I use very primitive tools (print-outs of the texts, a pen, colored highlighters, and, later, Word tables), but I do not think that NOT using software like Nvivo makes my study less rigorous. Actually, I think it makes it MORE rigorous, because my primitive tools allow me – force me – to deeply immerse myself in the data, physically engaging with them, embedding them in my brain – and eventually it is our brain, not Nvivo, that traces connections and captures patterns in our data. (Davide Ravasi)

As recognized, these tools are of benefit throughout all stages of data collection and analysis as we again acknowledge that qualitative studies rarely, if ever, follow a linear process. Therefore, iterating is not only useful but often necessary in generating theory, as follows:

To ensure that I tell an interesting story that advances understanding, I similarly iterate between the data, emergent categories and model, and the

theory to which I hope to contribute. I unabashedly dive into the literature to see how existing theory might inform my theorizing, and how my theorizing might inform existing theory, and write memos to capture these connections. I do not impose theory on the data, but I note theoretical connections when I see them. This, in fact, ensures that I am not just writing an entertaining, descriptive story, but am contributing to scholarship in a rigorous way. (Elaine Hollensbe)

As a closing note, we add that Corley, Gioia, and Kreiner have all adopted a grounded theory methodology in which the theories they derive are generated directly from the individuals they interview and related data sources that inform the context in which their informants create and/or experience. Their analyses almost invariably comprise two ‘orders’, a 1st-order level that captures informant-centric terms/codes and a 2nd-order level that denotes researcher-centric theoretical themes and dimensions. Furthermore, their approaches generate an inductive model that is grounded in and emerges from the 1st-order data, which incorporates 2nd-order themes and aggregate dimensions, and serves as a graphic representation of the emergent theory.

CONCLUSION

The intent of this chapter is to serve as a meaningful guide for those working to achieve rigor in their qualitative research. We appreciate that there are additional conceptions of, challenges to, and criteria for assessing rigor that extend beyond what has been offered here. Furthermore, we should note that chapter-length constraints have precluded us from including all of the delicious snippets our contributors offered. We nonetheless hope that this compendium of observations and opinions can serve as a valuable launch pad for expanding the dialogue about achieving rigor in qualitative research. We conclude with two metalevel observations derived from our foray into how the notion of

‘rigor’ is constructed by a sampling of prominent qualitative organizational researchers. First, we recommend that those who write and teach about qualitative methods take a stand on *the need for rigor*, even though it can be so variously defined. As was made clear by all those we spoke with, there might be different ways to achieve rigor, but rigor you must achieve. We mustn’t let its variability impede its applicability. Second, we encourage our fellow qualitative researchers to be *transparent* about the steps they have taken in each study; share with the reader how you went about trying to achieve qualitative rigor – it can help future generations of researchers improve their work and sustain the ‘big tent’ approach to meaningful qualitative research.

Note

- 1 Gioia would like to note that he did not create this label, but that it was applied by other scholars who became aware of the methodology’s systematic techniques as it evolved over 25 years in collaboration with junior scholars like Mike Brown, Kumar Chittipeddi, Shawn Clark, Kevin Corley, Aimee Hamilton, Rajiv Nag, Shubha Patvardhan, Kristin Price, and Jim Thomas.

Writing for Different Audiences

Michael D. Myers

INTRODUCTION

Having conducted qualitative research for almost 40 years, I have now reached the conclusion that the writing up phase of any research project is probably the most important phase of all. The reason for this is that the only thing that most people see or learn from your research project is what you write about it. It is the written account of your project that lasts, long after the project has finished. Borrowing a concept from hermeneutics, the concept of autonomization says that, once words are inscribed in text, the text takes on a life of its own. It becomes objective. Hence the written account of a project is what lasts and is the only thing which most people see. Unless you write about it, everything else that you did tends to be forgotten over time.

Of course, there are other ways to learn about your research project. For example, if you present your findings at a research seminar or in a lecture, then I agree that some

people will learn about your work without having to read it; they will hear what you say about it instead. But the fact remains that only those who attend the seminar will learn about it (Myers, 2013). And realistically, most people will not remember much about your presentation later on. Of course, as a supervisor of PhD students, I have sometimes visited the research site and even met some of the people there. However, my visits have always been for a short time only, and certainly no other researcher has ever visited the research site. Hence the primary way in which I or anyone else learns about a research project conducted by one of my PhD students is what they say about it in their write up. I believe the same point applies to all qualitative research projects.

Therefore, it is almost impossible to over-emphasize the importance of good writing. What is written becomes reality – it becomes the objective story that is told. Of course I am exaggerating a little, since it is possible to write a second edition of a book, and

people might disagree about the meaning of the printed word. However, the point remains that once the article or book is published you have little further influence on how others interpret your work. Once the story is in print, that's it.

This suggests that qualitative researchers need to give careful consideration to writing. As Wolcott (1990) points out, writing up for a qualitative researcher is absolutely essential. But if we are going to write, we need to write well. This means trying to keep a few things in mind. First, we should try to ensure that what we write is interesting. Caulley (2008) discusses how qualitative researchers can make their writing more interesting through creative writing techniques, while Ely et al. (1997) discuss how research writing can be useful, believable and interesting. Second, since writing itself is a creative process, we need to decide what story we are going to tell. When we write we create a particular view of reality and decide what (or what not) to say (Richardson & St. Pierre, 2005). As Grills (1998) explains:

[i]n the writing, we make decisions about the story we will tell – how the tale will be made theoretically interesting, what questions we will engage with our work, and what aspects of our research will be presented and what will be set aside. Through this process, lived research and the experiences that accompany it are represented and mediated by text. (p. 199)

Third, what is considered to be interesting, the story that we tell, and the style we use to

tell it will vary depending upon the audience we are writing for (if you are interested in different writing styles, Van Maanen (1988) discusses the various styles that can be used in ethnographic studies, including realist, impressionist and confessional styles). In this chapter, therefore, I want to discuss writing for different audiences, focusing on those audiences that are especially important for qualitative researchers in business and management.

DIFFERENT AUDIENCES, DIFFERENT OUTPUTS

Although there are various ways to categorize the different audiences for our writing (Richardson, 1990), I suggest there are five main audiences for qualitative researchers in business and management. These five audiences are academics, students, business professionals, institutions/organizations and the general public. Each audience tends to read a different kind of output, as summarized in Table 31.1.

Academics

For most academics, the main audience for our research work is fellow academics in our own discipline. These academics might be researchers or teachers or a combination of both.

Table 31.1 Audiences and outputs

<i>Audience</i>	<i>Sub-groups</i>	<i>Preferred outputs</i>
Academics	Researchers, teachers	Journal article, conference paper, book, thesis
Students	Undergraduate, postgraduate, MBA and executive students	Textbook, teaching case, journal article
Business professionals	Professionals in one's own disciplinary area; professionals in other areas	Newspaper article, magazine article, book
Institutions/organizations	Civil institutions such as trade unions, companies, and government and non-government organizations	Report
General public		Newspaper article, magazine article, book

The outputs for an academic audience include journal articles, conference papers, books and book chapters, theses, case studies and various teaching-related materials. When writing for academics, one of the most important things to bear in mind is that these people are likely to be experts in, or at least reasonably familiar with, qualitative research. This means they will be expecting you to demonstrate your own familiarity with the qualitative research literature and your expertise with your chosen qualitative method.

Students

A second audience for our research work are students. The students can be undergraduate students, postgraduate students, and/or MBA or other professional students. The outputs for this audience include textbooks, teaching case studies, and possibly teaching notes for the instructor. Of course, postgraduate students should also be reading academic journal articles, particularly if they are studying for a research masters or PhD.

Business Professionals

A third audience for researchers in business and management are business professionals, and especially those working in the same discipline (e.g. professionals working in human resource management if you are an HR academic). Since business professionals are always busy and are easily bored with the academic style of writing, the preferred outlet for this audience is the magazine article. Business professionals might read a book on the plane or when they are on holiday, but in this case the book still needs to be practical and engaging, not too laden down with theory. Of course they will also read newspaper articles. Since most business professionals like stories, probably the best qualitative research method to talk about with this audience is case study research.

Institutions/Organizations

A fourth audience for researchers in business and management are various institutions and organizations. These institutions/organizations might be companies, civil institutions such as trade unions, and government and/or non-government organizations. The preferred type of output for this audience is usually a report. This report is often commissioned by the organization. The report might be confidential for a certain period of time, particularly if the entire research project has been funded by them. For government funded research agencies, there might be no restrictions on publishing the research findings, although they will still want to see a report on the research project by the due date.

General Public

A fifth audience for researchers in business and management is the general public. Like business professionals, the general public like stories, so probably the best qualitative research method to talk about with this audience is case study research. People like to read stories, particularly if the case study findings are about a reasonably well-known person or organization. The newspaper article is probably the output of choice for communicating with the public, although magazine articles and books might also be useful.

As well as the outputs I have mentioned, there are many others: for example, blogs, websites and various social media outlets such as Twitter or Facebook. Each of these types of output has its own writing style and genre. Depending upon your chosen field and institution, some writing styles, genres and outputs may be more acceptable or valued than others.

A WRITING PLAN

Regardless of the audience and the type of output, I have found that it is always worthwhile to have a writing plan. One possible writing

plan is to use a modified version of the template that I mention in my book (Myers, 2013). This modified template lists nine items that should be considered at the start of a research project (Table 31.2). I suggest that you attempt to fill out this template as soon as possible, before you even begin collecting your data. This is because the template helps to focus your mind on the end product (the written output). Collecting qualitative data is very interesting, and I find it one of the most enjoyable aspects of doing qualitative research, but the template should help you to stay focused on the ultimate goal. Your ultimate goal should be to write up your research in a research output of some sort (e.g. a thesis or conference paper), and then publish it (if appropriate). The questions included in the template are designed to help you stay focused. Lack of focus is one of the biggest risks in doing qualitative research (Myers, 2013). In my experience as an editor, lack of focus is also one of the main reasons why manuscripts are rejected for journal publication.

- 1 **Title?** Can you come up with a title that captures the purpose and contribution of the work? Is it catchy? Is it sufficiently interesting to entice readers to start reading the rest? Sometimes I come up with three or four alternatives before deciding.
- 2 **Purpose?** Can you describe the purpose of the article or book in one sentence? If you cannot describe the purpose of your research in a succinct manner, the most likely reason is that you are not entirely clear about this yourself.

In qualitative research, one of most common purposes is to explore a relatively new topic in depth or explore a previously existing topic area from a new angle. It is less common for a qualitative piece to test a theory or to claim that it provides a definitive answer to a longstanding problem.

- 3 **Authors?** Who are the authors? This question is not appropriate if you are the sole author of the work (e.g. a thesis); however, if there are multiple authors, it is very important to discuss who they are going to be from the beginning. It is best to sort out authorship and the order of authors early, to avoid disputes later. I think it is very important for at least one of the authors to be very familiar with – if not an expert in – the qualitative research method used.
- 4 **Audience?** Who will read the output? Once you know, then you can write for this audience. For example, if you are writing a PhD thesis, then the most important person is your own supervisor or committee, followed by potential examiners. It is very important that these examiners should have some expertise in qualitative research; if they do not, then the danger is that these examiners might use inappropriate criteria to judge your work. I hope that your supervisor is able to nominate the appropriate people. If you are planning to write a journal article, then take a look at the editorial review board and see what kind of research the journal publishes. It is always a good idea to have specific people in mind when writing up. In fact, if you are able to suggest reviewers, I strongly recommend doing so. Just as with the examiners for a PhD thesis, you want the people reviewing your work to be sympathetic to – and have expertise in – qualitative research.

Table 31.2 A writing template (adapted from Myers, 2013)

<i>Nine questions</i>	<i>Description</i>
1 Title?	What is the title of the thesis, article or book?
2 Purpose?	What is the purpose of the article or book?
3 Authors?	Who are the authors of the work and what is their contribution?
4 Audience?	Who is the intended audience for the work?
5 Method?	What research method am I planning to use?
6 Publication outlet?	Which journal, conference or book publisher will I submit the work to?
7 Theoretical contribution?	What is my proposed theoretical contribution?
8 Practical contribution?	What is the practical relevance of my work (if any)?
9 Materials included?	What materials should be provided?

If you are writing a commissioned report for a government or non-government organization, you need to be very clear about the scope and focus of the report required. This might require meeting with the people concerned at the start and possibly when you have written your first draft. It is quite common for government officials to want to be briefed on the findings and possibly have some input to the final report before it is made publicly available.

- 5 **Method?** Which research method will you use? You need to have good support for whichever research method you are planning to use in your own institution. This includes having a good supervisor, i.e. a person who is 'qualified' and has the experience and expertise to do the job. It also includes having the right research training before you start the work, e.g. perhaps being able to take one or more courses on qualitative research.
- 6 **Publication outlet?** What is the most appropriate publication outlet for your research work? If you are considering writing up your work as a journal article or conference paper, then I suggest you start thinking about writing for that particular outlet from the start. This will affect the sort of topic you choose, your research method and the style of writing. For example, the style of writing for an academic journal is very different from that required for a magazine or newspaper article. In a journal article it is generally frowned upon to exaggerate or make any claims that are unsubstantiated by any evidence. In magazines and newspaper articles, however, it is more important for the written piece to be short and sharp and to grab the reader's attention. This often means it is impossible to provide all the evidence (e.g. references), which can be seen as boring by the editor and readers. They just want the findings without all the detail.
- 7 **Theoretical contribution?** What is your theoretical contribution? This question is important because it is a requirement of most of the top journals in business and management for research articles to make a good contribution to theory. As Siggelkow (2007) points out, a purely descriptive study is a hard sell. Needless to say, business professionals and the general public are unlikely to be interested in your theory.
- 8 **Practical contribution?** Is there some practical relevance to your work? If you are planning to write up your research solely for a top academic journal, this may not be so relevant; however, I think it is still a useful exercise to think about

practical relevance. Practical relevance is of course essential if you are writing a magazine or newspaper article.

- 9 **Materials included?** What materials do you need to include? If you are writing a PhD thesis or an academic journal article, then you definitely need to include an extensive set of references. I recommend using a bibliographic software program such as Endnote, Mendeley or ProCite to help organize these. The examiners and reviewers of a qualitative piece will also want to see some qualitative evidence. For example, if you have conducted interviews, then it is always a good idea to include some pertinent quotes from interviews in your article; if you have conducted an ethnographic study, then it is a good idea to include excerpts from your field notes. By contrast, if you are writing for a business magazine or newspaper, you definitely do not want to include too much detail. In a PhD thesis or book you would also be expected to include a table of contents, list of figures and tables, references and possibly an index, but you would definitely not want to include any of these items in a newspaper article.

I am sure there are additional questions that can be considered when writing up your research, but I believe the nine questions listed in Table 31.2 are the most relevant questions for qualitative researchers in business and management (Myers, 2013). How you answer these questions will help to determine the format and style of writing you adopt. For example, if your research method involves analysing data thematically, then the way you write up your findings will be different from someone who has analysed their data chronologically as a series of events. The former is likely to write up their findings organized by topic, whereas the latter is most likely to write up their findings as a narrative. If your publication outlet is a conference paper, then the length will usually be shorter than a journal article, which in turn is much shorter than a book; a newspaper article might just be one or two pages. If your work makes a limited theoretical contribution, then a top academic journal might not be the most appropriate outlet; on the other hand, if your research makes a good practical contribution,

then a magazine or newspaper article for business professionals or the general public might be best. Hopefully all nine questions will help you to focus your work appropriately and succeed in writing well.

WRITING FOR EACH AUDIENCE

I will now discuss in detail how to write for each audience. Fortunately, I have been able to write and publish my own work for all five audiences and been involved as an editor and reviewer as well, so hopefully I can pass on something that I have learnt along the way.

Academics

For most academics, the main audience for our research work is fellow academics in our own discipline. If you work in a research-oriented university, the most important output in all the business and management disciplines is the peer-reviewed journal article. Although in some disciplines other outputs such as books and conference papers might be highly regarded, in business and management it is the peer-reviewed academic journal article that is the most important. The journal article is the currency for promotion and tenure, with the more highly ranked journals counting the most. In many countries there are ranking lists of journals and in some cases these ranking lists can have a significant influence on someone's academic career and/or determine the amount of funding the university receives from the government.

The first point I want to make is that manuscripts submitted to academic journals are, as a general rule, read by academics only. Hence the audience is relatively small, usually limited to those academics with a particular interest in the same subject area. This means at least one of more reviewers will be very familiar with – if not an expert in – your chosen qualitative research method.

The second point is that all articles submitted to an academic journal go through a process of peer review. This process is often double-blind (i.e. the author does not know who the reviewers are, and the reviewers do not know who the author is). This peer-review process exists in virtually all academic disciplines and is assumed to give some assurance of quality. If the findings are judged to be significant and robust by one's peers (other 'experts' in the field), then the manuscript will be accepted and published as a new contribution to knowledge. If the findings are judged to be insignificant and not robust, then a manuscript will be rejected. The peer-review process varies from virtually nil in lowly ranked journals to very tough in the highly ranked journals.

There are a few important points to note about the peer-review process. First, by definition the peer-review process is a social process. Peer review involves having your work evaluated by other people. Second, the peer-review process is subjective. When a reviewer reads a paper, they bring their own background and experience to bear on your work. From hermeneutic philosophy we learn that everyone has their own prejudices (Myers, 2016). Third, these subjective reviewers, especially at the top journals, are likely to be regarded as experts in the topic and/or the research methodology by researchers in the field. Some if not all of them will have published in that same journal before. Fourth, the reviewers are appointed to their task by the editor in charge of your manuscript. In my experience editors tend to appoint reviewers who they know and trust to do a good job, i.e. those who have already published a paper in the journal and/or have reviewed for the journal before. These reviewers understand the style of the journal and the standard of research work that is required. Of course, who is chosen can make a big difference to how your paper is evaluated.

Taking all these points together, I suggest a journal can be seen as something like that of a social club: the people involved in a particular

journal as editors and reviewers have all paid their dues, they tend to know each other reasonably well, and they know the current state of play. There are exceptions, but the same people seem to crop up over and over again as authors in the same outlet. They are members of the club in good standing.

If you accept the metaphor of each journal being like a social club, then the most important question becomes: how can you become a member of the club?

The first way to become a member of a club is start playing the game. Playing the game is not limited to submitting your own papers; playing the game also means offering to review the papers of others. Many PhD students and junior faculty members make the mistake of thinking that they are too busy to review papers by other people, since they really need to spend as much time as possible on their own work. They think to themselves that they do not have time to review papers for journals. But this is flawed logic. It turns out that the benefits are counter-intuitive. The more reviews you complete, the more you get to know your audience and the review process; the more reviews you do, the more you get to know the current state of play in your field; and the more involved you get, the more you get to know what the editor and other reviewers think. Also, the more reviews you do, the better you get at writing your own work: you get to know your audience and you get to see the common mistakes that people make in their writing. Seeing the mistakes that others make helps you to eliminate these mistakes in your own writing.

The second way to become a member of the club is to pay your dues. Writing a good review, one that the editor and author will value, takes time and effort. Writing your own paper also takes work. Paying your dues means that you have contributed sufficiently to that particular journal that your efforts are recognized by someone more senior than yourself (e.g. by an associate editor if you are a reviewer, or by a senior editor if you are an associate editor).

The third way to become a member is to socialize with the other members of the club. You need to join the conversation and become a part of it. In my own case I consider it essential to attend a few conferences each year, where I know that the best qualitative researchers in my field will be. I have met all of my co-authors and virtually all of the editors of the journals in my field at these conferences. And while I might not know all of them very well on a personal level, at least I know what kind of qualitative research they do (if any) and what they are currently interested in. Amongst this group of people some topics and methods are fashionable, whereas others have ceased to be interesting. I highly recommend the article by Gerard Cachon about what it means for a research article to be interesting (Cachon, 2012). Although he mostly talks about his experience in the field of operations management, his article is relevant for all the business and management disciplines.

A fourth way to become an active member of the club is to team up with someone else, ideally someone who is already a member. I have found collaborating with other scholars to be very rewarding, from both a personal and scholarly point of view. Each person brings a different set of skills and experience to the game. I don't think I could ever have published in the top journals in my own field if I had not collaborated with others, others who were more senior than me and already well experienced in playing the game.

All these ways of becoming a member of the club will help you to understand your audience better: what they like, and what they don't like. Hence I consider it essential to know who the editors are at a particular journal, and while I might not know exactly who the reviewers are, at least I like to have some idea as to the kind of person they are likely to be. A good guess is people who have published on a similar topic and/or method before in that same journal. I like to know what kind of research they do, the style of paper published in that particular journal,

and what topics are currently fashionable (or might be in the future). In a similar vein to what I have just said, Clark and Thompson (2016) suggest five tips for publishing qualitative research in high impact journals.

One thing that all the best peer-reviewed academic journals in business and management like is theory. Every top-tier journal in business and management requires a good contribution to theory, otherwise the paper will be rejected. Making a theoretical contribution means more than just being a part of the conversation, but actively shaping it (Corley & Gioia, 2011). In qualitative research we rarely test theory; rather, we tend to use it as a sensitizing device to make sense of the findings. Alvermann et al. (1996) discuss some of the problems in distinguishing between levels of theory when writing up qualitative research.

Another thing they like is a good literature review. A good literature review does not simply summarize everything that it is possible to know about a topic, but is focused on identifying a gap in the literature. Typically, a paper will then seek to ‘extend the literature’ or ‘fill this gap’ identified in the literature review. As long as the literature has identified an interesting problem or gap (and not all gaps are interesting), then the literature review has fulfilled its purpose. An alternative to finding a gap is to ‘problematize’ something that has, until now, been taken for granted. Problematizing involves thinking differently about a commonly accepted ‘truth’ in a particular field and turning it into a (perhaps unwarranted) assumption. An interesting paper questions this assumption.

A third thing they like, especially important for qualitative work, is for the findings to be credible or plausible (Klein & Myers, 1999). A qualitative researcher needs to demonstrate that they have a good understanding of the social and cultural world that they have studied. Clifford and Marcus (1986) discuss how this can be achieved when writing about culture. Pratt (2009) says that to write a compelling and focused account for

an academic journal, qualitative researchers need to write an article that (1) honours the worldview of informants, (2) provides sufficient evidence for claims and (3) significantly contributes to extant theory (Pratt, 2009). He suggests that authors need to make sure their research methods section includes the basics, they need to show data in smart fashion, they should think about using organizing figures and they need to tell a story (Pratt, 2009). I have found that one way of demonstrating plausibility is to include at least some direct quotations from interviews. Reporting verbatim what someone said gives a certain amount of credibility to your work and as long as they are selected carefully, such quotations can help to make the story more interesting (Myers, 2013).

A fourth thing that all peer-reviewed academic journal articles like is the corollary of the previous point, i.e. qualitative researchers need to make sure that the purpose of their paper is crystal clear. A common problem with writing up qualitative research is that the researcher ends up with far too much data, only a fraction of which can be included in a relatively short journal article. It can be challenging trying to figure out what to include and what to exclude. A common mistake is trying to cram the ‘the whole story’ into just one article. If such a strategy is adopted, the article tends to have many purposes, not just one, and ends up being a mishmash of many ideas with no clear point. One solution to this problem is to tell just one part of the story in one particular paper. For example, if you are writing up a case study, then you have to decide what angle you are going to take. The advantage of this strategy is that it then becomes possible to write a few papers from the one study, each written from a different angle. If we combine the previous point with this one, then the key thing is to write a paper with one clear purpose, while providing just enough evidence to convince the readers that your findings are plausible. If you provide too much evidence, then your reviewers might get lost in the detail; if you provide too

little evidence, then your reviewers might say your findings lack depth.

A fifth thing that all qualitative academic journals like is for the researcher themselves to demonstrate reflexivity, a certain self-awareness of their own subjectivity (Richardson & St. Pierre, 2005). This adds both to the credibility of the work and the researcher.

There are differences in the requirements for an article in a top-tier academic journal as contrasted with more lowly ranked journals. Pratt (2008) says that for the top-tier North American journals, there are three major tensions. These are:

- (a) the need to both break away from and be firmly embedded in extant theory; (b) the need to both provide enough data so that a reader can draw conclusions, while also providing enough interpretation of that data; and (c) the need to be both detailed and transparent with regard to one's methods, while also fitting one's research into the format of a top-tier North American journal. (Pratt, 2008, p. 485)

For other types of journals, I have found that there is often no requirement to break away from extant theory – it is perfectly acceptable to use existing theory. I have also found that the requirement to interpret the data is not as stringent as for a top-tier journal, and that the description of one's research methods need not be as detailed.

To summarize, if you are considering writing a journal article, you need to be socialized into the social club of whichever journal you are targeting. Research is a social as well as a rational scientific process and therefore you need to become a part of the conversation. Becoming a contributor to the conversation means at a minimum knowing what the current debates are and who is actually conversing. Hence it is not a great idea to submit a paper to a journal when you do not know the people at all and you have not actually read any of the papers that the journal has published. Editors get frustrated when a paper is submitted by an author who has no real understanding of the style or standard

of research expected. If you are still unsure about the fit of your proposed research within a particular journal, then ask someone who has some experience with that particular outlet for some advice (Myers, 2013).

Another output that is important for all academics is the PhD dissertation. The PhD is regarded in most countries as the entry qualification for an academic career. Although PhD students spend a few years on their research project, at the end of the day only a few people actually read the thesis: your advisor/supervisor(s), the examiners (often just two people), and a close friend or relative who proofreads it for you. Hence the audience for a PhD thesis is even smaller than that for an academic journal article. However, the same advice that I have given earlier about journal articles applies to a PhD thesis. In other words, you need to know what your supervisor likes and does not like, you need to have a good literature review and identify a good problem/gap, plus you need to have a good theoretical contribution. Typically, the examiners will be people who have published before in your area, hence the process will be much smoother if you are already a member of the club (by doing some of the activities mentioned above). Your supervisor should make sure that these people are sympathetic to – if not experts in – your chosen research method.

Although not everyone agrees with me, in recent years I have become an advocate of the 'thesis with papers' model. Unlike the traditional book format, a thesis with papers requires a student to write three to five papers. These do not necessarily have to be published beforehand, but they should at least be good enough to submit to a journal and/or conference in the opinion of your supervisor. Of course, the thesis still needs to be a coherent body of work with an introduction and conclusion that ties everything together, but the main contribution of the thesis is contained in the papers. One advantage of this new model is that if the papers are submitted somewhere beforehand, the student learns

about the peer-review process and gets some external feedback. One disadvantage is that there tends to be some repetition amongst the papers, since each paper needs its own literature review, research methods section, etc. But overall, I think the advantages of a thesis with papers outweigh the disadvantages.

If you are a postgraduate student writing a thesis, I suggest you look at some of the recent theses produced in your own department or school. Ideally, I suggest only looking at those that are considered to be excellent examples. Previous examples are always helpful in showing what is required (Myers, 2013). Another suggestion I have is to write out an extended table of contents. I would show this table of contents to my supervisor to make sure that you are on the right track.

Other outputs that might be produced for an academic audience include conference papers and books. In most disciplines conference papers do not count for much, but in the field of information systems (like computer science) they are regarded as important. In such a rapidly changing field, conferences are where the latest thinking is presented (since a journal article usually spends a few years in the review process). The immediate audience for a conference paper are the program chairs, track chairs and reviewers. Once again, I cannot emphasize enough the importance of knowing the people involved, i.e. at least knowing what sort of research they do, the current debates they are involved in, etc. For qualitative researchers this means attending conferences where excellent qualitative research will be featured, such as the International Federation of Information Processing Working Group 8.2 conferences in information systems, or the Critical Management Studies conferences in management. Earlier in my career I made the mistake of attending the wrong type of conference, conferences where very little qualitative research was presented. But at the right conference, you might be inspired by other qualitative researchers and, even better, some of them will turn up to hear your presentation. I

have often found a future potential co-author immediately after a presentation (theirs or mine). If we discover in subsequent conversation that we have similar or complementary interests, this can lead to future collaboration.

Another output is a book. Books typically represent an in-depth treatment of a particular research topic or methodology, or contain a set of chapters by various authors looking at a topic from different perspectives. Hence in a book it is important to demonstrate depth, for example by including quotes from interviews, or if you have done a grounded theory study, by showing how the findings emerged from the data. I have found that the review process for a book is completely different from that used for a journal. Often a book publisher will ask you to write a proposal for a book, and then they will obtain reviews from other qualified researchers on your proposal. I have found these reviews to be very helpful. However, once the book is finished, often there are no reviews at all, or at most a review by an editor. The peer-review process thus occurs right at the beginning stage for a book, rather than at the end.

If you work in a teaching-oriented university, then a few other outputs might count in addition to conference papers, journals and books. Textbooks, case studies designed for teaching, and other teaching-related materials may count as well. These outputs can be an important contribution to knowledge dissemination. Although the main audience for these works will be students, fellow academics are also an important audience since they are the ones that ultimately decide which readings to recommend. Academics are the gatekeeper for their own syllabi. Personally, I consider teaching-oriented materials to be very important since this is one of the ways in which our research findings are translated into practice. Assuming our curriculum is up-to-date, then all our students who graduate should be familiar with the latest techniques and ideas and, hopefully, they will use some of these when they get a job (or create their own).

Students

A second audience for our research work are students. The students can be undergraduate students, postgraduate students, and/or MBA or other professional students. Most outputs written for students tend to be teaching oriented such as textbooks and teaching cases.

The ideal person to write a textbook is someone who is actively involved in teaching at the appropriate level. In my own case, for example, I used to teach the introductory first year course at undergraduate level and at the time wrote some teaching cases to accompany the textbook. But since I have not taught this course for almost 20 years, I would not be confident writing for this audience today. I am no longer plugged in, as it were, to that age group or social network, and so really have no first-hand knowledge of what they like or do not like. My sources of information are all second hand.

On the other hand, I am familiar with current postgraduate students, since I continue to teach at this level at my own university. My previous experience as associate dean for the entire business school also helped me to become familiar with many of the students in all the business disciplines, not just my own. This experience gave me the confidence to write a textbook for this wider audience (Myers, 2013).

MBA and/or professional students are probably little different from other business professionals, so I tend to think that the same points I make below about the latter apply to them. The only proviso I would make is that I think our professional students should be encouraged to read academic journal articles so that they can understand some of our theories. If all doctors are expected to keep up with the latest medical research and use the latest treatments, then why should business professionals be any different? We might not be treating patients, but we often do make recommendations that will affect the life of an organization. For MBA and professional students, therefore, while case studies might

be very appropriate, I think case studies that illustrate a theoretical point are even better.

Business Professionals

A third audience for academics in business and management are business professionals. Usually the ones that might be interested in our work are those working in the same discipline (e.g. professionals working in human resource management if you are an HR academic). There are many business magazines, from well-known global ones such as the *Harvard Business Review*, to local ones such as *The Business Magazine* in the United Kingdom.

Articles written for business professionals need to be written in a different style to those written for an academic audience, but the general principles are the same. That is, you need to be aware of the current fashions/debates amongst the practitioner community. Business people have their own conferences which they attend, and so just by looking at the agenda of the latest conference you can see what the hot topics are. I like to attend these conferences from time to time so that as well as knowing what the current topics are, I get to meet them as well.

Business professionals tend to prefer practical articles rather than theory-laden ones. This is not to say that theory is completely absent, but it just needs to be treated in a different way. It needs to be explained clearly without going into too much detail. The usual academic style of writing – of being guarded, tentative and not dogmatic – does not go down well with practitioners. They like to see us make some recommendations or at least spell out the implications of our work (Wolcott, 1990).

Business professionals also like case studies or brief examples that they can relate to. This means that qualitative researchers need to write a good story. This story should be interesting and compelling for the audience; it should grab their attention and make them want to read the article from start to finish.

In summary, when writing for business professionals, you need to be familiar with your audience. It certainly helps if you are teaching in the MBA or another executive program, but if not, attending a practitioner conference is certainly a worthwhile investment. Anything you write also needs to be engaging for this audience and relevant to the current topics of the day.

Institutions/Organizations

A fourth audience for academics in business and management are various institutions and organizations. These institutions/organizations are companies, civil institutions, and government and/or non-government organizations that tend to commission a researcher or research team to write a report on a specific topic. The institution/organization will usually specify the focus and scope of the project and the timeframe within which the project should be completed.

In writing such a report it is important to consider the audience and follow the guidelines for the report carefully. For example, if you are writing a research report commissioned by the government, you may be required to submit a draft first and brief the relevant government officials on your findings. If you are writing a report for a company, they may require the results to be kept confidential. These kinds of situations can lead to ethical dilemmas, especially if the findings are somewhat critical of government policy or company strategy, etc. Since most academic researchers want to publish their findings, keeping the written report a secret can go against the grain.

Therefore, I think it is important for researchers writing such reports to consider the consequences of doing so right at the start; make sure you know the audience for the report, and make sure that their requirements and your expectations are aligned.

In my own case, since my overriding interest is always to publish the findings, I make a

point of clarifying this requirement at the very beginning of any research project. If needed, I am happy to change names and various details so as to hide the identity of the organization, but for me the goal of most projects is to publish and contribute to the ongoing conversation in my discipline. I acknowledge that this may not always be the case for everyone writing a commissioned report.

General Public

A fifth audience for academics in business and management is the general public. I define the general public as anyone who is not a business professional in our area of expertise, e.g. if you are a marketing academic, a lawyer.

The newspaper article is probably the output of choice for communicating with the public, although magazine articles and books might also be useful. Once again, if you are thinking of writing a newspaper article, it pays to know your audience. That is, it pays to be familiar with the current topics and debates in the mass media. If your chosen research area is directly relevant to a current hot topic, then now is an ideal time to write a newspaper article. Hopefully your article can provide a different spin or some insight on an important topic. The key to a newspaper article is to keep it snappy and relatively short. The main point should be crystal clear. Newspaper editors are not fond of writing that contains too much jargon, is not well focused and is too long. Newspaper editors also tend to like stories and opinion pieces, especially one that will grab the public's attention.

Personally, I think it is important for academics to contribute to public debate, especially if the government is thinking of introducing some new policies. We should contribute and not stay silent. Of course, the politicians might not agree with us, but we should at least contribute to public debate if we have the expertise and opportunity to do so.

Badley (2015) makes a few useful suggestions about how qualitative researchers can make their research more accessible to general audiences. For example, he says that qualitative researchers should avoid writing in a way that is 'lumpy, heavy, and pretentious' if we want to enter into a fruitful dialogue with a wide range of readers.

Dunleavy (2016) explains how it is possible to write a blog post based on a journal article in just a short space of time. He says that a blog post helps to create external impact for one's work amongst a far wider audience than just academia.

CONCLUSION

Writing is a creative process that involves telling a good story that is relevant and interesting to a particular audience. As authors, the challenge we have is knowing what might or might not be interesting to someone else. What is interesting and relevant to one audience might be boring to another, and vice versa.

I have suggested that becoming part of the academic social club is one of the best ways of getting to know the academic audience. A qualitative researcher is someone who contributes to the field and is engaged in a conversation with fellow academics. But this does not mean that we can write fiction. As qualitative researchers, we rely on qualitative data and we have an ethical responsibility to report our findings honestly. We also have the responsibility of providing a plausible or credible account of the social and cultural world that we have studied. This does not mean that we have to agree with everyone in the club. In fact, as I said earlier, one of the ways to make a contribution is to question one or more taken-for-granted assumptions. We might be able to point out problems with current thinking and move the field forward. Hence we do not have to agree with everyone.

It goes without saying that writing for students is also important. Nowadays students

are our 'customers', especially in countries where they pay high fees, plus they also need to be taught the latest thinking in a particular discipline. Students are potential future business professionals and a few of them might become academics.

As well as academics, we can write for business professionals. Although the academic audience is the most important one in terms of promotion and tenure, it is also important to write for business professionals. This is especially so in a management or business school where we need to develop good relationships with the business community. Writing for this audience is one way of helping them to stay up-to-date with the latest research in our chosen field, but can also lead to engaging with them in other activities (e.g. participation in a future research project, sponsoring a research centre or participating in a careers evening for students).

It can also be very worthwhile writing for various institutions and organizations. These (usually commissioned) reports can make good use of our expertise and can make a contribution to public policy or help a company in some way.

Not all academics will have the inclination or the temperament to write for the general public, but those that do often find it a rewarding experience. It can be a way to inform public debate and to let people know what you and/or your research centre is doing.

No matter which audience we are writing for, however, we do have to write well. If our writing is poor, whatever we say will be misunderstood or ignored. One of the secrets to writing qualitative research in an interesting and engaging way is to be clear about your purpose and to have a good idea as to why your topic is important for your audience.

Ethics Creep from the Core to the Periphery

Emma Bell and Nivedita Kothiyal

INTRODUCTION

This chapter focuses on ethical oversight regimes that are intended to regulate the conduct of management researchers. These regimes are based on ethical principles and rely on the application of bureaucratic procedures and processes, enacted via university governance frameworks. They are intended to ensure that principles, such as informed consent and protection from harm, are applied and maintained. While ethical regimes in social science research originated in the United States in the 1970s, over time they have been exported into other cultural settings, initially Canada, the UK and Australia, and more recently to developing economies and indigenous cultures (Den Hoonaard, 2011). Ethical regulation is thereby assumed to be universally applicable and beneficial irrespective of cultural context. This universalist approach overlooks core-periphery relations and postcolonial conditions that divide the world unequally; the core comprises Western countries

in the global north while the periphery is comprised of developing nations in the global south (Westwood et al., 2014).

Here we draw on data from a qualitative interview study of management research in India,¹ to investigate how ethical regimes are experienced by management researchers in this context. This forms part of a broader study that explores how the globalization of management research shapes the methodological practices of qualitative and quantitative management researchers in India, including their ethical and political choices. Our analysis explores the process of methodological globalization in management research, whereby methodological norms, values and practices developed in the Anglo-American context are diffused throughout the world (Gobo, 2011). The study seeks to take into account postcolonial power relations between scholars in the global north, mainly North America and Europe, who are seen as the primary creators of management knowledge (Alatas, 2003), and management scholars on the periphery, encompassing regions of

the world like India that share a colonial past (Ibarra Colado, 2006; Prasad, 2012).

For management researchers, the dynamics of research globalization are also related to the expansion of business education, including in developing countries such as Brazil (Alcadipani & Caldas, 2012) and South Africa (Nkomo, 2015). International business school expansion has led to the increased dominance of global business school ranking systems which place pressure on researchers to publish in highly ranked, international journals that predominantly publish quantitative positivist research (Mingers & Willmott, 2013). Our analysis highlights the neo-colonial power relations entailed in the globalization of management research (Kothiyal, Bell & Clarke, forthcoming) and normalizing particular notions of scientific rigour in such contexts (Bell et al., 2017).

By paying attention to the voices of management scholars on the periphery, and reflecting on our experience of navigating complex ethical regimes in our own study, we provide insight into the problematic nature of ethical oversight and the kind of compliance that these regimes encourage. We suggest that the normalization of research ethics encourages researchers to abandon local, contextually relevant ethical principles in favour of Western ethical codes. Through this, the chapter endeavours to raise broader questions about ethical practice in management research, encompassing fundamental issues about the purposes to which research, is put and the responsibilities of the researcher (Bell & Willmott, 2014). In so doing, we seek to explore alternative conceptions of research ethics that are more sensitive to differential power relations than ethical regimes encourage.

THE CONSEQUENCES OF ETHICS CREEP

Methodological choices encompass the methods that management researchers use,

the ontological and epistemological positions they adopt, and the ethical decisions they make in designing and conducting their research. This includes choices about how to engage with research subjects or participants and how data collected from people and organizations should be treated. Since the late 1990s, management researchers in Anglo-Saxon countries have become increasingly subject to formal systems of ethical regulation in the form of national and international regulatory frameworks that regulate the conduct of social scientific study. This trend can be traced back to the 1950s, when initially in the US, and then in Canada, Australia and the UK, ethical oversight regimes for social scientific research started to become increasingly formalized and closely regulated, in part as a response to moral panic precipitated by a few high-profile disturbing psychological experiments such as Milgram's (1963) obedience studies.

The principles that inform these ethical governance structures – protection from harm, informed consent, confidentiality and anonymity – are widely assumed to be universal. Compliance with research ethics codes, such as those produced by the Academy of Management,² the British Sociological Association³ or the UK ESRC,⁴ is now a requirement of many national and international funding bodies, and some management journals. A growing number of management researchers in European, Australian and North American universities are required to submit their research plans for approval to an ethical review committee or Institutional Review Board (IRB) prior to the commencement of a project. Where research is externally funded, researchers need to demonstrate that effective university-level ethical regulation systems are in place before funding is released.

Yet in the UK, ethical regimes for the regulation of social scientific research are relatively recent. Only since the introduction of the ESRC Research Ethics Framework in 2005 has it been a requirement for UK

social scientists to have ethical procedures equivalent to US IRBs. Some suggest these trends are driven by mimetic isomorphism (Dimaggio & Powell, 1983), as social science organizations like the ESRC try to enhance their legitimacy by emulating what has become normalized in the natural sciences, such as health research (Dingwall, 2006). The adoption of risk management practices from the private sector has also encouraged UK universities towards reputation management, by trying to closely control the behaviour of their internal members in order to manage external reputations. This had led to the suggestion that research ethics committees in UK universities are primarily an instrument of organizational reputation management, by preventing organizationally sensitive research from taking place, (e.g. on students' engagement in sex work or links to terrorism), because this might adversely impact the university's reputation (Hedgecoe, 2015). Such decisions, Hedgecoe suggests, centre on protection of the institution's interests from potential harm, rather than protection of research participants or academic freedom. This has implications for research that explores power relations in organizations, including Critical Management Studies (Alvesson & Willmott, 1992).

For social science researchers in universities in the global south, compliance with ethical procedures is an increasing expectation in research collaboration arrangements with institutions/universities of the global north. This includes research funded by international development and aid agencies, as this is a route through which ethical regimes become normalized and diffused into research practices in the global south (Den Hoonaard, 2011; Sato, 2013). This has led to concern about 'ethics creep' (Haggerty, 2004), a process whereby the bureaucratic structure of ethical regulation colonizes new groups, practices and institutions, and at the same time expands its remit to incorporate a widening conception of what constitutes an ethical issue. A number of related criticisms

have been levelled at ethical oversight regimes. These centre on:

- ethical review committee members' lack of research experience and the secrecy that surrounds committee composition and practices (Den Hoonaard, 2011);
- inappropriate imposition of a biomedical model of research that follows the sovereignty of the positivist natural science paradigm and promotes a distanced, objectivist research stance that is insensitive to qualitative-interpretive study (Dingwall, 2006);
- notions of potential harm applied in a social science context where risks of harm are much less than in the biomedical sciences (Dingwall, 2006; Thorne, 1980);
- the time-consuming and dysfunctional nature of bureaucratic review processes which encourage detachment from humanitarian values (Bauman, 1989; Bell & Wray Bliss, 2009);
- unintended consequences of ethical regimes which encourage researchers to see ethics as a paper-based, tick-box exercise and a hurdle to be overcome, rather than an ongoing and essential feature of the research process (Sin, 2005);
- export of a research ethics model from scholars in the global north to those on the periphery without substantive dialogue and suitable modification (Riessman, 2005).

A further concern relates to the role of ethical regimes as a distinctive type of managerial rationality that is oriented towards achieving accountability in a risk-averse context where there is declining trust in public institutions. As Power (1994) notes, audit can become a practice where temporal and spatial distance from the practices to which it is applied results in dislocation, creating a 'ritual of inspection' wherein the establishment of a system whose operations can be verified becomes more important than the operations themselves. Ethical regimes can thereby become self-referential; a reification of the thing they are intended to represent.

Ethics creep is also criticized for having led to increasing homogenization of research methods in the social sciences and a reduction in the diversity and richness of these

disciplines (Den Hoonaard, 2011). Evidence suggests that some social science researchers in the UK and elsewhere have changed their research designs in response to anticipated or experienced difficulties in gaining research ethics approval. For example, Richardson and McMullan (2007) discuss the impact of ethical regimes on studying the UK National Health Service (NHS), particularly in situations where the research must go through more than one research ethics committee (where a study spans more than one organization it may have to go through a separate NHS Research Ethics Committee review in each case). This can be an extremely time-consuming process, led by medical practitioners who may be unfamiliar with social science methods, and involving different committees that sometimes give contradictory and conflicting advice. This is of particular concern to researchers who use naturalistic methodologies, such as ethnography and action research, where the context and nature of study is more difficult to predict than in studies using positivistic methods, like surveys and field experiments.

An additional critique suggests that research ethical regimes represent a form of authority wherein the researcher becomes an object of control. Within this, the exercise of technologies of examination, confession, guidance and correction are oriented towards gaining control of the subject (Foucault, 1980). First, the researcher is required to submit their research plans to a bureaucratic, institutional process and to show they understand, and are able to replicate, the stylized language favoured by these regulatory bodies, often using standardized forms and rules provided. Having provided information about their research, researchers are then contacted, usually via a letter to the researcher which communicates the outcome of the process. Finally, it is not uncommon for requirements for amendment to be issued, and sometimes for numerous iterations to be required before a research project is approved (Den Hoonaard, 2011). From a Foucauldian perspective,

ethical regimes can be understood as a form of governmentality which relies on coercive and non-coercive strategies to promote desirable behaviour in subjects through use of these techniques and processes. This ideology is predicated on the notion of the self-interested, autonomous, rational subject. Notions such as informed consent are formed by this neoliberal discourse.

Hammersley and Traianou (2014) argue that the focus on the autonomy of the research participant that ethical regulation encourages means insufficient attention has been paid to protecting the autonomy of the researcher. They argue that ‘what is and is not ethical in dealing with other people must be judged in the context of the distinctive obligations built into the role of researcher, rather than simply being assessed in terms of general ethical principles’ (Hammersley & Traianou, 2014, p. 233). This includes researchers questioning the ethical judgement of institutions, including funders and ethics committees.

In addition, the notion of informed consent assumes that autonomous action is possible. Yet from a Foucauldian perspective, agents are constituted in and through sociocultural forces; this implies that unconstrained individual choice is impossible (Hammersley & Traianou, 2014).

A final critique relates to the possibility that ethical oversight regimes and the normalization of research ethics encourage researchers to abandon local, contextually relevant ethical principles in favour of Western ethics codes. Ethical oversight regimes rarely consider the possibility that ethical principles may not be universally beneficial or that their meaning may be interpreted differently depending on the cultural context of study. In the remainder of this chapter we explore these issues in greater depth by focusing on the principle of informed consent, which we use to highlight the core-periphery dynamics associated with ethical regimes. We begin by introducing the principle of informed consent and outlining the model of the human subject on which it

is based. Next, we introduce our interview study of management researchers in India and discuss the ethical issues that it raised for us as researchers, and as a topic of discussion for our respondents. Finally, we introduce some alternative notions of research ethics that draw on notions of indigenous knowledge and decolonizing methodologies.

