictionary during all phases of analysis (sometimes beginning with the first interview coded). There tend to be differences in the level of detail in the coding as well. Gioia and Corley tend to operate at a higher level of meaning in the coding than Kreiner (including even a metalevel ‘gestalt’ analysis that constitutes a search for, or creation of, some overarching explanatory concept, e.g. ‘sensegiving’ from Gioia & Chittipeddi, 1991 or ‘identity ambiguity’ from Corley & Gioia, 2004). Kreiner and his co-authors, on the other hand, are inclined to operate at a more detailed, fine-grained level during the coding process, even though that detailed process often also ultimately yields a new overarching concept (e.g. ‘identity elasticity’ in Kreiner et al., 2015).

Rheinhardt takes both a top-down and a bottom-up approach in the data analysis phase. She first reviews audio recordings, as opposed to interview transcripts, with an ear for the total story an informant is conveying rather than a focus on answers to specific questions (somewhat of a top-down approach). Upon completing this process, she reads transcripts and implements a statement by statement coding process (more of a bottom-up approach). The first phase represents somewhat of a ‘gestalt’ analysis similar to that utilized by Gioia and Corley, while the second phase is more aligned with Kreiner and colleagues’ use of a more detailed coding scheme. The idea is

to first get a sense of the phenomenon that is occurring and then understand the underlying processes of how it is playing out.

A second divergence among the analytic approaches adopted by the authors of this chapter relates to the incorporation of relevant literature. Both Gioia and Corley advocate a stance of ‘assumed ignorance’ throughout the initial stage of analysis and therefore do not overtly incorporate past theory until later analytic phases. They justify this stance on the grounds that it allows greater revelatory opportunity and reduces the tendency for confirmation bias. With the *Tabula Geminus* approach, Kreiner and his co-authors (Rheinhardt included) overtly draw upon theory from the very beginning with the goal of providing analytic flexibility and increasing efficiency. Indeed, Kreiner chose the name of *Tabula Geminus* to openly reflect that grounded theorizing should draw on the ‘twin slates’ of data and existing theory.

Role of Others in the Research Process

Many of our informants recognized significance in including others in the analytical process. We see this participation in two forms. First, this involves returning to study participants for their critical input as a means of adding interpretative credibility. More specifically, one scholar noted that analysis can be strengthened, or made more rigorous, by:

[i]nvolving participants in the setting as much as possible. This means, as much as possible, having them co-author papers with me ... at the very least, contribute to the analysis and interpretation. I know that for some more positivist-oriented researchers, this is anti-rigorous. But for me it's important truly to understand setting members' perspectives throughout the writing process. (Jean Bartunek)

Although this approach called for extensive subject participation, other of our colleagues sought to employ their informants in a manner more reflective of verification, which is commonly referred to as member-checking. As an

example, Elaine Hollensbe said, ‘I share representations of the emergent findings (in presentations and reports) with the people I have studied to ensure that I have been true to the data and the participants’. Kim Elsbach added, ‘For validity, I take my findings back to informants (sometimes new informants from the same organization) and ask them if the findings seem correct, and if there is anything missing or concerning’.

Although there is the obvious value in calling upon study subjects to aid in analysis, rigor is often enhanced through a second participatory approach, by seeking input from those not directly involved in the study. One of our other colleagues noted:

A good way to ensure that your findings are rigorous, credible, and convincing is to be a student (even when you are a professor). Try to apprentice with someone whose work you admire, and read and deconstruct some of the many exemplary articles on qualitative research to see how they have gone about telling their stories ... I would strongly recommend doing qualitative research as a team. Doing collaborative qualitative research allows you to bring multiple views to bear on a set of data (which increases trustworthiness and verisimilitude) and can cut time off some of the steps in the process (e.g., interviewing, coding). (Elaine Hollensbe)

Involving others is both an indispensable verification tool and an expander of insight. An additional perspective can aid in directing meaningful interpretation so that rigorous outcomes can be derived (e.g. Masterson et al., 2016). Yet, as the plurality of these views suggests, there is a broad spectrum upon which the qualitative researcher can draw to aid in building and/or supporting their emerging findings and theories. At one extreme, although not specifically addressed, a scholar may conclude that an additional perspective and/or verification of their results is simply not necessary. Conversely, there are researchers, such as Jean Bartunek (referenced above), who welcome a significant level of participation and, in fact, embrace this as heightened rigor. We, as authors of this chapter, do not advocate any particular approach, but rather believe that the

individual qualitative scholar can best determine what will be most beneficial to their particular research endeavors.

Generating Theory

The ultimate goal of most inductive research endeavors is to generate a plausible, defensible theory and/or model or, at the very least, an interesting, relevant, and theoretically informative story. Reaching this final destination is typically challenging and often involves many twists and turns as we engage in thorough data analysis. Indeed, many qualitative researchers find it necessary or desirable to use tools such as memo writing, diagramming, and/or modeling to aid this process. This is exemplified in the following offerings:

One thing I try to do is ‘draw’ my data throughout the data collection and data analysis process. In many ways, a lot of the ‘iterating’ – a verb that is often talked about by qualitative scholars but rarely specified – is mediated by trying to visualize my data. For instance, I might conduct an interview and in the contact summary, I will try to diagram relationships that might have been described. (Spencer Harrison)