INFORMED CONSENT AND THE CONSTRUCTION OF THE AUTONOMOUS HUMAN SUBJECT

The principle of informed consent is conventionally thought to have developed in reaction against clinical trials carried out in Nazi concentration camps during World War Two (Hoeyer, 2009). The Nuremberg Medical Trials of Nazi doctors responsible for those experiments led to the development of the Nuremberg Code (1947). This sought to define legitimate research on human subjects and provide a universal standard for human experimentation. It later formed the basis of the Helsinki Declaration, developed by the World Medical Association, which provided the basis for a broad consensus surrounding ethical principles in the biomedical research context, including through the principle of voluntary informed consent, which seeks to ensure that the research participant has freely agreed to participate in the study and provides them with the opportunity to withdraw their consent at a later stage. Hoeyer (2009) suggests that the extent to which informed consent has travelled since the 1960s is a reflection of its success as an ‘organizational recipe’ that has broad appeal. Yet the atrocities committed by Nazi doctors occurred despite the existence of precedents to the Nuremberg Code, which had no effect in preventing experiments on prisoners (see also Dingwall, 2006). Hoeyer (2009) argues that this narrative constitutes an institutional myth which is presented as a remedy to a problem.

The transferability of informed consent as a universal ethical rule relies on its unproblematic presentation as a panacea that provides positive results irrespective of local context and without sufficient critical reflection on the ethical dilemmas and tensions that this gives rise to (Shamim & Qureshi, 2013). This provides the basis for widespread standardized ethical guidance such as the following:

Informed consent entails giving sufficient information about the research and ensuring that there is no explicit or implicit coercion ... so that prospective participants can make an informed and free decision on their possible involvement. Information should be provided in a form that is comprehensible and accessible to participants, typically in written form (or in a form that participants can access after the end of the research interaction), and time should be allowed for the participants to consider their choices and to discuss their decision with others if appropriate. The consent forms should be signed off by the research participants to indicate consent. (ESRC, 2015, p. 22)

The method that is widely recommended to ensure prospective participants are fully appraised of the research and their rights within it (including to withdraw consent at any time), is the information sheet and consent form (Coomber, 2002). According to the UK Data Archive, the information sheet should cover the purpose of the research, what is involved in participating, benefits and risks associated with taking part, and terms for withdrawal. It also covers issues relating to data usage and ethical precaution, as well as contact information in case of question or complaint. The consent form is a separate document that is signed by the participant. The form:

[s]hould be written in plain language free from jargon. It should allow the participant to clearly respond to each of these points:

- the participant has read and understood information about the project
- the participant has been given the opportunity to ask questions
- the participant voluntarily agrees to participate in the project

- the participant understands that he or she can withdraw at any time without giving reasons and without penalty
- procedures regarding confidentiality are explained (use of names, pseudonyms, anonymization of data, etc.)
- separate terms of consent for interviews, audio, video or other forms of data collection
- use of the data in research, publications, sharing and archiving are explained
- signatures and dates of signing for the participant and the researcher.⁵

Informed consent requires that the researcher considers whether the participant is 'capable of understanding all the potential risks involved' (ESRC, 2015, p. 44); without this, consent is not considered 'valid'. The intention is to enable a dual purpose to be communicated about the need to respect the autonomy of the individual, and the need to protect them from potential harm arising from research (Hoeyer, 2009). Guidance typically states that 'where participants are not literate, verbal consent may be obtained but this should wherever possible be witnessed and recorded'. While the guidance states that 'highly formalised or bureaucratic ways of securing consent should be avoided in favour of fostering relationships' (ESRC, 2015, p. 43), throughout, emphasis is placed on providing information in 'written form' and for these forms to 'be signed off by the research participants to indicate consent' (ESRC, 2015, p. 42).

A number of critiques have been offered of informed consent, as conceived in these ethical guidelines. Informed consent is based on a construction of the research subject that encourages participants to be viewed as fragile and needing protection (Den Hoonaard, 2011). Yet management research often involves studying powerful individuals and organizations, where there is less need for protection from harm than when researching more vulnerable subjects (Bell & Bryman, 2007). In some circumstances, there may conceivably be a case to be made for exposing powerful research participants (organizations and individuals), to a degree of potential

harm, especially when a case can be made that this is in the public interest. Thorne (1980) argues that some participants, such as vulnerable groups, may be more deserving of informed consent than others, including powerful elites. Informed consent can, in some cases, increase the level of perceived harm to which a participant is exposed, by requiring them to sign a document which can compromise their anonymity (Thorne, 1980) by requiring them to write their name and sign a form that is kept by the researcher and may be seen by other people. It is further argued that the different 'experiential worlds' (Thorne, 1980, p. 288) that research participants and researchers inhabit may mean they may be uninterested in listening to or reading information about the study, instead favouring 'partial truths'. Informed consent also focuses on a participant's right to say 'no' to being studied, rather than on their right to say 'yes'. Thorne's (1980) example of a group of mental patients who were prevented from being studied because hospital administrators did not give consent to access the institution illustrates how the formal process of gaining informed consent can effectively silence the less powerful rather than empower them. The extent to which consent is voluntary can be difficult to ascertain in natural fieldwork settings where researchers are observing everyday activities, such as participant observation or ethnographic study. These contexts, often involving many participants, do not lend themselves to moments of announcement and choice (Thorne, 1980).

Some researchers in the global south (Shamim & Qureshi, 2013) suggest that ethical guidelines fail to account for power relations that render conceptions of voluntary/willing participation in the research process, as well as withdrawal from it, highly problematic (Asif, 2010; Qureshi 2010; Rarieya, 2010). In some cultures, research participants may view participation as a personal favour to the researcher, and may be uninterested in the findings (Bhattacharya, 2007), or regard a direct request for an interview as rude

behaviour (Smith, 1999). But the insistence on signed consent forms is impervious to diverse settings and (sub)cultural differences within which research is conducted, including with non-literate or semi-literate research participants (Asif, 2010). The signed consent form is also insensitive to honour and sanctity associated with verbal (in preference to written) consent in some cultures, even if the research participant is literate (Qureshi, 2010). In these contexts, the act of granting informed consent by the research participant may emanate more out of cultural mores of honouring the relationship with the researcher (established through requests from friends and contacts), than from comprehension of, or agreement with, the research objectives stated in the informed consent sheet.

Ultimately, consent is argued to be contingent and situated. It cannot, therefore, be adequately addressed by getting participants to sign a form (Sin, 2005). Ethical regimes promote a bureaucratic approach that assumes the future can be anticipated and sufficient information about this provided to participants, including prediction of risks that could potentially arise in a research project. This, argues Sin (2005), is unrealistic. Instead, consent is an ongoing process of negotiation that must be sensitive to context, including how definitions of consent are operationalized by the individual with whom the researcher engages (Sin, 2005). A further problem arises when the bureaucratic procedures surrounding consent become ritualized and fetishized, resulting in dysfunctional consequences (Den Hoonaard, 2011). Examples include a researcher conducting an autobiographical study being required by an ethical review committee to sign a consent form for his own study, and a researcher analysing public photos in newspapers who was told to gain consent from every individual who appeared in the images (Den Hoonaard, 2011).

A final problem of relevance to our analysis here relates to the heightened sense of individualism that informed consent promotes through the requirement to respect the

autonomy of the research subject. This draws upon Western cultural values about the modernist subject as a bounded, rational, autonomous agent whose relationships to others are causal (Smith, 1999). These ideas, rooted in modernist, Western cultures, can encourage interviewees to narrate themselves according to a dominant discourse of subjectivity which they may not subscribe to (Alldred & Gillies, 2012). As Alldred and Gillies (2012, p. 142) observe, 'the very idea of interviewing someone is rooted in particular understandings about what being a person is, about communication between people and about how knowledge can be generated by the posing of questions by one and recording of responses by another'. The notion of informed consent assumes and reinforces this notion of subjectivity through a Cartesian concept of cognition as operating independently of emotion according to principles of abstract rationality. Yet Respect for this culturally specific notion of individual autonomy is presented as a universal truth (Hoeyer, 2009).

An example that illustrates the relationship between culturally specific understandings of subjectivity and research ethics arose during a workshop on action research organized by the second author and her colleagues in India. The workshop participants were local development practitioners doing action research with subaltern (i.e. dalits and tribal) communities in India. One practitioner narrated an experience involving the Musahar community in Bihar in a project which aimed to improve their access to state welfare schemes. Officially classified as scheduled castes, the Musahars and Paswans are concentrated in Northern India, particularly Bihar and Uttar Pradesh, and are commonly described as dalits. The Musahars are an extremely marginalized caste group from Bihar, who work mainly as bonded, landless, agricultural labourers. They are often described as 'dalits among dalits', and have little access to state-led development interventions which are usurped by local elites and landlords (Kumar, 2006; see also Singh,

2013, on how they negotiate and contest marginality on an everyday basis). Paswans are placed higher in the caste hierarchy, and more importantly, owing to wider social and political mobilization, wield greater power at the local level. The development practitioners hypothesized that it was a lack of self-worth, a result of centuries of caste-related stigmatization and poverty, which prevented Musahars from accessing these schemes that had been specially designed for them. As part of their research, they decided to use a modified form of Rosenberg's (1965) self-esteem scale to measure the self-worth of community members. The researchers administered a questionnaire to the Musahar people and completed a scale-based questionnaire themselves (as the respondents were non-literate). The team told a number of stories in the workshop relating to the difficulties in collecting meaningful data using this method. First, although the questionnaire was meant for individual respondents, the Musahar people answered the questions in groups. Second, for many questions it was very difficult to elicit any response from the Musahar respondent, and most often it would be a Paswaan (another disadvantaged community but a little higher up in the caste hierarchy in comparison to Musahar), who would give the response on behalf of the Musahar, who would then second it. This example draws attention to the difficulties in applying the principle of informed consent as based on a Western concept of the autonomous research subject.

STUDYING RESEARCH PRACTICES

Our awareness of the tensions involved in negotiating research ethics was further heightened through our own experience of applying for ethical approval for this study, a requirement of the UK-based project funder and the first author's university. This was in contrast to the experience of the second

author, based at an Indian higher educational institution where ethical review was not required, (although since the time of our study there have been moves to introduce an ethical review process as a consequence of recent international collaborations with a US university). While the UK university's ethical review guidelines state that the application should include a copy of the study information sheet and participant consent form 'if applicable' (sample templates provided), consistent with findings from other studies of ethical review processes (Den Hoonaard, 2011), conversations with colleagues at the institution who served on the committee, or had applied for ethical approval in the past, suggested that this was a tacit norm to which compliance was expected. We took account of this guidance and devised a standardized information sheet and informed consent form for the study. Consistent with other accounts (Den Hoonaard, 2011), our experience of the ethical review process was of a bureaucratic, document-heavy process involving two rounds of committee review that took two months from initial application to final approval, with outcomes and requests for modification at each stage being communicated formally to the researcher by letter.

Our semi-structured interview study involved 35 management researchers employed as Professors, Associate Professors or Assistant Professors in Indian Institutes of Management, universities and private business schools in India, in addition to a smaller number of respondents who were part of the Indian management research diaspora (management academics employed in UK or US universities). In this chapter we focus on the 31 management researchers in India. Interviewees were asked a range of questions relating to their methodological and research practices, including about their research training, empirical and theoretical preferences and publishing experience. Interviews were carried out either in person or via Skype, by either one or both of the researchers. Interviewee accounts were anonymized, a standard condition for ethical approval at the

first author's institution; in the analysis that follows we therefore use pseudonyms.

While we were interested in exploring issues relating to research ethics with interviewees, we were struck by the spontaneous way in which this topic emerged, often as a result of us presenting interviewees with the study information sheet and consent form (usually sent by email in advance of the interview to enable full consideration of our request). These accounts included respondents' reflections on their own research practice, including explanations of how they handle ethical issues in the research process, as well as reflections on how they felt as respondents being asked to comply with a formal ethical review process for the purpose of our study. While all of the interviewees were willing to sign the form, a number took this opportunity to observe the differences between Indian and UK/Western research ethics practices, using the example of our consent form to illustrate. Analysis of these accounts led to identification of the three themes presented below.

Informed Consent as a 'Western' Practice

Ethical guidelines for Indian social science researchers in the field of health⁶ emphasize the need for a 'common framework' to combat the perception that there is an 'indifference to ethics' in social science health research in India, calling for ethical principles and guidelines for research 'to improve and strengthen the system and environment in which research is conducted'. Enshrined within this is the principle of autonomy and the need for informed consent, although it is acknowledged that in India it 'may not be possible to obtain signed informed consent of participants'. While these guidelines call for 'organizational mechanisms' for the review of research ethics, stating that this is not something that can be 'left to the discretion

of individual researchers', they make clear that ethical oversight regimes for management researchers are a lighter touch in India than in countries like the UK. Several interviewees were dismissive of the principle of informed consent and the use of universal codes of ethics as the basis for institutional ethical regimes which they associated with the West.

This whole idea of informed consent, that's a minor issue, that's a trivial issue as I see it, it's more of an institutional requirement in the Western Academy. (Amrit, Professor)

Rather than reflexively considering the implications of ethical regimes and the possibility of developing 'contextually relevant and professionally sound ethical codes for conducting research' (Qureshi, 2010, p. 94), interviewees tended to dismiss this as irrelevant to their context.

In organisational research in India we do not have ethics committee[s]. (Durga, Professor)

No, we don't have anything like that in India, and in fact, when you sent me that sheet to sign, I thought oh my God ... I was a little surprised ... we don't have all that. (Rajni, Associate Professor)

While interviewees were conscious of changing expectations in relation to research ethics governance in India, this was seen as an external requirement imposed by the global north, rather than a necessary consideration from a 'praxis or critical consciousness perspective' (Aluwihare-Samaranayake, 2012, p. 66).

The only reason ... it would make sense now, [is] because globally it's a requirement and everything is so stringent, so perhaps it's a good idea to do that, so the researcher doesn't really fall into any problems. (Rachna, Assistant Professor)

Some interviewees expressed scepticism concerning our use of the consent form as a reflection of a bureaucratic approach to ethics. They were eager to discuss less formal ways of negotiating 'socially produced'

informed consent that were more sensitive to local power relations and cultural context.

In my doctoral work I [did] not take the kind of informed consent that you have taken here. Mine was more of a pragmatic legitimacy ... I have ... questions about the whole [ethical review] process ... [it] is a very institutionalised process. (Anu, Assistant Professor)

They also contested our approach to informed consent by invoking alternative moral principles of reciprocity and care:

I am a big sort of fan of consent ... I think it can be done less formally ... in a conversational format ... We need to ... find our own ways of doing it, but ... given the fact that we have even higher likelihood of power distance, it is very important that we ... establish [on] some level that we are equals and I am depending on you and you're depending on me. So, there is a little bit of interdependence ... So it may not be a formal signature based thing. (Annidita, Professor)

Signing Away Trust

A second theme relates to the relational nature of some South Asian cultures (Qureshi, 2010) and the need for researcher–participant relationships based on trust. The formal process of requesting informed consent is seen by our interviewees as a threat to the development of trusting relationships between researcher and participants. Paradoxically, the use of a consent form was interpreted as an indication, and a cause, of lack of trust, rather than a means of enhancing trust between the researcher and participant. This was especially the case in studying women research participants in rural communities, as one respondent who had used feminist research ethics in her work suggested:

There is no need for this [informed consent form] in our culture because we work more on trust. If the respondent trusts you, they will almost tell you everything. You know, they don't want any assurance further than that. They trust you, and certain things won't come through, even if you get this signed. If they don't want to disclose ... and [you]

make them sign this ... they will not say anything because they are always worried that they are vulnerable ... So this instrument is not going to make much of a difference to anything. With this, nothing more is going to happen. Without this, nothing less is going to happen. (Kaveri, Professor)

In such contexts, oral consent can be 'associated with personal honour and integrity of the speaker' (Qureshi, 2010, p. 86). Insistence on a signed consent form is seen as jeopardizing this relationship, and can have the opposite effect leading the respondent to feel disempowered.

The moment I put it in this [form], does it affect my data collection process? I think so ... the moment I give them [this] I raise suspicion. (Ahmed, Professor)

I think it is not relevant in the Indian context because he [research participant] agreed to talk to me. It implies that he has given his consent, so I can develop a form and I can ask him to sign, but I think in the real context ... this kind of signing will [scare him and not give him feelings] of right, entitlement ... It will make [the research participant think] 'okay, I cannot deny things', whatever I have said. (Dipesh, Assistant Professor)

This highlights the complexities and subtleties surrounding the building of trust in research relationships. Bhattacharya's (2007) feminist account focuses on dilemmas she faced in dealing with a research respondent who insisted that she 'trusted' the researcher to do whatever she wanted with the data. This caused Bhattacharya to reflect on whether, by 'following the rules' surrounding informed consent, she was failing to honour the relationship she had built with her respondent. However, ethical regimes take little account of relational trust and the researcher's interpersonal relationship to research participants, instead focusing on contractual establishment of parameters intended to prevent data misuse. This is predicated on an inherent mistrust of researchers as unable to exercise moral judgement without the presence of rules and systems of regulation that are intended to protect participants from such abuses.

Bureaucracy as Neo-Colonial Oppression

Our final theme focuses on the historical, cultural and political context within which views of informed consent are formulated. British colonial rule in India was enabled by the imposition of a legal system that enabled regulation and domination of 'others' (Cohn, 1996), while in contemporary India, state bureaucracy is suggested to be a mechanism for the exercise of biopolitical control (Gupta, 2012). Bureaucracy can therefore invoke painful memories of the colonial past and present-day struggles with neo-colonial capitalism for subaltern populations still affected by epistemic violence (Spivak, 1999) and associated with the 'civilizing mission' of Western, imperialist modernity. Formal documents that rely on legalistic language and requests for a signature can therefore invoke suspicion on the part of the respondent:

That's what our culture is. We are very much suspicious, so when you are taking a signature, they may be suspecting that you may be putting somewhere something else, because I have signed. So let's say for example, I have signed, and you have misquoted me, or you have not printed those exact statements that I have told ... that will be my suspicion, so I'll be extremely careful when I'm talking. I'll be extremely careful how I'm responding ... You are asking me to become more serious ... psychologically you are trying to build pressure on me. All the time, back of the mind, I'm thinking that I have signed. So, you have made me become conscious. (Chinmaya, Associate Professor)

Just as an example, if [my participants] see this [indicating study consent form], I will have more questions. If [they] read all this, they say, 'this is too much! Why are you asking me all these things?' ... Since I know what this is for, I'm okay with it, but if you give this to a [Indian] manager, he will say ... 'you are asking me to sign some legal document? You know, I'm hesitant to do that'. So it brings in a bit of reluctance. (Srinivas, Professor)

As these quotes suggest, rather than protecting participants from potential harm, obtaining a signature is likely to be viewed by

participants as lessening their control over the research process and the uses to which their data is put. Put differently, there is a perception that they are signing away their rights, rather than signing to protect them. While we cannot comment on whether or not research participants share these views, this suggests that a bureaucratic approach to informed consent has the potential to generate the reverse effect from that intended.

It will, depend ... on the education levels of the audience ... in case of rural areas, you know ... getting any documents signed by ... people, even if you're translate into their local language ... asking them ... [to agree] to participate in the research, I think it might lead to some troubles for the researcher, because ... by bringing in documents ... which we want them to sign ... I think that the impression ... you're giving is ... 'why are you getting a document signed?' Because you are not a government authority, [why] are you doing that? So, [that will give a] bad impression. (Vinayak, Assistant Professor)

Informed consent ... in [the] sense [of] a form that you have sent to me? No, that I have not done ... some of them ... they don't know how to read and write ... Whenever they see paper and something is on there, they become more suspicious. (Souvik, Associate Professor)

As the following quotes suggest, Indian researchers see informed consent, based on a notion of the universal modern research subject, as inappropriate in engaging with some groups of research participants, particularly indigenous communities in postcolonial contexts.

Oral informed consent fits in with the various contexts of research in India, unlike written consent, which would be perceived as alien and officious by many of the poor. (Nandini, Professor)

When I said I doubt, what I meant was ... the form you [sent] to me and then I have to tick it in many places, I doubt if it will work with the people, the kind of research that I do ... I doubt if I would have taken this form to my villagers and then I ask them to sign on this form, because signing is also something which is perceived in a very different way ... Because if I am taking the signature, while I was using my computer, my laptop, there was a story

going on in the village that I talk to people and then I feed everything in the laptop, and one day you will lose your land. (Gautam, Assistant Professor)

In this quote, we interpret Gautam to be articulating a deep suspicion held by his research participants about the motives of researchers like himself who require compliance to bureaucratic procedures, fearing that he may use this to trick them, such as into unwittingly signing away ownership of their land. Similar reactions have been observed in other studies, of women activists (Den Hoonaard, 2011) and Asian factory workers (Dingwall, 2008). Participants can become fearful or offended by being asked to sign a consent form, the use of legalistic language causing them to respond hostilely or to withdraw from the study, and this can cause researchers to abandon the study. However, we suggest these effects are compounded by distrust between subaltern populations and the researcher, which the formal language of an informed consent sheet cannot bridge. The requirement of ethics regimes for bureaucratic informed consent could result in reluctance to study disempowered participants such as those described here. This is likely to restrict the development of local or indigenous management knowledge (Jackson, 2014).

DECOLONIZING RESEARCH ETHICS

The ethical procedures that ethical regimes mandate are insufficiently adapted to particular research participants and cultural contexts. This potentially encourages management researchers to study individuals who are socialized into Western values that prioritize the autonomous human subject. The focus on individual autonomy discourages consideration of alternative conceptions of the social agent as a being whose identity is constructed relationally or collectively as part of a larger community. This

approach to consent is passive rather than active, assuming that obtaining a person's signature on a consent form constitutes the primary basis for involvement in a study.

Universal approaches to research ethics reinforce 'neo-colonial assumptions about the ability of the expert academic researcher to apprehend the native's point of view ... treat the researched as a colonized people ... that the expert researcher can assume to "know them and what is good for them better than they could possibly know themselves"' (Said, 1978, p. 35, also cited in Bell and Wray Bliss, 2009, p.79). This lack of cultural reflexivity runs counter to principles of indigenous research which seek to acknowledge and redress neo-colonial power relations that have resulted in the marginalization of non-Western forms of knowledge. In order to address this, management researchers need to develop decolonizing methodologies (Smith, 1999) that encourage reflexive investigation of the common-sense assumptions, ideologies and conceptions that lie behind the use of certain methods. Following Appadurai (2000), we suggest ethical regimes modelled on universalistic assumptions about the nature of the human subject are highly problematic. Instead there is a need for 'deparochialization' of research ethics. This would create spaces:

[t]o imagine and invite a conversation about research in which ... the very elements of this ethic could be subjects of debate. Scholars from other societies and traditions of inquiry could bring to this debate their own ideas about what counts as new knowledge and what communities of judgement and accountability they might judge to be central in the pursuit of such knowledge. This latter option – which might be called strong internationalization – might be more laborious, even contentious ... but [is a] ... surer way to create communities and conventions of research in which membership does not require unquestioned prior adherence to a quite specific research ethic. (Appadurai, 2000, p. 14)

Within such spaces, indigenous communities would be empowered, not only to suggest how to conduct 'ethical research' that

respects local norms and knowledge, but also to become *active* participants, as research becomes a 'right' to be claimed and exercised (Appadurai, 2006, p. 168). Conversations about research and its ethics could then 'seek to affirm diversity in ethical thought' (Tikly & Bond, 2013, p. 436) and contribute to 'emerging critical literature on research ethics in cross-cultural, postcolonial settings in ways that would provoke re-consideration of actual practice' (Tikly & Bond, 2013, p. 438).

Decolonizing approaches to management research ethics are founded on the assumption that research is done *with* human beings, rather than *on* them. This includes exploration of paradigms, including feminist and indigenous research, that build on an ethics of care and promote values of reciprocity, integrity and personal conduct (Czymoniewicz-Klippel et al., 2010). It also requires greater recognition of the importance of understanding local cultural context and building trust with research participants prior to negotiating informed consent (Czymoniewicz-Klippel et al., 2010). There is also much to be learned from indigenous scholars who have been influential in developing participatory modes of knowing through approaches to study that privilege indigenous knowledge and voices (Battiste, 2008; Smith, 1999). Drawing on their work, Denzin and Giardina (2007) suggest that participant involvement in research involves more than gaining agreement to participate. Instead, participation needs to be based on trust, negotiation and respect as an ongoing process of enactment through 'gift giving'. This justice- and care-based approach to research ethics rejects an ideology of empowerment and provides an alternative to utilitarian avoidance of deception by suggesting that morality is enacted in everyday life, rather than through the exercise of external bureaucratic agency (Denzin & Giardina, 2007). Exploring these ideas could help management researchers in peripheral locations to explore alternative

approaches to research ethics that are more sensitive to the moralities of everyday life, and for management researchers worldwide to be more open to scientific epistemologies grounded in these experiences. This could enable voices of management researchers from the global south to be heard more clearly through their reflexive accounts of conducting research in these locations and development of more 'contextually appropriate methodology and ethical practices' (Shamim & Qureshi, 2010, p. 2).

CONCLUSION

Management research takes place in complex social worlds and involves engagement with broad questions of social justice. Decisions about who, what and how to study are therefore fundamentally political as well as ethical. Questions of research ethics are also culturally and historically specific. Ethics regimes in Anglo-American universities are currently under strain through the bureaucratic burden created in recent decades. They are often seen by researchers and those who manage them, deterministically, as a requirement that cannot be questioned. In the US, where these ethical regimes originated, there is a growing recognition of the costly, complex and conservative nature of these regimes, and recently there have been moves towards reforming IRBs.⁷

This chapter has argued that the international spread of ethical principles and ethical regimes in management research is shaped by core-periphery relations which have implications for the kind of research that is conducted in contexts such as India. Universalist approaches to research ethics are based on colonial assumptions that implicitly privilege Western forms of knowledge and approaches to research (Czymoniewicz-Klippel et al., 2010). This includes the principle of informed consent and the formal, bureaucratic methods used to ensure it, which assume a static,

monolithic view of the human subject as an autonomous individual.

While social scientists from all disciplines are affected by ethics creep, for management researchers this presents particular challenges. There are increasing pressures on management researchers in peripheral locations such as India to adopt 'international' research practices (Khatri et al., 2012). Universalized ethical principles and ethical regimes form part of a broader globalizing trend in management research whereby particular understandings of rigorous research, and the methods on which they rely, have been transformed into global standards (Bell et al., 2017). These are suggested to be applicable in all parts of the world, irrespective of cultural context. The potential for ethics creep from the core to the periphery arose in this project as a consequence of a collaboration between an Indian-based management scholar and one based in the UK – where ethical regimes have become normalized. Ethics creep can also arise when students in countries where regimes of ethical regulation for social science research are not applied move to the US, Canada, the UK or Australia to do their doctoral research. In such cases, they may draw on their culture of origin as a conceptual and empirical resource. However, it is highly likely that in order to do so, they will be required to comply with ethical regimes that are based on Western ethical principles.

We suggest there is a need for a more nuanced, contextualized approach to ethics in management research. Rather than incorporating management researchers from peripheral locations into ethical regimes based on Western ethical principles and modelled on universalistic assumptions about the nature of the human subject, there is a need for more open discussion about the limitations of ethical regimes and the principles on which they are based. This relies on appreciation of cultural traditions that promote alternative conceptions of ethics to those that dominate in the global north.

Digital Ethics

Rebecca Whiting and Katrina Pritchard

INTRODUCTION

In the context of qualitative research, ethics are generally defined as the moral principles or rules of behaviour that guide research from inception through to publication and the curation of data. The main concern is to minimize risk of actual or potential harm whilst ensuring the maximum benefit of the research (ESRC, 2015a). Our focus here is ‘digital ethics’, referring to ethical considerations in research that uses and/or studies web-based activities and settings. It should be noted that this is variously referred to as ‘e-research’, ‘internet-mediated’, ‘web’, ‘digital’ or ‘online’ research. For simplicity, we use the term internet research as an umbrella categorization. Our primary interest is in the application of digital ethics to qualitative research in the field of business and management, though we draw from useful sources across a range of disciplines.

The aim of the chapter is to provide an overview of the key ethical issues in internet

research: assessing what is human participation; when informed consent is required and from whom; the dilemma of what is public or private on the internet; and decisions about anonymization or attribution. We situate these issues within a discussion of overarching tensions. These encompass flux and uncertainty surrounding both internet technology and the guidance developed to address it; the type and status of such guidelines; a lack of transparency in how digital ethics are actually addressed in practice; and the particular challenges of what is seen as ‘problematic’ qualitative research.

Our starting point is to scope the ethics context for researchers in the field of business and management. We then examine the literature that has considered the ethics of internet research. This is used to highlight various overarching tensions before examining the key issues in greater detail. In doing so, we consider a selection of different approaches that a qualitative researcher might like to consider when reviewing

ethical guidance and practice to address these dilemmas in their own research. It is not our intention to summarize or indeed review all possible different ethics guidelines that might conceivably apply. Examples are included of available material, ranging from the formal (published ethics guidance) to the more informal (published research that may nevertheless become accepted practice). We conclude with suggestions as to how qualitative researchers might address the practicalities of dealing with ethical dilemmas when carrying out internet research in the field of business and management.

SCOPING ETHICS IN BUSINESS AND MANAGEMENT

For business and management researchers, there is unlikely to be a single specific body or ethics code that applies; we must always draw on guidance from a developing range that may extend beyond this field to include our own institutions, professional and funding bodies, and specialist digital ethics guidance. For example, a number of bodies support and represent the academic community and its engagement with professional activities in the field of business and management. These generally serve particular geographical constituencies, though the events they organize and their members' work may be international. Member activities may include research, teaching, learning and practice. Researchers can check whether the relevant body for their location publishes a code of ethics or not. For example, the Academy of Management (AoM, United States) and the British Academy of Management (BAM, in combination with the Chartered Association of Business Schools and the Higher Education Academy) both issue such guidance. Their codes are widely drawn to address the full range of academic activities (not just research), though neither specifically addresses digital ethics. In the

case of BAM, the guidance is a starting point to encourage members to take responsibility for their own ethical practice; this is supplemented by links to additional resources such as the ethical codes of other bodies in the fields of social anthropology, sociology and psychology (including the British Psychological Society) and funders (including the Economic and Social Research Council (ESRC)).

On the other hand, as at April 2016, neither the European Academy of Management nor the Australian and New Zealand Academy of Management issue such guidance. Bodies focusing on the delivery of teaching in management and business schools, for example, the European Institute for Advanced Studies in Management, the European Foundation for Management Development and the Association to Advance Collegiate Schools of Business, also do not publish research ethic guidelines, though they may offer codes of practice on the need to include ethics in programme curricula and doctoral training. As at April 2016, none of these refers to internet research.

It should be noted, however, that new codes are emerging as organizations update their guidelines to reflect the increasing significance of internet research. This covers a 'wide range of activities' (British Psychological Society, 2013, p. 1) across both qualitative and quantitative approaches. Digital research tools and techniques are nascent, developing alongside the internet as it becomes more socially interactive and where content is constantly changing. Not only are traditional research methods reimagined, new forms of data are made available to study (for example, tweets, namely 140 character microblogs, YouTube videos, below-the-line reader comments on news stories), new collaborations are formed and new tools are made available (including proprietary ones by social media platforms such as Twitter). Procter et al. (2013) provide an example of an agreement between Twitter and *The Guardian* newspaper which involved

the former providing a Twitter corpus to the latter and its academic collaborators. The Twitter search application program interface (API), however, only provides 1 per cent of actual traffic (Burnap et al., 2015). Procter et al. (2015) discuss the development of tools specifically to address the limitations of the availability and analysis of social media data by researchers.

This changing landscape has implications for ethics in business and management. One aspect relates to the scope of institutional ethics committees. Traditionally, committees have often sought to determine whether data to be collected are considered primary or secondary; the former are generally seen as requiring greater ethical scrutiny. But we need to consider if this classification is still meaningful when digital technology allows for a 'redistribution of methods between researchers, devices, information and users, in online environments' (Marres, 2012, p. 161) and researchers explore new ways of accessing textual and visual data. See Pritchard and Whiting (2018), for a brief discussion of the ethical and practical considerations of using stock photos, one genre of visual data in internet research.

Primary data is usually defined as that obtained directly and actively by the researcher from participants. The interaction between participant and researcher is critical rather than its mode. In internet research, this could be via an online interview. In primary data analysis, the same researcher analyses this data. With secondary data, there is no direct interaction between researcher and research subject. Existing information is created or becomes available to the researcher. In internet research, data could be press reports of employee use of blogs and social media (Richards, 2012). In secondary data analysis, the researcher who analyses the data is not the one who created it. However, whilst such data is not generated by direct research interaction with participants, the researcher still needs to be active in collecting (or, we might say, constructing) it. Richards (2012)

describes this process, specifically monitoring and recording press reports via his own blog. So in the context of internet research, typologies of primary and secondary data begin to blur. We suggest that it is more useful to look beyond the primary/secondary dualism (Bishop, 2007) and to consider the more explicit question of whether or not the research involves human participants (discussed in detail below).

The scope of regulated internet activities also extends beyond research. Ethical considerations were first mentioned in academic publications in the 1990s (Sharf, 1999), and more formal guidelines for researchers appeared soon after, for example, from the Association of Internet Researchers (Ess, 2002). Potentially problematic research behaviours were identified, such as 'lurking' (reading online posts without contributing) and 'harvesting' (collecting and using the words of others, even in an ostensibly public domain and with consent, but without contributing to the purpose of the chat room or forum). Lurking was, however, seen as a methodological advantage by others (Mann & Stewart, 2000). At the same time, the responsibilities of other organizations such as news media and internet service providers also came under scrutiny (Broadcasting Standards Commission, 1999). Legislation now covers issues such as data protection, freedom of information, the 'right to be forgotten', freedom of speech and whistle-blowing. Indeed, for what was originally conceived as an open and unregulated space, the internet has become the focus of a great deal of policy, law and governance (Palfrey, 2010). So whilst our focus is on ethical rather than other types of regulatory codes, these can never be entirely separate and as researchers we need to take all these into account. This may pose particular challenges for multi-national research teams in business and management. For example, in the area of data protection, the European Union recognizes an Internet Protocol Address (the numerical label assigned to a computer or other device which

is connected to a network that uses the internet for communication) as personally identifiable data, but the US does not (Buchanan & Hvizdak, 2009). As we discuss below, this is significant in decisions by researchers about what ‘personal’ information about their participants to redact in research publications or data sharing.

OVERARCHING TENSIONS

Four overarching tensions provide a backdrop to a consideration of digital ethics. These concern the state of flux and uncertainty surrounding ethical codes in this field, the type and status of such guidance, the particular challenges presented by qualitative research, and the lack of transparency that flows from an absence of explicit examination of ethical issues in much published internet research. With an increase in such research, we found the emergence of specialist fields focusing on a particular feature such as Twitter use (Zimmer & Proferes, 2014), but also an emergent field specifically examining digital ethics. The topic has been the subject of several books (Ess, 2009; McKee & Porter, 2009; Whiteman, 2012), book chapters (Anderson & Jirotko, 2015; Buchanan, 2010; Buchanan & Zimmer, 2015; Eynon et al., 2008) and a special issue in the journal *Qualitative Research in Psychology* (Morison et al., 2015). We now explore the overarching tensions noted above and consider how they provide a backdrop to an examination of digital ethics.

Flux and Uncertainty

Rapidly changing technology leaves researchers and institutional ethics committees wrestling with specific situations not directly anticipated by such codes. Guidelines relating specifically to digital ethics are themselves also subject to flux in response to new technologies or new regulations. For

example, the UK’s ESRC has published two sets of ethics guidelines within five years (in 2010 and 2015) and the Association of Internet Researchers (AoIR) has published two within ten years (2002 and 2012). What is regarded as ethical also evolves over time (Schultze & Mason, 2012). Consequently, the field of digital ethics feels unfixed in comparison to non-digital ethics, for example, where ethical practice for ‘standard’ interviews is quite well known. Most research bodies address digital ethics to some degree, but how they do so is less clear and more varied. Quite contrasting stances may be adopted by different institutional ethics committees to similar issues and may differ from published guidance from particular governing bodies. We note from our own experience that it can be difficult to get institutional ethics committees to engage with the issue of whether human participation is involved in internet research. What is clear, however, is that new technologies such as wearable cameras (Mok et al., 2015), 3D printing, digital video and photography, use of avatars, and new forms and sources of online data such as leaked material from organizations (Michael, 2015) will continue to present new challenges. This brings us to what we can expect with regard to the type and status of ethical guidance available.

Type and Status of Guidance

The state of technological flux raises issues about the type of ethical guidance that is required or desirable. Where specific guidance is issued that directly addresses digital ethics, this can give rise to tensions as to its status vis-à-vis previous, more general ethics guidance. Some institutions now specify which takes precedence. For example, the British Psychological Society (BPS) specifies that its Ethics Guidelines for Internet-Mediated Research (British Psychological Society, 2013) is supplemental and subordinate to the Society’s Code of Human

Research Ethics (British Psychological Society, 2014) and to its overarching Code of Ethics and Conduct (British Psychological Society, 2009). Further, generic ethical guidelines tend to assume that researchers can anticipate forms of data and modes of participant engagement, describing in advance how to ensure participants' rights are secured. This is increasingly difficult to achieve in an era of open access and data sharing (possible future use of data by other researchers) and given we cannot predict how participants themselves might in future engage with the internet (Saunders et al., 2015). Likewise, institutions cannot be expected to anticipate all future settings for the ethical guidance they issue. In a similar vein, the ESRC identifies internet research as an area where ethics committees might need to consult independent experts for their guidance on research proposals (2015a).

Significantly, recent guidelines from the AoIR (Markham & Buchanan, 2012), the BPS (British Psychological Society, 2013) and the ESRC (2015a) all recommend a contextualized, continual approach to ethical appraisal for internet research. This involves a highly reflexive approach from the researcher, who is required to consider ethics not just at the outset of the project but throughout the research lifecycle. It also involves being sensitive to the specific internet context. We consider this continual, contextualized approach in more detail below. Likewise, authors in this area reject the idea of a straightforward formula for conducting ethical internet research, but rather emphasize the researcher's responsibility to consider guidance within the context of their own research and ethical practice (Whiteman, 2012). The extent to which such consideration is readily available as a resource for other researchers is the issue we explore next.

Lack of Transparency

Although we identified a literature in this area, there is a general absence of consideration of

ethics issues in published work across a range of academic disciplines. For example, in the field of information systems (IS), Schutze and Mason note 'currently insufficient discussion ... about the ethics of Internet research' (2012, p. 302), criticizing how much published internet research does not explicitly engage with ethical issues. In their useful summary of academic research using Twitter data, Zimmer and Proferes (2014) report that only 16 of the 380 studies they analysed mention ethical issues relating to research design and data collection (and when they did, they adopted a variety of conflicting positions). These authors attribute this to early dominance of social media research by computer science and related disciplines which have historically been outside the scope of ethical review boards because their methods were not traditionally seen as involving human participants (Carpenter & Dittrich, 2011). This is not to say that subsequent researchers have failed to address ethical issues, but rather that this is not reported in their publications. This absence and resulting lack of transparency of course simply exacerbates the other tensions we have outlined, and may present particular issues in qualitative research, as we consider next.

'Problematic' Qualitative Research

We noted an early view that qualitative internet research poses particular challenges, from concerns over quality issues to wider ethical considerations. For example, its 'highly personal' probing (DeLorme et al., 2001, p. 271) is seen as requiring greater reliance on researcher integrity than quantitative research such as surveys. This is not the first context in which qualitative research is seen as more inherently risky and problematic than quantitative studies (Cassell & Symon, 2011). Qualitative methods, such as those involving close textual analysis, are seen to raise particular ethical challenges, as we discuss in our section on anonymity or attribution, below. For example, a potential solution

to inadvertent disclosure of the source of data by direct quoting is through ‘cloaking’. This involves changing quotations by paraphrasing the material to prevent readers from identifying the original site by placing text in a search engine. But this is inappropriate where the chosen methodology is conversation or discourse analysis because of the need to use text in its original form (British Psychological Society, 2007), as we discuss further below. The situation is further complicated by research practice and protocols developed within primarily quantitative studies (for example, COSMOS, 2015) that may affect what is accepted as ethical practice in internet research, but which may be impractical or inappropriate for some qualitative research.

These four overarching tensions set the background for our consideration of the key debates in the area of digital ethics.

KEY DEBATES IN DIGITAL ETHICS

We now turn to examine in more detail key debates taking place within digital ethics today. Throughout this chapter, we touch on the ethical guidelines of three institutions (AoIR, BPS and ESRC) selected from a range of bodies that business and management researchers might need to negotiate in the course of their research. When starting our own internet research in 2011, we reviewed guidelines from a range of bodies and decided that the AoIR guidance was the most advanced in terms of digital ethics. This made it relevant to our project, which we carried out in the UK and started in a department of organizational psychology. Whilst we do not suggest that the selected three are necessarily representative of similar bodies in other countries, they usefully illustrate a contrasting range of approaches to the issue of digital ethics, including how internet research is defined. As discussed above, all researchers will have to negotiate similar

combinations of ethical guidance that might apply to the particular circumstances of themselves and their research. In addition to formal ethics guidelines, specific research projects may publish statements of their ethical practice. We have therefore additionally considered one such statement relating to social media research (COSMOS, 2015). This statement is partly driven by the need to abide by the terms of use of their data providers, terms geared more towards developers than researchers (specifically, Twitter’s Developer Policy and Developer Agreement), as required by the ESRC (2015a). Project ethics statements are a practical way for researchers to provide details of their own ethical engagement, which may be adopted by others as good practice or critiqued through publication and citation. We consider aspects of these various guidelines and statements as we now turn to address the key debates in more detail.

What is Public or Private on the Internet?

This question goes to the heart of a range of ethical issues facing internet researchers today and largely determines whether material can be used as data in research, particularly without explicit consent. The starting point is that although the internet is widely regarded as a public space, there are parts which users may conceive as private. The challenge for internet researchers is that much engagement with the internet takes place simultaneously in places regarded as private, such as the home, and in public, such as an open discussion forum (British Psychological Society, 2013). As Barnes explains, ‘sitting at home alone typing into a computer may feel like a private exchange. However, once private information is posted on the internet, it becomes available for others to read. We have no control over who can read our seemingly private words’ (Barnes, 2006). She suggests this confusion may be partly a function of the

design and sign-up processes of particular websites that may imply a degree of privacy to otherwise fully public sites. Usage of such sites is often bound by notoriously complex terms and conditions regarding the status of material posted (Hull, 2015). Determining what is public or private therefore forms a critical part of the context for considering digital ethics. It is recognized that these are contested terms and that the distinction between private and public is more of a spectrum than a binary divide. For example, Sveningsson Elm (2009) argues that online spaces should be considered along a continuum of public to private, reflecting the grey area between the two.

Much focus is therefore on determining how to classify the internet context along this spectrum for the purpose of assessing ethical choices for the researcher. Some argue that posting almost any material on the internet can be considered public behaviour and therefore subject to the same ethical guidelines as other behaviours in a public space (Gosling & Mason, 2015). This accords with an established tradition that observing behaviour in public spaces (pre-internet, these would have been physical locations) does not require advance notice that research is being carried out or consent from those present (Roberts, 2015). Others reject this, invoking consideration of social norms and practices in determining whether such observation and use are acceptable; they argue that internet users may have reasonable expectations of privacy and of their behaviour not being made the subject of research (Gosling & Mason, 2015). An alternative view regards online postings as not involving human participants (Rodríguez, 2013), an angle we explore in the next section of this chapter.

So how might a researcher determine whether a particular internet location is a private or public space, and if the material there can be used as data in research? In contrast to other aspects of ethical considerations, this is one area where researchers have begun to detail their decision-making about

the private/public status of their research data (Roberts, 2015). Although a comprehensive review of the literature on this topic is beyond the scope of this chapter, we have identified a number of different approaches which we briefly examine.

One view is where researcher understanding of what is public is driven by what technology makes it possible to access (Schultze & Mason, 2012). This might involve assessing whether the site in question requires registration (Schotanus-Dijkstra et al., 2014). But on its own this would represent quite a narrow approach, one which focuses more on the space and less on behaviour. It risks ignoring norms and practices which apply to the internet as much as other social spaces. The majority of studies now additionally include more nuanced tests that seek to contextualize the internet setting, such as the relative vulnerability of the population being studied (Holtz et al., 2012), the degree to which the material has already been publicly viewed (Marcus et al., 2012), the sensitivity of the topic (Trevisan & Reilly, 2014) and the intended audience (Fleischmann & Miller, 2013).

Another aspect of this contextualization is exploring whether users of a particular internet location perceive it to be a public or private space, and crucially whether they might expect a researcher to access user-generated material and use it for research. Here, research on the privacy and usage expectations of different groups of internet users is helpful. Without it, 'we risk constructing an understanding of Internet research ethics that is not supported by reality' (Dawson, 2014, p. 430). A survey specifically looking at user views reported a mix of opinions, with some considering that no online space is truly private (Beninger et al., 2014). Research on user privacy understanding and expectation (Paechter, 2013; Roberts, 2015; Schultze & Mason, 2012) suggests some users may adapt behaviours to fit with their perceptions of what is private or public in different internet settings. Schultze and Mason (2012),

however, conclude that users of internet chatrooms and online forums regard their communications as private (even on a website that its creators intended as being in the public domain). Most users in these cases considered that research without informed consent was unacceptable (see, for example, Chen et al., 2004; Hudson & Bruckman, 2004). The challenge for qualitative researchers in business and management is that most empirical examples are drawn from health sciences, where ethical concerns, for example in relation to perceived vulnerability to harm through research, may be higher. This is consistent with ethical guidance which imposes a greater obligation on the researcher to protect as the vulnerability of participants increases (Markham & Buchanan, 2012).

Schultze and Mason (2012) helpfully list characteristics for use in assessing expectations of internet privacy: these are group size, communicative purpose, social status of the community, intended audience for contribution, community membership policy, norms and expectations, and content storage and accessibility. These bring together many issues debated here and may provide a workable framework to guide researchers in this area. Recognizing the constructed nature of a concept like privacy is also useful. Hull's (2015) examination of privacy self-management online positions privacy as an individual commodity that internet users are willing to trade for other market goods. This usefully reminds us that privacy in online settings may be given up ('traded', in Hull's terms) for the convenience of accessing a website that allows sharing information with family and friends, but not necessarily for the convenience of researchers seeking online data.

The private vs. public dilemma is also specifically addressed in some ethical guidelines. The ESRC suggests that a full ethics review is potentially required for internet research 'when the understanding of privacy in these settings is contentious where sensitive issues are discussed' (2015a, p. 10). This highlights the difficulty for institutions

surrounding the public/private distinction. Some provide a guiding framework (such as the BPS's advice to consider the 'potentially damaging effects for participants' of using the material) rather than attempt precise categorizations (British Psychological Society, 2013; Markham & Buchanan, 2012). This is not straightforward either, as Markham and Buchanan neatly summarize: 'the uniqueness and almost endless range of specific situations defy attempts to universalize experience or define in advance what might constitute harmful research practice' (Markham & Buchanan, 2012, p. 7). Reviewing internet-mediated research, the BPS (2013) suggests researchers consider variable interpretations of public and private, advising significant time be invested in detailed consideration of the particular empirical circumstances. Thus it is incumbent on researchers to consider to what extent someone sharing information via the internet may expect to be subject to academic investigation and publication. This involves considering when, how and where the material was posted and its subsequent use and reuse across the web. So, for example, an individual who actively encourages distribution of their material might be regarded differently from someone attempting to restrict access even if both are publicly visible. Further consideration would need to be given in cases where an individual has subsequently retracted information.

Are We Dealing with Human Participants?

A research decision to identify and label participants, respondents or research subjects is significant not least since it implies particular ethical commitments and power relationships (Amis & Silk, 2008). It also identifies those who are not participants, thus setting up a number of other categories including 'researcher'. Online data produced by individuals (for example, material on websites, postings to online communities) forms the

basis for what has been described as ‘passive’ online qualitative research (Morison et al., 2015). The key debate is whether the use of such data should be conceptualized as human subject research (requiring ethical consideration) or, as we debate in our Introduction, merely as secondary analysis (Bradley & Carter, 2012).

More generally, the internet, particularly the interactive web, is seen to have increased the entanglement between users and the technologies they employ (Van Doorn, 2011). People’s identities become hybrid, ‘simultaneously performed in physical and digital spaces ... as Web 2.0 applications inherently entangle them with the digital material that results from their online activities’ (Schultze & Mason, 2012, p. 302). These authors problematize whether we can distinguish between the results of what people do in these digital spaces (send emails, upload photos, create profiles, comment on online media stories, write blogs) and their physical human identity. It is suggested that the two are inextricably intertwined (boyd, 2006) and their virtual presences online are ‘psychological extensions and projections of each user’s identity’ (Schultze & Mason, 2012, p. 302).

Schultze and Mason (2012) suggest an interesting parallel with archaeology. Initially, this discipline engaged with the material remains of human cultures (including long-deceased human bodies and their related artefacts). Over time, however, it developed from a field that prioritized the development of a taxonomy of found objects to one that encompassed the ‘rights, interests, sensitivities, cultures and attributes of the past inhabitants of research sites and, especially, with the rights and concerns of these ancient parties’ contemporary surrogates’ (2012, p. 309). These authors set out a framework to assess whether you are dealing with a human participant in an internet study. This involves rating from low to high on three dimensions (degree of entanglement, interaction/intervention and expectation of privacy). Their framework has been

described as ‘purposefully conservative’ and likely to result in more research being classified as involving human participation than would be the case within disciplines such as IS (Zimmer, 2012, p. 313), which illustrates how ‘human participation’ is a rather contested term. In summary, this debate highlights the extent to which a ‘human participants’ approach is the most suitable model to apply to internet research when deciding issues of digital ethics, with some authors questioning the appropriateness of its application (Bassett & O’Riordan, 2002).

Do We Need to Obtain Informed Consent and, If So, From Whom?

One starting point is whether the research involves collecting data in active or passive ways, the former where researchers engage directly with participants in, or about, online spaces and the latter where there is no direct interaction with participants (Morison et al., 2015). Both approaches require consideration of ethical issues, but that of obtaining informed consent is generally more likely with active methods. With passive research approaches, where there is no direct intervention or interaction between researcher and participant, the research may be judged as not involving ‘human participation’ and fall outside the requirement for formal application to an institutional review board or ethics committee. For example, Langer and Beckman (2005) contend that message board contributions are analogous to readers’ letters to newspapers and do not require notice or consent to be used as data.

But determining whether we need to seek consent in internet research is closely related to considerations of what is private or public, as debated above, and is by no means straightforward. For example, the COSMOS project adopts a ‘Big Data’ approach to the study of social media data across various social and policy contexts. Their ethics statement (COSMOS, 2015) states that in research outputs they do

not directly quote individual Twitter users without their informed consent (paragraph 10). They do, however, directly quote from Twitter accounts maintained by public organizations (such as government departments, law enforcement and local authorities) without seeking prior informed consent (paragraph 11). The statement relates to a particular research project and is not guidance as such, though if cited and adopted it could take on the status of accepted practice. There are a number of points to note. First, the statement rejects the notion that by having a public Twitter stream, an individual has given implied consent to its use in research. Second, the practice relates to what happens in research publications and not during data analysis. Third, the approach involves making a judgement call on the status of the Twitter account in question (Is it maintained by an individual or by a public organization? What is a public organization?). Fourth, where consent is not possible, the project team are able to represent the content of tweets in alternative ways (such as topic clustering, word clouds or themes). In our view, this practice may make it difficult for those qualitative researchers who are unable to rely on alternative ways of presenting Twitter content where close textual analysis is required, as we discuss further below. Significantly, perhaps, COSMOS have thus far published work applying social network analysis and sentiment analysis which rely on meta data and textual analysis approaches which do not require the identification of individual tweets in publications (for example, Burnap et al., 2015).

An additional challenge is from whom we seek consent. How might a researcher acquire informed consent from someone who wants to remain anonymous (Markham, 2005)? This should be possible through contacting the online persona of the individual though, as Paechter (2013) points out, the researcher should check the person they are dealing with is an adult and not a child. This may be less of a consideration in online sites relevant in the field of business and management. What if the internet site involves a number

of different contributors? In the context of a divorce support forum, Paechter (2013) took the view that the site owner was able to give consent to research using the site's postings on behalf of the community, but that consent to interviews should be given separately and individually. This importantly reminds us that internet research is often combined with offline data and methods. This combined information can threaten to increase the risk to a participant's privacy and potential harm, making informed consent more desirable.

Lastly, thinking about consent as an ongoing process becomes particularly complex in terms of foreseeing possible future uses of internet material if transferred to data archives. In the context of Twitter, one particular challenge is when tweets (or whole Twitter accounts) are later deleted by their users: this poses difficult issues for researchers depending on when this occurs (during collection, analysis or after publication). COSMOS define these as 'high risk' data which are precluded from publication under the Twitter Developer Agreement. Data may also include retweets which have been retweeted from a private restricted Twitter account into the public domain, which is also seen as problematic (Meeder et al., 2010). This has prompted debate as to whether it is appropriate to archive Twitter data for future research, given accounts include personally identifiable information including geo-locational data about the user; likewise, whether researchers should respect a user's desire to opt out or have unwanted tweets removed from any archiving function (Zimmer & Proferes, 2014). As before, the focus of debate centres on the privacy expectations of the Twitter users such as the extent to which they were aware of the fully public nature of their tweeting activity.

Should We Anonymize or Attribute?

Deciding whether internet material should be anonymized or attributed in research is

closely linked to views about the status of online material, the stage in the research process, and whether passive online qualitative research involves human participants or is just secondary data analysis (Bradley & Carter, 2012). It also depends on whether those who post material are seen as research participants or authors (Beaulieu & Estalella, 2012). As noted above, some regard online messages as equivalent to readers' letters to a newspaper (Langer & Beckman, 2005) or as literary works (Kozinets, 2010). This would mean it would be inappropriate to anonymize them or change any pseudonyms. Indeed, in this view it would be important to attribute the material to however the authors have self-identified themselves. A researcher might, however, need to consider who has ownership of the words and associated copyright. This might be the author, the online community or the owner of the site on which it is posted (Roberts et al., 2008). So the answers to these questions would determine whether the issue was one of obtaining informed consent or complying with copyright (or both). But as we have already seen, this may be overly simplistic without a fuller consideration of other contextual matters. So once again there are grey areas which add complexity when we consider the handling of publicly accessible material.

We have discussed elsewhere in relation to our own research (Pritchard & Whiting, 2012) the process of ethical review, which resulted in a focus on what we judged to be 'public' areas of the internet (for example, those not requiring membership or registration). Our research involves consideration of a range of web-based textual and visual data which represents a critical communicative context for understanding constructions of age and ageing at work (see Pritchard & Whiting, 2018). Our study involved the systematic collection of Web 2.0 material about age at work using internet tools in a daily automated search process over 150 days during 2011–12. Data included online news with reader comments, reports, images such

as stock photos, blog posts and tweets. A week's data was sampled to assess the range of data types, issues and voices. From this, more detailed research questions were developed, including how generations are enrolled in the construction of age-related employment issues (Pritchard & Whiting, 2014) and how understandings of gendered ageing are constructed and interpreted via stock photos (Pritchard & Whiting, 2015).

We retained whatever names were adopted by the internet user (not attempting any anonymization) in the data collection, management and analysis stages of our research. This seemed critical to our understanding of our data and the role of different voices within it. However, in our publications we have maintained a broad categorization of sites, sources and individuals to ensure anonymity (Pritchard & Whiting, 2014, 2015). This follows recommendations that online identities should be treated with the same care (re anonymity and confidentiality) as 'real' names (British Psychological Society, 2013).

A further specific concern is the traceability of data via search engines, even if anonymized. This is problematic for qualitative researchers who rely heavily on quotes to illustrate their analysis. Both the AoIR (Markham & Buchanan, 2012) and the BPS (British Psychological Society, 2013) suggest 'cloaking' quotes; the practice of subtly altering the original, providing this fits within the research design principles. This has significant implications and may create more problems than it solves. First, search engines often list alternatives for any search, so even an extensive rewording could result in the source being identified. Second, a rephrased quote might inadvertently direct the search to an incorrect source or a source which has also used this text. Third, cloaking will not be appropriate where the chosen methodology is conversation or discourse analysis because of the need to use text in its original form (British Psychological Society, 2007). For these reasons, we do not deploy

cloaking, but this practice is currently receiving a good deal of attention and, along with many of the issues raised so far, will require further debate.

GOING FORWARD: FUTURE DIRECTIONS

We now turn to consider likely future developments within digital ethics, including two key areas of further research. First is the matter of enhancing understanding of the researcher role and issues of researcher protection in internet research. These are comparatively undeveloped but we see them as an essential part of the second area, namely the adoption of a wider reflexive process of digital ethics to address the currently limited transparency in publications.

Researcher Role and Protection

With academics increasingly encouraged to participate in social media to enhance research impact (Brent Zook, 2015), this raises the wider issue of roles where internet researchers also engage with the web in other capacities. In our own research, blogging and tweeting have resulted in our online content appearing in the alerts we set up to collect data for our research; potentially we as researchers then become the ‘researched’. Whiteman (2012) notes how researchers move between the roles of ‘observer’ and ‘participant’ in the online field and the difficulty in maintaining separation between these in qualitative research. This theme is developed by Paechter (2013) in analysis of her hybrid insider/outsider status in respect of her research site (a divorce support website), in which she also participated in a personal capacity. Her account describes the challenge of keeping professional and personal identities separate in this ethnographic research. Such dual roles within an online

community positions the researcher as an insider (a regular member of the forum) and simultaneously as an outsider (a researcher observing and analysing the community). Paechter (2013) and Barratt (2012) usefully discuss how they handled the disclosure required in their online research settings. Paechter used a pseudonym in her personal capacity, her actual first name in her researcher role and her hybrid identity was only made explicit to the site’s management group. This involved an ethical responsibility not to mix these two roles so that ‘people do not become afraid that things said to [her] in [her] pseudonymous role will be incorporated into the research’ (Paechter, 2013, p. 82), part of a wider duty to act with integrity and good faith. Barratt (recruiting participants from various online forums of which she was, sometimes, a ‘lurking’ member) set up a dedicated project website and provided links to this and her university website as part of a legitimacy building process. She reiterates the importance of displaying technical and cultural competence (such as language and humour) to participants as well as a shared history of personal use of online settings (Barratt, 2012).

There are also issues of the safety and protection of the researcher. In one sense, our greatest protection is through enacting ethical behaviour. But within current ethical debates we find little attention given to researcher protection, notwithstanding ethical procedures should protect researchers as well as participants (ESRC, 2015a). Internet research may increase a researcher’s digital footprint, highlighting their identity to those who might seek to influence or engage with the research topic. This will depend on the mode of digital engagement, for example, using an institutional or commercial email address, maintaining a public research blog or deploying other social media. Our initial engagement was tentative, but over time we expanded both our personal and project-specific use of the web (Pritchard & Whiting, 2012). This raised our research

profile, providing opportunities for engagement both online (such as sharing outputs) and offline (such as invited presentations). Further, maintaining a research presence provides a contact for those who may want to find out more or enquire as to whether they feature in our data. Overall, our research presence has not posed any additional risk than would be encountered during our day-to-day use of the internet. Moreover, with increased debate about research impact, such online engagement seems likely to increase. However, dual or hybrid roles for researchers can problematize classifications of active or passive research. The unexpected challenges they present within internet research also underline the need for ongoing reflexivity on the part of the researcher in respect of both ethical considerations but also with regard to methodological adjustments.

Ethical Reflexivity and 'Ethics as Process'

Our second area concerns the call for greater ethical reflexivity (Roberts, 2015) and greater transparency in ethical considerations in published work involving qualitative internet research (Dawson, 2014; Saunders et al., 2015). This might include, for example, presenting 'practical illustrations of the challenges ... encountered in order to open up a discussion about how to manage anonymity issues in the face of the increasing accessibility of online information' (Saunders et al., 2015, p. 135). Likewise, this approach needs to encompass 'forward reflexivity' (Pritchard & Whiting, 2012, p. 350) as researchers need to anticipate issues such as how anonymity may be compromised by a participant's own behaviour (Saunders et al., 2015). Papers that debate ethical issues with which researchers have grappled are very useful, particularly when they provide solutions which meet with local ethical approval (Sharkey et al., 2011). The field of health research is particularly helpful here, providing a useful pointer for

qualitative researchers in business and management. As Dawson (2014) points out, this obligation extends to editors and reviewers to hold authors to account to provide this detail. As ever with qualitative research, though, we fear that word or page limits imposed by journals may militate against a move to accommodate yet further methodological detail.

All of this suggests that digital ethics cannot be addressed as a one-off tick-box exercise. One useful concept here is 'ethics as process', which 'views ethics as relationally dynamic and revisited frequently over the course of a study' (Sharkey et al., 2011, p. 753). This approach prioritizes the relationship between participant and researcher, though this can present a challenge where there is no direct contact between the two (as in our own study). Nevertheless, we consider this to be a promising framework for re-thinking digital ethics. We also recognize this as familiar territory for many qualitative researchers given the strong parallels with both reflexivity and methods of analysis in qualitative research which tend towards the circular and iterative (Morison et al., 2015).

Given how the more considered specialist guidelines and statements (AoIR and BPS) suggest a case-based approach with ongoing reflexive questioning, we suggest that 'ethics as process' would involve considering ethical issues at each stage in the research process: design, data collection/construction, analysis, publication, dissemination and data sharing. Whilst the latter has been less prominent in business and management than say health sciences, it is likely to increase, particularly in publicly funded research. For example, the ESRC expects data sharing and requires data management plans for research council funded work in the UK (ESRC, 2015b). In proposing a processual approach, we suggest these stages are not necessarily wholly discrete. Qualitative research is often an iterative process and there will almost certainly be temporal overlap between stages, particularly where data collection is an ongoing and partially automated procedure, as in

our own research. In other words, decisions made at one stage may need to be revisited later and may affect subsequent iterations of the same process. Neither do we imply that once certain ethical considerations (such as anonymity) are addressed at one stage they are finished with, since they may re-appear as the internet context itself changes. We see this as part of a wider trend towards issues such as informed consent being seen as ongoing ethical obligations (Anderson & Jirotko, 2015) requiring negotiations over time with participants rather than a one-off tick-box event (Mok et al., 2015), as reflected in guidance from the UK Data Service. This provides that ‘Consent for participation in research, for data use and for data sharing can be considered at different stages of the research, giving participants a clearer view of what participating in the research involves and what the data to be shared consist of’ (UK Data Service, 2015).

CONCLUSION

Rapid technological developments continue to present new challenges in the area of digital ethics, a situation made more difficult by a relative lack of transparency and reflexivity in much of the published internet research. We echo calls for an approach that moves away from reliance on fixed rules to one that highlights the need for continuing and reflexive practice. As qualitative researchers in the field of business and management, we can then work within an iterative framework that goes beyond ‘procedural ethics’, to examine ‘ethics as process’ and which continues throughout the research cycle.

We suggest that far from being ‘problematic’, qualitative research is well suited to this approach given the parallel with demonstrating validity. Traditionally, this might involve constructing a narrative ‘to explain ... what was done and why’ in order to demonstrate ‘why and how the [research]

findings are legitimate’ (Phillips & Hardy, 2002, p. 79). As Mason (2002, p. 190) concludes, the best way to demonstrate validity is to ‘explain how you came to the conclusion that your methods were valid’. Applied to digital ethics, and in the absence of more definitive rules, we suggest that working through the type of questions identified in say the AoIR guidelines in order to explain how you came to the conclusion that your methods were ethical may be the best way to demonstrate ethical compliance. We acknowledge that this may be an imperfect tool given that we as researchers have to accept our lack of perfect self-knowledge and that we may also be using such a narrative as a ‘device to invite trust’ (Hardy et al., 2001, p. 534). Perhaps all one can do, following Leitch and Palmer (2010), is to be explicit, as best one can, about one’s decision-making as a researcher in terms of the ethical decisions we have made.

The SAGE Handbook of Qualitative Business and Management Research Methods

Sara Miller McCune founded SAGE Publishing in 1965 to support the dissemination of usable knowledge and educate a global community. SAGE publishes more than 1000 journals and over 800 new books each year, spanning a wide range of subject areas. Our growing selection of library products includes archives, data, case studies and video. SAGE remains majority owned by our founder and after her lifetime will become owned by a charitable trust that secures the company's continued independence.

29	Metaphorizing the Research Process <i>Mats Alvesson and Jörgen Sandberg</i>	486
	<i>Index</i>	506

List of Figures

15.1	244
15.2	246
15.3	247
15.4	248
15.5	250
16.1 Drawing to record experiences	266
16.2 Recording Spatial Maps and Movements	268
16.3 Sketching existing images	269
16.4 Participant-Produced Drawings (Ward & Shortt, 2013b)	270
16.5 'How does it feel to be a Samaritan?'	273
16.6	274
18.1 Metaphorical gesture on 'bundle'	303
18.2 Metaphorical gesture on 'tiny'	304
18.3 Metaphorical gesture on 'processed in batches' and 'as and when'	305
18.4 Metaphorical gesture on 'across' and 'platform'	307
18.5 Metaphorical gesture on 'centralise'	307
19.1 Collage 1: The creative strategies of collage	316
19.2 Collage 2a: Transcription of the literal and symbolic meanings of the images posted on a collage surface	321
19.3 Collage 2b: Analysis of a collage's metaphorical relationship	324
22.1 <i>Nike Quilt</i> , Ann Rippin, 2002	375
22.2 Part of the exhibit <i>Waiting for the Warrior</i> , Ann Rippin, 2004	375
22.3 Close up showing part of <i>We Stand Surrounded by the Work of Thieves</i> , Dorothy Russell, 2014	377
22.4 <i>Cross Purposes</i> , Dorothy Russell, 2014	378
23.1 The four types of netnography	394
25.1 The use of fsQCA in management research	420
25.2 FsQCA Data sheet after Calibration in .csv	425
25.3 Selection of conditions	426
25.4 Truth table	426
25.5 Truth table	427
25.6 Truth table analysis	428
25.7 Descriptive statistics	429
28.1 Different degrees of pattern matching in qualitative (and mixed) research	471
28.2 The general logic of pattern matching and its application in explanatory case study design	473
28.3 The logic of pattern matching in bibliometric concept mapping for initial theorizing	478
28.4 Bibliometric concept map displaying 6000 concepts	479
28.5 NVivo visualisation of consumption related nodes	482
28.6 Bibliometric concept map displaying 846 concepts	482
29.1 A kaleidoscope of RP metaphors	491

List of Tables

2.1	Examples of autoethnographical approaches	25
4.1	Instances of terms rhetoric and/or reality in article titles	49
6.1	Five forms of organizational discourse analysis	88
8.1	Data table showing simple quantification of textual data	121
8.2	Spearman rho correlation matrix	122
8.3	Typology of group methods in organization and management research	129
11.1	A framework linking views about theatre and life to different elements of theatre	174
11.2	Dramaturgical methods in relation to perspectives about the relationship between life and theatre and to three elements that constitute theatre	183
13.1	Genette's (1983) theory of narratology applied to data collection methods	208
13.2	Relationships between researcher and organisation	209
13.3	Shadowing compared to other qualitative research methods	215
14.1	Different philosophical positions for research and their implications for the use of generic styles of thematic analysis	222
17.1	Key stages in analysing web images	290
19.1	Current methodologies for analysing collage visual data	319
19.2	Example of Collage 2a's story grid	322
19.3	The insights of the different processes in the analysis of collages	325
20.1	Comparison of approaches to documentary-making	335
20.2	Practical considerations in documentary filmmaking	340
25.1	Recent business papers using fsQCA (organisational, entrepreneurial and firm performance topics)	421
26.1	Summary of empirical examples that use ANTi-History	433
26.2	Benefits and limitations of the methods used with ANTi-History	446
28.1	A demonstration of flexible pattern matching through template analysis	476

Notes on the Editors and Contributors

THE EDITORS

Catherine Cassell has a longstanding interest in research methodology and the use of qualitative methods in the business, organization, and management fields. She has co-edited four books for Sage on qualitative organizational research and published numerous papers about the uses of qualitative research in the organizational psychology and management field more generally. Her latest text is *Interviews for Business and Management Students*, published by Sage in early 2015. Catherine was the founding chair of the British Academy of Management's Special Interest group in Research Methodology – a group she is still heavily involved with – and a founding member of the steering committee of the European Academy of Management's Special Interest Group in Research Methods and Research Practice. She is inaugural co-editor of *Qualitative Research in Organizations and Management: an International Journal*, and on the editorial boards of numerous other journals. She is a Fellow of the British Academy of Management and an Academic Fellow of the Chartered Institute of Personnel and Development. Having previously held a number of senior academic appointments, she is currently Deputy Dean and Professor of Organizational Psychology at Leeds University Business School, UK.

Ann L. Cunliffe is Professor of Organization Studies at Fundação Getulio Vargas-EAESP, Sao Paulo, Brazil. She held positions at the Universities of Bradford and Leeds in the UK, and the Universities of New Mexico, New Hampshire, and California State University in the USA. Ann's current research lies at the intersection of organizational studies, philosophy, and communications, exploring how leaders and managers shape organizational life, selves, and action in living conversations. In particular, she is interested in examining the relationship between language and responsive and ethical ways of managing organizations. Other interests include: leadership, selfhood, qualitative research methods, embodied sensemaking, developing reflexive approaches to management research, practice, and learning. Her recent publications include the book *A Very Short, Fairly Interesting and Reasonably Cheap Book about Management* (2014). She has published articles in *Organizational Research Methods*, *Human Relations*, *Management Learning*, *Journal of Management Studies*, and the *British Journal of Management*. She organizes the biennial Qualitative Research in Management and Organization Conference in New Mexico, USA.

Gina Grandy is Professor and RBC Women in Leadership Scholar with the Hill and Levene Schools of Business at the University of Regina located in Saskatchewan, Canada. Her research interests include leadership, gender and women's experiences at work, stigmatized work, identity, qualitative research methods, and case writing. She is the Associate Editor for the *Case Research*

Journal and serves on the international advisory board for *Management Learning* and *Gender in Management: An International Journal*. Her research has been published widely in such journals as *Human Relations*, the *Journal of Business Ethics*, the *Journal of Management Studies*, *Gender, Work and Organization*, *Organization*, *Management Learning*, *Gender in Management*, *Qualitative Research in Organizations and Management*, and the *Case Research Journal*.

THE CONTRIBUTORS

Mats Alvesson is Professor of Business Administration at the University of Lund, Sweden, at University of Queensland Business School, Australia and at Cass Business School, London. Research interests include critical theory, gender, power, management of professional service (knowledge intensive) organizations, leadership, identity, organizational image, organizational culture and symbolism, qualitative methods and philosophy of science. Recent books include *The Stupidity Paradox* (Profile 2016, with André Spicer), *Managerial Lives* (Cambridge University Press 2016, with Stefan Sveningsson), *The Triumph of Emptiness* (Oxford University Press 2013), *Qualitative Research and Theory Development* (Sage 2011, with Dan Kärreman), *Constructing Research Questions* (Sage 2013, with J. Sandberg), *Interpreting Interviews* (Sage 2011), *Metaphors We Lead By. Understanding Leadership in the Real World* (Routledge 2011, edited with André Spicer), *Oxford Handbook of Critical Management Studies* (Oxford University Press, edited with Todd Bridgman and Hugh Willmott), *Understanding Gender and Organizations* (Sage 2009, 2nd edition with Yvonne Billing), *Reflexive Methodology* (Sage 2009, 2nd edition with Kaj Sköldbberg), and *Changing Organizational Culture* (Routledge 2015, 2nd edition with Stefan Sveningsson).

Usman Aslam is Research Fellow at the Leeds University Business School, University of Leeds, UK. He holds a PhD in Enterprise Resources Planning from Loughborough University, UK. He has previously worked in primary healthcare, managing a number of IT implementation projects. His research interests include Organisational Changes, Contemporary Research Practices, and Diversity and Inclusion. He has presented his research in leading peer-reviewed conferences such as British Academy of Management and European Conference on Information Systems.

Nic Beech is a Vice Principal of the University of Dundee, UK and oversees strategic planning, academic leadership, staffing and resources. He previously held the role of Vice Principal at the University of St Andrews, UK and is Chair of the British Academy of Management. His research interests are in change, liminality, paradox and the construction of identity in creative industries (particularly music) and health care.

Peter Birch[†] was for many years a professional actor, often appearing in leading roles on stage and screen in British theatre. He changed career direction into organizational training in 2000 and was involved in the practice and evolution of organizational theatre in the UK. He inquired into aspects of his work as theatre practitioner in organizations by undertaking a PhD at Manchester Business School, UK. He was involved in executive and MBA education for Alliance Manchester Business School and for Cranfield and Lancaster Schools of Management, all UK. His particular research and practitioner interest was in leadership as performance, on which topic he led on senior leadership development in the National Health Service in the UK.

Stephen Broad is Head of Research and Knowledge Exchange at the Royal Conservatoire of Scotland. Following interdisciplinary studies at the Universities of Glasgow and Oxford, he now pursues a range of research interests across historical musicology, music education and arts policy. He is co-author of *What's Going On?* (Scottish Arts Council, 2003), a study of young people's music making in Scotland that initiated the Scottish Government's £100m Youth Music Initiative.

Joanna Brooks is a Chartered Psychologist and a Lecturer in Psychology and Mental Health at the University of Manchester. The focus of her work is on applied and health-related research topics, and Jo has a particular interest in the management and experience of chronic illness conditions and end of life care. Jo's research explores networks of care and support in health and social care, and her work includes the development and use of novel and inclusive qualitative research approaches in applied settings. She is editor (with Nigel King) of *Applied Qualitative Research in Psychology* (Palgrave, 2017), and co-author (with Nigel King) of *Template Analysis for Business and Management Students* (Sage, 2017).

Jean Clarke is Professor of Entrepreneurship at Emlyon Business School, Lyon, France. Her research focuses on how entrepreneurs use linguistic and visual cues in interactions with stakeholders such as investors, customers and employees to develop legitimacy for their new ventures. She uses a variety of visual methodologies including visual ethnographic work, participant produced drawings and micro-analysis of body language and gesture. Her work has been published in journals including *Academy of Management Review*, *Journal of Management Studies*, *Journal of Business Ethics* and *Journal of Management Inquiry*, among others. She is currently the Senior Editor at *Organization Studies*.

François Cooren, PhD, is a Professor at the Université de Montréal, Canada. His research focuses on organizational communication, language and social interaction, as well as communication theory. He is the author of three books: *The Organizing Property of Communication* (John Benjamins, 2000), *Action and Agency in Dialogue: Passion, Incarnation, and Ventriloquism* (John Benjamins, 2010), and *Organizational Discourse: Communication and Constitution* (Polity Press, 2015) and has also edited five volumes published by Oxford University Press, Routledge, John Benjamins and Lawrence Erlbaum. He is also the author of more than 50 articles, published in international peer-reviewed journals, as well as more than 30 book chapters. In 2010–11, he was the president of the International Communication Association (ICA) and was elected Fellow of this association in 2013. He is also the current President of the International Association for Dialogue Analysis (IADA, 2012–17), as well as a Distinguished Scholar of the National Communication Association (NCA) since 2017.

Joep Cornelissen is Professor of Corporate Communication and Management at the Rotterdam School of Management, Erasmus University, the Netherlands. The main focus of his research is the role of communication and sensemaking in processes of innovation, entrepreneurship and change, but he also has an interest in questions of reasoning and theory development in organization theory. His papers have been published in *Academy of Management Review*, *Journal of Management Studies*, *Organization Science* and *Organization Studies*, and he has written a general text on corporate communication, *Corporate Communication: A Guide to Theory and*

Practice (Sage), which is now in its fifth edition. He is a Council member of the Society for the Advancement of Management Studies, a former General Editor of the *Journal of Management Studies* (2006–12) and serves on the editorial boards of the *Academy of Management Journal*, *Journal of Management*, *Journal of Management Studies* and *Organization Studies*.

Tracey M. Coule is Reader in Non-profit Governance and Organization at Sheffield Business School, UK, and DBA programme leader and academic lead for the university-wide Centre for Voluntary Sector Research. Her current teaching, research and publications coalesce around two areas: the nature of organizing and managing work in non-profit organizations and the intersection between research philosophy, methodology and methods. Recent publications have featured in international journals such as *Nonprofit and Voluntary Sector Quarterly*, *Public Administration* and *Qualitative Research in Organizations and Management*.

Olivia Davies is a PhD candidate in the Monash Business School's Department of Management, Australia. Her thesis builds on a series of focused, multispecies ethnographies to develop a more-than-human ontology of Management and Organization. Specifically, her work explores different modes of human-animal working relationships including beekeeping, animal assisted therapy, clerks of the course, and search and rescue organizations. Her broader research interests have led to a specific concern with the politics of methodological and analytical choices in qualitative organizational research.

Gabrielle Durepos, PhD is an Associate Professor at Mount Saint Vincent University, Canada. Her co-authored book: *ANTi-History: Theorizing the Past, History, and Historiography in Management and Organization Studies* (with Albert J. Mills, Information Age, 2012) addresses the need for more history in Organization Studies. She is a co-editor of both the *SAGE Encyclopaedia of Case Study Research* as well as the *SAGE Major Work on Case Study Methods in Business Research*. Her recent publications appear in *Management & Organizational History*, *Journal of Management History*, and *Critical Perspectives on International Business and Organization*. Gabrielle is a co-investigator on an SSHRC funded project focused on Reassembling Canadian Management Knowledge with an interest in dispersion, equity, identity and history. She is the Executive Director of the Atlantic Schools of Business Conference. She is currently engaged in an organizational history of a provincial museum complex in Canada.

Gail T. Fairhurst, PhD, is a Distinguished University Research Professor of Organizational Communication at the University of Cincinnati, USA. Her research and writing interests are in organizational communication, organizational discourse and leadership processes, including problem-centred leadership and framing, and organizational discourse analysis. She has published over 75 articles and chapters in communication and management journals and books. She is the author of three books, including *Discursive Leadership: In Conversation with Leadership Psychology* (Sage, 2007), *The Power of Framing: Creating the Language of Leadership* (Jossey-Bass, 2011), and *The Art of Framing: Managing the Language of Leadership* (Jossey-Bass, 1996). She is a Fellow of the International Communication Association; a Distinguished Scholar of the National Communication Association; a Fulbright Scholar; and former Associate Editor for the journal *Human Relations*.

Yiannis Gabriel is Professor of Organizational Theory at the School of Management of Bath University, UK and Visiting Professor at the University of Lund, Sweden. Earlier, he held chairs at Imperial College and Royal Holloway, University of London. Yiannis is known for his work into leadership, management learning, organizational storytelling and narratives, psycho-analytic studies of work, and the culture and politics of contemporary consumption. He is the author of nine books, numerous articles and maintains an active blog in which he discusses music, storytelling, books, cooking, pedagogy and research outside the constraints of academic publishing (www.yiannisgabriel.com/). He is currently Senior Editor of *Organization Studies*. His enduring fascination as a researcher and educator lies in what he describes as the unmanaged and unmanageable qualities of organizational life.

Annilee M. Game is a Lecturer in Organizational Behaviour and Business Ethics at the Norwich Business School, the University of East Anglia, UK. Her research interests focus on the nature and functions of affect at work, mixed methods research, and attachment and relational perspectives on individual and collective experiences of work, careers, and organizations.

Martyn Griffin is a Lecturer in organizational behaviour at Leeds University, UK.

Peter Hamilton is an Associate Professor at Durham University Business School, UK. He previously worked at Imperial College, London and the University of Central Lancashire, UK. His main research interests are in the areas of organisational rhetoric, rhetorical agency, dirty work and interactive service work. He has published in journals such as *Journal of Management Studies*, *British Journal of Industrial Relations* and *Human Resource Management and Organization*.

Kathryn Haynes is Professor of Accounting and Dean of the Faculty of Business, Law and Politics at the University of Hull, UK. Kathryn's research has been widely published in accounting and management journals and broadly relates to the role of accounting in society, with a particular interest in sustainability, accountability and social responsibility. Her work also addresses issues of gender and diversity; identity and its relationship with gender; the body and embodiment within organizations; the juxtaposition of professional and personal identities; and the conduct of the professions and professional services firms. She is particularly interested in reflexive research methodologies including autoethnography, oral history and narrative. Her research has been published in leading international journals such as *Accounting Organizations & Society*, *Accounting Auditing & Accountability Journal* and *Gender, Work & Organization* and has been funded by the UK Economic and Social Research Council (ESRC).

Samia Ferdous Hoque is Research Associate in Responsible International Business at Alliance Manchester Business School, UK. She obtained an MBA from University of Bradford, UK. Her work is at the interface of development literatures and international business, within the specific context of the Bangladesh garment sectors. She has published in *Critical Perspectives on International Business*, *Accounting, Auditing & Accountability Journal* and *European Journal of International Management*.

Paula Hyde is Professor of Organisations and Society and Director of the Health Services Research Centre at Alliance Manchester Business School, University of Manchester, UK. Her critical-ethnographic research has included participatory research with ordinarily disenfranchised groups.

chised members of society such as older people in residential care homes. Previously, her interest in sewing and participation in quilting groups has been an activity isolated from her research.

Nigel King is Professor in Applied Psychology and Dean of the Graduate School at the University of Huddersfield, UK. He has a long-standing interest in the use of qualitative methods in ‘real world’ research, especially in community health and social care settings. His research interests include professional identities and interprofessional relations in community palliative care, psychological aspects of contact with nature and ethics in qualitative research. Nigel is well-known for his work on Template Analysis and, more recently, the development of a visual interview technique known as ‘Pictor’. He is author (with Jo Brooks) of *Template Analysis for Business and Management Students* (Sage 2017), *Interviews in Qualitative Research* (Sage 2010, with Christine Horrocks) and *Managing Innovation and Change: A Critical Guide for Organizations* (Thomson Learning 2002, with Neil Anderson).

Robert V. Kozinets is the inventor of netnography, and a social media research authority. He has authored and co-authored over 100 pieces of research, usually about the intersection of technology, media and the social. His publications include articles in top-tier journals, popular press articles, videographies, poetic research representation, a textbook, a blog and four books: *Consumer Tribes* (2007), *Netnography* (2010), *Qualitative Consumer and Marketing Research* (2013), and *Netnography: Redefined* (2015). He is the Hufschmid Chair of Strategic Public Relations and Business Communication at the University of Southern California’s Annenberg School for Communication and Journalism and Marshall School of Business, USA.

Mark Learmonth is Professor of Organization Studies at Durham University, UK, having previously worked at the Universities of Nottingham and York, UK.

Bill Lee is Professor of Accounting at the University of Sheffield, UK. He has a long-term interest in research methods and has been active in the broader community establishing groups in which the development of research methods may be discussed. In this regard, he was the inaugural secretary, subsequent convenor and chair of the British Academy of Management (BAM) ‘Research Methodology’ Special Interest Group and he was the inaugural Chair of the European Academy of Management (EURAM) ‘Research Methods and Research Practice’ Strategic Interest Group. He is an Associate Editor of *Qualitative Research in Organizations and Management: An International Journal* and of *European Management Review*. In the latter, he is the inaugural Editor of a section ‘Methodology Matters’. He is also an editor of Sage’s Mastering Business Research Methods series.

Seonaidh McDonald is a Professor in Aberdeen Business School at Robert Gordon University, UK. Her research centres on sustainable consumption. She has investigated a wide range of sustainable practices including recycling, green energy tariffs, travel, domestic appliances, food and household goods. Her work is largely underpinned by qualitative research methods. She is interested in how research designs and researcher assumptions effect the questions researchers can ask.

Jean Helms Mills is Professor of Management in the Sobey School of Business, Nova Scotia, Canada. She is also a Visiting Senior Research Fellow at Hanken University, in Helsinki, Finland and was (2012–14) an International Professor (2.0) at Jyväskylä University’s School of

Business and Economics, Finland. Her research interests are in the areas of gender, historiography, Critical Management Studies and Critical Sensemaking. Jean's books include *Making Sense of Organizational Change* (Routledge, 2003), *Workplace Learning: A Critical Perspective* (Garamond Press, 2003), *Organizational Behaviour in Global Context* (University of Toronto Press, 2007), *Understanding Organizational Change* (Routledge, 2009) and *The Routledge Companion to Critical Management Studies* (Routledge, 2015). Jean is currently Associate Editor of *Gender, Work and Organization* (GWO), serves on the editorial board of scholarly journals, and is co-editor of *Qualitative Research in Organizations and Management*.

Albert J. Mills, PhD, is Professor of Management and Director of the PhD (Management) in the Sobey School of Business at Saint Mary's University in Nova Scotia, Canada. Over the years he has received several grants from the Social Sciences and Humanities Research Council of Canada (SSHRC) to undertake archival research on the gendered histories of airline companies, including British Airways, Air Canada, Pan American Airways and, more recently, QANTAS. This work has generated numerous books, book chapters and articles. His work has been published in *Business History*, *Equality, Diversity and Inclusion*, *Gender, Work & Organization*, *Group & Organization Management*, *Human Relations*, *Journal of Management Education*, *Journal of Management History*, *Management & Organizational History*, *Organization*, *Organization Studies* and many other scholarly journals. His books include *Gendering Organizational Analysis* (SAGE, 1992). He is the co-editor of *Qualitative Research in Organizations and Management: An International Journal*. *Absent Aviators: Gender Issues in Aviation* (Ashgate, 2014), and the *Oxford Handbook of Diversity in Organizations* (Oxford University Press, 2016).

Rachel Morgan is currently undertaking a scholarship funded PhD in Management Studies at Brunel University, UK. Her research interests include dirty work, identity and recognition. Rachel also has a keen interest in qualitative research methods, including ethnography, photographic representation and elicitation, and in-depth interview techniques.

Ursula F. Ott is Professor of International Business at Kingston University, UK. She earned her PhD in Economics and Social Sciences from the University of Vienna, Austria. She is an award-winning expert in international negotiations and cooperation. Before joining Kingston University in January 2016, she was at Loughborough University, the London School of Economics and the University of Vienna. She is now the Director of the Centre for Experimental Research in International Business (CERIB) and the Head of the Strategy Research Group. She has published research monographs and articles in leading journals. Her publications appear in top-tier journals such as *Journal of Management Studies*, *Journal of Business Research*, *Organization Studies*, *Sociology*, *International Business Review*, among others.

Emmanuella Plakoyiannaki is Professor of International Business at Leeds University Business School, UK. She holds a PhD in Marketing from the University of Strathclyde, Glasgow, UK. Her research interests lie at the interface of philosophy of science, qualitative research and international marketing/business. She has published in various academic journals including the *Academy of Management Review*, *Journal of International Business Studies*, *Journal of World Business* and *Journal of Management Studies*, among others.

Katrina Pritchard is an Associate Professor in the School of Management at Swansea University, UK. Her research interests include the construction of identity and professional knowledge, digital media and devices at work, and diversity, with a specific focus on age and gender. Katrina is interested in a broad range of methodological issues in organizational studies including digital and visual approaches.

Laura S. Radcliffe is Lecturer in Organisational Behaviour and Director of the Masters of Research Programme at The University of Liverpool Management School, UK. Her research focuses on how people manage their roles and identities, with a particular interest in the relationship between those enacted in the work and home domains, associated gender dynamics and implications for inclusivity. To explore these issues, she draws on methodological approaches that have the ability to capture rich insights into lived, daily experiences. Her research has been published in journals such as *Human Relations* and the *Journal of Occupational and Organisational Psychology*.

Kathleen Riach is Associate Professor in Management at Monash Business School, Monash University, Australia. Her research focuses on the role of the body in organizational life, with a particular concern with ageing and the biological-social nexus as a site of organizational disruption. Previous research has appeared in journals including *Human Relations*, *Organization Studies*, *Sociology* and *Urban Studies*, as well as a number of edited collections. She is currently involved in a collaborative multidisciplinary project exploring menopause in the workplace and a longitudinal study of growing up and older in the financial services.

Ann Rippin is Reader in Management at the University of Bristol, UK, in the Department of Management. Her research is centred on the role of cloth in society. This covers everything from how we organise to produce cloth, to why we keep certain items of clothing, to how we form our identities through what we wear, to the importance of what she calls Hestia crafts in women's lives. Hestia crafts are to do with creating a home, after the Greek goddess of home and hearth, Hestia. Ann creates quilted and embroidered textiles about the companies she researches related to themes such as organisational excess or foundation narratives.

Kendra Dyanne Rivera, PhD is an applied organizational communication scholar who is interested in identities, emotion and wellness in organizational settings. Rivera has engaged in extensive research with everything from the US Border Patrol to community health clinics. Her research focuses on solving critical problems faced by marginalized populations and understanding how communication can both shape and reflect our emotional health and wellness. She received her PhD in Human Communication from Arizona State University, USA, and is currently an Associate Professor in the Department of Communication at California State University, San Marcos, USA.

Jörgen Sandberg is Professor in the School of Business at the University of Queensland, Australia and Distinguished Research Environment Professor at Warwick Business School, UK. His research interests include competence and learning in organizations, sensemaking, practice-based research, theory development, qualitative research methods and philosophy of science. His work has appeared in several journals, including *Academy of Management Review*, *Academy of Management Journal*, *Journal of Management Studies*, *Journal of Organization Behavior*, *Harvard Business Review* and *Organization Studies*. He has published several books,

including *Managing understanding in organizations* (with Targama, Sage, 2007), *Constructing research questions: doing interesting research* (with Alvesson, Sage, 2013), and *Skillful performance: Enacting capabilities, knowledge, competence and expertise in organizations* (with Rouleau, Langley and Tsoukas, Oxford University Press, 2017). He serves on the Editorial Boards of *Academy of Management Review*, *Journal of Organizational Behavior* and *Organization Studies*.

Harriet Shortt is Associate Professor in Organization Studies at Bristol Business School at the University of the West of England, Bristol, UK. Her research focuses on organizational space, artefacts and identity and she has an expertise in qualitative research methods including innovative visual methodologies, specifically, participant-led photography. Harriet has led a number of research projects in both public and private sector organizations that examine spatial change and the impact of work space on employees' everyday working practices. Her research has been published in journals including *Human Relations*, *Organizational Research Methods*, *Management Learning*, *Visual Studies* and the *International Journal of Work, Organisation and Emotion*. She is a member of 'inVisio' (The International Network for Visual Studies in Organization) and part of the ESRC RDI funded team that developed 'inVisio inspire', an online resource for visual researchers in business and management.

Noemi Sinkovics is Lecturer in International Business and Management at the University of Manchester, Alliance Manchester Business School, UK. Her research interests are theoretical and practical issues surrounding entrepreneurship (including international and social entrepreneurship), human rights, social value creation, global value chains and global production networks, business model design, innovation and capability development, conscious business practices, mindfulness and well-being in organizations, and research methods. She received her PhD from the University of Manchester and holds a Master's degree from the Vienna University of Economics and Business (WU-Wien), Austria.

Rudolf R. Sinkovics is Professor of International Business at the University of Manchester, Alliance Manchester Business School (AMBS), UK. He is also Visiting Professor at Lappeenranta University of Technology, Finland and currently Fox Visiting Scholar at Temple University. He received his PhD from Vienna University of Economics and Business (WU-Wien), Austria. His research covers inter-organizational governance issues, the role of ICT and research methods in international business. He currently works on an ESRC funded project on rising powers, and a Lord Alliance funded project on responsible business. Outputs have been published in journals such as *Journal of International Business Studies*, *Management International Review*, *Journal of World Business*, *International Business Review*, *Journal of International Marketing*, *International Marketing Review* and *Journal of Product Innovation Management*. He is Associate Editor of *Critical Perspectives on International Business* and also serves on the editorial boards of international business journals.

Martyna Śliwa is Professor of Management and Organisation Studies and Dean of Postgraduate Research and Education at the University of Essex, UK. Her research addresses a range of topics relevant to the employees, managers and other stakeholders of contemporary organisations, especially those operating in the international business environment. Martyna has a specific interest in bringing to the study of management and organisations

insights from other disciplines, such as history, linguistics, philosophy and sociology. Martyna's current research projects include language(s) and power in multinational corporations, transnational professional mobility, aesthetics of leadership, and organisational consequences of Brexit.

Natasha Slutskaya is a Senior Lecturer at the University of Sussex's School of Business, Management & Economics, UK. Her research interests span stigma management (especially 'dirty work' and managerial tactics for countering occupational taint) and equality, diversity and inclusion (especially social class differences and how 'class work' perpetuates inequalities in organizations).

Georgia Stavradi is Teaching Fellow at Surrey Business School, UK. She holds a PhD in Consumer Behaviour from the Aristotle University of Thessaloniki, Greece. Her research interests lie in the areas of visual research methods in consumer behaviour, consumers' identity projects and experiential consumption. Her research has appeared in books and academic journals as well as in international conferences.

Rowena Viney is a Research Associate at University College London Medical School, UK, where she is currently conducting research on postgraduate medical education and assessment. She obtained her PhD in Social Sciences at Loughborough University, UK. Her background is in sociolinguistics, with a particular interest in conversation analysis, and she has previously used this analytic method to study identity, gaze and touch in everyday interactions, and entrepreneurs' means of doing persuasion and meaning-making in business pitches.

Jenna Ward is Associate Professor of Work, Organisation and Emotion at the University of Leicester. Jenna's research focuses on exploring emotionality within organizations, organizing and managing. Prioritizing marginalized voices, Jenna employs and develops innovative arts-based research methods that complement her ethnographically informed research designs to observe and probe beyond the surface of both organizations and individual experiences of work, organizing and organizations. Areas of interest include emotional labour, dirty work, visual and arts-based methods, creative industries, death work and the management and organization of volunteers. Her research has been published in journals including *Human Relations*, *Social Science and Medicine* and *Environment & Planning A* and in her research monograph *The Dark Side of Emotional Labour*. Jenna is co-director of the Art of Management & Organization www.artofmanagement.org

Samantha Warren has been researching with, and writing about visual and sensory methodologies since 2001. Her passion is inspiring doctoral and early career researchers to be methodologically adventurous without sacrificing conceptual rigour. She is a founder member of the ESRC funded International Network of Visual Studies in Organizations (moodle.in-visio.org) and co-editor of the *Routledge Companion to Visual Organization*. She has undertaken projects exploring visual and aesthetic cultures of fun at work, accountants' professional identities, objects and material selves, and the role of smell in office workplaces. She is Professor in Management, Employment and Organization at Cardiff University, UK, having previously held a Chair in Management at University of Essex, UK and working at the universities of Surrey and Portsmouth, UK earlier in her career.

Rebecca Whiting is a Lecturer in the Department of Organizational Psychology at Birkbeck, University of London, UK. Her research interests include aspects of the contemporary workplace such as the discursive construction of work identities (for example, the older worker), concepts (such as age, gender and work-life boundaries), and digital technologies at work. She is also interested in the particular challenges of qualitative digital research and visual methodologies.

Introduction: Qualitative Research in Business and Management

Catherine Cassell, Ann L. Cunliffe and Gina Grandy

Welcome to *The Sage Handbook of Qualitative Business and Management Research Methods*. The *Handbook* aims to provide a state-of-the art overview of qualitative research methods in the business and management field. Our intention is to provide a comprehensive review of the history and traditions that underpin qualitative research within management and organisations; outline a number of contemporary methods and their relevance; and explore some of the challenges that may lie ahead for qualitative researchers. In doing so, we draw from a wide range of research traditions. While any handbook seeks to be comprehensive, it will inevitably offer a view of the field informed by a particular lens. In this case, that lens is the view of the three editors, all experienced qualitative scholars, and also the viewpoint of our contributors, who are all leading-edge, international qualitative researchers. A number of chapters are targeted at those who are relatively new to the field, while others are aimed at experienced

qualitative researchers. Some chapters cover methods that are well established, whereas others highlight new and unfolding methods or areas of investigation. We encourage you to dip in and out of the *Handbook*, following up on any traditions, methods or issues that particularly capture your interest.

Our philosophy in putting together the *Handbook* is that we have sought to recognise and celebrate the diversity of qualitative business and management research methods. The three editors all come from different traditions and we may make quite different methodological and philosophical choices in relation to our own qualitative research practices. However, we are committed to encouraging rather than problematising such diversity and believe it is important, especially for new researchers, to be aware of the range of philosophical positions, epistemologies, methodologies and methods available. As John Van Maanen noted back in 1995, 'From examples of novel practices can come individual and collective experiments and

perhaps as a result we can loosen up some of the writer's cramps that seem so prevalent in our field' (1995, p. 139). Loosening researcher's cramps by supporting diversity maintains the richness of our field and legitimates different ways of theorising, writing and enacting researcher roles. The authors in the *Handbook* are therefore researching management and/or organisations from within different disciplines (including strategy, organisational psychology, organisational communications, sociology, international business and education) using a wide range of traditions and methods. Inevitably, while acknowledging that the *Handbook* is wide in coverage, we also recognise that we will never be able to fully capture a developing and ever-changing domain.

This introductory chapter positions what follows in the *Handbook* by outlining some of the characteristics of the current state of qualitative business and management research methods and highlighting some of the debates and challenges in the field. We also introduce the different sections of the *Handbook* to offer the reader an overview of what follows. The chapters have been arranged across two thematic volumes; the first focussing on 'History and Traditions', and the second covering 'Methods and Challenges'. For ease of navigation, in this chapter we have included notes in parentheses wherever specific chapters or sections are mentioned, to indicate which companion volume ('History' or 'Methods') the chapter appears in. We invite you to join with us on this journey through what is a thriving and exciting methodological domain.

CHARACTERISING QUALITATIVE RESEARCH IN THE BUSINESS AND MANAGEMENT FIELD

Given the diversity outlined above, how can we characterise qualitative business, management and organisational research? The

first comment we would make is that there is increasing interest in the uses and opportunities offered by research informed by qualitative methods. Qualitative research can now be found in many different areas within the 'discipline' of business, management and organisational research, including those traditionally seen as founded upon objectivity, 'facts', numbers and quantification. For example, we now see qualitative research in accounting (Boll, 2014; Lee & Humphrey, 2006); entrepreneurship (Díaz García & Welter, 2011); finance (Kaczynski et al., 2014; Salmona et al., 2015); human resource management (Townsend et al., 2016); international business (Doz, 2011; Moore, 2012); information systems (Hoeftnagel et al., 2014); marketing (Bellenger et al., 2011; Rokka & Canniford, 2016); organisational behaviour (Cassell & Symon, 2004; O'Leary & Sandberg, 2016; Symon & Cassell, 2012); organisational communication (Brummanns, 2014; Tracy et al., 2014); organisational psychology (Crozier & Cassell, 2016; Neergaard & Ulhøi, 2008; Symon & Cassell, 2006) and strategy (Anteby et al., 2014; Bettis et al., 2014). Hence qualitative research now takes place and is also published in most, if not all, of the sub-disciplines of business and management. There has also been a number of new journals focussing upon qualitative methods and issues, for example the *Journal of Organizational Ethnography* established in 2012; *Qualitative Research in Financial Markets* established in 2009; and *Qualitative Research in Organizations and Management; an International Journal* established in 2006. Furthermore, there have been a number of special issues of management journals focussing upon work informed by qualitative research methods. Sometimes these special issues bring together a range of different qualitative methods to support the development of a particular research topic, for example exploring and understanding dirty work (Grandy et al., 2014) or international marketing (Andriopoulos & Slater, 2013). Other special issues focus upon the

uses of a particular type of method across a range of topics, for example case studies (Lee et al., 2007); shadowing (McDonald & Simpson, 2014); stories (Donnelly et al., 2013) or video (Jarzabkowski et al., 2014). Additionally, others are connected to qualitative research conferences, for example, QRM Conference 2012 'Embodiment, Imagination and Meaning', in *Qualitative Research in Organizations and Management*.

Within sub-areas of the discipline it is evident that qualitative research has developed at different rates and with different foci. However, many of the common debates around methods such as philosophical approaches, quality criteria, different tools of analysis and the role of software in data analysis have been critiqued within these different areas. For example, there have been debates about quality criteria within qualitative management research more generally (see Amis & Silk, 2008; Bluhm et al., 2011; Symon et al., 2016), as well as how it relates to specific research designs and subject areas (see Gibbert et al., 2008 on case study research; Healy & Perry 2000 on market research; and Welch et al., 2013 on international business).

There has also been differential progress towards the use and acceptance of qualitative research in various geographical communities of qualitative researchers. The use of qualitative management research in North America, Europe and the rest of the world has developed at different rates and has been informed by different traditions (Lee & Humphrey, 2006). Üsdiken (2014) notes that there is less qualitative research published in US journals than their European alternatives. Bengtsson et al. (1997) suggest that the transatlantic gap can also be explained by different methodological approaches in that European research is more frequently idiographic and processual, whereas, in contrast, US research is dominated by nomothetic approaches with their emphasis upon quantitative analysis across large samples to test hypotheses. This is still relevant today, and perhaps partially explained by cultural differences in

postgraduate research training. In the UK, Europe and Australasia it is not unusual to see such training focus around learning the craft of research, with courses on research philosophy, and qualitative and quantitative research methods to advanced levels. In the US, postgraduate training is usually discipline-based (e.g. accounting, organisational behaviour, marketing), focussing on extending disciplinary knowledge. Research philosophy is rarely covered and the positivist assumptions underpinning much of the coursework remain unchallenged. This has had not just a methodological impact but also a philosophical one. For example, critical, practice-based and discursive approaches to research are more common to European, Australasian, and Latin American business and management researchers – and US-based organisational communications researchers – because of their philosophical training. Other parts of the world also have different epistemological traditions, some of which may not be as open to qualitative research. For example, Chen (2016) discusses the challenges of teaching qualitative research in China, where, he argues, there is a lack of support for qualitative research because it is seen as subjective, biased and unrepresentative. In addressing such concerns, Chen (2016, p. 72) outlines the importance of an experiential learning strategy that draws upon a pedagogy familiar within Chinese management learning of the 'unity of knowing and doing'.

We recognise there is a potential danger in characterising traditions as US or European. We do acknowledge that there is diversity within continents and regional locations and that some caution is required. For example, Knoblauch et al. (2002, p. 2), in discussing the variety of qualitative research in Europe, highlight how scientific enterprises such as qualitative research are imprinted by cultures – not only by 'epistemic cultures', but also by their surrounding institutions, traditions and political, as well as economic contexts. They suggest that in the European context, the impact of specific national traditions of

thinking upon qualitative research can particularly be seen in countries that have passed through a Communist era, such as Poland and Slovenia.

Having noted the diversity in histories and development, we would also characterise qualitative research in this field as one where there is currently considerable methodological innovation. Indeed, as Buchanan & Bryman (2007) highlight, recent methodological innovation within the field of management and organisational research more generally has been located around qualitative and interpretive methods. Three trends are particularly worthy of mention here: first, the opportunities offered by increasingly sophisticated communication technologies; second, advances in the use of visual methods; and third, innovations in how researchers 'do' and write up qualitative research. Taking new technologies first, the development of the internet and new forms of social media have opened up a variety of online contexts available for the qualitative researcher to study (Zicker & Carter, 2010). The recent emergence of virtual ethnography, where participant observation can occur in a variety of locations such as online chat rooms, offers new opportunities for accessing the culture of online communities. Other terms used in this area include netnography and webnography. The former is a term coined by Kozinets (2010) and the latter by Purli (2007), both intended to refer to particular types of online ethnography. Other qualitative researchers have looked at the opportunities for using standard qualitative methods online, for example interviewing (Morgan & Symon, 2004; Salmons, 2015) and online focus groups (Stewart & Williams, 2005). Within the *Handbook*, we deal with some of these new methods of collecting research data in chapters such as *netnography* by Kozinets and *analysing web images* by Pritchard and Whiting. We also consider some of the distinctive challenges that such methods pose, for example in Whiting and Pritchard's chapter on *digital ethics*.

Turning now to developments in visual methods, although previously under-explored in organisation and management research (Davison et al., 2012; Meyer et al., 2013), Bell & Davison (2013) suggest that this is changing. Whereas in the past the emphasis upon the linguistic turn had led to visuality typically being neglected, this is now being re-addressed in organisation and management studies. An indication of this visual turn is the increased resources available for qualitative management and organisational researchers interested in such methods (e.g. Invisio <http://in-visio.org/>) and the special issues on visual methods that have been produced by different journals (e.g. *Accounting, Auditing and Accountability Journal*, 2009; *Qualitative Research in Organizations and Management*, 2012; *Organizational Research Methods*, 2016). Hence it is not surprising that this *Handbook* contains a number of chapters and, indeed, a special section on visual methods. As Davison et al. (2012) suggest, visual methods particularly lean towards qualitative analysis, and within this collection we have chapters on *photographs* (Warren); *drawing* (Ward and Shortt); and *collages* (Plakoyiannaki and Stavradi). The use of video is also highlighted in the chapters on *multimodality* (Viney, Clarke and Cornelissen); and *ethnographic documentaries* (Morgan, Game & Slutskaya). A key issue in all these developments is the possibility of both established and emerging approaches and methods to offer new research insights (Gill, 2014; Jarrett & Liu, 2016; Ray & Smith, 2012).

The turn to visual methods has clearly also opened up novel ways to 'do' and present or write up qualitative research. We have also seen attention directed to other innovative ways to do and present qualitative research. Qualitative researchers have brought to light the significance of smell to workplace and research experiences (Baxter & Ritchie, 2013; Riach & Warren, 2015), the body as a critical aspect informing the researcher's experiences (Mavin & Grandy, 2016a,

2016b), as well as that which informs the everyday experiences of leadership (Ladkin, 2014; Sinclair, 2005, 2011, 2014), and the role of emotion in research (Rivera & Tracy, 2014). Rivera & Tracy's (2014) qualitative research on the experiences of border patrol officers is a particularly poignant piece which draws from vignettes, participant observation, shadowing and interviews to sharply bring to light how emotion does inform our experiences of work and research. Their piece vividly surfaces what it *feels* like to do such 'dirty work', something we suggest can only emerge through an innovative approach to doing and writing-up qualitative research. Overall, rare and rich insights are afforded through reflexive, embodied, emotive and aesthetically driven qualitative research.

In a related vein, yet at the same time in ways moving us away from methods more generally, an increased interest in qualitative management research draws attention to the role of the individual researcher. Within the methodological literature this has been evidenced by the increased focus upon researcher positioning and reflexive research practice (Cunliffe & Karunanayake, 2013; Hibbert et al., 2014). There is a burgeoning literature within organisation studies about the role and contribution of researcher reflexivity (e.g. Cunliffe, 2003; Johnson & Duberley, 2003; Weick, 2002). Given the closeness of the researcher to the research participants within qualitative research, this is particularly pertinent for qualitative researchers. For Alvesson and Sköldberg (2009, p. 9), reflexivity 'means that serious attention is paid to the way different kinds of linguistic, social, political and theoretical elements are woven together in the process of knowledge development, during which empirical material is constructed, interpreted and written'. The benefits of researcher reflexivity are seen to be numerous, ranging from enabling us to think about our own thinking (Haynes, 2012) and our own bodies (Mavin & Grandy, 2016a, 2016b; Sinclair, 2014); questioning the taken-for-granted in our own and others beliefs (Ripamonti et al.,

2016); emphasising the inclusion of the researcher (Hardy et al., 2001); and creating 'more imaginative, more nuanced and richer interpretations' (Cunliffe, 2011, p. 409) from our data. Reflexive thinking also enables the opening up of new possibilities with different types of research questions (Sandberg & Alvesson, 2010), new ways of theoretical thinking (Shotter, 2008) and new ways of engaging with participants and the outcomes of such engagements (Corlett, 2013; Holton & Grandy, 2016). Moreover, within qualitative organisational research, reflexivity is moving towards being seen as standard practice. Indeed, authors have suggested it should be a regular part of research methods training (e.g. Symon & Cassell, 2004). Considerations of reflexivity within the literature have expanded beyond the purely methodological; as Weick (2002, p. 893) suggests, theory construction in the current millennium can be seen as an exercise in 'disciplined reflexivity'.

In summary, we would portray the field of qualitative business and management research methods as characterised by diversity in epistemologies and methods, with novel methodologies and approaches being developed all the time. We have suggested that there is now a more nuanced approach to the role of the researcher and to reflexivity, and more generally an exciting future ahead. Within the *Handbook* we have captured some of that diversity and the chapters offer thought-provoking explorations to those interested in using these methods.

KEY CHALLENGES

Any academic domain faces challenges and critique, and here we outline some of the challenges currently experienced by qualitative management researchers. The increased prevalence of qualitative research has resulted in the emergence of a number of debates including the status and quality of qualitative business and management research. Recent

commentaries have focussed upon the extent to which qualitative research has made it into the mainstream (e.g. Bluhm et al., 2011; Üsdiken, 2014) and the increased acceptance (or not) of qualitative research within top journals in the field. Some argue that considerable progress has been made. However, this advancement is not universally recognised by qualitative researchers. While Üsdiken's (2014) review of 40 years of management publications argues that there is an increase in the amount of qualitative research published in those journals, we suggest that an increase of 14.3 per cent over a 30 year period is hardly a radical change.

These debates inevitably link in to discussions of quality in qualitative research and how quality is defined (e.g. Symon et al., 2016; Tracy, 2010; Welch et al., 2013). This has long been a problem within the evaluation of qualitative management research in that criteria associated with a positivist paradigm informed by quantitative approaches have been inappropriately applied to qualitative research (Easterby-Smith et al., 2008; Johnson et al., 2006). This has led to various authors creating alternative sets of criteria for qualitative research and some arguing that without the expansion of such evaluation criteria, some of the work produced by qualitative management researchers may be undermined (Amis & Silk, 2008). Organisation studies scholars argue that the criteria for evaluating qualitative management research need to be contingent upon the philosophical tradition within which such research is conducted (Cunliffe, 2011; Golden-Biddle & Locke, 1993; Johnson et al. 2006), the implication being that the different traditions outlined in the first section of the *Handbook* would draw upon different evaluation criteria. To supplement this, Tracy (2010) identifies eight flexible 'big tent' criteria – a worthy topic, rich rigour, sincerity, credibility, resonance, significant contribution, ethics and meaningful coherence – markers of goodness for qualitative research. She argues that while criteria are contextual

and not value free, they provide important heuristics that reflect the core values of a particular craft. The use of criteria appropriate to the philosophical and methodological positioning of the research would lead to a more level playing field for qualitative business and management research.

Such criteriological debates link into concerns about the move towards increasing standardisation within qualitative management research (Cassell, 2016). In outlining sources of standardisation, Cassell cites the recommendations made by different journal editors about what qualitative researchers need to do in order to get their papers published in the top international outlets. Such prescriptive types of editorials and articles are critiqued extensively by Symon et al. (2016, p. 1), who argue that they serve to produce '(inappropriate) homogeneous evaluation criteria' with the consequence of 'marginalising alternative perspectives and disciplining individual qualitative researchers into particular normative practices'. A concern with a move to formulaic treatment of research questions has been critiqued more generally elsewhere within our field (e.g. Alvesson & Gabriel, 2013), but Cornelissen (2016) notes that there is also a move towards what he describes as factor analytic approaches to qualitative research, where data analysis strategies mimic the principles of quantitative analysis. Our concern is that this potentially serves to limit creativity within qualitative research – a state, as Van Mannen (1995, p. 139) provocatively observed, of 'technocratic unimaginativeness' where 'our generalizations often display a mind-numbing banality and an inexplicable readiness to reduce the field to a set of unexamined, turgid, hypothetical thrusts designed to render organizations systematic and organization theory safe for science'. As noted earlier, we see diversity as something to celebrate, rather than to be constrained.

We would also be remiss not to acknowledge the challenges that qualitative researchers can confront in trying to balance the need to stay within what can be restrictive page

limits with the inclusion of enough ‘raw’ data to present a persuasive account for their reviewers. Pratt (2009) suggests that qualitative researchers include both ‘power’ and ‘proof’ quotes as a means to persuade the reviewers of the rigour of the findings. This, however, can often be challenging within page limits historically designed for research that employs quantitative methods.

Institutional requirements can also create a challenge. Pressure to publish a defined number of articles in top (often mainstream) journals within a specified time frame has an impact on a researcher’s ability to engage in more longitudinal and ethnographic studies – good qualitative research takes time! Negotiating institutional review boards and ethics committees when doing snowball sampling (confidentiality issues), ethnography (does everyone that the researcher encounters need to sign a consent form?), and getting consent when doing participatory action research (see Burns et al., 2014) requires persistence, but is often rewarded by rich, in-depth insights into organisational life.

Such debates are characteristic of lively methodological engagement. We would argue that the production of a *Handbook* to highlight, critique and review the contribution of qualitative research to our field is somewhat timely. Clearly, considerable progress has been made in this area, but there is also room for so much more. We would hope that the *Handbook*, through its coverage of these different debates within a methodological context, enables us to progress these debates in a constructive way and draw attention to the many opportunities that qualitative research methods offer to our diverse research field.

INTRODUCING THE *HANDBOOK*

Putting together the content of the *Handbook* felt like an important responsibility in that it could be interpreted as the editorial team defining the content of the field, though, as

noted earlier, as shaped by our own perspective and position within it. Feedback from the reviewers of the collection and our international advisory board helped to develop the content. In the end, we found out that the challenges in putting the *Handbook* together very much mirrored the challenges facing the discipline and practice of qualitative management research. We wanted the content to reflect the diversity of the methodological field, including epistemologies, methods and research designs. Hence the reader will find chapters from a wide array of philosophical stances to qualitative management research ranging from *positivist qualitative research* (Su), *interpretative science* (Gephart) and *constructionism* (Grandy), to analytic techniques informed by post-structuralism such as *discourse* (Fairhurst and Cooren) and *sociomateriality* (Riach), to those informed by post-positivism, for example *fuzzy set qualitative content analysis* (Sinkovics et al.). Perhaps unsurprisingly, the challenges outlined in the previous sections are all addressed within different contributions of the *Handbook*, so we have chapters on publishing qualitative research aimed at beginners to the field, *writing for different audiences* (Myers), together with the more challenging questions and debates about *conducting and publishing rigorous qualitative research* (Rheinhardt et al.).

The book starts by addressing some of the wide variety of traditions within which qualitative research is conducted. The aim here is to provide an overview of those different traditions and we cover long-established philosophical approaches such as *positivism* (Su); *interpretivism* (Gephart); *pragmatism* (Simpson); *hermeneutics* (Tomkins & Eatough); *critical realism* (Vincent & Mahoney) and *ethnomethodology* (Whittle); alongside more recent approaches such as *critical management studies* (Pritchard et al.); *poststructuralism* (Benozzo); *mixed methods* (Molina-Azurin); *feminism* (Harding); *constructionism* (Grandy); *postcolonialism* (Weston & Imas) and *indigenous methodologies* (Schneider & Kayseas). Each of those

chapters provides an overview of the philosophical approach, together with summaries of key debates and the implications for qualitative business and management research.

The next section of the book focusses upon research designs within qualitative business and management research. Again, our aim here was to represent the key approaches used within the field with a particular focus on what perhaps can be seen as traditional research design approaches within qualitative research. We start with chapters on *field research* (Michel) and *workplace ethnographies* (Ciuk et al.), which help characterise some of the first forays into qualitative research by management researchers. Holton's chapter on *grounded theorizing* provides needed clarity to the debate on grounded theory as a design in qualitative research. She distinguishes between grounded theory as a general methodology in its own right and the inductive approach typically employed by qualitative researchers often referred to as grounded theory. She advocates for the use of grounded theorising, not grounded theory, to depict that which is employed by qualitative researchers. There are also chapters on *action research* (Scaratti et al.) and *case studies* (Piekkari & Welch), both of which have long traditions in qualitative management research. Chapters on *process* (Fachin & Langley) and *practice designs* (Abdallah et al.) conclude this section.

As noted earlier, there is an increased emphasis within qualitative business and management research about the role of the researcher in the research process. Within lies a recognition that we are part of the organisational world that we study and therefore this will impact the methods, process and outcomes of our research in a variety of different ways. Section Three includes a number of chapters that focus explicitly on the researcher's role. Within this section considerable attention is paid to reflexivity and the implications in practice of taking a reflexive stance. The key issues and challenges are outlined in reflexivity and positionality (Corlett & Mavin) and

the problematic issue of how the researcher achieves some critical distance, if indeed this is possible, is critiqued (Hayward & Cassell). Fahad et al. provide an informative insider account of the reflexive challenges faced by men interviewing women, while Sinclair & Ladkin provide an interesting account of the possibilities that come for the researcher when they acknowledge and embrace writing from the body as a qualitative researcher. Rodriguez's chapter on *intersectionality and qualitative research* brings to light how gender and other 'markers' of difference are re-created and sustained within systems of power and inequality and how qualitative research opportunities and challenges arise through this methodological framework. Both Sinclair & Ladkin and Rodriguez offer insights into the researched and the researcher. Our editorial aim in this section is to problematise the role of the qualitative researcher and explore a range of different dimensions of the lived experience of qualitative research.

Volume one concludes with a section on some of the challenges associated with conducting qualitative research. Taylor & Land discuss the key issue of *access and departure*, something that faces every qualitative researcher and is increasingly discussed within the qualitative literature. Publication is an often-cited challenge for the qualitative management researcher and here we have two different insightful approaches to the topic. Whereas Myers offers *writing for different audiences* as a resource for the novice qualitative researcher, Reinhardt et al. offer suggestions for how we understand conducting and *publishing rigorous qualitative research*, recognising that rigour may be defined in a variety of ways by different qualitative researchers. The increasing globalisation of management research offers both opportunities and challenges and these are addressed by Gobo in his chapter about globalisation and *qualitative research across boundaries*. The distinctive challenges of ethics in international research are also explored by Bell & Kothiyal. The increased impact of

globalisation and the use of novel communication technologies offers a series of new ethical challenges, as critiqued by Whiting & Pritchard in their chapter on *digital ethics*. The chapter in this section by Saunders & Townsend offers discussion on an issue of key importance for qualitative researchers: *choosing research participants*.

Volume two of the *Handbook* turns to consider methods more specifically. Given the extensive variety in methods as noted earlier, the volume outlines both the traditional approaches with a long history, such as interviews and those that are relatively new. Where well-used approaches are discussed, the intention is to provide the reader a new angle or perspective on those methods, for example Lee & Aslam discuss the nature of the *wholesome interview* and Learmonth & Griffin offer us a new way of understanding images of women at work through *analysing fiction* in Disney films. Section 5, on contemporary methods, includes methods of data collection and analysis, although in some chapters the method encapsulates both, as can be seen in the chapters on *autoethnography* (Haynes) and *stories and narrative* (Gabriel). Novel methods often underemployed by qualitative researchers in business and management are also covered, for example *diary studies* (Radcliffe), *shadowing* (McDonald) and *archival analysis* (Mills and Helms Mills). Contemporary theoretical approaches such as *sociomateriality* (Davies & Riach) and *dramaturgical methods* (Birch) are showcased alongside methods that have had a long history within the field, for example *group methods* (Coule). Other chapters in this section focus upon alternative ways of analysing language, for example *rhetoric* (Hamilton), *discourse* (Fairhurst & Cooren) and *stories and narrative* (Gabriel). The section concludes with a new look at one of the longstanding ways of analysing qualitative data, *thematic analysis* (King & Brooks).

As noted earlier, there has been an increased usage within business, organisation and management fields of visual methods. In recognising these developments, we decided to devote

a full section within the *Handbook* to these approaches, though we recognise that the visual is also considered in other places within the *Handbook*. The chapters in Section 6 illustrate the potential of different visual methods such as *photographs* (Warren), *drawing* (Ward & Shortt) and *collages* (Plakoyiannaki & Stavrakaki). The possibilities for videos in qualitative research are also on the rise. In a particularly unique approach, Morgan et al. discuss how research participants can create their own videos through *ethnographic documentaries*. Analysis of visual images is more directly addressed in Viney et al.'s chapter on *semiotics and symbols* and Pritchard and Whiting's chapter on *analysing web images*. Our prediction is that as time progresses there will be even more methodological developments within the area of visual methods of qualitative research.

The final section of the *Handbook* covers methodological developments. This section focusses upon contemporary methods that have had little airing in the qualitative business and management field. For example, Rippin & Hyde produce an intriguing account of the use of *sewing* as a critical research method technique, whereas Beech & Broad introduce us to the concept of *ethnomusicality* and what that means for research methods. Adopting an innovative approach in presenting methodological developments, Rivera threads insights from Yoda (*Star Wars*) throughout her thorough account of the important topic of *emotion and qualitative research*, while Durepos & Mills outline *ANTI-history* as an alternative approach to historiography. Using the internet for research into ethnographic communities is the focus of Kozinets' chapter on *netnography*. Alvesson & Sandberg critique the metaphors traditionally used for research design and through the use of different metaphors offer some alternative conceptualisations of the research process. This section also highlights some of the developments at the more quantitative end of qualitative data analysis such as *pattern-matching* (Sinkovics, N.) and *fuzzy set qualitative comparative analysis* (Ott et al.).

CONCLUSIONS

In putting together this *Handbook* we have sought to capture the essence of what is an ever-evolving, exciting and diverse field for business and management research. The chapters weave in and out of philosophical, conceptual and empirical considerations relevant for those already engaged in qualitative research, but also relevant for those new to qualitative research and those simply curious about the possibilities afforded through qualitative research in business and management. The chapters also incorporate extensive reference lists, which can serve as a resource for those who want to delve deeper into a particular topic or study. Not only does the content reflect considerable breadth and depth in topics as it relates to qualitative research, the contributors provide perspectives from across the world, spanning such countries as Italy, Canada, the United States, the UK, India, Brazil, Greece and New Zealand, amongst others.

Putting together this *Handbook* has been a valuable learning experience for us as well. We continue to be intrigued by the different and complementary approaches that emerge across the chapters and sections of the *Handbook* and excited by the prospects they offer in terms of our own development as researchers and the insights they offer for organisation scholars and practitioners. We sincerely hope that this collection serves as a valuable resource and stimulates new paths for qualitative researchers in business and management to explore. We encourage you to read on to see what might inspire you for your next study.

Autoethnography

Kathryn Haynes

INTRODUCTION

Autoethnography is a methodological approach to research and a genre of writing where the researcher is the focus of reflexive inquiry. However, the researcher's self is inevitably experienced and positioned within a social context, hence the autoethnography also addresses to varying degrees the wider social, cultural and political environs with which the researcher interacts. Autoethnography therefore enables the researcher themselves to form a subject of lived inquiry within a particular social context.

This chapter first addresses the definition and conceptualisation of autoethnography. Second, it evaluates different forms of autoethnography, illustrating with examples to demonstrate their approach. Third, the chapter considers the interaction of these multiple forms of autoethnography and their different epistemological approaches. Fourth, a section gives some examples of the uses

of autoethnography, before a fifth section discusses the challenges within autoethnography, such as ethical dilemmas, representation, validity and truth, and the application of reflexivity to autoethnography. Finally, the chapter outlines the future possibilities for autoethnography in qualitative research.

DEFINING AUTOETHNOGRAPHY

As the way that inquiry can be carried out can take a number of forms, there is not necessarily an agreed and simple definition of autoethnography, as seen from these multiple perspectives from proponents of the genre. For example,

Autoethnography refers to writing about the personal and its relationship to culture. It is an autobiographical genre of writing and research that displays multiple layers of consciousness (Ellis, 2004, p. 37).

Autoethnography is 'cultural analysis through personal narrative' (Boylorn & Orbe, 2014, p. 17).

Autoethnography is defined as a form of self-narrative that places the self within a social context. It is both a method and a text, as in the case of ethnography (Reed-Danahay, 1997, p. 9).

What all these definitions capture is the acknowledgement that autoethnography allows for an understanding of personal experience intersecting with a social and cultural context. In common with ethnography, which attempts to understand and interpret a particular cultural system, such as an organisation, by immersion of the researcher in that setting (Van Maanen, 1988, 2006), autoethnography also examines a social and cultural context, but through the personal experience of the researcher. It involves turning the ethnographic gaze on the self, while maintaining the outward gaze of ethnography, looking at the larger context where such experiences occur (Denzin, 2014). As such, autoethnography has the potential to be used in many empirical sites and in relation to many topics as discussed later in this chapter. Autoethnography has a narrative component, though that may take a number of different forms such as stories, poems, performance or vignettes as discussed later in this chapter. Autoethnography can also refer to both a methodological approach to research, wherein the researcher reflexively interprets their own experience in relation to a cultural context, *and* the resultant outcome or product of that interpretation or research in the form of a narrative.

However, my conceptualisation of autoethnography that I have used to position my own work is as follows:

Autoethnography is a genre of qualitative research which uses reflexive autobiographical writing to analyse the self in a specific social and cultural context. It encapsulates a personal, intuitive knowledge, derived from a knowing, situated, subject, which is analysed in relation to theory (Haynes, 2013, p. 381).

As a *genre*, this tries to capture the extent to which autoethnography is a style or wide categorisation of research approaches using autobiographical material, with a nod to its literary, poetic or aesthetic tradition, and performative or embodied experience. The *reflexive* element is to acknowledge not only the positioning of the researcher in the research as a subject of inquiry, but to embed and make explicit the underlying ontology of the self, the researcher or the *auto* of the autoethnography. The second part of the above definition suggests that the value of the *knowledge* derived from autoethnography is subjective (for example, drawing from experience, emotion and identity) and also inter-subjective, in relation to self-other, self-culture, self-social context. From this perspective, the ability to *analyse*, and importantly analyse in *relation to theory*, is fundamental. Some theoretically informed interpretation of experience is central to this definition of autoethnography.

What these definitions of the form have in common is the linking of some dimensions of the self (*auto*), the socio/cultural (*ethno*) and forms of representation or writing (*graphic*). However, where approaches to autoethnography differ is in the nature of and the degree of analysis that occurs within the narrative, and the ontological and epistemological positioning of the author in various research traditions which will affect the form of autoethnography. The degree to which this is represented in various forms of autoethnography is discussed in the next section.

FORMS OF AUTOETHNOGRAPHY

What has been termed the narrative turn in social science research brings 'a subjective or cultural turn in which personal and social meanings as bases of action gain greater prominence' (Chamberlayne et al., 2000, p. 1). It has enabled a multiple conceptualisation of scholarly work away from the

objective and distanced observer towards a subjective, culturally engaged and emotive researcher (Grant et al., 2013). This enables autoethnography to be conceptualised as an alternative to conventional, realist or positivist forms of writing and research. However, even within autoethnographical research itself there are different approaches and analytical traditions. This section will evaluate and illustrate with examples what I perceive to be the dominant forms of autoethnography represented in the literature: evocative, analytical, dramaturgical and poetic, interpretive and critical.

Evocative

Evocative forms of autoethnography have dominated some early forms of the genre, deriving from the sociological and communications tradition, and exemplified in the work of Carolyn Ellis and Art Bochner (see, for example, Ellis, 2000, 2004; Ellis & Bochner, 2000). Their heartfelt and often emotional approach to autoethnography, with introspective narrative focusing on the auto-dimension of autoethnography, is what has come to be termed evocative autoethnography (Anderson, 2006; Doloriert & Sambrook, 2012; Ellis & Bochner, 2000; Learmonth & Humphreys, 2012). Ellis and Bochner's position on autoethnography is that it allows for the examination of the self, emotions and experiences as they are affected by social and cultural structures (Ellis & Bochner, 2000). The form this takes is to expose personal and vulnerable aspects of the self, in often dramatic and evocative form, in order to increase self-understanding. Often the narrative centres on some form of critical event, turning point or epiphany which has shaped or formed the writer in some way, or caused them to reflect on their own life. For example, in this extract Ellis writes about the experience of visiting and caring for her sick elderly mother in hospital:

I hold my arms out straight again. When she grabs on, she and I pull her to a standing position. When she winces in pain I embrace her around her middle steadying her for the long journey back to bed, eight feet away. The tubes extending from her chest and abdomen, the bile-bag necklace – all are properly positioned. She shuffles her feet in baby steps, all the while holding onto my outstretched arms. She looks into my eyes as I walk backwards, to pick up my cues, when to move forward, when to turn. We are intimately connected. We are totally trusting (Ellis, 1996; cited in Ellis, 2004, p. 134).

The account has a sense of immediacy and presence derived from the use of writing in the present tense, even though the narrative is based on memory and reflection. The larger piece is a visceral account of the weakness of bodies and bodily functions; an acknowledgement of love and regret, and the juxtaposition of birth and death in the centrality of life. Yet, these points are not formally analysed as such in the narrative; they are left for the reader to interpret and reflect upon. According to Ellis (2004, p. 135) 'Good autoethnographic writing is truthful, vulnerable, evocative, and therapeutic', but, as seen here, not overtly and explicitly analytical. This may be why the focus on the self in some forms of autoethnography is characterised as both easy and self-indulgent, as argued against by Sparkes (2002). The degree of analysis in evocative autoethnography varies, but it tends towards the representational and emotive rather than the analytic. For example, Parry (2012) combines what he himself defines as evocative autoethnography from mostly diary entries and reflective narrative accounts of being a football fan, with some evaluation of the nature of sporting passions to provide and give insights into the nature of sporting obsession. Rather than hiding behind an illusion of objectivity, emotive, vulnerable and sensuously poetic, autoethnographers may place themselves closer to the subjects they study (Pelias, 2004) and by exposing their own lives, touch the lives of their readers (Holman-Jones et al., 2013; Richardson, 2000).

Analytical

In contrast to evocative, analytical autoethnography defined and coined by Anderson (2006) tends to acknowledge more explicitly the researcher's position in a research community, the experience of fieldwork, and the theoretical contributions of the research in distinct and separate points of the narrative (Adams et al., 2015). In arguing for this form, Anderson (2006, pp. 386–7) suggests:

The purpose of analytic ethnography is not simply to document personal experience, to provide an 'insider's perspective', or to evoke emotional resonance with the reader. Rather, the defining characteristic of analytic social science is to use empirical data to gain insight into some broader set of social phenomena than those provided by the data themselves.

He positions analytical autoethnography as an alternative to evocative autoethnography and argues for five key features of analytic autoethnography: 1) complete member research status; 2) analytical reflexivity; 3) narrative visibility of the researcher's self; 4) dialogue with informants beyond the self; and 5) commitment to theoretical analysis (Anderson, 2006, p. 378). Complete member status refers to the researcher being fully immersed in the social world under study, 'conferring the most compelling kind of "being there" on the ethnographer' (Anderson, 2006, p. 379), which can occur through chance, such as in the case of illness, or through choice, such as through recreational or lifestyle activity. Analytic reflexivity refers to the awareness of the reciprocal influence between the autoethnographer, their context and other members. This interrelates with the needs for enhanced visibility of the self in the text through the recounting of experiences of the researcher and others, that demonstrate the researcher's personal engagement with the world under study and analytic insights (Anderson, 2006). In contrast to evocative forms of autoethnography which Anderson (Anderson, 2006, p. 386) argues seek 'narrative fidelity only to the researcher's subjective

experience', analytical forms are grounded in self-experience but reach beyond it by being informed by dialogue with others. Most importantly for Anderson, analytical autoethnographers gain insight into a broader set of social phenomena than that provided by the data themselves through the use of analysis. However, while Anderson refers to this dimension as theoretical analysis, it is unclear to what degree this would actually use social theories or inform new theories; rather, he points to 'a broad set of data-transcending practices that are directed toward theoretical development, refinement and extension' (Anderson, 2006, p. 387).

An example of such an analytical form might be Davie's autoethnographical account of the experiences and processes of conducting PhD research on accounting for Fijian pine forests, including how and why methodological themes and theoretical frameworks are selected, in what she terms 'the serendipitous and fortuitous choices made' (Davie, 2008, p. 1055):

The search for permissible Habermasian explanations about accounting's accessibility and acceptability within the pine forests culminated in an enormous amount of data. These were collected at various levels, in both the Fijian and the wider South Pacific context. As the connection between accounting, the Chiefly hegemony, communal interests, and pine-forest activities was theorised, the empirical focus was gradually being redefined and the extant data re-interpreted and on occasions filed away . . . Engrossed in a whirlpool of confusion, anxiety, excitement and a peculiar awareness of the ambiguities in accounting in the pine forests, refuge and help was sought in theoretical and empirical discussion with colleagues (both sympathetic and unsympathetic to my research style); in literature on political economy, sociology, modernity and postmodernity; multiple re-readings of articles on Habermasian studies of accounting (Davie, 2008, p. 1064).

The account contains much less, though is not completely without, emotion and vulnerability. It analyses Davie's initial preoccupations with an a priori conceptual framework, and how these shifted to new theorising. Such

analytic autoethnographies produce a more realist account of ethnographic practice.

Dramaturgical and Poetic

In contrast, some dramaturgical and poetic forms of autoethnography allow the writer to experiment with the interaction of different forms of literary representation and analysis of the self in a cultural context. Such autoethnographies may take the form of poetry (De Villiers & De Villiers, 2012; Faulkner, 2009; Spry, 2001), dramatic novels (Ellis, 2004), and dramatic interludes (Ellis & Bochner, 1992; Lawrence, 2014). Not all poetry or drama would be considered autoethnographical, but when it confirms the central tenets of autoethnography in making contributions to knowledge, valuing the personal and experiential, demonstrating the craft and power of storytelling, and taking a responsible approach to research practice and representation (Adams et al., 2015), it can be considered autoethnography. Importantly it has to have ‘aesthetic merit’ (Richardson, 2000, p. 254) and exhibit accessible literary qualities such as being lyrical, dramatically evocative or aesthetically effective (Denzin, 2014).

An example of this form of autoethnography is exemplified by Ross (2016) who incorporates autoethnographical narrative poems into her PhD thesis. In this extract, she uses short rhythmic poetic stanzas, interspersed with short discussions, to represent her life history in a way that is both emotionally engaging and analytical:

Planning was tight
For my pregnancy
Finished the same time
As my accounting degree

My baby was small
When work made the call
They wanted me to come in
At the beginning of the fall

A struggle between
My family and work

For neither of these
I wanted to shirk

Vacation got shuffled
All over the place
Because the work training
Was saving my place

It interrupted a time
That was for my son
And when it was over
Breastfeeding was done

I cried on the inside
But outside looked strong
To mother or audit
The struggle was long

These stanzas highlight one of the many struggles between my identity as a mother and as a professional accountant. I continue to feel the emotional struggle each time I read these words. I was very invested in my identity as an auditor at the time. Although I had been raising my daughter, at first on my own and then with my husband, I had never felt that the two identities were competing. I had, until that point, felt that I was balancing the two quite easily. Adding another child as well as progressing in my career meant that the two roles were in competition with one another for time and identity. These stanzas also show that I was learning to ‘play the game’ as Bourdieu would say (Bourdieu, 1990, pp. 66–68). I understood that the rules of the game included hiding my embodied self, my pregnancy, as well as being available and giving work top priority; becoming that neutral, but actually male-gendered employee (as discussed by Acker, 1990) (Ross, 2016, pp. 195–6).

Not all poetic and dramaturgical autoethnography is so explicitly analytical; yet analysis occurs in the minds of the author in writing the text and the reader in interpreting the text. Poetry can contain what Spry (2001) deems required elements of autoethnography: to be well written, emotionally engaging, critically self-reflective, participative and embodied, weaving both story and theory. It allows what Denzin (2014, p. 77) terms ‘the dialogical requirement’ whereby by being moved by a text, autoethnographical writers value work that invites them into another person’s experience, allowing them to bring new meaning

to the written text, informed by their own theoretical understandings.

Interpretive and Critical

Denzin (2013, 2014) takes a position on what he terms ‘interpretive autoethnography’ as where the explicit subjectivity of the researcher is permeated by relations with, and interest in, subjects other than him or herself. He sets interpretive autoethnography around an epiphanous or meaningful event in a subject’s life, where this event, how it is experienced and how it is woven through the multiple strands of a person’s life, becomes the focus of critical interpretive inquiry (Denzin, 2013). This critical component is important since Denzin argues that interpretive autoethnography has ‘a commitment to a social justice agenda – to inquiry that explicitly addresses issues of inequity and injustice in particular social movements and places’ (Denzin, 2014, p. x).

Other autoethnographers explicitly position their work as ‘critical autoethnography’ with an ethical responsibility to address injustice or unfairness, acknowledge privilege or marginalisation, reflexively recognise subjectivity, and address cultural inequalities and social injustice (Boylorn & Orbe, 2014). Critical autoethnographies give overt critiques of cultural identities, experiences, practices and cultural systems, to address instances of unfairness or injustice (Adams et al., 2015). For example, Morella-Pozzi (2014) provides a strong critique of the practices within higher education in relation to disability, in an account that intersects dramatic interludes with discussion and analysis:

‘You seem upset, what happened?’ Ruby asks me over lunch. She is my best friend and knows when I am hiding something, especially something unpleasant.

‘I’m having more problems with grad school. I can’t explain how insulting they have been and how much I have come to resent the administration, especially my disability advisor’.

‘Tell me what happened . . . all of it’. (Morella-Pozzi, 2014, p. 177)

The workshop proctors brought their own socially constructed ideas of non-visible disability to the workshop. They knew they would have to interact with someone who has a non-visible disability, yet they did not stop to check their own perceptions and compare their expectations with the reality of the situation. . . . no-one acknowledged the power discrepancies, inequities, prejudices or insults that were present. No one even acknowledged that this could happen or how many times it has happened before. (Morella-Pozzi, 2014, p. 185)

Hence, critical autoethnographers are concerned with the Other, and with themselves as Other, in order to address issues such as intersecting, marginalised, privileged or silenced identities, within potentially oppressive cultural contexts.

INTERACTING FORMS OF AUTOETHNOGRAPHY AND DIFFERENT EPISTEMOLOGICAL APPROACHES

These different forms of autoethnography discussed above are not mutually exclusive, but they generate a different feel to the narrative, being more or less evocative, and a varying level of criticality and analysis. Writers have also explicitly made use of different forms to address similar issues. For example, Learmonth and Humphreys (2012) play with different forms of autoethnography resonating with analytic and evocative, in what they term a ‘double autoethnography’, to ‘show how multiple accounts of the same phenomena written over time (and therefore written by different versions of the self) can be a valuable way of doing autoethnography’ (Learmonth & Humphreys, 2012, p. 101) and to have analytic engagement with ideas about identity and identity work. Their article provides a distinctive overview of both these autoethnographical forms and illustrates how evocative autoethnographies provide identity scholars, and others, with new forms of

empirical material, while also highlighting possibilities of and the need for analytical experimentation.

My own autoethnographical work has also demonstrated that the forms of autoethnography discussed above are not mutually exclusive (Haynes, 2006a, 2006b, 2013). For example, in an analysis of sexuality and sexual symbolism in an accounting firm (Haynes, 2013), I combine elements of evocative writing, critical analysis and interpretation to evaluate personal experiences and memories surrounding gender domination, culture and power in my working life as a woman. This autoethnography takes the form of a number of short illustrative vignettes interwoven with reflections on observations and emotions, and in relation to theoretical perspectives, designed to enable a retrospective, reflexive interpretation of previous events and experiences (Haynes, 2013):

I notice the image on the calendar in the boys' room almost as soon as I walk in. A bare and large breasted woman smiles from the glossy paper. I am not sure whether to draw attention to it or ignore it, but I am perturbed by the graphic nature of the image, as well as surprised by its incongruity in an accounting office. Why is it here? What is the point? The image discomforts, angers and saddens me. [Vignette – (Haynes, 2013, p. 386)]

...there is a strong relationship between identity formation, gender and sexuality. While sexuality forms part of personal identity, gender identity is how one makes sense of being a man or a woman within society. Identities emerge from within the relationships between the self and society, between individuals and discursive practices. Identities may be developed by individuals, but within constrained circumstances which may be highly communalistic and political. As gender identity is fundamentally social, institutions and organisations both contribute to and undermine it. The ordering of activities, practices and structures within organisations support gendering as a system or process which shapes identities. (Haynes, 2013, p. 391)

The vignettes, written in the present tense to capture and illustrate evocative and epiphanous moments, are based on real events but

are also certainly a narrative construction. Unlike Anderson's (2006) concept of analytical autoethnography, however, which seems to assume that the researcher has an intent to research the field while he or she is in the field, this approach uses narrative, memory and retrospection, interwoven with analysis, to make sense of past experiences, emotions and turning points. Critical interpretation is provided through the use of theorisation on gender and culture. This approach combines some elements of more constructed evocative autoethnography with more conventional academic constructs.

There is no right or wrong way of researching and writing autoethnography. The degree of emotion, vulnerability, analysis, interpretation, aesthetic poeticism or embodied interaction will depend on the nature of the research topic and the style of the writer. However, it also relates to the positioning of the researcher in respect of their ontology, or view of reality, and its relationship with the production of knowledge (epistemology) and the processes of knowledge production (methodology). Autoethnography has both an ontological dimension, as it constructs our positioning in the world, through our telling of stories to ourselves and others about ourselves, and an epistemological dimension, as a means by which we understand and know the social world (Haynes, 2006a). Autoethnographers access their own ontology, making themselves an object for analytical discussion, in a way that links epistemology and methodology. Autoethnography becomes an epistemological and methodological approach, rather than simply a research method or data resource. It is a way of knowing and a way of researching, informed by valuing the subjective in conjunction with the social. However, its style and form will be influenced by the degree of representational realism adopted by the researcher. As Grant et al. (2013, p. 5) point out, 'this is played out in the politics of autoethnographical representational practices, with normative cultural assumptions arguably frequently forming

the framing backdrop in autoethnographies which tend towards the tradition of conventional qualitative inquiry and voice'. By this they mean that autoethnographies may reflect an ideology which takes for granted social, political and organisational structures, rather than disrupting them. As a result, they argue for the use of a narrative poststructural voice using fictional, satirical or provisional truths to destabilise conventional qualitative and autoethnographical approaches, to highlight overlapping, intersecting and often contradictory discourses, and to reject 'hegemonic assumptions of universally shared reality positions ... seen in some examples of evocative and therapeutic autoethnography' (Grant et al., 2013, pp. 8–9).

EXAMPLES OF AUTOETHNOGRAPHY IN ORGANISATIONAL AND MANAGEMENT RESEARCH

Within the organisation studies and management research context there are many examples of issues that have been addressed using autoethnography, including identity formation (Haynes, 2006a; Learmonth & Humphreys, 2012), illness and bullying (Vickers, 2002), academic careers (Haynes et al., 2014; Humphreys, 2005), academic performance management (Malsch & Tessier, 2015; Sparkes, 2007), employee engagement (Sambrook et al., 2014), workaholism (Boje & Tyler, 2008), motherhood and academia (Haynes & Fearfull, 2008), and teaching practices (Humphreys, 2006; Lawrence, 2014). It is also relevant to explore wider social issues such as pilgrimage (Slavin, 2003), consumerism (Hackley, 2007), illness (Minge & Sterner, 2014) and violence (Metta, 2013). Table 2.1 provides more detail of the research question or area addressed; the theoretical or conceptual emphasis; the form of autoethnography or the general balance of its form if it straddles different approaches; the style of the autoethnography; and a summary of its outcomes.

No subject is out of reach of autoethnographers if it enables an analysis of the self in relation to the social context.

CHALLENGES WITHIN AUTOETHNOGRAPHY

Ethical Dilemmas

Since autoethnography requires by its very nature the divulgence of personal subjectivities, it requires a considerable sensitivity to research ethics. All research, especially qualitative research involving the disclosure of personal information, requires ethical consideration in relation to safeguarding participants' privacy and/or anonymity. Anonymisation of the researcher as subject of the research is not possible within autoethnography, so the various degrees of exposure bring ethical considerations to writing and publishing autoethnographically. Doloriert and Sambrook (2012) suggest these ethical concerns are threefold: first is protecting the participants within the ethnos of the study; second, the relational ethics of those other parties revealed in the study; and third, the auto-ethics of revealing the autoethnographer's identity both during a blind review process and for publication. The reveal for the autoethnographer may cause a degree of vulnerability or pain which is difficult to cope with or manage (Doloriert & Sambrook, 2009) and which can potentially do harm to the researcher themselves by exposing them to further distress. Any compulsion to reveal through examination processes of doctoral candidates could expose students to physical or psychological harm through self-disclosure (Doloriert & Sambrook, 2009). On the other hand, some autoethnographers find great strength and freedom in addressing difficult or traumatic issues, such as sexual violence (Metta, 2013) or serious illness (Minge & Sterner, 2014). Others find that retrospective autoethnographical analysis of situations

Table 2.1 Examples of autoethnographical approaches

<i>Reference</i>	<i>Research question or area addressed</i>	<i>Theoretical or conceptual emphasis</i>	<i>Form of auto ethnography or balance of form</i>	<i>Style</i>	<i>Outcomes</i>

where the researcher was potentially put at personal risk can be helpful for future researchers (Yassour-Borochowitz, 2012).

The consideration of and anonymisation of related parties who figure in autoethnographical narratives has to be considered carefully, since they could not only be identified but affected by the intimate and often emotive disclosures revealed. For example, in the excerpt previously quoted in this chapter in relation to Ellis's mother being cared for in hospital, *Maternal Connections*, Ellis (2004, see pages 144–55) discusses at length the fact that she did not ask permission of her mother before exposing this work, or give her sight of it until much later after publication, thus raising ethical issues of exposing her mother's vulnerability and frail physicality. The resulting dilemmas of potential harm or perceived disrespect to other parties have to be considered. In my own autoethnographical work I wrote about the difficulties of balancing professional life and motherhood (Haynes, 2006a), which my own child on reading it experienced as rather sad, although did not disapprove of it as such. For these reasons, autoethnographers have to consider the degree to which they disclose issues which affect other parties as well as themselves. Similarly, in the review process for journals and upon publication organisations or individuals could potentially be revealed, which in the case of highly critical issues could be controversial. For example, in the case of my autoethnography of sexuality within an accounting firm, the firm was carefully anonymised to prevent any potential issues on publications and the paper was scrutinised by lawyers before publication, thus revealing that it was considered by those lawyers in a highly realist paradigm.

Representation

To avoid or mitigate against some of these ethical disclosure dilemmas, autoethnographers can use a number of approaches. Some writers,

particular when including autoethnographical material as part of a larger study, present themselves as a research participant in a more anonymised detached way (cf. Harding et al., 2010), though this then often diverges from what autoethnography might be said to represent. The use of vignettes, dramatic episodes and even poetry can provide representations of experiences without directly naming or fully describing them. Representationally real, yet partly fictionalised accounts, known variously as 'ethnographic fiction science' (Watson, 2000), 'semi-fictional ethnography' (Humphreys & Watson, 2009), 'ethnographic fictions' (Inckle, 2010) or similar, can support the preservation of key truths about experience and processes without exposing the researcher or organisational context in which they are embedded to risk. Other approaches to protect related parties to the autoethnographer involve the use of composite characters based on but not wholly accurately representing the actual people (Ellis, 2004).

Validity and Truth

This may subject autoethnography to debates about validity and truth, but autoethnography does not seek an objective truth; rather than relying on questions of truth and validity, autoethnographical researchers are responsible for selecting, representing and interpreting experiences to inform meanings and shared understandings (Haynes, 2011). For the autoethnographer, 'validity means that a work has verisimilitude. It evokes a feeling that the experience described is true, coherent, believable, and connects the reader to the writer's world' (Denzin, 2013). 'Validity is interpretive and dependent on context and the understandings we bring to the observation' (Ellis, 2004, p. 123). Hence, traditional concepts of validity are overturned to encompass what may be a composite, partial or fictive 'truth', but which nonetheless resonates as narrative rather than literal truth, based on how the author and reader responds.

The Role of Reflexivity

The need for reflexivity in autoethnography has been stressed throughout this chapter. Reflexivity is the subject of Chapter 23 of this *Handbook* so it will not be covered in detail, but it is worth some further consideration of how reflexivity pertains to autoethnography. In simple terms, reflexivity is an awareness of the researcher's role in the practice of research and the way this is influenced by the object of the research, enabling the researcher to acknowledge the way in which he or she affects both the research processes and outcomes (Haynes, 2012). In the case of autoethnography, the researcher's role in the process means that they are immersed in the cultural setting and the subject of the research, though their actual analysis of this experience may be retrospective rather than contemporaneous. A reflexive approach means problematising this immersion, understanding and acknowledging the reciprocal interaction of self with others, to consider how the research is influenced by the values and actions of others as well as one's own. Moreover, being reflexive requires awareness and consideration of how the autoethnographer may be transformed by the process itself. For example, following a research project I wrote an autoethnographical account of how the project was transformative in two ways: first through the process of engaging with autoethnography and listening to the oral history narratives, I came to know myself better by observing and reflecting on the experiences presented by others, articulating my own story, and by reflexively reviewing my own experiences in the light of other's narratives; and, second, how engagement with theoretical perspectives on identity, the politics of motherhood and the sociology of the accounting profession gave me some new insights into my own position (Haynes, 2006b).

The autoethnographer will also be present in the outcome of the research, in the text itself, in whatever form that takes. Hence

they have to be aware of how they position themselves, as self and in relation to others, in the text. Reflexive autoethnography shows awareness of the power relations inherent in the research and in the representation of others, where the researcher has the decisive authority about what to include and in what form. The degree to which emotive, deeply personal or challenging disclosures are made in autoethnographies will differ depending on the balance between evocative, analytical or other forms; but the researcher should reflexively engage with the effects of their choice of text. Being reflexive, therefore, incorporates a need to be aware of the interaction within autoethnography of the three areas discussed above in this section: ethics, representation, and validity and truth. Ultimately it results in enhanced meanings and outcomes. As Berry suggests:

Reflexivity entails taking seriously the self's location(s) in culture and scholarship, circumspectively exploring our relationships to/in autoethnography, to make research and cultural life better and more meaningful. (Berry, 2013, p. 212)

CONCLUSION

The Future for Autoethnography

In summary, autoethnography represents a rich methodological and epistemological approach to the analysis of the self in a social context. While it takes numerous forms as identified in this chapter, whether evocative, analytical, dramaturgical and poetic, interpretive and critical, each of them brings about new possibilities for research that links the auto (self), ethno (socio-cultural) and the graphic (forms of writing). Moreover, autoethnography enables the reflexive interpretation of previous events and experiences, so that pre-existing understanding is constantly revised in the light of new understandings and in relation to theory (Haynes, 2013).

As such autoethnography brings a host of potential opportunities for future research. It can be applied to any organisational issue or problem involving human interaction in a particular socio-cultural context. It could even be applied in a virtual, as well as physical, socio-cultural context, through the use of online spaces and worlds, which would raise all the more challenges in relation to ethical dilemmas, representation, validity and truth due to the impersonal nature of online representation. However, new and innovative autoethnographical forms of narrative using combinations of poetry, vignettes, drama, performance, art, blogs, as well as novels, essays and stories, can be applied to any of these challenges, raising numerous possibilities for the expanded use of autoethnography in qualitative research.

Archival Research

Albert J. Mills and Jean Helms Mills

INTRODUCTION

At its simplest, archival research can be said to involve the study of collections of documents (e.g. newsletters, annual reports, memoranda) and artifacts (e.g. uniforms, photographs) to gain an understanding of a selected organization (e.g. British Airways), leader (e.g. Sir Colin Marshall), or professional group (e.g. flight attendants). However, this ignores the fact that, like other research methods, archival research is informed by underlying research philosophies. In this chapter, we focus on three major research philosophies – modernist, postmodernist, and amodernist – and how they inform and shape archival research. Where possible we draw on all aspects of our own research because over the years we have moved from an initial modernist approach, to a postmodernist approach and, quite recently, an amodernist approach.¹

To begin with our three major approaches: in brief, the *modernist* approach views the

past as having an ontological basis in fact, whose factual traces can be found through – among other means – a methodical search through archival documents. The resulting narrative (or storied account) is an attempt to provide a history of what really or actually happened in the past (Elton, 1967). The *postmodernist* approach² views the past as ontologically unavailable. People and events in the past were real at the time but we can only re-present the past through narratives that rely on the dominant understanding of those people and events at the time but also in the present. In other words, there is a disconnect between the past and history (Munslow, 2010): the past is what happened before now and history is the attempt to reproduce the past through narrative (a story of events) or chronicles (a description of events). Finally, the *amodernist* approach focuses on how ‘knowledge of the past’ is socially constructed through a series of human (e.g. historians) and non-human (e.g. archives) actors

to create *a sense* of history (Durepos & Mills, 2012; see also Chapter 26 of this volume).

For respective modernist, postmodernist, and amodernist accounts, see Elton (1969, 1991), Jenkins (1991), and Durepos and Mills (this volume). For useful overviews of the field see Bryman et al. (2011), Durepos (2015), Jenkins (1995), and Rowlinson et al. (2014).

- Before doing archival research, you should become familiar with some of the key ontological and epistemological debates surrounding the understanding of history and the past.

WHAT DO WE MEAN BY ARCHIVAL RESEARCH?

Before you consider archival research, you need to have an understanding not only of *what* you are looking for but *why* and *how* you are looking for it. You need to know something about recent debates in management and organizational history about the nature of the past and history. A good place to start is Booth and Rowlinson's (2006) discussion of the 'historic' turn in management and organizational history. This is useful not only for understanding debates around what constitutes the past and history but also in discussing the range of methods and methodological approaches associated with different approaches. See also the debate between Toms and Wilson (2010) and Taylor et al. (2009).

Different approaches to history and the past shape not only *what* to look for 'in the' archives but also *how* to study archival materials and *where* to look for archives. For example, *modernist* historians tend to view archives as 'an empirical data corpus' of artifacts and documents that are usually associated with a physical location (McHoul & Grace, 2003, p. 30). These locations are often referred to as an archive where the purpose is to collect together a number of artifacts around a specific topic. It is a place where

elements, or traces, of the past can be studied through a search of documents (e.g. in-house newsletters) and other artifacts (e.g. airline uniforms). *Postmodernists*, on the other hand, are not simply looking for documents and other artifacts from the past but also the complex system of practices that underlie the way of collecting and ordering materials in an archive. Arguably, these practices 'govern one's manner of perceiving, judging, imagining and acting' (Flynn, 1996, p. 30) in ways that constitute an 'unconscious structuring of discourse' (May, 2006, pp. 38–9). This can influence what you come to view as (legitimate) knowledge and what counts as evidence of that knowledge. The *amodernist* focus is on gaining an understanding of the relationships between human (e.g. flight attendants), non-human (e.g. uniforms), and non-corporeal (e.g. airline stories) actants in the creation of a particular phenomenon (e.g. the association of females with flight attending and males as pilots).³ The essential idea here is to understand the production of knowledge (for example, discriminatory notions of women's roles at work) by tracing the relationships that come to constitute and maintain that 'knowledge'.

These three approaches generate different views of what constitutes an archive. From a *modernist* perspective, it can be argued that:

Archival records are an invaluable *tool* of *data* gathering ... that is focused on the past and its *impact* on the present. The careful analysis of archival records can provide valuable *information* of the life, concerns, and aspirations of individuals and groups, as well as on the activity, structure, mission, and goals of associations, organizations, and institutions. (Stan, 2010, p. 29, emphasis added)

This is a clear modernist account of the value of archival research. The *postmodernist* will contend that this type of account lures us into thinking that archival records, in themselves, embody some sort of fixed elements of empirical truth that can be uncovered through methodical techniques of collection and analysis of information-bearing data.

While modernists tend to talk about archives as physical locations that house a particular collection of documents and artifacts (e.g. the Pan American World Airways Collection at the Otto Richter Library of the University of Miami), postmodernists view ‘the archive’ as something broader. Thus, for example, Rostis (2015, p. 33), in his Foucauldian study of the discourse of humanitarianism, notes that:

The archive in its broadest sense is everywhere and not restricted to the four walls of an archival office of any one organization. Therefore, traces of constructs such as madness, discipline, or sexuality should be found in multiple places; Foucault's genealogies draw upon this feature and sweep quite broadly across sources, historical periods, and people.

In contrast, the amodernist views the archive – be it a specific building or broader social phenomena – as a potential nexus for the production of knowledge, a site of networked relations to be explored and uncovered.

This provides us with at least three forms of archive. The first is a formally constituted collection of documents and other artifacts at and as an ‘archive’. The second refers to a number of sites, including physically designated archives, which are thought to constitute the traces of a pattern of ideas and practices that influence our understandings of the past. The third refers to a site of outcomes of networked relationships. These various sites are thought to constitute a complex set of underlying rules or an *archive*. Following Mills and Helms Mills (2011), we will use the term archive to refer to the modernist notion and *archive* to refer to the postmodernist notion: either can be the starting point of a site of networked outcomes for the amodernist depending on where they focus their attention.

Despite the fundamental differences in approach you will still find *modernist*, *post-modernist*, and *amodernist* researchers in formally designated archives undertaking analyses of documents and other artifacts. Rostis (2015), for example, included in his

archival research, analysis of documents at the Museum of the International Red Cross in Geneva.

For simplicity sake, the focus of the rest of this chapter will be on formally constituted archives, defined as a collection of materials that serve to provide traces of the past of a particular organization (e.g. Air Canada⁴), organizational leader and other members (e.g. Juan Trippe, the former CEO of Pan Am, and female members of the same airline), or social phenomenon (e.g. Aviation and Space). This will allow us to focus on the value of documents, which is an important focus of various forms of archival research.

WHY DO ARCHIVAL RESEARCH?

The question of the value of archival research is often tied up with questions about the value of history and the past. If history and the past are important for business studies then, the argument goes, archives are an important source for tracing what happened before now.

Modernist

First, let us briefly review the argument for the importance of history and the past from the modernist perspective. Professor Alfred Kieser (1994), who has played an important role in encouraging an ‘historic turn’ in Management and Organization Studies (MOS), makes four key points for the value of history and the past:

- 1 ‘In order to understand contemporary institutions it is important to know something of their historical development’ (p. 609).
- 2 Historical analysis can reduce the ideological biases embedded in current ‘fashionable trends’ in MOS (p. 610).
- 3 We need to ‘interpret existing organizational structures not as determined by [objective] laws but as a result of decisions in past choice[s] ... whether intentional or implicit’ (p. 611).

- 4 'By confronting theories of organizational change with historical development, these theories can be subjected to a more radical test than they have to pass when merely being confronted with data on short-run changes' (p. 612).

Each of these points relies in large part on the availability of archives or accounts based on archival research. British Airways, for example, has been in operation, in one form or another, since 1919.⁵ While it is possible to conduct interviews with current and former employees of the airline, this approach would be limited to the number of people you could interview in a certain time span; the availability of people prepared to talk to you; the span of time that their experience would cover (most of those who worked for the airline before World War II would now be dead); and the memories of those interviewed. At the very least you would need to access company documents and other artifacts to verify and expand on what interviewees tell you. Existing published histories (e.g. Penrose, 1980) could also help to provide other insights into the company. However, the various documents to be found in an archive, including associated airline histories, were written for a specific purpose that may not address or reveal other purposes. For example, feminist studies of the airline industry (Barry, 2007; Yano, 2011) are more likely than not to be confronted by archival materials (and histories) that largely focus on men and machines.

Modernist accounts of management and organizational history include Urwick (1938), George (1968), Kieser (1994), Wren (2005), and Bowden and Lamond (2015).

Postmodernist

Postmodernists see value in archives for various reasons other than proof of any particular truth. Their interest is in the role that archives, as 'complex systems of rules', play in the construction of 'knowledge'. There are at

least two levels to this. The first one involves analysis of the materials themselves to reveal how corporate thinking and practices helped to socially construct particular discourses. For example, in our study of British Airways, we examined the airline's hiring and imaging of women to gain a sense of how discriminatory practices develop, are maintained and change over time (Mills, 2006). To do this we used the framework of the juncture (or 'a concurrence of events in time in which a series of images, impressions, and experiences come together, giving the appearance of a coherent whole that influences how an organization is understood' Mills, 2010, p. 509). This helped us to identify changing dominant corporate attitudes to the role of women over time and factors associated with the development, maintenance and change in selected practices.⁶ The second level is to examine how the archive itself serves to shape our understanding of the past. In a plea for 'a fuller reflection of the uses and limitations of the archive in business historical research', Schwarzkopf (2012, p. 1) cites Foucault's contention that 'archives are not just sites for the passive collection of records from the past. Rather, archives are very active in both enabling and limiting what we see, know, understand, and accept as real' (p. 9). To return to our study of British Airways, we found that much of what was collected and saved focused primarily on activities associated with men, such as piloting, engineering, and management at all levels. We note that the *association* between men and particular activities not only reflected dominant practices in the airline but also served to reinforce those associations. As our research went on to argue, a powerful discourse of gender relations played an important role in the development of British Airways, determining who was hired and to what position; who was privileged and who was marginalized in the stories told (e.g. detailed accounts of male airline pilots and managers) and the stories not told (e.g. the role of female pilots during World War II).

For a considerable period of time, a large number of corporate stories about female employees centered on sexuality and the female flight attendant as the leading, albeit marginalized, image of women in the airline industry (Helms Mills & Mills, 2008; Mills, 2006). Similarly, a discourse of colonialism is evident for much of British Airways' first forty or more years of operation. Here the archive neglects the impact of the airline on non-white members of the British Empire, both in terms of the airline's restricted hiring practices of non-white Africans and their imaging as irrational, menial labour, and basically savage (Mills, 1995).

Postmodernist accounts of management and organizational history include Jacques (1996), Rowlinson (2004), and McKinlay (2013).

Amodernist

Amodernist social scientists have come lately to archival research⁷ and are particularly interested in how histories are produced as an outcome of a series of actor-networked relations. Here the archive is of interest as a punctuated actor, i.e. *something* that is spoken of as if it is a single, albeit powerful, entity that offers a potential treasure trove of facts about a particular person, company, event, or period. Here the focus is not so much on developing histories out of available archival materials but rather analysis of how specific histories come to be developed. Myrick et al. (2013), for example, analyzed archival materials of the Academy of Management (AoM). The analysis was not to develop a new history of that association but rather to make sense of how the existing history of the association (see <http://aom.org/About-AOM/History.aspx>; Wrege, 1986) came into being, and what the implications are. We were particularly interested to see what coherence of actors worked together to create the idea of an association that has been continuously in operation since 1936. While

this point of longevity lent credence to the authority and legitimacy of the AoM, it papered over contrary details, such as the fact that the supposedly first two meetings (1936, 1937) were dinner meetings not conferences; that the name Academy of Management was retrospectively applied to the association at a later date; and that between 1941 and 1947 the association was basically defunct. Yet the 2011 conference was heralded as the 75th year of the AoM – dating the association back to 1936, while the 2015 conference was deemed the 75th conference – contradictorily dating the conferences back to 1941.

Amodernist accounts of management and organizational history include Bruce (2006), Bruce and Nyland (2011), Collier et al. (2015), Hartt et al. (2014), Myrick et al. (2013), and Shenhav and Weitz (2000).

- Archival research is useful for understanding relationships between the past and history in understanding management and organizations over time. Those insights can be in the form of establishing factual details of what really happened and their impact on current organizational reality (modernist); revealing powerful discourses and their influence on extant knowledge (post-modernist); and gaining insights into how history is produced as knowledge (amodernist).

THOROUGHLY MODERN MISSION

In this and the next section we will explore the methods and challenges faced by, respectively, modernists and then postmodernists and amodernists.

It would be doing a gross injustice to modernist researchers to suggest that they are unaware of the multitude of problems surrounding the gathering and analysis of archival material. Indeed, much of the discussion of archival research from a modernist perspective involves questions about focus, access, and the evaluation; collection and storage; evidentiary value and triangulation. Let's look at each in turn.

Focus

You may want to study some aspect of the history of a particular person, organization, phenomenon, etc. A couple of good places to start are lists of archival sources and histories of your chosen topic.

Archival source lists:

There are numerous online sources to available archives and their accessibility these days. A search by archives and then within the archive may provide useful clues to what you are looking for. For example, when, in an earlier modernist phase, we were interested in studying how organizational cultures develop, maintain, and change discriminatory practices over time, we looked around for a business that (a) had an existing and well-developed archive – to allow us to track different cultural artifacts; (b) had been in existence for at least 50 years – to allow us to study changes over relatively long time periods; (c) was internationally well-known – to provide us with an example that was of interest to a large number of potential readers/researchers, as well as being socio-economically powerful to have an influence on social thinking; (d) where possible, had a powerful socio-cultural association with gendered practices; and (e) had a number of published histories on the company. A search through a guide to British archives (Foster & Sheppard, 1989) led us to British Airways, which proved to be a treasure trove of documentation, artifact collections, documentary films, and photographs. The Archives and Museum collection included in-house newsletters⁸ (useful for tracking people and events over time), annual reports⁹ (providing clues to leading members of the airline and their strategic thinking), corporate memoranda¹⁰ (interesting for insights into factors that were of particular interest to the company), advertisements¹¹ (showing how the company imaged itself and its employees), and corporate films and a vast photographic library¹² (for gaining insights into who is privileged

and who is marginalized by corporate leaders and editors).

Histories:

The existence of published histories can help the researcher to gain insights into the chosen organization, people, and or/phenomena but can also provide extensive information into the available sources of information to be found. Our research into histories of Pan American Airways not only led us to the Pan American World Airways Collection at the University of Miami but also to the Smithsonian National Air and Space Museum as well as the British Airways Archives and Museum, which contain a number of documents on relationships between Pan Am and British Airways. We would note that while this collection of ‘information’ is similar to a modernist approach, the ultimate difference lies in what material is being collected (e.g. evidence of dominant discourses versus fact) and how it is analyzed. Our framework at the time drew on postmodernism.

These sources will not only help you to decide what it is possible to focus on but in all likelihood, they will shape the direction you go in. Esterberg (2002, p.130) suggests that such histories and debates around the subject can help you ‘to conceptualize your study and figure out what the main controversies are’. On the other hand, existing histories may appear to limit what you can study. British Airways histories, for example, say little or nothing on gender and colonial relations. That may be an indication of what is potentially missing from the archives and/or the time needed to be spent searching the archives. This will shape the focus on your study and the types of documents you will need to spend more time on. In our study of British Airways, we had to spend a considerable time looking for accounts of female members of staff and the role they played in the airline. The problem is exacerbated where there are no available archival sources or they are spread out across a number of places.

- Consult specific companies and organizational members, archival source lists, and existing histories to assess your ability to study the topic in hand.
- Begin your archival research by reading 'what other historians and social scientists have said about the topic' (Esterberg, 2002, p. 130).

Access

These sources are only the beginning of the process. Access is a crucial issue. You may know where to look, but you need to check what is accessible and what isn't. Not all archives are open to the public, and where they are, some of the materials may not be accessible (Berg, 1989; Lipartito, 2014). An example of the former is where we attempted to gain access to the archives of United Airlines (UA). Our study of Air Canada indicated that UA had played a role in training Air Canada's flight attendants in 1937. In our request to visit the UA archives, we were referred to the online part of the archive, which contained very limited (and carefully crafted) material, and to a recent corporate history (Garvey & Fisher, 2002), which gave no clues to the material we were seeking. An example of the latter problem is detailed by Rostis (2015) who was attempting to study the role of the Biafran War (1967–70) in the development and role of humanitarian agencies in Africa, only to find that the International Red Cross restricted access to those files. Rostis resorted to newspaper reports of the time, but we have been unable as yet to gain information on the early role of UA in the development of Air Canada.

- Check access to selected archives and the availability of related histories in advance of developing a specific focus.

Collection and Storage

Having found your way to an archive, there are a number of considerations to take into

account that affect what you find and how you make sense of it. Berg (1989) distinguishes between those archives (usually public) where the documents have been developed for 'the express purpose of the examination of others' (p. 86) and those (private) archives that were not developed for public engagement. While the latter may take on a range of peculiar forms according to the needs of the person(s) establishing them, the former have usually been ordered in a particular way to assist researchers to find certain materials. This may be quite systematic as in the case of the National Archives of Canada or they may be placed in a rough order such as the Pan American collection, where materials are boxed together in broad categories (e.g. 'interviews and biographies', 'China', etc.). Either way, what is collected and how it is ordered can greatly affect the material that you manage to find and what sense you make of it. Webb et al. (1984) contend that there are at least 'two major sources of bias in archival records – how they are collected and how they survive' (p. 114). According to Stan (2010, p. 29) researchers need to 'be aware that not all archives were systematically collected [and may not] include many relevant documents, either because these documents were destroyed intentionally or accidentally or because they were scattered among other archives collections'. The Pan Am collection, for example, for many years consisted of just over 600 boxes of material, but this changed dramatically on, what was to be, our last day of research at the collection when another 900 boxes were added to the collection. The additional boxes, we were informed, were culled from tens of thousands of boxes discovered in a warehouse in New York.¹³ Addressing the issue of what does and does not get collected, Schwarzkopf (2012) argues that 'archives reinforce survivorship bias [with large] and dominant companies often [having] better archives' than smaller companies (p. 7). He also goes on to argue that there is a European bias in the establishment of

archives 'because it is only within the global north and the west that this institutional support is so widely available that local and national authorities and firms themselves can afford to preserve company records' (p. 5). In summary, Schwarzkopf (2012) argues that 'archives are not just sites for the passive collection of records from the past. Rather, archives are very active in both enabling and limiting what we see, know, understand, and accept as real' (p. 9). He goes on not only to warn researchers about the in-built biases of archives but also for 'an open theoretical debate about the epistemological status of the archive in business history' (p. 2).

- Researchers need to be aware of the influence of archives through the establishment, selection, and ordering processes involved.
- A process of reflection of the influence of the archive should be encouraged.

Evaluation

Scott (1990) argues that four criteria should be used to evaluate documents – authenticity, credibility, representativeness, and meaning (cited in Myers, 2009, p. 159).

Authenticity refers to whether the document is what it claims to be. The most high profile example is a document called *The Protocols of the Elders of Zion*, published in the early part of the twentieth century, which was claimed to be a Jewish plan for world domination. The document was eventually proven to be a forgery but not before carmaker Henry Ford published half a million copies in 1920 in an attempt to spread anti-Semitism.

Credibility refers to the extent to which the author of a document is believable in what they are claiming. For example, in 1950, United States Senator Joseph McCarthy constantly referred to documents in his possession that proved that there were over 200 known communists working in the State Department. He was later to claim that there

were communists in the U.S. military. None of these claims was ever authenticated and McCarthy became known in some quarters as self-serving and prone to exaggeration (Caute, 1979).

Representativeness refers to the extent to which any single document can be taken as evidence of a particular phenomenon. For example, in our research in the Academy of Management archives we found a letter to Keith Davis (AoM President, 1964) from Max Schmoor, in which he, Schmoor, states that 'I too hope that Goldwater or someone similar in philosophy does get to be VP or pres. Next time around' (Schmoor, 1961). Given the usually liberal character of Davis and his importance in the field of business studies at the time, we searched for other documentation to corroborate his support for right-wing Senator Barry Goldwater and other right-wing causes. Finding none, we did not pursue the matter further.

Meaning, in this case, refers to the extent to which a document can be clearly understood. For example, some of the phrasing may not be clear. In the letter from Schmoor to Davis, discussed above, for example, it is possible that Schmoor is not referring to Davis' political preferences but rather responding to an earlier comment by Davis that distances him from Goldwater supporters. Context can also be critical in making sense of what was meant by a person at a given time. For example, if you were trying to evaluate the 1944 Hollywood movie *Song of Russia*, you would need to take into account the time and context of the film when the Soviet Union was seen by many as the heroic ally of the United States. Viewed in the context of McCarthyism in the 1950s, it was seen by many as an attempt by communists to infiltrate the cultural understandings and values of Americans (Caute, 1979). Similarly, research activities and stances taken by some university professors were viewed as progressive in the 1930s and 1940s, but then viewed as treasonous in the 1950s (Schrecker, 1986). Abraham Maslow, for one, came under suspicion by the Federal

Bureau of Investigation (Cooke & Mills, 2008). Esterberg (2002) adds that in the evaluation of sources we also need to take into account the biases and predilections of the author as well as his or her overall viewpoint, the kinds of evidence they use, and the extent to which they are credible.

- To evaluate archival documents, look for:
Authenticity
Credibility
Representativeness
Meaning

Evidentiary Value

George and Bennett (2005) raise questions about how to judge the worth or evidentiary value of documents. They argue that ‘scholars are not immune from the general tendency to attach particular significance to an item that supports their pre-existing or favored interpretation and, conversely, to downplay the significance of an item that challenges it’ (p. 99). Thus, they advise, we need to be ‘prepared to revise existing interpretations when new evidence and compelling new interpretations emerge’ (ibid.). In order to do this, they continue, archival documents need to be regarded ‘as a type of purposeful communication’ and as such analyzed for what is being communicated, and ‘*who* is speaking to *whom*, for *what purpose* and *under what circumstances*’ (pp. 99–100, original emphasis). For example, when Pan Am’s corporate leadership attempted to hire a professional historian to write a history of the company, they were turned down by a number of respected scholars who balked at the idea of a history geared to lionizing the role of Juan Trippe, the airline’s chief executive. Eventually they turned to crime fiction writer Robert Daley who was willing to write a corporate history. Thus, when reading Daley’s history of Pan Am – *American Saga. Juan Trippe and His Pan Am Empire* (Daley, 1980) – we need to take into account the

various influences on the author, the author’s ability/training to write a history; his (financial) reasons for writing the book and the circumstances surrounding his appointment (Durepos et al., 2008). This may not mean that it is a flawed history, but it does raise questions about how it was developed. For instance, when reading the subsequent book, we need to take into account that after approaching a number of historians to write a corporate history of Pan American Airways the airline’s leadership settled on detective fiction writer Robert Daley.

- Judge the evidentiary value of documents based on an analysis of who wrote it, for whom, under what circumstances, and in the context of its production.

Triangulation

Triangulation refers to the research strategy of ensuring that you don’t rely on just one source of data. It is used in journalism all the time to ensure that the authenticity of a story does not rely on a single source. According to Berg (1989, pp. 97–8) it is ‘particularly important to use multiple procedures (triangulation) when working with archival data to reduce possible sources of error (missing data and so on)’. We came across this problem recently when we were trying to understand the influence of the British Airways’ (BA) archives on extant histories of the company. We began by asking the BA archive staff, consisting largely of retired employee volunteers, when the archive was established. The various responses we got indicated that there were several conflicting answers and most did not know the answer. We then returned to the archive at a later date and searched through in-house newsletters for some kind of definitive answer. Again, there was some confusion so, in an iterative process, we used the written information to review with the volunteers what made more sense to them (Coller et al., 2015).

- Use multiple procedures (triangulation) when working with archival data to reduce possible sources of error.

POSTMODERNS AND AMODERNS IN THE ARCHIVE

To contrast the modernist with postmodern and amodern approaches, we will revisit some of the issues raised above.

Postmodernism

Earlier we defined postmodernism as ‘a critique of modernist representation, specifically the idea that concepts mirror reality, arguing that representations provide at best partial perspectives on their objects ... and the cognition proceeds through representation that is mediated by language and historicity’ (Linstead, 2010, p. 694). In terms of specifically archival research, this means that the postmodernist occupies an apparently paradoxical role that is linked through a critique of language use. On the one hand, the postmodernist seeks to understand the character, location, and context of powerful discourses. Foucault, for example, looked for traces of constructs such as madness, discipline, or sexuality in multiple places (Rostis, 2015). On the other hand, postmodernists are harsh critics of (realist understandings of) the archive. White (2004, p. 198), for example, characterizes the modernist approach to the archive as a voyage of discovery whereby, through the uncovering of a series of facts, sources, or traces a history emerges (or at least that is the hope). He then asks us, from a postmodernist perspective, to imagine a completed history: ‘Here you will find in it things that are in no conceivable archive: a story, an emplotment, a narrative structure, tropological figurings, foregrounding or backgrounding arguments, and the positional and positional thesis’ (ibid.). In other words,

what the modernist has deigned to discover is in fact a self-imposed story on a group of disparate words read as facts. In the end, the postmodernist adopts a relativist approach to the archive, arguing that there are numerous possibilities for reading into the ‘traces’, including explorations and exampling of powerful discourses.

From this perspective *written histories* are viewed not as more-or-less factual accounts but as *archives*, that contribute to discursive views of the world. The histories of BA, for example, arguably contribute to a gendered discourse of inequality. The *collection and storage* of archival materials are examined for the way they order knowledge, i.e. influence discursive understanding of the materials contained therein. The chronological arrangement of BA’s museum artifacts, for example, serves to construct a narrative of technological and ownership progression that privileges private over public ownership and marginalizes the role of women in the company.¹⁴ *Authenticity* of a document matters less than its potential impact. In the case of Henry Ford’s reproduction and distribution of *The Protocols of the Elders of Zion*, its impact on anti-Semitism is likely of more importance than whether it was a forgery or not. Its forged character is more likely to raise questions about how discourses are shaped than whether the document can be trusted as authentic. Similarly, the postmodernist may be less interested in whether the author of a document can be trusted in their account as much as whether their account is influential regardless. Senator McCarthy’s lists of communists may have been bogus, but the very nature of his claims and the way in which he presented them made his name into a socio-political phenomenon viz. McCarthyism. Representativeness and triangulation may be the two areas where the postmodernist and modernism come closest as both are usually looking for phenomena that can be claimed to have some socio-political impact at some level or other. And both are looking for other sources to help them develop

plausible accounts of a particular phenomenon. Nonetheless, the meanings imbued in each term do differ considerably between the two approaches. Which bring us to the issue of a document's meaning. While the modernist is trying to get to the truth of what someone says through cognitive means, the postmodernist seeks to gain insights on how meanings are produced (rather than influenced) by the context in which they appear and in the context in which they are being read. Finally, in terms of evidentiary evidence, modernists, such as George and Bennett (see earlier) stress cognitive processes of addressing bias, as if the world of ideas and practices were rooted in discernible facts. The postmodernist, on the other hand, would be more interested in how interpretations were rooted in discursive notions of reality.

Amodernism

Amodernism is a conceptual stance that shares much of postmodernism's critique of modernism. However, although it 'shifts our focus away from the modernist necessity for accurate representations of reality (realism)', it also shifts focus away from 'the relativist nature of a reality mediated through knowledge and text (the anti-realism of the textual turn)', focusing instead on 'practices' (Durepos, 2015, p. 169). This means 'tracing the many shapes that human–non-human associations make when engaged in activity' (ibid.). Thus, if history-making 'is an everyday practice ... why not study the various compositions it takes in its situated practices?' (ibid.). In simple terms, amodernism seeks to understand how histories are produced rather than made. The latter, modernist idea, suggests that histories (more-or-less accurately) describe the activities of real people and events over time. The former, amodernist idea, suggests that ideas about people and events are shaped through a series of relationships between people and things. Those relationships can include historians,

history books, conferences, but also a series of activities involving a variety of people. Thus, unlike modernists, history is not made, it is socially constructed; and unlike postmodernists, history is not simply mediated by historians, but rather by a host of human and non-human actors of whom the historian may be one. This approach simultaneously dismantles the idea of history as a real and truthful account of the past while recognizing its value as an outcome of human–non-human relationships. We don't have to believe in Santa Claus to recognize the value of the phenomenon.

How does this play out in the archives? Essentially the idea is to attempt to reassemble any given history to see how it is produced. This entails trying to gather insights into what, how, and when something (some sense of history) was produced. To that end, amodernists try to follow the actors involved to see how something was produced and came to be an accepted account.

From this perspective, written histories are an interesting starting point in their own right but also in providing clues to some of the potential actors and events to be followed through archival documents. Robert Daley's (1980) history of Pan Am, for example, masks the various relationships that went into its making (Durepos et al., 2008). On the surface, it is a series of historical facts brought together by the author as historian. Through that process, the book performs as a history because we have no reason to question the voracity of the details. On further examination, through archival research, the making of the book involved a series of senior managers who set out to commission a particular history of the airline, based on a series of selectively collected artifacts and documents, and a desire to avoid a more critical history that was published four decades earlier. For the amodernist, the collection, storage, and ordering of the archive are important actors in influencing what gets to count as history. What you cannot find in an archive is just as important as what you can find and perhaps

more so. Authenticity is more interesting as a process whereby an actor becomes involved in a process and is enrolled (i.e. accepts the truth or sense of something). A forged document is no less an actor than an authentic document. Both can influence the production of a history. Representativeness is less important in amodernist research or at least it takes on a different meaning. The issue is not whether a single account is reproduced elsewhere, so much as the influence that the related actor plays in the production of an account. Thus, while the modernist is looking for corroborating evidence, the amodernist is looking at how/whether the actor appears to have influenced some level of relational activity. In regard to meaning, the amodernist tries to assess not what the author means so much as how is a particular meaning produced and what type of activity helped to produce a given meaning. The same is the case with credibility. For the modernist, it is a question of the value of a document if the author is not deemed credible. For the amodernist, the question would be whether or how something becomes accepted as credible. Just what is it that Senator McCarthy did to get some of his flawed ideas across? For the amodernist, evidentiary value does not reside in an appraisal of the words and expressions of an author so much as understanding how it works as a matter of influence on other actors. Finally, for amodernists, triangulation, although it has different meanings from those intended by modernists, involves looking for different sources to assess the influence of selected actors on particular outcomes (i.e. historical accounts).

ENDPOINT: THE SILENCE OF THE ARCHIVES

In this entry, we have tried to show the value of archival research and the varying ways that different research traditions approach it. We have tried to indicate, through various examples, some of the gendered and racialized

issues involved in the construction and ordering of archives – its European bias as Schwarzkopf (2012) terms it. But it is more than that. The problem facing all three approaches discussed is fundamentally the issue of collection and storage. As a number of feminists (J. W. Scott, 1987) and postcolonialists (Ibarra-Colado, 2006) have pointed out, archives are often silent on the role of women and formerly colonized people. To that end, we conclude with a paradoxical plea for more archival studies that address what Decker (2013) calls ‘the silence of the archives’ and a reappraisal of the Western bias inherent in the value placed on archives.

Notes

- 1 At times, we move between postmodernist and amodernist accounts as we explore not only the impact of powerful discourses on people (postmodernist) but also on the network of relations (amodernist) associated with the production of a particular discourse.
- 2 There are debates within the literature around the difference between postmodernism and poststructuralism, with some authors viewing postmodernism as an umbrella term that also includes poststructuralism and others distinguishing between them based on methodological approach (see P. Prasad, 2005). For the purpose of this chapter we use the umbrella term, drawing on Linstead (2010, p. 694) who defines postmodernism as ‘critique of modernist representation, specifically the idea that concepts mirror reality, arguing that representations provide at best partial perspectives on their objects ... and the cognition proceeds through representation that is mediated by language and historicity’.
- 3 Hartt (2013) refers to non-corporeal actants as phenomena that are non-physical in nature (e.g. stories, values, traditions, memories, and even histories) but yet can influence human actors.
- 4 The Air Canada archives are housed at the Canada Aviation and Space Museum in Ottawa.
- 5 The date of British Airways’ establishment is not without contestation (see Collier et al., 2015).
- 6 For example, between 1919–24 the airline hired less than a handful of women, and this reflected a dominant mindset about the role of women. However, between 1924–39 women constituted 10 percent of the airline’s employees and reflected a changing mindset about women’s role.

- 7 Although actor–network theorists have been undertaking amodernist research since the late 1970s, the great majority of this has revolved around ethnographic research of on-going activities – see, for example, Latour and Woolgar (1979).
- 8 See special issue 7, 3–4, 2008 of *Management & Organizational History* on company magazines and in-house newsletters.
- 9 For interesting work on annual reports, see Benschop and Meihuizen (2002), Tinker and Neimark (1987), and Burrell (1987).
- 10 An interesting account of the use of corporate memoranda can be found in A. Prasad and Mir (2002).
- 11 For work on ‘reading’ and analyzing advertisements, see Alvesson (1998).
- 12 For work on photographic and film analysis see Warren (2002) and Bezner (1999).
- 13 On the problems of archival storage and the challenge of information/knowledge, see Burke (2012).
- 14 A relatively large collection of female mannequins in flight attendant uniforms suggests that this was women’s major role in the airline.

Rhetoric

Peter Hamilton

INTRODUCTION

The last few decades have heard calls for the need to research talk and text within the workplace (Boden, 1994; Cameron, 2000). This has resulted in on-going research projects that have adopted different approaches to how they relate to a variety of organizational processes and practices. These approaches include discourse analysis (Oswick, 2012), conversational analysis (Greatbatch & Clark, 2012) and rhetoric (Conrad, 2011). This chapter is focused on rhetoric and provides a broad overview of issues that relate to qualitative research on organizational rhetoric.

Although rhetoric has a strong historical association with persuasion (Herrick, 2001) definitions are both more subtle and varied. For example, Aristotle's (1991) *Art of Rhetoric*, considered by some to be the pre-eminent text on rhetoric (Golden et al., 1997), defines it as '*the detection of the persuasive aspects of each matter*' (Aristotle, 1991,

pp. 69–70, original italics). In that sense rhetoric concerns what resources, such as the most appropriate arguments or language style, to use in light of the particular situation in which a speaker seeks to persuade an audience. An alternative definition from the classical period by Quintilian defines rhetoric as 'the science of speaking well' (Williams, 2009, p. 398). In developing the view that the ideal orator was 'the good man [sic] speaking well' (Bizzell & Herzberg, 1990, p. 35) Quintilian stresses a moral character to the orator who should also seek to benefit society. More contemporaneously, Kenneth Burke, a major figure in twentieth-century rhetoric, contends that rhetoric is the use of symbols in order to shape and alter both humans and their context. Burke also supplements the traditional focus on persuasion through his concept of identification (Foss et al., 2002). Identification is seen in his comment that, 'You persuade a man [sic] only insofar as you can talk his language by speech, gesture, tonality, order, image, attitude, idea, *identifying* your ways

with his' (Burke, 1969: 55, original italics). Attaining identification can be the catalyst to attitudinal or behavioural change. Finally, the literary scholar Wayne Booth (2004) identifies rhetoric as the production or reduction of misunderstanding and defines it as 'the entire range of resources that human beings share for producing effects on one another' (Booth, 2004, p. xi). These effects could be ethical, practical, emotional and intellectual. In their various ways, these definitions posit rhetoric as the deployment of symbols aimed, for example, at convincing, influencing or pleasing an audience in order to advance a point of view.

In an organizational context rhetoric has a central role for a number of reasons. For example, many organizations engage in public relations, recruit workers, develop advertising campaigns, seek investment, sell things, lobby government, negotiate with trade unions and so on. Rhetoric is also argued to be a key facet of leadership (Conger, 1998). Rhetoric therefore plays a central role whenever an organization seeks to convince, influence or please an audience(s) through the use of symbols (Hoffman & Ford, 2010). This highlights two distinct characteristics of rhetoric: it is contingent and strategic (Keith & Lundberg, 2008). The former refers to a reliance on audiences whose uniqueness and predispositions mean that they may or may not be persuaded. The latter refers to the need for a speaker to think about the substance and form of a message in order to achieve a positive audience response. While rhetoric as a practice is about how things can get done through the uses of various discursive resources, it is however also a means of analysing such practices. As Martin puts it, rhetoric is 'both a mode of enquiry and the object of that enquiry' (2014, p. 2). The subject and object of rhetoric are therefore not wholly inseparable as we can study rhetoric in order to learn persuasive skills or we can examine the persuasive aspect of a discourse. In the latter sense, we can therefore rhetorically analyse an organization's public

relations message or advertising campaign in order to examine 'its' rhetoric. This could include analysis of the argument strategies, the use of figures of speech and any visual imagery, as well as the intent and purposes of such organizational rhetoric. In this chapter, the primary focus is the persuasive aspect of a discourse, what Andrews describes as 'the art behind choices in communication of all kinds' (2014, p. xi).

The chapter's focus on rhetoric can be understood within the context of what has been called the 'recovery of rhetoric' (Roberts & Good, 1993) or 'the rhetorical turn' (Simons, 1990), whereby over the last few decades there has been a growing interest in rhetoric within the social sciences (Cohen, 1994; Leff, 1987; Myers, 1989). This 'recovery' or 'rhetorical turn' is also evident within business and management as there is now an impressive body of work that has focused upon organizational rhetoric and conducted rhetorical analysis on a variety of organizational processes and practices (Hartelius & Browning, 2008). However, while it is nearly three decades since Simons was able to 'present news of the "rhetorical turn"' (1989, p. 1), we remain within an intellectual context in which a pejorative perspective towards rhetoric arguably remains dominant. In this chapter, we therefore begin by initially discussing the dominant pejorative understanding of rhetoric. The discussion then proceeds to position rhetoric as a means of critical analysis rather than a shorthand for obfuscation. It then proceeds to discuss rhetoric within the context of qualitative research, both as a focus of research and as a method of critique and analysis which can aid our understanding of the rhetorical discourses that pervade and construct contemporary workplaces.

RHETORIC'S PLATONIC HANGOVER

In relation to rhetoric, Alfred Whitehead's dictum that Western thought was but 'a series

of footnotes to Plato' (Honderich, 1995, p. 284) reminds us that any discussion of rhetoric needs initially to be placed within the context of Plato's early critique in dialogues such as *Gorgias* (1994) and *Protagoras* (1956). There Plato advances his arguments that rhetoric lacks substance and equates to manipulation, obfuscation and deception, a critique that has left a lasting impression on how rhetoric is understood both in the popular imagination and in much academic discourse. For example, as Corbett and Connors write, 'all the derogatory things that men [sic] have said about this art down through the ages have their root in Plato's strictures' (1999, p. 492).

Plato's strictures in part relate to his charge that rhetoric as a form of public address is tainted by flattery and corruption (Vickers, 1988) since those engaged in rhetoric could, through the power of persuasion, sway an audience towards believing that the weaker argument was the stronger. The focus of rhetoric on the contingent and indeterminate, as exemplified in the political or legal arenas, also contrasted with a Platonic theory of knowledge that was based around universal essences and truths (Cunningham, 1991). Plato therefore views rhetoric as form without content, and having no inherent linkage to truth and virtue. This perspective is still evident in much contemporary popular discourse that uses the term solely in a pejorative manner, for example, when referring to a politician's talk as rhetoric. Rhetoric is therefore often preceded by such adjectives as 'mere' and 'empty', or there is 'a typical semantic pattern in which "rhetoric" is equated with hypocrisy or falsehood, and reality with "truth"' (Charteris-Black, 2014, p. 3).

The 'Rhetoric and Reality' of Research

This semantic pattern, which has important research implications, is common across the social sciences. We see the instances of it in Table 4.1, which indicates the number of entries on the *Web of Science* database that have the phrases or terms 'rhetoric and reality', 'rhetoric or reality', or the individual terms 'rhetoric' and 'reality' in their title. While rudimentary it does show a continuing and upward usage of the phrases and terms.

These phrases/terms are used across a range of fields that include law, politics, social policy, education studies, international development, health studies and religious studies. One possible explanation for the increased use of these terms could be the impact of a neo-liberal discourse from the 1980s onwards. Against this background, writers may therefore be interested in contrasting the claims, the rhetoric, with how they materialize in practice, the reality. In that context, it is unsurprising that this Platonic semantic pattern that treats rhetoric as lacking substance when compared to the 'truth' of what is actually happening is evident in numerous research papers on business and management. For example, in the area of human resource management (HRM) writers have distinguished between the notion of 'soft' and 'hard' HRM (Storey, 1995). These are often aligned with 'rhetoric' and 'reality', whereby the literature often implicitly or explicitly equates 'soft' HRM with rhetoric, while 'hard' HRM is equated to reality. In simple terms, if a manager expresses the value of employees and extols the virtues

Table 4.1 Instances of terms rhetoric and/or reality in article titles

	1960s	1970s	1980s	1990s	2000s	2010–15
'Rhetoric and reality'	4	20	65	133	171	115
'Rhetoric or reality'	0	5	20	21	38	19
'Rhetoric' / 'Reality'	6	42	151	256	311	185

Source: Web of Science 10 December 2015

of their high trust employment relationship, this is likely to be labelled as the 'rhetoric' of 'soft' HRM. The 'reality', the outcome of the researcher's detached inquiry, often reports a misalignment between managerial words and actions involving various worker deprivations. We saw this made explicit in Truss et al.'s (1997) early appraisal of the 'hard' and 'soft' models of HRM whereby they explicitly equated 'soft' HRM with rhetoric and 'hard' HRM with reality. Their appraisal of whether management were adopting 'soft' control through commitment or 'hard' control through tight strategic control was summed up in the following passage: 'even if the rhetoric of HRM is "soft", the reality is almost always "hard", with the interests of the organization prevailing over those of the individual' (Truss et al., 1997, p. 70).

Although there have been calls to go beyond the naivety of the 'rhetoric and reality' dichotomy (Beech, 1998; Watson, 2010) referring back to Table 4.1 suggests these calls have fallen on deaf ears as use of the dichotomy has increased over the years. In recent years, for example, one of the research questions in Warner and Nankervis's paper on HRM practices in three Chinese MNCs asks 'How does their rhetoric about their HRM practices match the reality of their chosen systems and practices?' (2012, p. 64). Similarly, Razouk and Bayed make the bold claim that 'This study confirms that the SHRM [strategic human resource management] in France is reality rather than rhetoric' (2010, p. 1207). Finally, Rasche et al. in their examination of whether ethics education within MBA programmes is a case of rhetoric or reality report a gap between educational providers 'upbeat rhetoric around ethics education and their actual MBA curriculum' (2013, p. 71). We find a similar treatment of rhetoric within papers on careers (Fernando & Cohen, 2013), diversity management (Soldan & Nankervis, 2014), procurement (Flynn & Davis, 2015), operations management (Langstrand & Drotz, 2016) and new public management (McGeough, 2015). Nearly two

decades on, the treatment of rhetoric in these papers is little different to that of Truss et al.'s (1997) and conform to the point that:

In the popular 'rhetoric versus reality' style of HRM critical writing, 'rhetoric' all too often simply comes to mean 'false claims' about changes in managerial practice, claims which the researcher on 'HRM' is able to debunk by investigating the 'reality' of what is 'actually going on'. (Watson, 2004, p. 451)

Such studies tend to a view of rhetoric as manipulation and control (Hartelius & Browning, 2008). However, a problem with such a treatment of rhetoric, at least from the perspective of the 'rhetorical turn', is that although a manager may not be able to avoid using rhetoric when characterizing their employment management as positive, this does not in itself establish such talk as rhetorical. Neither would it be rhetorical if such celebratory words were established to be false. Instead such talk would be considered rhetorical were it considered an instance of strategic, instrumental discourse which sought to influence amongst other things the values, beliefs and behaviours of an audience (Gill, 1994). Therefore, whether such talk is positive, negative, true or false is not the essential characteristic of it being an instance of rhetorical discourse. The problem therefore with how 'rhetoric and reality' are typically juxtaposed is that it simply provides a Platonic account of rhetoric as, for example, bombastic, obfuscating or manipulative, reducing rhetoric only to what Booth (2004) has called 'rhetickery', rhetoric that is 'shoddy, dishonest communicative acts producing misunderstanding' (Booth, 2004, p. 11).

As noted earlier we can instead appreciate rhetoric as the use of language for purposes that can include persuasion (Aristotle, 1991), the generation of identification (Burke, 1969) and/or (mis)understanding (Booth, 2004). When adopting such a treatment of rhetoric, a manager would therefore be engaging in rhetoric whether they made claims

towards an employment strategy of commitment ('soft' HRM) or direct control ('hard' HRM). So, for example, if we were analysing the talk of Michael O'Leary, the often infamous and controversial Chief Executive of Ryanair, we would not deny he was rhetorical simply because he seems to 'tell it as it is'. When he reportedly commented that 'we all employ some lazy bastards who need a kick up the backside, but no one can bring themselves to admit it' (Hogan, 2013), the apparent absence of 'soft' HRM does not mean we would deny a use of rhetoric! As Watson writes such 'Plain speaking is simply a rhetorical alternative, not a turning away from rhetoric' (1995, p. 806). Thus, even the apparently plainest of statements carries normative assumptions and inferences which we require to deconstruct. In even the plainest of talk there is therefore no escaping rhetoric, a perspective that Grint considers self-evident when writing, 'How can an account of "reality" be provided except through rhetorical practices?' (1995, p. 157).

Of course, it might justifiably be argued that this position simply ignores how language use occurs in practice. These earlier writers are not after all replicating Humpty-Dumpty's refusal in Lewis Carroll's *Through the Looking Glass* to accept that you cannot simply make words mean whatever you want. Their intended meaning of the term *rhetoric* may therefore be perfectly justifiable since it can be argued that from the time of Plato's critique it has carried agreed semantic properties such as bombast, manipulation and emptiness. However, it can be retorted that this meaning ignores other long-standing semantic properties, many of which also emanate from antiquity. These include persuasion, argument, appeal, eloquence, contingency and deliberation. Thus, while the populist use of the phrase can be argued to be empirically and philosophically narrow, it also wilfully or otherwise ignores the long history of rhetorical theory and practice that has been systematized over three millennia. As Gill (1994, p. 39) summarizes

it, perspectives have been forwarded which view rhetoric as the art of persuasion, as the addition of ornamentation to language and as a truth creating mechanism that conceptualizes rhetoric in epistemological terms. The narrow, pejoratively focused use of the term also means that we potentially lose sight of important aspects of organizational processes and practices, as well as a means to analyse and understand these.

ORGANIZATIONAL RHETORIC

Although the rhetoric/reality dichotomy shows an on-going resilience, the argument of the previous section against such dichotomization can be understood in the context of Gane's claim that 'there can be no doubt ... that there is a considerable interest in the revival of rhetoric more widely across the social sciences' (1989, p. 127). For example, this revival was evident in long established and important work that adopted a rhetorical perspective within the three major social science disciplines of economics (McCloskey, 1998), sociology (Edmundson, 1984) and social psychology (Billig, 1996). In each of these texts the writers establish how their disciplines are rhetorical endeavours that can be rhetorically analysed to show how they operate as persuasive texts. These writers, while highlighting a value and utility to a rhetorical perspective at a disciplinary level, also remind us that writers need to appreciate that they cannot avoid using rhetoric in their own writing since they are attempting to persuade an audience to accept their position. How we craft and write up research is therefore an important point of consideration, which in business and management research is acknowledged by amongst others Watson (1994) and Easton and Aranjó (1997). For example, while in *In Search of Management* Watson (1994) argues that rhetoric is central to the talk of managers as they go about their search to make sense of their organizational

world, he expresses the view that the academic writer cannot escape from rhetoric. As he writes:

The book is a rhetorical product; it is a set of artfully crafted arguments in which I am trying to persuade my readers to accept the plausibility of my view of the world of management. It could not be otherwise. (Watson, 1994, p. 25)

In terms of the value and utility of rhetorical analysis to our understanding of organizational processes and practices, there is now a wealth of studies that attest to this. As with the social sciences more generally, organizational research has also been argued to have undergone a ‘linguistic turn’ (Alvesson & Kärreman, 2000) and within this rhetoric has a reasonably prominent place. While this has entailed a shift towards a focus on language in a constructive and constitutive sense, and towards a reliance and support for interpretive methods, Hoffman and Ford (2010) also forward two important reasons for studying organizational rhetoric: organizations are a powerful social force that can shape our identities, ideas, beliefs and behaviours; in turn, they are major producers of rhetoric. Analysis of this abundant rhetoric is therefore important if we want to understand or challenge the strategies they deploy to influence us. For example, organizational documents constitute one resource often freely available. These could include advertisements, written strategies and policies, company constitutions, press releases, executives’ statements and various company reports. Organizational documents, both virtual and non-virtual, are therefore potentially important and useful discursive resources that can provide data for conducting rhetorical analysis. This is particularly the case when documents are viewed not as a neutral account of organizational reality or what Prior (2008, p. 824) labels ‘containers of content’, but as being capable of constituting social organization. In that sense, documents can be considered as rhetorically designed to achieve something (Bryman & Bell, 2015). For

example, McDonald et al. in their qualitative rhetorical analysis of private school prospectuses argued that ‘The rhetorical strategies evident in school prospectuses illustrate how these “organizations of interest” use rhetoric to enhance their reputation and image and to leverage advantage in a competitive neo-liberal market’ (2012, p. 14).

While many qualitative studies within business and management have used a variety of documentary sources including government reports (Brown et al., 2014), executive letters (Griffin, 2009) and mission statements (Hamilton, 2005), other studies have however used semi-structured interviews (Domajnko et al., 2011; Hamilton, 1997; Holt & Macpherson, 2010; Huang & Tansley, 2012) or naturally occurring data such as recordings of group meetings or witness transcripts (Hamilton, 1999; Lowenhaupt, 2014; Suddaby & Greenwood, 2005; Whittle et al., 2008). In terms of how such rhetorical studies understand and critique such organizational rhetoric, in light of the diverse nature of the rhetorical tradition there is heterogeneity. While by no means exhaustive of the range of approaches, a number of qualitative studies focus upon Aristotle’s three rhetorical appeals of logos, pathos and ethos, while others draw on the work of particular twentieth-century rhetoricians.

Rhetorical Heterogeneity and Organizational Rhetoric

In terms of rhetorical studies that have drawn from the Aristotelian tradition we typically find qualitative studies that examine organizational processes and practices through his three rhetorical appeals of logos, pathos and ethos. The three appeals derive from the roles played in the communicative act by the text, audience and speaker. Logos refers to rhetorical appeals that are based around logic and the arguments that can be made when advancing a position. These arguments could involve the use of examples and/or what

Aristotle (1991) referred to as enthymemes. The use of examples involves a rhetorical argument based on inductive reasoning such that if something is true in a particular instance then it will be true generally. Enthymemes are typically viewed as a simpler and more everyday form of syllogism, such that a withheld premise and/or conclusion is required to be completed by the audience. For example, advertising straplines often operate on the basis of enthymemes as they require the consumer to fill in missing elements. The appeal of pathos involves the speaker or text's effect on the emotions of an audience. The intent is to elicit an audience emotion and is partly premised on the notion that our emotions affect our judgements. In essence pathos creates a mood music (Hood, 2000). Finally, ethos is based on how the audience perceives the character of the speaker and is typically generated through a narrative that seeks to show good will, good sense and strong moral character.

Qualitative studies adopting the three appeals include the work by Beason (1991) on business speeches, Hamilton (1997) on devolving payment systems, Holt and Macpherson (2010) on entrepreneurial sense-making, Brown et al. (2012) on institutional change and Heracleous and Klaering (2014) on Steve Jobs' leadership. For example, Brown et al. (2012) analyse the three appeals in their study on how the case for institutional change is made through rhetoric. The rhetorical analysis is conducted on a report advocating separate care arrangements for the young, disabled and frail elderly from the Australian Senate Committee, an issue that generated much criticism and debate. They argue such reports are implicated in power relations and at a micro-level they deploy rhetoric to persuade of their truth, plausibility, authority and verisimilitude. The central premise of the study is how rhetoric articulates institutional logics, i.e. frameworks for reason and belief. On that, they are interested in how the three appeals, 'the principal dynamics of rhetoric' (Heracleous & Klaering, 2014, p. 137),

promote specific logics. In addressing their research question, 'how does a text argue for institutional change?' (Brown et al., 2012, p. 298), their data analysis involved three stages, the third of which was an examination of the rhetorical strategies, the coding being based on the report's use of the three appeals. Coding for logos was on the basis of arguments relating to cost, efficiency or effectiveness, pathos on appeals to emotions such as individuals' fears for their future care arrangements and ethos on the basis of arguments centred around community values. Amongst other things, their analysis allowed them to show that contrary to a dominance of logos-based analysis, pathos and ethos are of greater significance than previous studies suggest. This implied that when there are shifts of dominant logics, moralizing and emotion-evoking rhetoric needs to be carefully scrutinized. More broadly their study justified a greater attention on rhetoric's role in institutional change.

While it is unsurprising that Aristotle's pre-eminence means that his work has been central to many rhetorical studies, there is also work that has drawn from more contemporary rhetoricians such as Kenneth Burke and Stephen Toulmin. For example, Walker and Monin (2001) examine a company newsletter through Burke's concept of the pentad in order to analyse an organizational event, Case (1999) draws from Burke's dramatism to analyse the rhetoric of various textual material on Business Process Re-engineering and Whittle et al. (2008) use Burke's work on rhetoric and identification to analyse a segment of naturally occurring talk in their study of rhetoric's role in organizational change. Each of these studies illustrates the potential of Burke's work to explore situational complexities, analyse the ambiguities of multivocality, demystify managerial doctrines and show the contradictory identifications that actors employ in particular situational contexts. In relation to the work of Toulmin, studies have drawn from his argument structure developed in *The Uses*

of *Argument* (Toulmin, 1958). For example, Hamilton (1999) deployed it within the context of naturally occurring talk to understand the arguments of a joint consultative committee, Peters et al. (2011) through interviews and documentary analysis to develop a framework to evaluate knowledge claims and Gold et al. (2002) through interviews assessing how incorporation of Toulmin's work into a university personal development module aided critical thinking.

Finally, a stream of research on organizational rhetoric has focused on various rhetorical tropes. Tropes involve a transference of meaning and create a deviation from the supposed proper meaning of a word(s) and rhetorically it is done in order to create an effect on an audience (Rowe, 1997). Widely used tropes include phrases such as 'surfing the web', 'getting the sack', 'let's touch base' or 'thinking outside the box'. While there is a vast array of tropes, writers such as Burke (1941) have referred to the 'four master tropes' of metaphor, metonymy, synecdoche and irony. Metaphor involves the substitution of one thing by something different, for example, perceiving organizations as machines, prisons or brains. Metonymy substitutes an attributive or suggestive meaning for what is meant such as when the term Wall Street is used as a reductive term for the US financial system. Synecdoche involves an intra-domain representation of a part for the whole or vice versa. A part-whole synecdoche is the use of the term 'hired hands' to represent workers while a whole-part synecdoche would be 'Apple cuts 1,000 jobs' to represent the individual decision-makers. Lastly, irony involves the conveyance of a contrary meaning. We can read verbal irony in Bell Telephone's advert strapline 'sure you could live without Yellow Pages (or without newspapers or automobiles or clocks)' (Corbett & Connors, 1999, p. 406), while situational irony is apparent when there is a clear disjunction between a product and the images used to advertise it as was often seen in tobacco advertising. While Pinto's (2016)

analysis examines *The Icehotel* through each of the four master tropes, and Watson's (1995) qualitative study goes 'hunting the tropes' in a dialogue between two managers, many qualitative tropological studies often focus on a single trope. For example, Hamilton (2003), through use of semi-structured interviews, analyses how synecdoche can help us understand how employment relations are conducted, while Musson and Tietze (2004) examine metonymy through an ethnography related to talk about an organization's physical place and space. Such studies, which typically identify and analyse the trope in talk and text, help us appreciate how rhetoric's aims involve using and playing with language in part to make claims more persuasive. It also reminds us that language is not neutral, but in relation to whatever event or phenomenon are being examined, there are multiple meanings. Tropes are therefore important because their capability for transference and deviation can establish meanings that are new, creative and innovative (Keith & Lundberg, 2008). In an organizational context they are therefore part of how meaning is made and their analysis also aids our understanding of their connection to wider, institutionalized discourses (Tietze et al., 2003).

Doing Rhetorical Analysis: An Example

Following on from discussing qualitative studies on organizational rhetoric, in this part of the chapter I examine how rhetorical analysis can be conducted on naturally occurring talk within the context of industrial relations. As Whittle et al. (2008) note, naturally occurring data is particularly suited for studying organizational rhetoric. While there are potential limitations related to the quality of the audio-recording and the researcher's choices and interpretations in relation to what and how analysis is conducted, a complete and accurate recording of a real-time event can be captured. This can ensure

authenticity and a high degree of validity. Following transcription, detailed analysis of participants' rhetorical discourse is then possible. In a manner similar to Brown et al. (2012) and Heracleous and Klaering (2014), the analysis here has its roots within Aristotelian rhetoric as it rhetorically analyses text through identification of the three appeals of logos, pathos and ethos.

The piece of naturally occurring talk was recorded during fieldwork I conducted within a UK healthcare organization and involved a management and trade union pay negotiation. At the time of the negotiation the staff within the organization were either on a nationally negotiated or a locally negotiated contract of employment. The former were generally long serving staff, the latter more recently employed staff. Staff on national contracts had already received an annual pay rise and the negotiation discussed below applied only to those on a local contract. In Bitzer's (1968) terms this is a rhetorical situation, since there is an exigence or problem to be resolved and rhetoric is one means to potentially achieve resolution. It can also be considered from a rhetorical perspective since negotiation within a collective bargaining context has long been considered to involve persuasion (Martin, 1992; Singh, 1992). For example, as Kirkbride and Durcan put it 'rhetoric and argument are obviously a key part of the whole negotiation and bargaining process' (1987, p. 7).

In Aristotelian rhetoric, a pay negotiation would be illustrative of the deliberative genre of oratory. One of the three genres identified by Aristotle (1991), it contrasts with the judicial and epideictic genres. The judicial genre was associated with the legal arena and concerned courtroom pleadings over past events that were principally related to a person's innocence or guilt. Epideictic or ceremonial oratory was primarily associated with praising or condemning individuals as exemplified in funeral and victory speeches. Deliberative oratory was originally associated with the political arena and concerned debates relating

to public policy. It was therefore concerned with what was the best future policy or course of action. Amongst other things, 'deliberative reasoning addresses questions of the expedient use of time, money, and other resources' (Herrick, 2001, p. 79).

The extract of talk occurs early in the pay negotiation and involves talk from the organization's Human Resource (HR) and Finance Directors. It begins with the opening statements from the HR Director, which set out constraints that limited what the organization was able to offer for that year's pay increase:

HR Director: Okay. This year for September for Trust staff, I mean, we're looking at what sort of increase the Trust can afford and I think, you've had all the paperwork and basically you've had the purchasers' plans as well, which state the money that they're going to give us. You've got sheet one, this sheet one, and that basically tries to put all that information together, all together down in as few headings as possible, so you know exactly how much money, and just at this moment, [the Finance Director] will take us through that, alright?

The documents referred to were provided by the management side. The HR Director's points concerning the provision of these documents could be an appeal based on both ethos and pathos. That is, he could be projecting good character in providing the relevant documentation for the union side. Such good character could emanate from not trying to deny related documents and information to the union side. This action might also evince pathos through attempting to put the audience in a receptive frame of mind so ensuring that the meeting began on a positive note. The HR Director's central point focuses on the constraints that the organization faces. This is presented in the form of an enthymeme, which together with the example forms the two elements of logos (Aristotle, 1991). While the enthymeme, a form of rhetorical deduction, often involves suppressing a premise(s) or conclusion of an argument on the basis that an audience is capable of filling in the missing elements, they are also to be understood as being used in situations of

indeterminacy rather than certainty (Cunningham, 1991). The key enthymeme in the above extract is along the lines that 'the level of pay rise that the organization can afford is limited because of what they will receive from the purchasers of healthcare'. Not stated but implied is a missing premise that if they receive a low revenue from the purchaser then only a low pay rise will be possible. The rhetorical strategy is therefore to deflect responsibility for such an outcome onto a third party as there appears to be what Winkler (1974) some time ago referred to as a ghost at the bargaining table. This allows the HR Director to advance both a rhetoric of affordability based around circumstances and a rhetoric of transference. Rhetorically the HR Director in a pre-emptive manner seems to be trying to convince them that any possible objections they might have to what management will propose as a pay award is the responsibility of the external funding bodies.

The Finance Director then begins to talk in relation to the organization's financial position and what the pay award amounts to:

Finance Director: What we started off with was the actual reserves that had been made available to us by the various health authorities. With the initial reserves that we've managed to keep on one side for purposes of inflation, that's the total that we have from all the various health authority purchasers, and that's the grant in respect of inflation. And what we've done to that is reduce it by the various pay awards as they come through as applicable to staff who are on national negotiations. What we've then done is apply to that a 3% rate for staff on local conditions of service.

The situation here looks relatively straightforward. The organization receives money from various health bodies as part of a contracting process. The organization then reduces the reserves by the additions required under the pay award for that year. In his talk, there is a continuing sense of externalization as the Finance Director's talk is also constructed through a rhetoric of transference. The Director's argument is that the organization can pay a 3 per cent pay rise because of

the financial settlement from the purchasers. Implied within this again is the contention that the organization cannot pay above what is given by the purchasers. These third parties are therefore established as the principal reason behind the level of pay offer. The Finance Director, in similar fashion to the HR Director, presents the organization as bound by circumstances that mean it is impossible for them to pay beyond what they receive from their contracts. In terms of further rhetorical appeals the Director's rhetoric of transference also projects an emotional appeal as he argues that the local managers are hamstrung in what action they can take vis-à-vis the level of pay rise they can set. The Director's rhetoric of transference also ironically suggests the twin notions of control and centralization. That is, both Directors were keen advocates for localizing pay settlement arrangements and supported a shift away from nationally negotiated contracts. From interviews conducted with them, they had expressed the view that it would benefit the organization through establishing local control. Yet here in a contrary manner their rhetorical strategy is to project the local organization as possessing limited ability to make choices in relation to the pay uplift. Contrary to the claims they were known to have made for the benefits to local pay bargaining, the talk of both Directors exhibits no local responsibility on their part and instead scapegoats responsibility onto third parties.

Following the Finance Director's statement offering a 3 per cent pay rise, the HR Director proceeded to outline various options that the management had considered in relation to the offer:

HR Director: What we looked at as well is various options as well, what would staff want, would they want additional annual leave days? So we costed that up, so if there was a lower increase in the rate of pay then we said, give them say an additional two days leave.

In terms of persuasive discourse, the HR Director's comments on the possibility of

additional annual leave to make up for a lower pay award involves an appeal through ethos as a sense of good character seems to be projected through his stated concern with what staff might prefer. He evidences this through forwarding the example of extra holidays as something that staff might want. The use of the first person personal pronoun *we* might also suggest that the management side was united in trying to think of possible additions which could improve the overall award. The ethos is also extended through the reference to action in the form of actually costing the effect of additional annual leave in light of a lower percentage pay award. While the HR Director had suggested the possibility of different options, he goes on to repeat the offer stated earlier by the Finance Director:

HR Director (cont.): But I think, it was generally felt under the circumstances because our leave arrangements are very generous anyway, that staff would prefer to have the money. So all that being said, the preferred option was, so, well that's the money on the table, it's 3 per cent that we've got available for pay. Now if you wanted to divide it in some other way, we're quite willing to look at that, whether you wanted...

When the HR Director commented upon the generosity of the organization's holiday arrangements there was laughter from the trade union members. The possible hostility or disbelief that such laughter might suggest may mean that successful persuasion becomes more difficult. However, it does not mean that the situation is non-rhetorical since the Director is still attempting persuasion or what Bryant referred to as the 'process of adjusting ideas to people and people to ideas' (1953, p. 413). At the beginning of the above passage is therefore an enthymeme that could be expressed as: 'staff would prefer a cash-based pay rise because the organization's holiday entitlement is already very good'. Implied is a belief that if people have enough of one thing they will choose something else. Any staff preference would presumably also need to be considered in the light of what had

been the pay awards in the previous few years. The Director's rhetorical strategy also seems to be to draw out a relationship on the basis of consequent and antecedent. That is, the relationship between satisfaction with holiday arrangements and desire therefore for a pay rise is not one of causality. Instead, satisfaction with holidays is an antecedent, which to the Director the consequent of which is not more holidays, but instead a different option, in this case more cash. We then hear further confirmation that the 3 per cent offer is not open to negotiation. He also reaffirms the possibility to examine the ways in which the pay award can be broken down. We therefore read an appeal to ethos in which the management's good character is projected. This is expressed in an enthymeme: if the unions want the total pay uplift divided differently, the management are willing to consider that. Contained within this is the contention that the management will listen to what the trade union preference is. This does of course need to be heard against the continuing refrain that there is a maximum uplift available due to the actions of the purchasers.

Across this short extract of talk the two senior managers' rhetoric seemed to project both a bilateral and unilateral form of rhetoric: the former involves one side trying to do something *with* the other side, while the latter involves one side seeking to do something *to* the other side (Conley, 1990). The bilateral rhetoric could be argued to be instanced through the management claim that they were willing to listen and work with the trade unions on what the composition of the pay award should be. The unilateral form could be instanced in management's unwillingness to countenance a pay award beyond a maximum uplift of 3 per cent. We seem here to have both pluralism in the form of a bilateral rhetorical discourse, and unitarism in the unilateral rhetorical discourse of a managerial prerogative. The rhetorical analysis can therefore be argued to show competing approaches operating in tandem. What is

also clear is that the negotiation, while constructed through rhetorical discourse, is also material as there are potentially important economic and political matters at stake. The negotiation concluded later with the trade union agreeing to ballot their membership on a 3 per cent pay uplift, composed only of a cash uplift. The trade union had felt this was the most appropriate composition of pay award since they claimed that in the previous years the pay awards had lost ground with the cost of living. Here we are not contending that the agreement with the management side's pay offer was not also the outcome of power, but that management power was refracted in part through their rhetorical discourse.

Although these extracts of talk in the context of an industrial relation pay negotiation may appear quite bland, innocuous and underwhelming, their very mundaneness highlights the pervasiveness of rhetorical discourse. So what initially might be considered a relatively bland and innocuous piece of talk is actually rich with rhetorical strategy and appeal. The use of naturally occurring data also allows us to appreciate that in the context of a pay negotiation, talk will most likely be quite spontaneous. Thus, although the two sides to the negotiation may have prepared their cases beforehand, the actual talk will be more extemporaneous. The talk also allows us to read the social ordering of organization and business. For example, the rhetorical analysis has drawn out ideological dimensions in this case related to the managerial prerogative, as well as a shift to a more market-based orientation on the part of the management. A rhetorical analysis enables us therefore to appreciate the pay negotiation as an event but also how text and talk construct understandings of such phenomenon. The identification of even such apparently mundane talk as replete with rhetoric also highlights just how central rhetorical discourse is to organizational processes and practices, in turn justifying a focus on rhetoric.

CONCLUSION

In this chapter the focus has been on rhetoric. Rhetoric, a long-standing discipline that has its Western roots in the work of the sophists, Plato and Aristotle, was for a long period at the centre of a liberal education and integral to a citizen's education. While considered important and potentially powerful, it has also been derided and condemned. However, here the argument has been that when appreciated as persuasive discourse it is central to organizational processes and practices. Thus, it would seem difficult to engage in practices such as recruitment and selection, negotiation, selling, advertising, advocacy or leadership without some use of rhetoric. In terms of research, rhetoric also plays a significant role. As researchers, we write and talk and when doing so are reliant on rhetoric as part of the shaping and crafting process aimed in part at persuading an audience that our research has merit and deserves to be presented and published. Beyond the process of crafting research output, rhetoric is also a focus for and means of analysis. Rhetoric can therefore refer to a practice and any resulting product as well as being the means to analyse both of these. In that sense, it is both the object and subject of analysis. It is therefore both a practice and a means for conducting qualitative analysis, for example, through tropological or argument-based frameworks. In conducting qualitative research while 'producer-free' data in the form of naturally occurring talk or organizational documents may be particularly appropriate, semi-structured interviews can also be used, for example, as a means to analyse how actors rhetorically shape meanings in relation to events or phenomenon.

While the chapter has not set out to overlook the view that rhetoric can be studied to analyse abuses of power, here it has been argued that we should not restrict ourselves only to a focus on 'rhetickery'. Instead, given the abundance of rhetoric, we should also be willing to engage in serious rhetorical

analysis of that rhetoric, whether its purpose is seemingly noble or base. As Martin (2014) argues, rhetoric is often dismissed because it is not based on eternal truths or certainty. It therefore potentially threatens consensus and order. Rhetorical analysis can therefore be an important means to reveal the conflicts that underlie human association as alternative views and argument can be made that can destabilize and challenge the dominant ideology. This is particularly important since the texts and images of business and management practice are more available and abundant than ever before, highlighting the recurring relevance for the need to understand persuasive discourses. That organizational actors deploy arguments and ideas in a situated manner to define, name, advance, contest or challenge seems to make clear the importance of analysing the rhetoric that is central to such activity.

Stories and Narratives

Yiannis Gabriel

INTRODUCTION

Storytelling has been part of human life at least for as long as we can think of humans as inhabiting a culture. Stories, sagas, myths, fables, tales, legends, narratives of every kind, are the yarn from which culture is woven. They are what gives people a past and a future, what celebrates their achievements, what gives meaning to their sufferings, what organizes their experiences and, often, drives their actions. Etymologically deriving from the Greek *eidenai* (to know), story has a legitimate claim as the fundamental unit through which knowledge has been produced, shared and passed from generation to generation over the centuries.

The role of story as the elementary particle of knowledge and meaning has been complemented and maybe usurped by the rise of history and science, two relative newcomers. Somewhat at odds with stories that emerge spontaneously out of the depths of human experience, conscious and

unconscious, history and science claim to emerge systematically, *methodically*, following certain procedures of verification, confirmation and systematization. Where is the evidence? asks theory, a question of modest importance to story. History and science, as disciplines rooted in facts, call for a methodology to determine how empirical material (i.e. the material generated by our senses from the outer and inner worlds) may be systematically collected, organized, analysed and tested if it is to provide the firm ground for rigorous explanations, generalizations and predictions.

There was a time in the earlier part of the twentieth century when major thinkers believed that modernity, with its emphasis on information, science and facts, had sounded the death-knell on storytelling (Benedict, 1931; Benjamin, 1968). Stories, it was thought, were doomed to become museum pieces, relics of a pre-modern universe. This view now seems itself rather quaint, as narrative has become a major part in many

contemporary discourses, not least in politics, management, ethics, culture, the arts, the media and so forth. It is even claimed sometimes that we now inhabit a narrative universe, where various storylines emerge, merge, interact, compete and disappear, seeking to sustain meaning, prop up institutions and motivate action.

In organizations too, stories and narratives have attracted considerable attention in the last 25 years, as part of a narrative turn (e.g. Czarniawska, 2010; Georgakopoulou, 2006b; Polkinghorne, 1988), a growing belief that narratives do not merely 'happen' in the world but actually constitute the way that the world, including organizations, public policy, science and politics are constructed and experienced. As a result, organizational theory, along with business and management studies, have deployed a variety of research methods to examine stories and narratives 'scientifically', treating them as raw materials for theory. This chapter provides an overview of the major approaches in this area, singling out some of the points of agreement and disagreement.

STORIES, NARRATIVES, TEXTS AND DISCOURSES

As the narrative turn is played out in different fields of study, the meanings of four key terms, namely, story, narrative, text and discourse, have multiplied, merged, overlapped and fragmented. Attempts to order or police their usage through definitions have not been very successful. Neither maybe should they be, since one of the qualities of the narrative turn has been a move away from adjudication by definition. Terms, concepts and so forth are approached not as immutable essences, but as elements of language in action. What constitutes a story may change as culture moves from an oral age, where every story is spoken, to a written age, where stories are written and illustrated, to an electronic age of

SMS texts and images, tweets and so forth (Kearney, 2002). Thus, stories and narratives are used interchangeably by some authors (e.g. Polkinghorne, 1988). Others, like Boje (1991, 2008), aware of how individual stories are often silenced by official narratives, restrict story to living, actually verbalized accounts, and treat narratives as larger formations that emerge from fragments of stories, official reports, theories, formal statements and so forth. In line with Lyotard (1991 [1984]), some narratives may then be viewed as 'grand narratives', such as the narrative of emancipation or the narrative of progress, and others as 'small narratives', local, personal and frequently fragmented.

My own preference is to treat stories and narratives as special types of text, and stories as a special type of narrative. Many things can be viewed as 'text', as long as we can 'read' meaning into them. These include catalogues, inscriptions, labels, PowerPoint slides, lists, recipes, logos, scientific hypotheses, theories, neurotic symptoms, buildings, archaeological remains, clothes, musical instruments and so forth. Narratives can be viewed as particular types of accounts involving temporal chains of inter-related actions undertaken by characters with purposes, emotions and desires, or events that affect such actors positively or negatively. Narratives are then no simple signs, icons or images, still less are narratives material objects and physical events, all of which may, in deference to Barthes (1977 [1966]), be regarded as texts but not narratives. Narratives, by contrast, require verbs denoting what characters did or what happened to them. They are not mere snapshot photographic images, but require sequencing, something noted by most systematic commentators on narratives (Bruner, 1990; Culler, 2001 [1981]; Czarniawska, 1997, 1999; Labov, 1972; MacIntyre, 1981; Polkinghorne, 1988; Ricoeur, 1984; Van Dijk, 1975; Weick, 1995). As we move from narrative to story we are forced to recognize the increasing importance of plot, which 'knits events together', allowing us to understand

the deeper significance of an event in the light of others (Czarniawska, 1999, p. 64f; Polkinghorne, 1988, pp. 18–19). In line with Ricoeur and following a tradition of reasoning that goes back to Aristotle's *Poetics*, we may then view a story as describing:

[a] sequence of actions and experiences done or undergone by a certain number of people, whether real or imaginary. These people are presented either in situations that change or as reacting to such change. In turn, these changes reveal hidden aspects of the situation and the people involved, and engender a new predicament which calls for thought, action, or both. This response to the new situation leads the story towards its conclusion. (Ricoeur, 1984, p. 150)

What characterizes this definition is a central ambiguity (Czarniawska, 1999; Gabriel, 2000) – the characters and events in the plot may be real or imagined, they can be the product of experience or fantasy. This ambiguity gives stories a unique combination of two qualities, that of having a plot at the same time as representing reality. Stories purport to relate to facts that happened, but also discover in these facts a meaning; they are welcome or unwelcome, good or bad, accidental or deliberate, ordinary or exceptional. In short, stories are not 'just fictions' (although certain stories may be fictional), neither are they mere chronicles of events as they happened. Instead, they represent poetic elaborations of narrative material, aiming to communicate facts as experience, not facts as information (Benjamin, 1968). This accords the storyteller a unique narrative privilege, poetic licence, that enables him/her to maintain an allegiance to the effectiveness of the story, even as he/she claims to be conveying something 'truthful'.

This poetic licence that makes stories suspect as reliable 'data', is the very reason why many researchers are currently drawn to them. Stories may not provide accurate or reliable accounts of actual events, but they offer powerful insights into the *meaning* accorded to such events. They then reveal the judgements that different people pass on events they

experience, the emotions which such events fuel and the desires which are gratified, frustrated or silenced by them. Narratives, in their great variety, which includes 'grands récits', 'petits récits', meta-narratives (Lyotard, 1991 [1984]), counter-narratives (Bamberg, 2004), myths, world-views, ideologies and so forth, can then be viewed as larger meaning-creating and meaning-sustaining schemes that mould human experience and drive human action. In this way, we can envisage numerous stories actually being told, alluded to or even silenced (Izak et al., 2015) coagulating or coalescing to constitute or to challenge a particular narrative. Overlapping stories with similar *storylines* (for example, older employees being treated with disrespect by a particular employer or by many employers) can then be viewed as contributing to a narrative ('old employees are viewed as a cost by organizations which seek to get rid of them' or even 'old people are treated with disrespect'). Such narratives can then be seen as supporting, challenging or simply existing side by side with other narratives or prompting counter-narratives of their own.

A wide range of organizational and business phenomena can be explored using stories and narratives. These include culture and politics, innovation, entrepreneurship and resistance to change, discipline and disorder, leadership and followership, group dynamics, alliances and conflicts and so forth (see, for example, Boje, 1991; Gabriel, 1991a; Rhodes & Brown, 2005). Thus, *even* researchers adhering to a predominantly positivist paradigm, have found ways of identifying, collecting and analysing stories and narratives as a means of developing their research agendas. Interpretive researchers, for their part, have hugely enlarged their repertoires of working with stories and narratives, using the resources of discourse and narrative analysis (Alvesson & Kärreman, 2000; Fairclough, 1992; Georgakopoulou, 2002; Hollway & Jefferson, 2001; Kohler-Riesman, 1993; Labov & Waletzky, 1967; Phillips & Hardy, 2002; Reed, 1998), often

imported or translated from other disciplines, including ethnography, psychoanalysis, literary criticism and media studies.

The result of these developments has been a general legitimization of the use of narrative and storytelling in organizational research and its proliferation in a wide range of inquiries. It is now quite common to encounter doctoral dissertations deploying a storytelling or narrative methodology with no fear of embarrassment. Reputable journals regularly publish articles in this area. Thus, by February 2016, *Organization Studies* had published 43 articles with *story* or *storytelling* in the abstract, 61 articles with *narrative* in the abstract and 652 articles with *narrative* in some part of the text. The corresponding figures for *Organization* were 39, 53 and 456, and for the various *Academy of Management* publications 68, 32 and 952. Some of these publications deploy storytelling as a major part of their research methodology, while others may use narrative analysis and storytelling as part of a wider range of methodological and conceptual scaffolding. The next sections give an overview of how stories and narratives have been theorized in organizational and management studies before examining some methodological issues raised by their application.

STORIES, NARRATIVES AND ORGANIZATIONS

One of the main reasons for studying narratives and stories in organizations has been a recognition, since the 1980s, of the importance of culture in organizations (Allaire & Firsirotu, 1984; Barney, 1986; Frost et al., 1991; Pettigrew, 1979; Schein, 1985). Far from being cultural deserts, organizations came to be viewed as entities with a more or less rich cultural life, where many if not most practices and processes were culturally rather than instrumentally driven. The study of culture had, of course, been the terrain of

anthropology and ethnography, with their theories of kinship systems, mythologies, beliefs, rituals and so forth. As scholars of organization turned their attention to culture, organizational rituals, sagas, taboos and other cultural elements came under close scrutiny.

Paramount among these were narratives and stories, texts that in their different ways are pithy and memorable. Set against a backdrop of information overload that characterizes much of organizational life, narratives and stories can be approached as rich depositories of meaning helping people make sense of their experiences and motivate their actions. Several early contributions to the study of stories and narratives in organizations noted how they act as cognitive maps assisting sensemaking (e.g. Wilkins, 1984) but also how they can be instruments of managerial control over organizational participants (Wilkins and Ouchi, 1983). In an article that observed many similarities between organizational and mythological narratives, Martin et al. (1983) argued that a relatively narrow range of storylines circulates in most organizations, offering *retrospective* rationalizations for the actions of significant actors by attributing blame and credit. Martin and her colleagues propose a 'uniqueness paradox' according to which every organization's narratives make a claim to uniqueness (the uniqueness of its culture, its leaders etc.), even though they fall into highly formulaic patterns.

Scholars of organization were quick to realize the persuasive qualities of stories, especially as management gurus and consultants were picking them up at around that time (e.g. Peters & Waterman, 1982) and there is a distinct managerial emphasis in this research (e.g. McConkie & Boss, 1986), the argument being that managers could rely, at least in part, on effective storytelling to disseminate their ideas, initiate change, instil conformity and overcome resistance. There is now a very healthy literature on how managers and leaders may use stories to enhance organizational effectiveness, implement change or motivate

their followers (Armstrong, 1992; Denning, 2005; Salmon, 2010).

Against this background, Boje's (1991, p. 106) contribution broke new ground. Boje argued that an organization can be viewed as 'a collective storytelling system in which the performance of stories is a key part of members' sense making and a means to allow them to supplement individual memories with institutional memory'. What was original in Boje's argument was that most storytelling in organizations is fragmented, terse and abbreviated. There is no implicit or explicit 'agreed text' (p. 106) to these stories, but only variants surfacing in unique performances. Stories form part of a noisy, plurivocal and polysemic universe where they surface, they collide, they are often contested and eventually disappear. Many wither away while still-born. Defining a story as 'an oral or written performance involving two or more people interpreting past or anticipated experience' (p. 111), Boje emphasized the multi-authored character of organizational storytelling, where different participants contribute different narrative elements, amplifying some lines and contesting others, while, by contrast, de-emphasizing the importance of plot. Boje's approach thus became part of a wider problematizing of 'story' in post-modern theorizing that questioned the centrality of plot and character in narratives and has tended to broaden the concept of story to include many conversational texts, not necessarily having beginnings, middles and ends (e.g. Georgakopoulou, 2006a, 2006b; Kearney, 2002).

In subsequent works, Boje developed his postmodern approach to organizational narrative through an exploration of how corporate discourses silence and marginalize some narratives while privileging others (Boje, 1995). Concerned about attempts by powerful corporations to silence stories that they object to, Boje proposed the concept of 'antenarrative' – a 'fragmented, *non-linear, incoherent, collective, unplotted*, and pre-narrative speculation, a bet ... a wager that a proper narrative

can be constituted' (Boje, 2001, p. 1). It is within this antenarrative space that marginalized voices can be found, frequently not able to articulate themselves as full narratives or stories but capable of doing so under the right circumstances. Boje's later work shows a much keener awareness of the political ramifications of narratives and acts as an important corrective to the 'stories as sensemaking' approaches that all too frequently overlook power and politics.

Stories as sensemaking have now become part of the orthodoxy in studies of organizations. As Weick (1995, p. 129f) argues, stories aid comprehension by drawing connections between causes and effects, by offering mnemonic landmarks of earlier events and by conveying shared values and assumptions. They highlight what actions are rewarded and what are punished, where trouble lies and what the future may hold. What is lost in this approach, sometimes, is the deeper meaning of a story. Why do some stories prove very much more powerful than others? Why does a story mobilize and enthrall people while another leaves them cold? All too often, a story may assist sensemaking while actually destroying meaning. 'You don't have to be mad/crazy to work here but it helps', one of the commonest organizational storylines, highlights how people make sense of the absurdities and irrationalities of corporate life, their very meaninglessness coming to the rescue of sensemaking. Thus, in a very thought-provoking contribution, Pelzer (2004) has argued that sensemaking is a surrogate rather than a prop for meaning. When a large part of everyday life is reduced to meaningless routines, when meaning loses its anchors, we turn to sensemaking as its inadequate replacement.

A different use of stories and narratives addresses more directly their role in organizational politics and conflict. That narratives play an important part in all politics in tangible as well as intangible ways is now widely acknowledged (Bevir, 2011; Bevir and Rhodes, 2015; Rhodes, 2011). Anyone

who has worked in an organization knows that many, if not most, narratives are about politics – about conflicts and alliances, about deals and double-deals, about victories and losses and so forth – or indeed they are part of politics. In this way, stories may be used as instruments of persuasion and even brutalization, becoming depositories of disciplinary power. ‘This is what happens to people who break rules or act in this way’ such stories proclaim. The ‘chastising effect’ of *comic* stories which ridicule particular groups has been known at least since Hobbes (1962 [1651]) and Bergson (1980) (for organizational contexts, see, e.g. Collinson, 1988; Davies, 1988; Linstead, 1985).

Tragic stories, for their part, demonstrate the wide range of trouble that organizational life can visit on individuals and groups, including humiliation, insult, bullying, oppression, discrimination, demotion and dismissal, and offer various warnings of what is to be avoided and what is to be emulated. In my own work (Gabriel, 1991a, 1991c), I showed how stories told by conscripted soldiers in training camps acted as powerful instruments of organizational socialization and control, generating anxiety and fear, and dampening critical and rebellious attitudes. Neither should it be thought that such stories are limited to a few particularly oppressive organizations. Theodosius (2008) offers numerous examples of how cliques of nurses used storytelling as a humiliation or exclusion device to maintain unofficial hierarchies and privileges. Czarniawska (2008, p. 1034) has argued that such humiliation, far from being exceptional, is ‘standard organizational by-product, considered to be an unavoidable if regrettable effect of power’. Sims (2003), for his part, has shown that humiliation is experienced when stories of particular groups are systematically challenged, ignored or ridiculed. Stories can then be viewed as part of a disciplinary machinery in many organizations, silencing opposition, instilling conformity and spreading anxiety and fear.

This line of argument is consistent with various approaches which have postulated a decline of employee resistance from organizational life or, more generally, from the political and cultural lifeworld of late capitalism. In a curious way, many of the narratives discussed in organizational literature tend to be managerial, ultimately serving the interests of managerial control, or pluralist, coexisting often uneasily as different parties seek to legitimate their actions and interests (e.g. Brown, 2002). Stories by oppressed or exploited employees are often couched in terms of cynical distancing (e.g. Fleming and Spicer, 2003; O’Leary, 2003). What is less common are stories displaying a rebellious or defiant attitude, challenging managerial prerogatives or ridiculing bureaucratic irrationality and waste. Yet stories of resistance have been documented widely in organizational life (e.g. Brown et al., 2005; Humphreys & Brown, 2002; Karlsson, 2012; Mishler, 2005) and most persistently surfaced in my own fieldwork (Gabriel, 1991b, 2000, 2004b). Snowden (2001) has demonstrated brilliantly how stories that seem contrived to promote managerial agendas instantly prompt ‘anti-stories’ that puncture the official narratives and turn them into objects of ridicule and disparagement.

Between narratives of oppression seeking to enforce control and narratives of resistance which actively oppose them, I have argued that there is a class of narratives that neither promotes nor contests management controls, but rather seeks to bypass them. These are the narratives and stories which I assigned to the ‘unmanaged organization’, a kind of organizational dreamworld dominated by desires, fantasies and emotions (Gabriel, 1995). This unmanaged organization does not challenge directly the practices of power and management, but involves different attempts to evade them through spontaneous activities which may involve clever ruses, privately coded texts, noise, silence, graffiti, cartoons, whispers, nods, smiles, secrets, gossip, but above all narratives and stories – all of which seek to

reintroduce the claims of the pleasure principle in organizational life at the expense of the reality or performance principles (Marcuse, 1955).

NARRATIVES AND IDENTITY

In recent times, identity has emerged as something of a 'master signifier' in many areas of social and organizational studies (Alvesson et al., 2008). There are many reasons for this including its ability to mutate and fragment, to grow and shrink, to incorporate and shed elements and to become a terrain ripe for crises and struggles. Unlike related terms, like self and subjectivity, identity is not tainted by philosophical assumptions of sovereignty and rationality. It easily accommodates a social component while preserving the fundamental qualities of sameness and uniqueness across time.

Identity and its transformations seem well attuned to the fluid and porous qualities of late modernity (Coupland & Brown, 2012). In particular, today's organizations make ambiguous and contradictory demands on their employees. They frequently demand that they go beyond 'doing a job', by buying into their values, brand and narratives. At the same time, they fail to offer employees the security of stable employment, by constantly looking for opportunities to outsource and off-shore. The project of identity describes well the plight of the individual who is frequently on the move, who is often called to reinvent themselves, the individual who is free from an obligation of life-long loyalty to an employer (or anyone else for that matter) but who is expected to fully identify with his/her employer for indeterminate periods of time. The concept also ties in well with the ways that contemporary capitalism creates disciplined and self-disciplined employees who, in seeking to maintain their identities, go beyond the call of duty (Alvesson, 2001; Fleming, 2009; Fleming & Sturdy, 2011; Kärreman & Alvesson, 2001).

Organizational scholars have been particularly interested in exploring the intertwining of personal identity narratives and organizational narratives, one that may range from full identification to provisional or ambivalent identification, to total disidentification or distancing (Humphreys & Brown, 2002). Thus Thornborrow and Brown (2009) who studied British paratroopers found that the identities of these soldiers revolved around an idealized conception of the regiment. Their stories revolved around reminiscences of great and fun times they had had and found their way onto websites, documentaries and films about the regiment, sustaining a folklore of paratrooper heroism that reinforced the organizational narrative of the regiment's elite status. These stories were used to socialize and even 'test' new recruits and seamlessly embed themselves in their new-found identities. Studying a global consultancy firm, on the other hand, Costas and Fleming (2009) found that personal narratives consistently sought to distance themselves from their employer by embracing personal narratives of imaginary authenticity allied to narratives critical of their employer. Yet, these employees recognized that their putative 'real' identities were paradoxically unreal and foreign to their conformist organizational identities, a paradox explained by revisiting the concept of alienation.

In addition to personal identities, narratives have been viewed as instrumental in fostering and developing organizational and group identities. 'Shared' stories and narratives enhance solidarity and engagement, raising organizations above the level of machine bureaucracies, infusing meaning and life into them and, in the view of some authors, turning them into institutions, i.e. objects of value (e.g. Linde, 2009). Just as communities and nations need symbolically charged myths and stories to sustain them, organizations too need them to sustain and nurture them (Meyer & Rowan, 1977). We noted already Martin et al.'s (1983) 'uniqueness paradox', the narratives through which

organizations claim to be singular and unique. In this way, many organizations cultivate ‘foundation myths’, stories that mythologize the organization’s foundation, for example in the founder’s encounter with social injustice (Schwabensland, 2006) or the entrepreneur’s early experiments in his father’s garage. Such stories serve both a legitimating and an inspirational function (Lounsbury & Glynn, 2001), and are extensively relied on by consultants keen to strengthen the collective identities and energize the individual identities of their clients.

THE MYTHICAL DIMENSION IN NARRATIVES

If organizations can be viewed as cultures, it would follow that at least some of their narratives have mythical qualities. These were among the qualities that brought them to the attention of early organizational scholars, like Mitroff and Kilmann (1975). They highlighted the *epic* qualities that characterize many managerial stories, that lionize the manager as a hero capable of extraordinary deeds and achievements. Indeed, it is these mythical qualities that brought narratives to the attention of management gurus who have made epic stories of managers prevailing against the odds part of their stock in trade (Clark & Salaman, 1996; Collins, 2007). Several of the early contributions to organizational narratives also displayed a keen interest in myths, as ‘popular untruths’ (Bowles, 1989; Ingersoll & Adams, 1986; Rosen, 1984) that cannot be easily corrected by appeal to reason and facts. Since then, there has been a steady growth of scholarship on organizational mythologies, although there has been no general agreement about how a myth may be differentiated from stories and narratives.

The relation between story, narrative and myth, remains one of substantial disagreement and confusion among scholars. Many

scholars, following the classical formulation of Meyer and Rowan (1977) tend to look at myths as institutionalized narratives that accord legitimacy to organizations, their structures and practices. Others, however, including myself (Gabriel, 2000, 2004a) and Grint (2010) prefer to restrict the concept of myth to those larger than life narratives, possessing sacral meanings, revolving around unique deeds performed by great heroes and addressing the enduring mysteries of life, that as Barthes (1973) suggested, lose their historical bearings. They assume a cosmic or transhistorical significance whereas stories concern the realities of mundane everyday life, in all their commonplace regularity. Thus while a myth can be seen as part of *mythology*, a system of beliefs and narratives that has a cosmic dimension, a story can be seen more as part of *folklore* (in the sense that accountants, computer programmers and other professionals develop their own folklores).

The mythological qualities of organizational narratives have not attracted as much attention as their sensemaking, identity and political aspects, but there has been a steady growth of scholarship, culminating in Gabriel’s (2004a) and Kostera’s (2008a, 2008b, 2008c) edited compilations of mythological explorations of organizational stories. Bowles (1989, 1990), an early pioneer in this area, argued that as religious world-views are displaced by scientific and managerial ones, mythology loses its sacral associations and assumes, instead, secular analogues. Thus religious myths are supplanted by, among others, managerial myths; these may revolve around the great achievements of superheroes like Steve Jobs or the wicked deeds of supervillains like Kenneth Lay. Other characters that populate these myths may be shrewd tricksters, rescue objects, sleeping beauties, white knights (Hirsch, 1986), or even holy fools (Kets de Vries, 1990). Overall, however, Bowles was of the view that such managerial mythologies generally fail to rise much above ideology. As a result, they rarely assume the

cosmic significance of genuine myths and are quickly forgotten.

One way of linking organizational narratives with myths has been by seeking to identify various unconscious symbolic archetypes that reside in a collective unconscious of humanity expressing timeless anxieties and desires. Inspired by Jung's (1968) theory of archetypes, Moxnes (1998, 1999), has argued that the characters of organizational narratives enact deep unconscious roles drawn from a relatively small cast of twelve archetypal or 'deep' roles whose origin lies in the essential family – father, mother, son and daughter. Each of these roles is available as either a positive or negative version, matching the archetypes of the father as God or devil, the mother as queen or witch, the son as crown prince or black sheep, and the daughter as princess or whore. These deep roles recur regularly in organizational mythology, and real individuals come to occupy these roles in specific narratives, thus drawing on the symbolic power of the original archetype. A leader can then be experienced, after the father archetype, as benevolent God-like father or, alternatively, as a devil. Alternatively, he or she may be experienced (and feature in stories) as a prince (hero or clown), or indeed in any of the other deep roles. This archetypal approach into organizational stories and narratives remains somewhat undeveloped but contains many rich possibilities, if reservations regarding the idea of a collective unconscious can be addressed.

NARRATIVES, KNOWLEDGE AND LEARNING

A different approach to the study of organizational narratives treats them as a means of sharing knowledge, especially among people facing the same problems and concerns. Such groups of people are sometimes referred to as 'communities of practice' (Wenger 1998),

individuals who have complementary skills and outlooks. These can be occupational groups, like airline pilots, computer analysts and academics, but they can also refer to people sharing hobbies or interests, like plane spotters or amateur gardeners, or people who share particular problems such as medical conditions or forms of discrimination (Wenger, 1998).

Within communities of practice, the distinction between knowledge and action is diminished. Knowledge becomes inscribed in practices that are not the property of any one individual, and much of this knowledge is not scientific, assuming instead the form of *narrative knowledge*, which includes stories, recipes and direct accounts of experience. Learning from each other's stories was a crucial feature of ethnographic research carried out by Orr (1996) among photocopy repair technicians. Their stories of machine faults and idiosyncrasies provided a far more coherent and pliable guide and toolbox than formal manuals and instructions. Telling and listening to stories about fixing machines is also a means of celebrating the technicians' professional identity 'as masters of the black arts of dealing with the machines and of the only somewhat less difficult arts of dealing with customers' (p. 2). A study undertaken by Patriotta (2003) at a Fiat plant in Italy draws attention to the political dimension of narrative knowledge, emphasizing how problem-solving narratives can be viewed as 'detective stories' aimed at sharing social practices on how to deal with formal hierarchies and attributing or shifting blame.

Narrative knowledge, as it emerges from current scholarship in organizational studies, should not be restricted to a kind of traditional or 'folk wisdom', surrogate for scientific knowledge. Instead, it is increasingly argued that it is of vital importance for managers, professionals and even people working at the cutting edge of scientific discovery (Chia, 1998; Czarniawska-Joerges, 1995; Orr, 1996). In this way, physicians at a

conference may announce the latest scientific break-through in the treatment of diabetes, but in informal discussions may swap stories about the effects of particular treatments on particular patients. Far from being seen as the enemy of science, narrative knowledge may then emerge as its indispensable corollary (Tsoukas, 1998; Tsoukas & Hatch, 2001) – knowing the rules of the game is one thing, knowing how to play the game effectively is another.

RESEARCHING STORIES AND NARRATIVES: SOME METHODOLOGICAL ISSUES

In the previous sections we have considered how stories and narratives can be studied in relation to a number of interconnected themes – organizational culture and sense-making; politics, organizational conflict, power and resistance; individual, occupational and organizational identities; mythological themes and archetypes and their capacity to stir up powerful emotions; and the management, generation and sharing of knowledge. There are several other research themes and agendas that have been pursued through the exploration of stories and narratives, including emotion, innovation, entrepreneurship, gender, trauma and others. In all of these instances, stories and narratives are viewed by researchers as opening windows into organizational life that reveal aspects unavailable or inaccessible through other means, for example questionnaires or structured interviews. Qualitative researchers making use of stories and narratives frequently deploy them in combination with other research methods such as ethnographic research, semi-structured or unstructured interviews, observational methods, archival and picture research. We will now examine some of the common methodological issues raised by narrative and storytelling research.

TO COLLECT OR TO ELICIT?

One of the first decisions facing narrative investigators is whether to elicit stories by asking appropriate questions after explaining the point of their inquiry to their respondents, or whether to collect them as and when they occur. Both approaches are justified, depending on the purposes of the research. Eliciting stories generates larger amounts of field material, the stories ‘framed’ for the benefit of the researcher. Different accounts of the same story may be compared as can the story profiles of different organizations in a relatively economical manner. Questions that can be used to elicit stories include:

- Can you think of an incident in this organization that made you feel happy / unhappy / proud / disappointed (etc.)?
- Can you think of an incident that sums up the best / worst aspects of your job?
- Can you think of an incident / episode that sums up the quality of leadership / management / customer care (etc.) in this organization?
- Can you think of a story that you heard in this organization that influenced the way you approached it (or you approached your work)?
- What kind of things do you and your colleagues talk about when you meet each other?
- Have there been any funny stories making the rounds in your department lately? Any sad stories?
- Can you think of an incident that radically changed your views of this organization or the people who work here?

Most respondents recognize very well the meaning of the word ‘story’ (which is to be preferred here to the word ‘narrative’) and respond well to questions like the above, provided the researcher has given a sound explanation of the rationale for asking such questions. When eliciting stories, researchers may invite respondents to comment on a story they have already heard, respecting, of course, the confidentiality of their sources. The main disadvantage of eliciting stories is that the researcher risks imposing his/her

definitions of what is important or meaningful. Stories are not encountered in their natural state, i.e. as part of organizational interaction and talk, but are framed and performed for the benefit of an outsider. They are part of the dyadic research discourse rather than of organizational discourse proper.

The alternative to collecting stories when and as they occur is more time- and money-consuming and would form part of a broader ethnographic approach. It was an important part of traditional ethnographies in sociology of work (e.g. Beynon, 1973; Tangherlini, 1998; Watson, 1994) and has been used with notable success in the study of organizational humour (e.g. Collinson, 1988; Coser, 1959). Collecting stories in situ is especially important if the emphasis lies on approaching stories as performance rather than merely as text. As Boje (1991) has noted, when encountered in their natural state, most stories omit large amounts of information which is taken for granted, and are presented in a terse manner. Observers who are not familiar with such taken-for-granted information may miss the point or the catch or may not be aware that a story is actually being performed at all.

LISTENING TO STORIES

One of the safest ways to undermine storytelling research is if the researcher asks too many questions, especially questions that may be perceived as undermining the story's meaning or credibility. For this reason, the researcher must relinquish any notion of 'discovering what actually happened' and become a fellow-traveller on the narrative, engaging with it emotionally, displaying interest, empathy and pleasure in the storytelling process. The researcher should not risk alienating the storyteller by appearing to doubt the narrative or by placing a respondent under cross-examination, but conspire to detach the narrative from the narrowness of the discourse of facts, guiding it instead in the

direction of free-association, reverie and fantasy. Contradictions and ambiguities in the narrative are accepted with no embarrassment. Ambiguity lies at the heart of many stories, displaying an individual's ambivalent feelings or partial knowledge or understanding. While the researcher may ask for clarification of particular aspects of the story, the storyteller must feel that such clarification is asked in the interest of increased pleasure and empathy rather than in the form of pedantic inquiry.

As fellow-travellers on a story, researchers must not only be prepared to suspend their disbelief but also to withhold their moral values and assumptions. They may be invited to laugh at sexist or racist stories, to commiserate with characters for whom they have no sympathy or to celebrate achievements in which they see no merit. Researchers who find themselves in such situations should generally resist the attempt to directly challenge a narrative, although probing it in discreet ways may actually be a way of enriching them. To this end, they may use prompts like 'Would everyone think of this as a funny incident?' or 'What would you say to someone who may not find this so funny?' or 'How typical do you think that this type of incident is?'

When using stories as part of a research agenda, researchers sometimes find themselves being invited to share their own stories. Most researchers tend to hold back from emotional disclosures about themselves, but such disclosures can open up great opportunities for sharing stories. Sharing involves mutuality, something that cannot be achieved so long as the relation between researcher and researched is deeply asymmetrical, the former asking questions, the latter disclosing personal and even intimate emotional experiences. A researcher who is willing to share some of his/her own emotional experiences with his/her respondents can open up large areas of empirical investigation that would remain closed to other researchers (Gabriel & Ulus, 2015). This is especially

effective in settings where self-disclosure by the researcher can help bridge cultural divides and minimize the feeling that the researcher is an outsider, an intruder or even a colonizer.

ANALYSING STORIES

The ways of analysing narratives and stories, using them as the building blocks for theory, are examined in the currently burgeoning literature of narrative analysis (e.g. Clandinin & Connelly, 2000; De Fina & Georgakopoulou, 2015; Hollway & Jefferson, 2001; Kohler-Riesman, 1993; Wells, 2011). There are innumerable ways of analysing stories and narratives, some of which may involve interpreting or deconstructing the text, others in juxtaposing them with other narratives or interrogating them from different theoretical vantage points. When listening to a recorded story (and there are great advantages to listening to stories rather than reading transcripts), researchers may ask themselves questions like:

- Is it a good story? What makes it a good story?
- What is the emotional tone of the story?
- What is your own emotional response to the story?
- Is there anything about the story that troubles/bothers you?
- Who stands to gain from this story and what political interests does it promote?
- If you could re-write history how would you change the story?
- What do you see as the main meaning/moral of the story?
- What does the story tell us about (a) the nature of the project, (b) the nature of the organization, (c) the topic of our study?
- What meaning/moral may outsiders read into the story?
- Could the story also contain some other tacit or implicit meanings?
- What are the 'silences' in the story?
- Does the story fall into a recognized genre?
- How does it relate to other stories collected as part of this research?

In analysing stories and narratives, researchers must accept that there is no single method¹ which will magically convert 'data into theory'. Researchers must use their own skills and resources of probing, questioning, juxtaposing, framing, filtering and so forth. Such skills call for the exercise of *imagination*, which Kant described as 'a blind but indispensable function of the soul, without which we would have no knowledge whatsoever, but of which we are scarcely conscious' (quoted in Freydberg, 2005, p. 21). Hillman (1999) who made imagination a centre piece of his psychology views it as a great archetypal principle, like love, order, beauty and justice, a principle that 'endlessly produces possibilities' (p. 183) restlessly examining, exploring, juxtaposing, visualizing and testing.

Mills (1959) argued that sociological imagination is the sine qua non for creating sociological knowledge by looking for regularities and irregularities, paradoxes and trends, while being willing to play devil's advocate and question most received assumptions by persistently asking the questions 'why', 'what if' and 'so what' (see also Gabriel, 2015). All in all, imagination is probably the critical quality required of a narrative investigator if his/her empirical material is to generate insights beyond the commonplace and predictable.

REFLEXIVITY

If there is no royal road for analysing stories, there is also no foolproof way of validating narrative research. In recent years, there has been an increasing recognition of the importance of reflexivity as an on-going process of vigilance and self-questioning that narrative researchers must exercise in enhancing the trustworthiness and value of their work (Alvesson & Skoldberg, 2009; Willig, 2001). Reflexivity refers to a constant questioning on the part of researchers of their own stance vis-à-vis their empirical material,

analysis and theorizing. Reflexivity emanates from a realization that the investigators' own values, experiences and motives cannot be separated from the research process. These can certainly be a source of bias and error which reflexivity may forestall. More importantly, however, the researchers' own previous experience, sensitivity and self-knowledge can be valuable resources, enhancing their engagement with narrative material and deepening their understanding of its meaning and significance. Unlike other forms of social research, listening to stories prompts the researcher to engage emotionally with his/her informant, inviting the researcher to respond to experiences of disappointment, achievement, trauma, loss, injustice and so forth. These are not experiences that will leave the investigator indifferent to be analysed and theorized later, but will inevitably make demands to engage emotionally with what is being said, to make some judgements and to display the right emotional responses.

Reflexivity begins with a recognition of the effects of the researcher's presence in the field. Reflexive researchers do not aspire to be value-neutral and are alert to the ways that their research expresses, reinforces or undermines the values that they hold. They are also sensitive to the fact that some of their deeper values, needs and insecurities may surface while conducting their research. For this reason, reflexive researchers are aware of the possibility that in undertaking a serious piece of research they embark on a journey whose end may see them emerge as different subjects. Reflexive researchers then cannot deal with empirical material as something separate from themselves – as something stored in a computer file, to be processed, squeezed or distilled to generate knowledge at a later date. Instead, their own identity as researchers and their own practices as investigators are intimately intertwined with their experiences in the field.

ETHICAL CONSIDERATIONS

In addition to the familiar and important ethical issues facing qualitative researchers, including confidentiality and anonymity, intrusiveness, researching vulnerable people, discovering different forms of misconduct and endangering the well-being of respondents, inviting respondents to share their experiences through stories and narratives creates special ethical challenges. Listening to other people's stories makes them uniquely vulnerable in a number of ways. At what point does a respondent's distress or pain in telling a story become unacceptable? What if the questions unleash a torrent of painful memories and traumas in the respondent which he/she is unprepared to deal with? In researching the stories of vulnerable, broken or brow-beaten people an interviewer may unwittingly get far more than he/she bargained for. Even when ostensibly the respondents are self-confident, mature individuals, an invitation to 'tell their story' may reveal deep cracks and vulnerabilities. Such was the case with a series of interviews with unemployed managers and professionals, some of whom repeatedly broke down in tears in the course of telling their experiences (Gabriel et al., 2010, 2013) and required considerable reassurance and restoration before the completion of their interviews.

Another very important ethical question concerns the interpretation and potential misinterpretation of the stories related 'in good faith' by respondents. How often do we, as narrative investigators, feel uncomfortable with some of the inferences and deductions we draw from stories and narratives that we appear to believe and endorse during the field work? How often would we experience discomfort or embarrassment were our respondents to read exactly what we say about them in our published work? Is anonymity meant to protect the respondent or indeed the investigator, who can often deny that a particular

interpretation or inference pertains to a narrative provided by a particular respondent? Maybe, then, the key ethical issue for the narrative investigator is how to treat the narratives that he/she collected *with respect* and yet at the same time with what would be legitimate scientific *suspicion*.

A related ethical issue facing narrative investigators concerns the ownership of the story. In protecting the confidentiality of respondents, researchers often tamper with what they regard as insignificant details, for example, by recasting a male respondent as a female respondent. They may also choose to ignore or obliterate what they may view as irrelevant aspects of a story, such as the subject's sexual orientation or an aspect of their earlier life, that would be absolutely essential to the subject. More generally in editing or retelling a story they have heard, narrative researchers face vital ethical issues of what is significant and to whom, which rarely have easy answers.

CONCLUSION

Stories and narratives are currently attracting the attention of an increasing number of organizational researchers. Much of this attention is focused on the relation between storytelling and culture and politics, knowledge transfer, individual and group identities; and the relations between formal organizational narratives and private, personal stories, the value of storytelling in knowledge transfer and the building of communities of practice. Another rich area of storytelling studies looks at narratives told by and about leaders, as part of the wider management or meaning and emotion, some of this material generating more practical guidebooks and manuals on how leaders may improve the quality of their stories and use them to inspire their followers. Finally, an increasing importance is accorded to the study of stories and narratives as means of investigating the emotional and

ethical qualities of organizations. The collection, interpretation and analysis of stories have, thus, proven very useful in a wide range of contexts and feature regularly in academic publications and doctoral dissertations.

While the power of narratives to communicate meanings and experiences is increasingly recognized, a majority of business and management scholars remain tied to positivist traditions that are deeply suspicious or dismissive of stories. This situation is likely to persist, though several management and business journals are currently publishing articles in this area. In the last five years, the Web of Science (wok.mimas.ac.uk) listed no fewer than 113 articles with the word 'storytelling' in the title or abstract in business and management journals that included *Human Relations* (11), *Management Learning* (5), *Academy of Management Journal* (2), *Journal of Organizational Change Management* (8), *Journal of Management Inquiry* (3), *Culture and Organization* (4) and *Organization* (4). When the words 'story' or 'stories' are also included, the number swells to 652 and journals include *Harvard Business Review* (26), *Journal of Business Ethics* (14), *Organization Science* (7) and *Organization Studies* (6). In the same period, 455 articles were listed with 'narrative' in the title or abstract in all of the above journals as well as in *Journal of Business Ethics* (21), *Journal of Business Research* (23), *Work, Employment and Society* (15), *Marketing Theory* (13), *Journal of Consumer Behavior* (8) and *Academy of Management Review* (6).

For researchers who are attracted to narratives and storytelling as important aspects of organizational life, serious difficulties remain. The absence of an agreed definition of narrative and story would not be much of a problem if it were not for the confusion that it creates when people with different assumptions and definitions try to communicate with each other. A more important difficulty concerns the as yet unanswered question of whether the concepts of story and narrative must themselves be historicized – whether, in other words, we must

recognize that, along with many other concepts (like class, work, identity, drama, painting, etc.), our culture, with its social media, its new communication technologies and its other unique characteristics has churned out new forms of storytelling, new forms of narratives and stories, maybe shorter, terser and looser than those known to our grandparents, which in some important respects have occupied the same conceptual space as traditional stories and narratives did in the past. Would the idea of a plotless story be a contradiction in terms or would it be an eminently sensible notion at a time when people no longer need a plot to make sense of a text?

Another enduring tension, in my view, concerns the relation between narratives and facts. Our times have deeply problematized the idea of a fact with some scholars being prepared to give it up altogether. Others, including myself, maintain that facts may be plastic but they are not infinitely malleable, and some of them may indeed be brutal (Taylor, 1971). A narrative may convert a defeat into victory and a hero into a fool, but cannot convert a violent death on the battlefield into a peaceful death on a bed.

These tensions pose serious challenges to social researchers making use of narratives and stories in their research. The rewards, however, of narrative-based research, the sudden discoveries and unexpected illuminations, the hidden depths and distorting illusions that it reveals amply justify facing up to these challenges.

Note

- 1 Method from the Greek μέθοδος meaning [travelling] 'along the path'.

Organizational Discourse Analysis

Gail T. Fairhurst and François Cooren

INTRODUCTION

Organizational discourse analysis (hereafter, ODA) represents a broad class of approaches examining the constitutive effects of language; processes of text production, distribution, and consumption; and reflexive, interpretive analysis aimed at deciphering the role of discourse in a socially constructed reality (Grant et al., 2011, p. xvii). More specifically, a constitutive *language* focus emphasizes its organization and what it is doing; it is performative of a social reality rather than reflective of it (Berger & Luckman, 1966; Gergen, 2001). *Texts* refer to the material representation of discourse in spoken or recorded forms (Taylor & Van Every, 2000), and they may range from written documents to memory traces to verbal routines – all of which may be reconfigured through continued use (Derrida, 1988). Finally, *discourses* are meaning systems anchored in socio-historical time that source and constrain communicating actors

simultaneously. Discourses source actors by providing them with repertoires of speech and behavior (Potter & Wetherell, 1987), while also disciplining them to its ways (Foucault, 1975, 1983). In short, ODA wants to know how processes of language and communication coalesce to constitute one socio-material reality over another.

In this chapter, we direct ourselves to three key issues, the first of which involves answering the question, ‘what does ODA do that other qualitative methods do not?’ We demonstrate that ODA adopts a constitutive view of communication (Cooren, 2015) and a muscular view of language and social interaction (Alvesson & Kärreman, 2000), in contrast to other methods for studying communication in organizations. It also demonstrates a strong interest in three overlapping concerns that other methods find more difficult to capture: processual views of organizing, relational and subtle manifestations of power, and issues of materiality.

The second issue asks, ‘how does ODA answer the questions to which it directs itself?’ In this section, we demonstrate a range of both theoretical and methodological considerations depending upon the questions under consideration. Processual views of organizing, for example, offer a variety of approaches centered on the organizing potential of language and text. Issues of power move up a level of abstraction to study discursive formations, while issues of materiality may combine both of these.

Finally, we ask, ‘how does one implement ODA in its various forms?’ There are too many forms of ODA to cover in a single chapter (Putnam & Fairhurst, 2001), thus we have chosen to focus on five of the most prominent: rhetorical analysis, ethnomethodology-informed conversation analysis, narratology, critical discourse analysis, and the CCO (communicative constitution of organizations) approach. We conclude with a discussion of the future of ODA for organizational studies.

WHAT QUESTIONS DOES ODA ANSWER THAT OTHER METHODS DO NOT?

To answer this question, consider that many traditional methods for studying the communication of organizations and its actors, such as network analysis or survey methods, view communication as a simple act of information transmission (Axley, 1984). By contrast, ODA is more meaning-centered. It adopts a constitutive view of communication by positioning discourse and, more generally, interaction as actively participating in the creation of organizational forms (Cooren, 2015), the meanings for which are often negotiated, frequently fragmented, and ultimately unfinalizable (Grant et al., 2011). ODA is thus more likely to problematize what *organization* and *organizing* consist of.

While grounded theory methods also focus on communication, they mainly rely on

actors’ language to identify content themes in the data in order to translate them into scientific concepts (Charmaz, 2006; Tracy, 2013). Content themes are largely abstractions, or what some scholars suggest is ‘meaning condensation’ (Lee, 1999; p.89).

Put another way, content themes reveal the ways in which language simply reflects a social reality, rather than constructs it. ODA adopts a far more muscular view of language and interaction (Alvesson & Kärreman, 2000), such as we see in *turn-taking patterns* that reveal interruptions and floor dominance (Fairhurst et al., 1995); episode initiation and closure through *speech act* use (Cooren & Fairhurst, 2004); *category work* that automatically frames one outcome as more logical than another (Jayyusi, 1984; Sacks, 1992); *ventriloquizations* in which one actor speaks for or on behalf of the organization writ large or other entities (Cooren, 2010); or simplified *argument structure* as an indicator of institutionalization (Green et al., 2009).

As mentioned, ODA often directs itself to three (increasingly) overlapping domains of study that other methods struggle to capture: processual views of organizing, relational and subtle manifestations of power, and issues of materiality. First, in terms of *processual views of organizing*, ODA studies the organizing potential of language, conversations, and texts, such as the sequential pacing that talk gives to tasks, how interactional moves or objects can signal the organization’s presence from one moment to the next, and the co-defined nature of all relationships (Boden, 1994).

For example, Fairhurst and Cooren (2004) found that an injured officer’s use of designated police categories in a radio call signaled how she had joined the search for her own body, in the sense that she was using the discourse of high reliability organizations (HROs) to routinize emotions and communicate efficiently. An interaction analysis over the course of the call also demonstrated consistent deferral by the police dispatcher to the commands of police supervisors on scene that, in turn, paralleled

the stand-down by other beat officers (Cooren & Fairhurst, 2004; Fairhurst, 2007a). Category work and dominance/deferral patterns constituted the means by which the scene of action organized into a coherent pattern, reflective of HROs, in which swift, coordinated action address safety concerns, and emotions are routinized to shorten response times (Weick et al., 2005).

Second, in terms of *relational and subtle manifestations of power*, ODA studies discourses and their widespread effects. Recall that discourses are complex systems of meaning suffused with social and historical practices (Grant et al., 2011, p. xxi). Of great interest in ODA is how discourses produce ‘truth effects’, in the ways that culturally rooted knowledge is treated as if it were true (Foucault, 1975, 1983). In more specific terms, ODA studies power through what is made to appear natural or normal vis-à-vis the context. This is because it directs itself to the conditions under which ‘something can become an object for possible knowledge’ (Foucault, 1998, p. 460) and how that object becomes problematized, defined, and ‘just the way things are’.

Leonardi’s (2008) study of technologically determinist rhetoric is one such example. He observed a discourse of inevitability pervading technology adoption in multi-national corporations, obscuring the indeterminate relationship between technology and culture. Users unwittingly restricted their own agency vis-à-vis technology use because they perceived a ‘natural order’ due to science, progress, or nature that they did not wish to violate (p. 980).

Discourses also create ‘subjectivity’ in the way they position actors as objects of knowledge; such ‘positionings’ are the focus of ODA. In the organization, they frequently reinforce power asymmetries and foster unselfconscious discipline (Deetz, 1992), in much the same way as Sewell et al. (2012) found in their study of the discourses of surveillance as it impacted call center employees. Aspiring employees became ‘piggies in

the middle’ when they were coopted by management to train hard for elusive management positions that they would never assume.

Finally, ODA also studies how power and resistance knit together in complex ways (Foucault, 1975, 1983), such that the struggles over meaning that ensue require treating them as a singular dynamic (Fleming & Spicer, 2008; Mumby, 2005). ODA can reveal the ways in which the same discursive act can both resist and reproduce extant power relations, as Collinson’s (1988) classic ethnography of working class masculinity in a truck manufacturing plant demonstrated. Humor as a discursive practice demonstrated the ways in which shop floor workers resisted the managerial culture, produced rigid adherence to the strongly masculine culture of the shop floor, and yet maintained control over worker’s output.

Third, in terms of *issues of materiality*, ODA increasingly questions the limits of language and a purely constructionist orientation (Cooren, 2015; Taylor & Van Every, 2000). This is because all discourse, whether expressed through the form of a turn of talk, a text, an ideology, an intonation, a look, and so on, possesses a material foundation (e.g. speech sounds, written text, neurons firing, and so on) whose presence – and some would say agency – must be considered along with the actions of human beings (Cooren, 2006; Cooren et al., 2008; Latour, 1994).

Consider that critical discourse analysis focuses on the relationships among discourse, institutions, and structures of privilege that have material qualities (Chouliaraki & Fairclough, 2010; Fairclough & Thomas, 2004). For instance, Fairclough (2006) and Fairclough and Thomas (2004) examined how the discourse of globalization gets translated into texts (e.g. consulting books) that, in turn, shape the globalization of discourse to influence practice, including displacing workers through reorganization and downsizing in the name of globalization. For Fairclough, discourse is but one of many elements to consider in a social setting, not the

primary medium through which other elements gain meaning.

By contrast, socio-materialists who use ODA focus on practices, which are organized, situated activities undertaken with material arrangements (Schatzki, 2005). They analyze practices vis-à-vis communication, where the discursive and material interface via objects, sites, and bodies function as the focal points of study (Ashcraft et al., 2009; Cook & Brown, 1999). Sorsa et al. (2014), for example, used video-ethnography to study how organizational strategy was used in performance appraisals. They analyzed the ways in which strategy was appropriated in the appraisal, highlighting the embodied, intertextual, and material nature of strategy. Gestures, in particular, were found to concretize strategy while strategic texts gained agency (read, power) as they were ‘ventriloquized’ (Cooren, 2010).

As demonstrated in the foregoing example, processual views of organizing, power manifestations, and materiality are overlapping concerns; increasingly, this is the case for many ODA researchers (Ashcraft et al., 2009; Cooren, 2015; Fairhurst & Putnam, 2014). However, exactly *how* ODA addresses these key themes is the subject of the section below.

HOW DOES ODA ANSWER QUESTIONS RELATED TO ORGANIZING, POWER, AND MATERIALITY?

To study *processual views of organizing* vis-à-vis the organizing potential of language and texts, ODA studies what they are doing *in situ*, how they are doing it, and what it means (Fairhurst & Putnam, 2014). The focus is on the communication in and around the organizing activities themselves, including how actors’ interaction patterns over time coproduce organizing. Different forms of discourse analysis each adopt their own ways of

studying the organizing potential of language and texts, including whether one or both are emphasized. For example, turn-taking and category work might fascinate a conversation analyst (Boden, 1994). Dominance and deferential patterns would intrigue an interaction analyst (Fairhurst, 2004), while intertextuality might concern an institutionalist or critical discourse analyst (Phillips et al., 2004).

Forms of ODA also vary in how they study text and context, as well as one or multiple levels of analysis (e.g. interpersonal, organizational, institutional, societal). There is less emphasis on interviews, and more emphasis on recorded interaction where transcripts may be subject to coding schemes, coded for themes, or carefully prepared for intensive analysis by the researchers themselves.

Work by Cooren et al. (2008) showcased video-ethnographic methods, which is increasingly being adopted by ODA scholars, especially to study the organizing potential of language, texts, and other objects. Some 42 hours of video recording revealed how both human and nonhuman agents coproduced and ‘made present’ Médecins Sans Frontières (MSF, a.k.a. ‘Doctors Without Borders’) in the war torn Democratic Republic of the Congo, Africa. This study is yet another example of the overlap between the study of processual views of organizing and issues of materiality. ODA revealed how MSF’s presence was a continual negotiation and mobilization of people, logos, vehicles, buildings, and more.

The study of *relational and subtle power processes* differs from the organizing potential of language and texts. To untangle the workings of power, ODA scholars with critical and postmodern leanings focus on discursive formations, which are groups of statements that reflect a system of thought embedded in discursive practices. Indeed, discursive formations are macro-level phenomena only realizable in micro-discursive practices. As such, it leads discourse analysts to look for sites of struggles among diverse forms of knowing, being, and speaking (Broadfoot et al., 2004).

For example, Cloud (2005) explored contradictions between the participatory, egalitarian rhetoric of capitalist discourse versus its economic and physical realities. She conducted a narrative analysis of an industrial conflict in locked-out workers' newsletters, finding that changes in workers' discourses from 'warrior' to 'victim' to 'martyr' demonstrated shifts in capitalist power relations that obscured the economic basis for union action.

Postmodern scholars focus on the ways that meanings shift or carry the seeds of their own transformation (Weedon, 1997), or the diverse ways that discourse constructs subjectivities. Consider Ziegler (2007) who found that the discourse of wildland firefighting, located in historic and contemporary documents, created multiple subject positions for firefighters: benevolent leaders, heroic saviors, self-aware servants, obedient rule followers, or critical-thinking team members that had changed little over the past 50 years.

Within this same arena, ODA lends itself to juggling multiple discursive methods and multiple levels of context, much as Wodak et al.'s (2011) study of autocratic and egalitarian leaders' impact on creating consensus in an aerospace firm demonstrated. Based on 150 hours of meetings and individual interviews, they studied the organization's structural context, the history of specific communities of practice, and a close discursive analysis of meeting interaction, the latter revealing several influential acts of organizing impacting the creation of a durable consensus.

ODA scholars will also deploy multilevel, multimethod approaches often through intertextuality (Kristeva, 1984). With intertextual analysis, analysts can focus on how texts interconnect, how texts embed themselves within other texts, or the interplay of current texts with past conversations (Broadfoot et al., 2004). Phillips et al. (2004) advocate exactly this kind of analysis for a proposed model of institutionalization based on the

emergence of institutional entrepreneurs who create influential texts of organizational sensemaking and legitimacy that layer and interweave.

Finally, to study *issues of materiality*, ODA targets objects, sites, and bodies (Ashcraft et al., 2009; Cook & Brown, 1999). *Objects* have matter, form, and properties of a 'temporarily permanent' quality (Orlikowski, 2000). They cannot easily be categorized by their physical characteristics, since their properties and exact matter often change, such as we see in the case of the physicality of information technology (Leonardi, 2012). Technology also reflects how not all of an object's features are relevant to every user or practice; hence ODA directs itself to how an object's materiality is made applicable through discourse and communication.

Sites reflect physical spaces, locations, or the materiality of place. ODA eschews treating physical spaces as boundaries, backdrops, or containers in which interactions transpire; rather, they shape and are shaped by social action (Halford, 2008). As with objects, ODA studies space through its affordances, how the social and spatial mutually implicate one another, and the network of meanings negotiated through these entanglements (Burrell & Dale, 2003; Dale & Burrell, 2008). Cooren et al.'s (2008) aforementioned study of MSF in the Congo, for example, provided a stark site contrast with that of its Paris headquarters. One space was marked by the enduring trappings of a formal organization (e.g. building, signage, bureaucratic forms), while the other was marked by the ephemerality of white Toyotas, the MSF logo, and identity cards, all of which spoke on behalf of MSF, but in very different ways.

ODA also concerns itself with *bodies*, its practices, its struggles, and the ways in which organizations construct themselves through and with the body. ODA targets the ways in which bodies materialize in discursive struggles of gendered workplace practices (Butler, 1993; Wolkowitz, 2006), or the ways

in which universal, disembodied workers emerge in early discourses of safety, health, and security in the workplace (Levenstein & Wooding, 1997; Wolkowitz, 2006). ODA stresses embodied experiences and the symbolism of the body rather than highly glossed typifications, such as in the occupations or professions (Ashcraft, 2013).

Some forms of ODA grant explicit agency to objects, sites, and bodies, while others do not (Cooren, 2006). For those that do, emphasis is given to how they make a difference, through their affordances in their human entanglements, even though they may lack the ability to symbolize or be reflective (Taylor & Van Every, 2000).

To summarize, the theories and methods by which ODA studies processual views of organizing, relational and subtle manifestations of power, and issues of materiality are wide-ranging, and many approaches are still in their infancy. ODA is also increasingly moving toward new methods such as video-ethnography, the use of multiple methods, and attempts to capture multilevel contexts. In different ways, they all encourage interrogating the discursive struggles over meaning in rich and interesting ways. In the following section, we introduce five of the most popular forms of ODA.

HOW CAN ODA BE IMPLEMENTED IN ITS VARIOUS FORMS?

In this section, we review five prominent forms of ODA, namely rhetoric, ethnomethodology-informed conversation analysis, narratology, critical discourse analysis, and the CCO (communication as constitutive of organization) approach. We present each tradition according to its basic tenets, representative work, the types of questions it answers, specifically as they relate to processual views of organizing and issues of power and materiality, and its limitations. Table 6.1 summarizes these methods.

Rhetoric

Defined by Aristotle as ‘the faculty of discovering in any particular case all the available means of persuasion’, rhetoric sometimes suffers from negative connotations in ordinary language, e.g. charges of manipulation, double talk, or deception. In keeping with Aristotle’s view, however, rhetoric should also be understood as the art of eloquence, i.e. that which is persuasive, but also touching and elegant (Burke, 1969).

Rhetoric, as the art of speaking or writing, mixes three primary means of persuasion. Aristotle identified them as: (1) *ethos*, which is the rhetor’s capacity to establish credibility, (2) *pathos*, which involves the emotions the rhetor arouses, and (3) *logos*, which is the logical or reasoned dimension of the rhetor’s discourse. While rationalists like Jürgen Habermas (1984) prioritize *logos* over *ethos* and *pathos*, rhetoricians point out that credibility and emotionality are key elements of discourse, and they should not be minimized a priori (Cooren, 2000). Rhetors not only rely on the power of logical arguments (*logos*) but they also often simultaneously establish their credibility (*ethos*) and strike an emotional chord (*pathos*) in order to persuade (Hoffman & Ford, 2010).

However, rhetoric is not only about persuasion and argumentation, but also *constitution*. Maurice Charland (1987, 1990), a proponent of *constitutive rhetoric*, argued that one of the problems with conceiving of rhetoric solely as persuasion and argumentation is that it may take the audience for granted. Instead, the audience should also be considered the *outcome* or product of rhetorical processes. Drawing from Burke (1969) and Althusser (1971), Charland (1987) argued that rhetors come to implicitly or explicitly define *who they and the others are* and *what they and the others are supposed to do* in a given situation. Relying on ‘common sensations, concepts, images, ideas [and] attitudes’ (Burke, 1969, p. 21), constitutive rhetoric unveils the facts, principles, ideas, and values that support and

Table 6.1 Five forms of organizational discourse analysis

<i>Forms of Organizational discourse analysis (ODA)</i>				
	<i>Basic tenets</i>	<i>Key questions</i>	<i>Limitations</i>	<i>Representative work</i>
Rhetoric	Issues of ethos, pathos, and logos, but the audience must also be the <i>outcome</i> of rhetorical processes Rhetors define <i>who they and the others are and what they and the others are supposed to do</i> in a given situation	(1) How discourse constitutes certain identities, images, audiences, and cultures (2) How rhetorical acts legitimate certain organizational values, principles, or norms over others	Rhetorical studies are less sensitive to the dynamic aspects of interaction and thus processual views of organizing	Chaput et al. (2011); Christensen & Cornelissen (2011); Leonardi & Jackson (2004)
Ethnomethodology and conversation analysis (EMCA)	People make sense of the world to one another and meaningfully co-construct the circumstances in which they are involved	(1) How interactions signal the organization's presence, without resorting to macro structures (2) How interactions reflexively enact certain organizational realities over others (3) How the question of materiality always depends on what comes to <i>matter</i> in a given situation	EMCA tends to have a restricted view of the (organizational) context It also tends to treat power as relevant only if actors make it relevant	Boden (1994); Cooren (2007); Fairhurst (2007a, 2007b); Gromm (1983); Heritage (1997); Larsson & Lundholm (2010, 2013); Samra-Fredericks (2003)
Narratology	Narratives are always about particular events occurring over a specific period of time Narratives 'organize' by privileging some actors, spaces, and temporalities over others Telling a story must deal with a breach of certain norms and/or the overcoming of obstacles toward goal achievement. Narratives express how people think of a given situation and how it should be treated normatively	(1) How discourse contributes to the articulation of various sequences of action (2) How these articulations amount to positioning certain organizational values, principles, or norms as superseding others (3) How narratives highlight what matters and does not matter to storytellers, in turn, enabling sensemaking and closure	Narratology runs the risk of communicating a single relationality when relationships are, by definition, co-defined and contestable	Boje (1991, 2001); Cooren (2000); Czarniawska (2004); Czarniawska & Gagliardi (2003); Fisher (1984); Gabriel (2004); Gioia et al. (2013); Maitlis & Christianson (2013); Taylor & Van Every (2000); Vaara et al. (2016); Weick et al. (2005)

Critical discourse analysis (CDA)	CDA examines the <i>conditions of possibility</i> of a given discourse or ideology, i.e. what makes it possible, or sometimes impossible, in terms of what is said, how it is said, and who is authorized to say it Questions of power and resistance are thus always at stake in CDA because of the performative dimension of discourse, i.e. its capacity to privilege or reaffirm certain realities over others	(1) What and how specific discourses constitute organizational life (2) How certain organizational realities and subject positions are systematically and repeatedly privileged by these discourses (3) How economic, institutional, or technological materialities participate in the constitution and reproduction of these ideologies and the privileging of specific interests over others	CDA tends to reproduce a classical distinction between discourse and social structures or between discourse and materiality	Ashcraft & Mumby (2004); Cloud (2005); Fairclough & Thomas (2004); Fairhurst (2007a); Hardy & Thomas (2014); Medved & Kirby (2005); Wodak et al. (2011)
Communication as constitutive of organization (CCO)	Communicating consists of establishing links or relations between various beings, while also recognizing that these links or relations are themselves beings through which this communication can take place Communication is not only a matter of people interacting with each other, it is <i>the way by which relations or links take place</i> , but only between human beings, but also between texts, organizations, or even situations they represent	(1) What voices populate a given discourse, whether these voices are facts presented as <i>speaking for themselves</i> , situations portrayed as <i>dictating specific courses of action</i> , or principles defined as <i>requiring particular decisions</i> (2) <i>In the name of what or who</i> someone or something appears to say things, that is, the various voices that it, he, or she claims to represent, i.e. make present	CCO tends to neglect questions of power and longitudinality, where the staging and weight of various voices could be assessed and analyzed over time	Cooren (2004, 2010, 2015, 2016); Cooren et al. (2012); Cooren & Sandler (2014); Matte & Cooren (2015); Robichaud et al. (2004); Taylor & Cooren (2006); Taylor & Van Every (2000, 2011, 2014); Vásquez (2013)

are supported by the positions people take (Chaput et al., 2011) that, in turn, define and legitimate organizational identities, images, audiences, and cultures.

Organizational scholars use both traditional and constitutive rhetorical approaches to understand situations of uncertainty or possibility (Christensen & Cornelissen, 2011); when message intent is ambiguous for the speaker or audience (Leonardi & Jackson, 2004); when source credibility (ethos) is problematic; when the audiences for messages are unclear or complex (Sillince, 2006); how organizations form legitimating arguments for decision making with multiple stakeholders in mind (Erkama & Vaara, 2010; Green et al., 2009); and assessing the ethics and values of persuasive campaigns (Heath, 2011; Meisenbach & Feldner, 2011).

Rhetoric thus addresses: (1) how discourse constitutes certain identities, images, audiences, and cultures; and (2) issues of power vis-à-vis how these rhetorical acts legitimate certain organizational values, principles, or norms over others. Relatively little rhetorical work explores issues of materiality (cf. Cheney & Cloud, 2006; Cloud, 2005); however, there is nothing prohibitive about using it to study the organizational objects, sites, and bodies of rhetorical situations (Ashcraft et al., 2009).

In terms of limitations, rhetorical studies focus heavily on institutionalized forms of communication (e.g. formal speeches, official documents, public forums, and so on) and are less sensitive to the dynamic aspects of interaction and thus processual views of organizing (Cooren, 2015).

Ethnomethodology/Conversation Analysis

While rhetoric often targets more institutionalized forms of communication, ethnomethodology-informed conversation analysis (hereafter, EMCA) focuses on *discourse-in-interaction*. Ethnomethodology literally means the study

(-logy) of the methods, procedures, or techniques (-methodo-) that people (*ethno*-) use to make sense of their worlds in and through social interaction (Garfinkel, 1967). Founded in the 1950s by Harold Garfinkel, ethnomethodology not only revolutionized sociology but also influenced conversation analysis, a sister discipline initiated by Harvey Sacks (1992). While ethnomethodology is not exclusively interested in the detailed study of social interaction, conversation analysts were among the first to systematically study how people interact with each other in naturally occurring, recorded conversations (Levinson, 1983).

In EMCA, people make sense of the world to one another and meaningfully co-construct the circumstances in which they are involved. Garfinkel's (1967) notion of *accountability* is illustrative because interactants are not 'judgmental dopes', but knowledgeable of their motives and logics for action. They can readily account for their actions (i.e. explain and justify them), even when others struggle to do so, because they operate from within the context of the interaction itself. Studying interaction from an EMCA perspective therefore consists of focusing on what people are doing while interacting, moment-by-moment, turn-by-turn. EMCA thus emphasizes how interactants implicitly or explicitly: (1) *position* themselves and others; (2) *orient* to contextual relevancies; (3) *invoke* specific procedures, norms, values, documents, objects, and so on; and (4) *define* situations, relationships, and identities (Cooren, 2012).

As such, EMCA also involves a constitutive view of discourse. The participants themselves establish the context of a given conversation. Following Heritage (1984), context is 'something *endogenously* generated within the talk of the participants and, indeed ... something created in and through that talk' (Heritage, 1984, p. 283, emphasis in original). Moreover, organizations are also *talked into being* (Heritage, 1984) on the terra firma of interaction (Cooren, 2006), whose configurations have organizing potential.

Organizational forms (re-)produce themselves in people's interactional and sequential moves.

Such work builds upon seminal work on EMCA in institutional settings such as that by Boden (1994), Heritage (1997), and Gronn's (1983) classic 'talk as the work', study of the micro-understandings and sensemaking as it unfolded in a school administration. More recently, Samra-Fredericks (2003) used EMCA to study organizational strategy sessions, while Cooren's (2007) EMCA analysis of a corporate board meeting charged with leadership succession enabled Fairhurst (2007b) to demonstrate how leadership attributions take shape sequentially. Larsson and Lundholm (2010, 2013) studied the organizing properties of leadership in bank interactions, and Cooren et al. (2012) used EMCA to study the interactive objects of a building manager's walk-through with technicians.

EMCA thus addresses questions related to processual views of organizing and materiality: (1) how discourse-in-interaction signals the organization's presence, without resorting to macro structures (Boden, 1994); (2) how these interactions amount to reflexively performing certain organizational realities over others; and (3) how the question of materiality always depends on what comes to *matter* in a given situation, as any situation is at least partly defined and constituted by the way people enact, orient to, and make sense of it.

In terms of limitations, EMCA has been criticized for a restricted view of the (organizational) context (Cooren, 2007; Fairhurst & Putnam, 2004; Putnam & Fairhurst, 2001). Despite the quality and detail of the analyses regarding the organizing structure of conversations, it could do more to analyze the nature of organization (Taylor & Van Every, 2000). It has also been criticized for treating power as relevant only if actors make it relevant, unlike the view of critical discourse analysts who believe power issues are ubiquitous (Fairhurst, 2007a).

Narratology

The analysis of narrative has certainly been among the most popular forms of ODA over the past thirty years (Brown, 2006; Czarniawska, 2004; Czarniawska & Gagliardi, 2003). Organizing and narrating have a lot in common as both deal with establishing relations and accounting for events, activities that trigger *sensemaking* and *closure* (Taylor & Robichaud, 2007). Among the ten features of narratives that Bruner (1991) identified, we examine four of the most important: diachronicity, particularity, canonicity, and referentiality. All demonstrate how narratives participate in the constitution of organizing and organization.

First is *diachronicity*, which means that narratives are always about particular events occurring over a specific period of time (Bruner, 1991). They have a beginning, middle, and an end, which circumscribe and organize what is related. In any narration, however, certain events will be left out due to constraints of space, time, or agency (Greimas, 1987).

Particularity, a second narrative feature, implies that some choices be made vis-à-vis: (1) circumference or the spatial context in which action unfolds (Burke, 1962 [1945]); (2) periodicity, which are start and stop time frames; and (3) agency, including nonhuman agency, i.e. who or what makes a difference as events unfold. Narratives 'organize' vis-à-vis acts of selection that privilege some actors, spaces, and temporalities over others (Mumby, 1987).

Third is *canonicity*, by which Bruner (1991) means that narratives must have a point to be 'tellable'. Telling a story is not a neutral activity; it must deal with a breach or violation of certain norms and/or the overcoming of obstacles toward goal achievement (Cooren, 2015; Greimas, 1987). In constructing narratives, members knowingly or unknowingly reinforce norms and values by showing how an *order* is restored through the overpowering of impediments

and opponents. A narrative will tend to be selective not only in terms of space, time, and agency, but also in terms of specific standards, beliefs, or principles, which can reveal a great deal about organizational norms and values.

Fourth is *referentiality*, which refers to the way a specific situation comes to be defined or identified by the stories people tell of it (Bruner, 1991). Since relating an event is never a neutral activity, stories allow situations to *express themselves* in a specific way depending on who is telling them (Cooren, 2010). From a constitutive viewpoint, narratives express how people think of a given situation and how it should be treated normatively; hence, the familiar ‘moral of the story’ moment with most narratives.

Narratology can be used not only to analyze how people’s stories express and contribute to the constitution of organizations, but also how their actions and conversations hierarchically articulate with each other to form collective action with a sense of closure (Cooren & Fairhurst, 2004; Taylor & Van Every, 2000). Specifically, analyzing organizational discourse from a narrative perspective reveals how people implicitly or explicitly define situations by first identifying a breach, violation, or problem and subsequently how resolving it produces closure. A narrative’s organizing potential thus reveals itself in its sequentiality, and in the way that sequences of action imbricate or embed within each other (Cooren & Fairhurst, 2004; Taylor & Van Every, 2000).

Narratology thus addresses such questions as: (1) how discourse contributes to the articulation of various sequences of action; (2) how these articulations amount to positioning certain organizational values, principles, or norms as superseding others; and (3) how narratives highlight what matters (human or nonhuman) and does not matter to storytellers, in turn, enabling sensemaking and closure. Thus, in different ways than EMCA, narrative analyses also focus on processual views of organizing.

Narrative studies abound on almost every organizational topic, but they are especially prominent in research on organizational change, leadership, identities, and sensemaking (Boje, 1991, 2001; Czarniawska, 2004; Czarniawska & Gagliardi, 2003; Fisher, 1984; Gabriel, 2004; Gioia et al., 2013; Maitlis & Christianson, 2013; Taylor & Van Every, 2000; Vaara et al., 2016; Weick et al., 2005). However, one limitation of narrative analysis is that it runs the risk of communicating a single relationality when relationships are, by definition, co-defined and contestable (Gabriel, 2004).

Critical Discourse Analysis

Critical discourse analysis (hereafter, CDA) can take many forms, but they all prioritize issues of power. Some forms of CDA emphasize the operations of ideology (Althusser, 1971) and a more totalizing view of power, while others adopt a postmodern influence with Foucault’s (1975) discursive and relational view of power and resistance (Mumby, 2014). Either way, CDA examines the *conditions of possibility* of a given discourse or ideology, i.e. what makes it possible, or sometimes impossible, in terms of what is said, how it is said, and who is authorized to say it (Fairclough, 2005). Questions of power and resistance are thus always at stake in CDA precisely because of the performative dimension of discourse, i.e. its capacity to privilege or reaffirm certain realities over others.

To reveal this performativity, Fairclough (1992, 1995, 2005) recommends a text-oriented discourse analysis involving three dimensions: (1) text, (2) discursive practice, and (3) social practice. The *textual* dimension of a discourse corresponds to what is verbalized or written to produce it (e.g. an organizational vision statement). Analyzing a discourse as a *discursive practice* amounts to focusing on how a text is produced and interpreted, i.e. processes of text production,

distribution, and consumption (e.g. the circulation or promotion of the vision statement). Finally, discursive events are analyzed as instances of broader *socio-cultural practices* (e.g. visionary leadership). Each of these three dimensions is intended to map onto one another to examine relations of power (e.g. through the ways in which managers, owners, or shareholders use an organizational vision statement to mask their interests).

Drawing from Fairclough (1992, 1995, 2005), CDA has been used to examine the economic realities associated with the discourse of globalization (Fairclough & Thomas, 2004) and conflicts between management and labor (Cloud, 2005), along with critical leadership practices in producing consensus (Wodak et al., 2011). More postmodern analyses have studied the subjectivities and fallen status of airline pilots (Ashcraft & Mumby, 2004), executive coaching discourses that subjugate female leaders and alpha males in very different ways (Fairhurst, 2007a), and corporate mothering discourses that create new positions for stay-at-home moms (Medved & Kirby, 2005).

CDA thus addresses such power and materiality laced issues as: (1) what and how specific discourses constitute organizational life, i.e. how organizational practices are constantly traversed by ideologies and regimes of truth, which surface in what people say, write, and do; (2) how certain organizational realities and subject positions are systematically and repeatedly privileged by these discourses; and (3) how economic, institutional, or technological materialities participate in the constitution and reproduction of these ideologies and the privileging of specific interests over others.

In terms of limitations, CDA has been accused of reproducing a classic distinction between discourse and social structures (see, especially, Fairclough, 1992) or between discourse and materiality (Hardy & Thomas, 2015). This is contrary to a constitutive view of discourse that emphasizes the material dimension of discourse (Barad,

2007; Orlikowski & Scott, 2009, 2014), as well as the discursive dimension of structures (Cooren & Fairhurst, 2009). In other words, CDA is susceptible to an old-fashioned way of conceiving structures and materiality in overly reified terms, which might be explained by its Marxist/Marxian roots (Althusser, 1971).

THE CCO (COMMUNICATION AS CONSTITUTIVE OF ORGANIZATION) APPROACH

A relatively newer approach put forth by scholars, mostly from the Montreal School of Organizational Communication (Brummans, 2006; Brummans et al., 2014), adopts a *relational ontology* (Barad, 2007; Robichaud, 2006), which places communication, not just discourse, at the forefront of theorizing processual views of organizing and organizational ontology. Although the CCO approach has often been used to analyze discourse-in-interaction (Cooren, 2004; Cooren & Sandler, 2014; Fairhurst, 2007a; Matte & Cooren, 2015; Robichaud et al., 2004; Taylor & Cooren, 2006; Vásquez, 2013), the distinction between discourse and communication is an important one for this perspective (Jian et al., 2008a, 2008b).

Communicating, according to this approach, consists of establishing links or relations between various beings, while also recognizing that these links or relations are themselves beings through which this communication can take place. Accordingly, communication is not only a matter of people interacting with each other. It is, more generally, *the way by which relations or links take place*, not only between human beings, but also between, for example, texts, organizations, or even situations they represent. This is why we can (figuratively) say that a situation – say, poor management – can *speak to* another situation – say, employee morale. In other words, these two realities *connect*,

relate, or *link* to each other because a poor form of management might allegedly *express itself* when managers speak to employees, which might result in the decreasing of morale.

According to Cooren (2010, 2015, 2016), communication can be compared to a form of ventriloquism, i.e. acts by which various beings are *made to say things*. In the organizational world, these beings can take the form of numbers, graphs, figures, indexes, facts, reports, mission statements, principles, protocols, or programs, i.e. as many *sources of authority* that are supposed to lend their weight to specific courses of action. As pointed out by Taylor and Van Every (2000, 2011, 2014), authority is intimately connected with the notion of authoring (they both come from the Latin root *auctor*, which means the father, source, or origin), which shows that gaining in authority amounts to multiplying the authors of what appears to be one's own positions.

In terms of discourse analysis, a ventriloquism-based approach unveils the voices that populate a given discourse, whether these voices are facts presented as *speaking for themselves* (Cooren, 2008), situations portrayed as *dictating specific courses of action* (Follett, 1926) or principles defined as *requiring particular decisions* (Cooren, 2010). Studying discourse according to this perspective thus amounts to identifying *in the name of what or who* someone or something (a text, for instance) appears to speak, that is, the various voices that it, he, or she claims to represent, i.e. make present.

Regarding the question of materiality, the Montreal School opposes any distinction between a discursive world and a material world, as any discourse has, by definition, to materialize itself in order to exist. Materiality must be understood relationally, that is, as expressing what or who sustains or supports the existence of something or someone else (Cooren et al., 2012). Echoing key tenets of sociomateriality (see, especially, Orlikowski & Scott, 2014), the ventriloquist perspective

thus highlights that discourse is a key way by which *materialization* actually takes place.

In terms of limitations, the CCO perspective, especially the one associated with the Montreal School, has often been accused of neglecting questions of power and longitudinality (but see Cooren et al., 2007). In other words, its focus on the detailed study of interaction has often been operated at the expense of more longitudinal studies where the staging and weight of various ventriloquized voices could be assessed and analyzed (Cooren, 2015).

CONCLUSION

In one way or another, the aforementioned discursive methods enable the study of processural views of organizing, relational and subtle manifestations of power, and the relationship between discourse and materiality. However, they do so in different ways. For example, CDA *always* foregrounds issues of power and politics; its theories stem from the power-laced writings of Marx, Althusser, Foucault, and many others. However, EMCA waits for organizational actors to make these issues salient, following in the tradition of ethnomethodology (Garfinkel, 1967). EMCA values actors' views so strongly that they believe analysts are the only ones who can carefully produce transcripts of interaction, while the other methods have no such preferences. CDA likewise concerns itself with economic and institutional materialities, while some forms of narratology appear more open to the technical and physical world, given the theorizing of Greimas (1987).

Moreover, these forms of ODA are not 'pure' in the sense that they continually evolve and cannot necessarily claim a specific type of discourse analysis as their own; rather, they adopt familiar themes. As mentioned, rhetoric has now broadened its scope with 'constitutive rhetoric' (Charland, 1987,

1990), although there continues to be a heavy emphasis on persuasion, legitimacy, and argumentation. EMCA studies discourse-as-it-happens, and the everyday-ness of communication in organizations. Narratology remains broad and flexible across numerous domains of study, even for those lacking discursive sensitivities. Finally, CDA's move to enroll postmodern sensibilities broadens its appeal considerably by viewing power and resistance as inseparable in struggles over meaning both large and small.

Thus, it is not uncommon to see different forms of ODA meeting at the crossroads. Cloud's (2005) CDA of a labor dispute contained elements of rhetoric and narrative. As mentioned, she studied the stories of locked-out labor workers' newsletters (narrative), a more institutionalized form of communication with an intended audience (rhetoric), but focused on the eclipse of its rhetorical impact wrought by financial disparities (critical). The scholars advancing a CCO approach are pushing the boundaries of EMCA and narratology to consider nonhuman agency, advanced by actor-network theory (Latour, 1994).

In addition to addressing issues of materiality, analysts are increasingly combining discursive methods with grounded theory methods, such as work by Kreiner and colleagues (2015) who study varied forms of category work (EMCA) in organizational identification first produced by constant comparison. Also, work by Sheep et al. (2017) used grounded theory methods to understand organizational tensions, but relied on EMCA to refrain from separating them and analyzing them independently to focus on their 'knotted formulations'.

The possibilities of discursive methods notwithstanding, there are, of course, limitations. One of the chief limitations leveled at ODA in the past has been an overemphasis on language (Conrad, 2004; Reed, 2000). Of course, there is ample evidence in this review that discourse analysts are beginning to address this issue in much more serious ways. However,

we should expect the growth of ODA to move more forthrightly in this direction, much the way CCO analysts and others are now using video-ethnographic methods (Cooren et al., 2008, 2012) to capture the physicalities of organizational life.

A second limitation associated with ODA involves the issue of 'scaling up' from very localized interactions to broader organizational phenomena (Cooren & Fairhurst, 2009). This also translates to too much of an interest in *organizing*, and not enough on *organization* and more institutionalized stabilities (McPhee, 2004). Addressing this issue will require discourse analysts to adopt more multilevel and, perhaps, multimethod approaches not just to examine how organizations are 'brought off' in social interaction but, simultaneously, how they are also objects of knowledge whose agency is communicated in and through reflection and interpretation (Foucault, 1975), much like discursive leadership (Fairhurst, 2007a).

Finally, a third limitation associated with ODA is that it can be costly and labor intensive. Video-ethnographic methods, for example, exceed the costs of grounded theory methods and standard transcript preparation; they also place new demands on journal publications to consider video and photographic evidence.

Limitations aside, ODA methods are informed by a great deal of interdisciplinary work that is exciting and holds promise for almost every aspect of organizational life. Indeed, ODA arguably brings life to the study of organizations.

Towards the Wholesome Interview: Technical, Social and Political Dimensions

Bill Lee and Usman Aslam

INTRODUCTION

This chapter is about individual interviews, rather than either group or focus group interviews, that will have different characteristics and dynamics. Interviews of individuals have been taking place in different settings for different purposes for a number of centuries and across the social sciences for research purposes for over 100 years (Alvesson & Ashcraft, 2012; Denzin, 2001; Herzog, 2005; Platt, 2001). Thus, most people would be aware that an interview often entails a verbal exchange that enables the interviewer to obtain information from the interviewee to allow the interviewer to use that information to realise a given objective. Such is their commonplace nature some commentators have suggested that we now live in an interview society in which all are individuals that may use the technology of the interview to narrate the self (Atkinson & Silverman, 1997; see also: Alvesson & Ashcraft, 2012,

p. 239; Denzin, 2001, p. 28; Gubrium & Holstein, 2001).

Despite their popularity in being used in 90 per cent of social science investigations (Denzin, 2001, p. 23), there is very little agreement about many aspects of research interviews. The dominant positivist tradition has often conceived interviews as simple technical exercises that the interviewer uses in a neutral and apolitical way so as not to bias responses or contaminate the procedure when pursuing a higher good of value-free knowledge. As Gubrium and Holstein (2001, p. 19) have said of this tradition:

Interviewers are generally expected to keep their 'selves' out of the interview process. *Neutrality* is the byword. Ideally, the interviewer uses his or her interpersonal skills when meeting to encourage the expression of, but not to help construct, the attitudes, sentiments and information in question. (*Italics in original*)

However, this perspective's implicit social (Dundon & Ryan, 2010; Holstein & Gubrium,

1995; Humphrey & Lee, 2008; Myers & Newman, 2007) and political assumptions (Cunliffe & Alcadipani, 2016; Kezar, 2003; Kvale, 2006, 2007) have been challenged.

The contribution of this chapter is to synthesise these different challenges with considerations about the technical qualities to put forward an argument for wholesome interviews in which an interviewer acts with honest intent in aligning their input into the social, political and technical dimensions of interviews. In conducting this exercise, we tend towards a realist ontological position and an interpretivist epistemology. The former leads us towards believing that humans have an inner essence that is expressed in their values, and while we acknowledge the possibility of mutation, change and development *over time*, we reject the ease of fluidity, contradiction and multiplicity of character implied of researchers in some research perspectives. Our choice of an interpretivist epistemology is an acknowledgement that neither values nor meanings expressed by humans are universal and it is possible for different researchers to look at the same phenomenon, adopt different interpretations of the same events and offer different explanations for the outcomes.

In putting forward our argument, we use the term wholesome for two reasons. First, the concept of wholesome suggests pursuit of a balance of the different dimensions of an interview. Second, the idea of the wholesome interview assumes a desire to promote wellbeing for the interviewer, for the interviewee and for the research community. In considering the interviewer, recognition that each will have different identities – for example, as a parent, colleague, community participant and worker – in other spheres of his/her life is not to argue that people are completely fractionated with one part of a person's life having no impact on other parts. While sometimes roles of a person may conflict, individuals' inner essence demands some form of consistency across different dimensions of a life if that person is not to experience dissonance

and the discomfort and anguish that it brings (see also, Cunliffe & Alcadipani, 2016, p. 12; Nadin & Cassell, 2006, pp. 213–14). An interviewer's consistency across different spheres of his/her life is more likely to promote wellbeing in the interviewee. That is to say that consistent behaviour by the interviewer will preclude the interviewee having a sense of being misled if s/he finds out that the interviewer espouses one set of beliefs in one sphere of his/her life, but subscribes to a completely different set of values in another sphere of his/her life. Expression of different beliefs during the interview to those that the interviewer holds may be interpreted as a form of covert research. Such actions could lead to the interviewer failing to understand points from the belief system of the interviewee while being restricted in his/her capability to question the interviewee when they do not understand because of their earlier misrepresentations, leading to poorer quality data. It could also damage other researchers' opportunities to enter into the field (Punch, 1994). In putting forward these arguments for wholesome interviews, this chapter goes beyond others' suggestions that avoidance of harm to anyone is apt (Cunliffe & Alcadipani, 2016, p. 23).

In promoting understanding of the technical, social and political dimensions that need to be synthesised in the course of an interview, we adopt the following definitions. We borrow from Jamous and Peliolle's (1970, p. 112) discussion of knowledge bases of occupations to define the technical dimensions of interviews as the 'means' that can be mastered and communicated in the form of rules' to gather the information to realise a given research objective. In effect, some dimensions of interviewing have been codified and may be found in methodological text books. With any activity, there is a difference between knowing the codes and enacting what the codes suggest. Interviews inevitably involve some form of *interaction* between the researcher and the person from whom information is sought. It is a social

activity in which both the interviewer and the interviewee can each choose from a range of actions during the interview, regardless of the preparation of the technical dimensions prior to the interview, and it is these interactions that have to be executed that constitute what are defined here as the social dimensions of interviews. Interviews can never be seen as a wholly neutral activity (see also, Cunliffe & Alcadipani, 2016, p. 6). Both the conduct of the interview and its outcome will mark a change from a situation that would have existed if the interview had not taken place. Ways in which change may take place are in the relationships between the interviewer, the interviewee and others. The political dimensions of an interview represent the power relationships between the different parties involved in an interview and others, and the ways in which these may be managed and transformed either in the course of the interview, or because the interview has taken place.

This chapter will proceed by discussing each of the technical, social and political dimensions of interviews in turn before making some concluding remarks. The way in which we have defined the technical, social and political dimensions may suggest that they are separate stages of an interview with the technical preceding the social and the social preceding the political. While acknowledging that the interview should be perceived as a process and each of the technical, social and political dimensions may appear to be more to the fore at different stages of an interview, the different dimensions are used for analytical purposes only. As will be evident in the discussion, all dimensions may manifest at each stage in the process.

TECHNICAL DIMENSIONS OF AN INTERVIEW

As indicated in the previous section, the technical dimensions of an interview are those

aspects that may be codified. Such codification means that the technical dimensions are often discussed in research methods text books. The following discussion will provide a brief overview of four issues that may be codified before introducing a fifth issue, that of making an interview wholesome.

Logic and Order of the Interview

A common taxonomy divides interviews into structured, semi-structured and unstructured according to the extent to which the interviewer ‘structures’ or directs the interview. Particular devices that help to attain structured or less structured interviews are closed-ended questions that predefine a limited range of responses that are permissible, and open-ended questions that invite expansive answers. Different commentators (e.g. Alvesson & Ashcraft, 2012, pp. 248–9; Cassell, 2015; Harvey, 2011; Jacob & Furgerson, 2012; Ng & Coakes, 2014) suggest ordering questions into different sections according to their relative importance in seeking an understanding of the phenomenon being investigated and their contribution to managing the social dimensions of the relationship between the interviewer and the interviewee. Jacob and Furgerson (2012, pp. 3–4) indicate that it is most useful to start with questions that the interviewee will find easy to answer, such as those designed to solicit information about the background of either the interviewee or the organisation to which they belong, or his or her role in the organisation. These questions not only help to set the interviewee at ease – or break the ice (Alvesson & Ashcraft, 2012, p. 249) – but they can also generate relevant context information. As the interview proceeds, questions that are essential to the substantive phenomena under investigation may be asked with the most difficult and controversial questions being located in the middle of the interview. Towards the end of the interview, there are likely to be questions that fall outside of what

the researcher has necessarily gleaned from their own prior experience and review of the literature. So it is not unusual for interviewers to invite comments on whether there is any issue relative to the phenomena being investigated that the interviewee believes should have been asked, but which was omitted, or whether there is anything else that the interviewee wishes to add (see also, Alvesson & Ashcraft, 2012, p. 250).

The Ontological and Epistemological Assumptions of the Researcher

There are a range of taxonomies used by different authors (for examples, see Alvesson & Ashcraft, 2012; Cassell, 2005, pp. 168–70) to articulate how people with different ontological and epistemological assumptions perceive and conduct interviews. The ontological assumptions of how the interviewer understands the world of which they are part may be interpreted simply by considering a single axis that ranges between realism, whereby a researcher views the world as a separate external reality to him/her and the interviewee, and constructivism, where the researcher perceives a phenomenon existing only in the interaction between the interviewer and the interviewee, or between the interviewee and others with whom they interact. Epistemological assumptions of the relationship between investigators and the phenomenon that they study may be interpreted simply along a single axis between positivism, which assumes that a possibility of perceiving and measuring external phenomena in an objective way is free of any bias, and interpretivist stances that seek to understand the meanings that may be given to a phenomenon from the subjectivity of the participants.

Ontological and epistemological assumptions will affect what the researcher will see as important phenomena, the types of questions asked about a particular phenomenon

and the ways in which each question might be constructed to derive particular forms of information. Researchers towards the realist end of the ontological dimension, regardless of whether they are positivists or interpretivists, will view the interview as a technique that will access a comment – albeit one of a potential range from an interpretivist epistemology (e.g. Denzin 2001, p. 30) – on the external world. Researchers from a constructivist position will view interviews as a situated account in which interviewees either draw on ‘cultural resources to yield morally adequate justifications’ (Alvesson & Ashcraft, 2012, p. 243), or they will view each interview as producing a reality (Kezar, 2003; Limerick et al., 1996).

Research Design

Research design embraces the type of interview that the interviewer believes will enable him or her to address that research question which in turn will affect the subsequent method of analysis and the choice of whom to interview. Structured interviews are highly similar to questionnaires and are ignored here. Cassell (2015) has provided a recent disaggregation of semi-structured interviews into the following:

- Exploratory interviews that focus on an emergent issue from a range of different perspectives;
- Theoretical interviews where existing theories around a topic help to structure the research objective and the types of questions that are asked;
- Event-based interviews which involve asking the interviewee to focus on the importance of a particular event to explain a phenomenon;
- Comparative interviews that seek to understand the models that interviewees utilise when interpreting the relationship between different phenomena or the varying courses of a phenomenon in different circumstances;
- Narrative interviews that encourage interviewees to tell stories about their own experiences of organisational phenomena as a means to understanding how those interviewees make sense of their experiences;

- Biographical interviews which seek understanding of an interviewee's experiences by locating those experiences within a chronology of that interviewee's life history;
- Visual technique interviews which involve using pictures of different types as foci for interviewees to discuss their opinions and emotions surrounding what is portrayed.

Cassell describes unstructured interviews as phenomenological interviews which entail telling an interviewee about the topic of the research and simply inviting him or her to tell his or her story around that topic.

When choosing participants for an interview study, Alvesson and Ashcraft (2012, p. 247) suggest that there are two loose principles, namely representativeness and quality. Put simply, the aim will be to interview either a cross-section of people that will give a diversity of opinions on the phenomenon, or those who can provide the most insightful, informed or relevant view or example of the phenomenon under investigation. How the data is analysed and/ or presented will vary in part by the type of interview and in part by the type of account that the researcher wishes to provide. In some instances, such as in theoretical interviews when there is a desire to explore the prospective outcome of a policy change, the phenomena or the impact of the change may be taken as the unit of analysis and a form of thematic analysis may be utilised. If biographical interviews have been used to explore the impact of a change on particular groups, the unit of analysis may be the individual and a story-telling form of analysis may be used.

The Substantive Area or Discipline

An interview project will require a research question that has been at least partially influenced by reading sections of the literature in the discipline, although it might also be motivated by an issue of importance to the researcher for personal reasons. The research question will help to define the overall

objectives of the interview. Other issues informed by the literature or insights derived from the researcher's experience will provide further ideas for expansion of the interview's focus around the relationship between the phenomenon in which the interviewer is interested and other phenomena. Those issues will also help decide on the people to interview. One of the strengths of qualitative research is that unexpected issues often emerge in the course of the research and it is important that the researcher is flexible and sensitive to the need to adapt the design of the content as issues are revealed by the interviewees.

Considering How to Make the Interviews Wholesome

The technical aspects of interviewing may have been treated here as analytically separable, but they have social and political dimensions. For example, the ordering of questions can help to manage the interviewer's social relationship with research participants. The ontological assumptions will affect whether the researcher sees the possibility of external structures that could be oppressive, while epistemological assumptions about the possibility or otherwise of making value-free judgements will inform a researcher's view of what his/her responsibilities are if oppressive structures are observed. There are similar political dimensions when designing the research in deciding how to represent opinions of different parties to the research and in choosing the research area and the research questions to ask to facilitate the expression of a voice of particular groups. In this regard, this last sub-section could have been put at the start of the discussion as it is necessary for a researcher to ask him or herself a number of essentially political and social questions before embarking on a research study if s/he wishes to achieve a wholesome interview. These questions include: Do you believe that a group affected by your studies

suffer a disadvantage vis-à-vis others? What might be the source of that disadvantage? How might you help to overcome that disadvantage? Do you want to help that group? On a social level, the questions that might be asked before embarking on a project include: Do you belong to the community that you wish to research? If not, can you gain access to that community? Will you like the people in that community sufficiently to interact with them? How will you manage interaction with them and what are the issues to consider when managing that interaction? It is to the social dimensions of interviews that this chapter now turns.

SOCIAL DIMENSIONS OF AN INTERVIEW

As indicated above, a research interview involves an interaction between a minimum of two people who may not know each other. The types of interaction will be different according to the approach to interviewing that is assumed, which may in turn be influenced by factors such as the ontological assumptions of the researcher, i.e. whether he or she views him or herself as co-constructing knowledge with their research participants, the interviewer and interviewee's relative knowledge of the topic and their assumed role in the interview. Different authors (e.g. Duff, 2002; Granott, 1993) offer classifications of different orders and objectives in interview situations. These may include simple questioning of one party by another to allow the researcher to construct understanding individually, or forms of collaboration to operationalise each other's different spheres of knowledge to realise a joint objective, such as in action research where researchers may work with practitioners to realise a stated shared goal (Coghlan & Brydon-Miller, 2014).

Regardless of its exact form, the interactions make interviews, by definition, a social

activity. Even though the researcher may have prepared an interview schedule of questions based on the technical knowledge and converted that schedule into an interview protocol (see, for example, Jacob & Furgerson, 2012) with reminders about providing explanations of the objectives of a project and the conduct of other tasks such as securing consent from the interviewee, etc., the interview still needs to be executed. There is, however, a difference between knowing the codes to follow for doing something and being able to turn the ideas and codes into action. Doing requires the exercise of a form of knowing that Polanyi (1962) describes as tacit, as not everything can be expressed explicitly for pre-codification. Even implementation of codes will involve competencies and adeptness that are assumed and implicit rather than explicit. It is not surprising that some authors describe doing the interview as an accomplishment (Myers & Newman, 2007, p. 5) or performance (Denzin, 2001).

The idea of a performance is also manifest in dramaturgical analyses of interview situations (Cunliffe & Alcadipani, 2016, pp. 15–17; Gubrium & Holstein, 2001, p. 28; Hermanns, 2004; Myers & Newman, 2007). To a lesser (e.g. Hermanns, 2004) or greater (e.g. Myers & Newman, 2007) degree of explication, those who adopt this approach draw on Goffman's dramaturgical sociology. Goffman drew a comparison between routine social phenomena and theatrical performance. To follow the detailed description provided by Myers and Newman (2007, p. 11), the interview is the performance of a drama at the front of the stage – although over time, interviewers may be allowed to the interviewee's backstage area (Cunliffe & Alcadipani, 2016) – according to a script composed by one of the actors, namely the researcher, as both the interviewer and the interviewee play out their respective roles. The merits of this approach do highlight that the interviewer role is different from other roles that the same person may hold in other parts of his/her life and the performance of the role implies working

with others to construct the outcome of the interview. There are, however, a number of problems with this form of analysis. The first one is that while there may be expectations of the role that interviewers and interviewees may play, only one of them has a script, so the analogy is not wholly applicable as the role of the interviewer is not simply to act out a part, but it also often involves directing the other party. More significantly – and is acknowledged by some (Myers & Newman, 2007) – the idea of the interviewer playing out a role could encourage feigning or acting out human qualities such as interest in what the interviewee is saying, naivety when wanting the interviewee to provide an explanation of a situation or empathy with the dilemmas that face the interviewee. The contention here is that while the interviewer may have to adopt a persona that is suitable for spending an extensive time in the company of someone whom s/he has never met, or only met on one or two occasions – and which is different from the way in which s/he may act most of the time – the central essence of the interviewer's character is likely to remain unchanged, even if the interviewer's knowledge and understanding is enhanced. In other words, in a wholesome interview, the selection of a topic that is of genuine interest to the interviewer and which promotes affinity and sympathy with the research participants is paramount and is more likely to promote rapport with research participants than feigning sympathy and empathy.

Closely aligned with dramaturgical approaches to the social interaction involved in an interview is an emergent literature on rapport (Dundon & Ryan, 2010; Garbarski et al., 2016; see also Harvey, 2011; Jacob & Furgerson, 2012). Garbarski et al. (2016, p. 5) provide three definitions of rapport as a sense of affinity, expression of non-verbal and verbal behaviours, or co-ordination and synchronisation in interaction. Both Dundon and Ryan (2010) and Garbarski et al. (2016) propose ways in which rapport may be constructed to facilitate better information

gathering, although Dundon and Ryan also warn of a danger of over-rapport which could lead to collection of non-research related tales or information that the interviewee thinks the interviewer wishes to hear. If, however, the core of rapport is seen as a shared sense of affinity so the expression of behaviours and the liking for forms of co-ordination in interaction is simply a product of that affinity, there is a problem with the argument that both Dundon and Ryan and Garbarski et al. put forward. That is, rapport is based on mutuality and cannot be generated by one party. Ironically, Dundon and Ryan's paper illustrates that the foundations of mutual affinity precede the social interaction in the interview and stem from shared interests, political affiliations, mutual acquaintances and senses of humour. Thus, a wholesome approach to interviewing encourages interviewers to pick a research question which itself generates affinity between themselves and their research participants.

For this reason, one of the authors – Bill – has often expressed affinity with particular parties that have an interest in the phenomenon that is being researched prior to the interview taking place. For example, in the work that Bill has conducted with Catherine Cassell (e.g. Lee & Cassell, 2008, 2011; Cassell & Lee, 2009, 2012) around trade union learning representatives (ULRs), it was not unusual for the interviewers to explain to the many respondents who were ULRs that the interviewers were sympathetic to the introduction of ULRs. In this context, preparation of initial reports from an early part of that programme of research and a subsequent publication of a report by *TUC Unionlearn* (Lee & Cassell, 2009) that could be given to the respondents also provided a means of adding to trust so that a shared affinity could be established at the start of the interviews.

When conducting interviews, there is a range of factors to consider that could impact on the quality of the social relationship. One of these is the medium through which the interview will take place. In addition to the

face-to-face interactions – that have been assumed here – interviews may take place over the telephone (Harvey, 2011, pp. 435–6), electronically through such mechanisms as emails, internet forums, discussion groups and chatrooms (Morgan & Symon, 2004) and through Skype. The social relationship between the researcher and the interviewee will be different when these media are used. For example, Morgan and Symon (2004, p. 28) describe the relationship between the interviewer and the interviewee as disembodied and de-contextualised when electronic means are used. The medium for the interview and the social relationship that follows may affect the quality of the information that is shared. For example, Harvey (2011, p. 439) suggests that the absence of full social interactions in telephone interviews can have a detrimental effect on the confidence of the interviewee that the information will be kept confidential (cf. Cachia & Millward, 2011). By contrast, there may be many advantages and positive effects including enhanced responses around difficult topics and protection afforded to vulnerable groups by the anonymity that may be realised through electronic methods (Morgan & Symon, 2004, p. 24; Willis, 2012). The use of media such as Skype has the benefit of permitting interviews to be conducted even when there are great distances between the interviewer and the interviewee, but it can affect the quality of the social relationship. Hence, we would suggest that in most circumstances, it is easiest to establish and demonstrate the shared affinity essential to a wholesome interview when the first contact is face-to-face.

A final consideration around the social dimensions of an interview is where it takes place. There is not a special time and space for interviews as they are rarely a routine part of interviewees' normal days. So interviews often take place in a space that has been designed for other purposes. As Herzog (2005, p. 35) indicates, this will involve the interviewer crossing boundaries into other domains of the interviewee's life where work

or domestic life commitments will regulate the interviewee's behaviour. While this may provide insights into other parts of an interviewee's life, the location of the interview could result in disruptions that affect the quality of the information that is collected. We have always found disruptions and entering unexpected social interactions with others to be useful. For example, in the research into ULRs described above, Bill was often sat in an office, interviewing a trade union learning convenor, when a ULR or a learner would enter the learning convenor's office. The interruption would provide an opportunity both to observe the operation of the scheme and to have an informal discussion with that other person about the ULR project. Of course, there are times when the interruptions may not facilitate learning more about a project. In one interview, an interviewee had to receive a phone call about his wife who was in hospital. The interruption obviously involved a break in the interviewee's train of thought and he requested that he be reminded of what he had been talking about. Having the genuine interest in the topic that is necessary for wholesome interviews can help the interviewer recount where the discussion had reached.

As we have indicated above, while the social dimensions may be analytically separable from the technical and political dimensions, they overlap in practice. There are, for example, political dimensions to the choice of where to conduct the interview. Interviewees' being able to choose the location helps to equalise relationships between the interviewer and the interviewee. It is to the dimensions of an interview that are most significantly political that we now turn.

POLITICAL DIMENSIONS OF AN INTERVIEW

As indicated above, there are inevitably political dimensions to interviews because

interviewees and interviewers are involved in relationships with one another and with others who might be affected by the research. In considering political dimensions, this chapter is informed by Gramsci's (1971) ideas that academics do not form a separate and self-contained group of intellectuals, but those who espouse ideas of any description are intellectuals that are aligned with one or more groups in society. The nature of that alignment is based on whether the ideas that are articulated serve to protect a society which benefits some groups rather than others, or whether the ideas articulated seek to change that society to move away from unjust inequality. Three dimensions of political relationships of interviews will be considered here. The first is the interpersonal relationship and a requirement for the interviewer not to be exploitative of the interviewee in the interview situation. The second is whether the interview situation may be transformative *per se*. The third is the interventions that the interviewer may make to help bring about change that is beneficial or disadvantageous to the interviewees.

In considering the first issue, interviews have been described as a 'gift' or 'privilege' (Denzin, 2001, p. 24; Limerick et al., 1996). These are useful metaphors because they highlight that the interviewee is giving something to the interviewer. In many cultures, there is the expectation of some form of reciprocation in research, even if it is just sharing of personal details (Cunliffe & Alcadipani, 2016, p. 9; Walker et al., 2006). Such expectations should be contrasted with concerns that interviews are essentially asymmetrical in the power relationship which gives rise to patterns of exploitation (Gubrium & Holstein, 2001; Kvale, 2006; Limerick et al., 1996; Tanggaard, 2007). The interviewer sets the agenda, controls the exchange between the parties and decides on how knowledge produced by the interview may be presented. The interviewer may also be the person who receives the most immediate gratification from the interview exchange.

As Kvale (2007, pp. 55–6) argues, although interviewees may sometimes find the opportunity to discuss their lives as enriching, an alternative feeling is one where the interviewee 'has given much information about his or her life and may not have received anything in return'. The interviewee is also reliant on the researcher to act with a proper duty of care with that information (Gattrell, 2009). Similarly, the researcher, rather than the interviewee, obtains the longer-term benefits of the interview. Except in some types of action research (e.g. Rod, 2011), interviewees may gain little from the research, but published outputs from the research project may benefit the researcher's academic career. Issues surrounding the disparate power relationship in the interview situation are accentuated when deception on the part of the researcher is involved. Cunliffe and Alcadipani (2016, pp. 17–21) suggest that deception and non-deception are not binary categories, but fall along continua which they break into three. First, there is impression management where props such as the provision of potted histories are used to gain gatekeepers' approval, and the choice of special clothing may serve to deceive. Second, there is the extent to which the goals of the research and the particular groups' interests that those goals serve are revealed or withheld. Third, there is the extent to which the accounts produced of the research are fully 'truthful' when they are based on selection and exclusion of some of the information collected.

As it is the interviewer who constructs the unequal relationships, some authors propose redress of the disparate power relationships through a range of mechanisms. For example, Limerick et al. (1996) suggest ways of shifting power away from the interviewer to the interviewee including: negotiating over the interview schedule; allowing the interviewee to choose the time, setting and method of recording and whether to terminate the interview; the provision of transcripts and articles for reading and commenting before publication; and generally being accessible after the

interview. Such analysis is accompanied by advice about being prepared to be challenged throughout the interview process and adoption of modes of behaviour to reduce social differences. An alternative suggestion around addressing disparate power relationships in the interview situation is provided by Ben-Ari and Enosh (2012) who argue for indirect reciprocation. Ben-Ari and Enosh (2012) suggest that the efforts made by interviewers to equalise power relationships between themselves and interviewees are relatively superficial, and the disparate relationship between the interviewer and the interviewee is not only inevitable but can also be helpful in generating curiosity about the other as a prelude to seeking understanding. Rather than focusing simply on the dyadic relationship between the interviewer and interviewee with the aim of seeking direct reciprocation between the two, Ben-Ari and Enosh argue that it is necessary to set that relationship in the context of a common goal. This effectively creates a third party and triadic relationships involving the third party and the interviewer and interviewee. It is then possible to acknowledge that reciprocation will not be realised through the direct relationship between the interviewer and interviewee, but will instead be derived indirectly via the third party within the triad.

Ben-Ari and Enosh's account suggests that the third party in the triad is a collective interest when what has been argued above is that many projects may support some groups at the expense of others, and assumptions of indirect reciprocation are not sufficient in wholesome interviews. While the idea of wholesome interviews that is proposed here supports the principles of seeking to conduct interviews in ways that are not oppressive or exploitative, it rejects the idea that researchers may be involved in deception when they have not revealed everything that they know about their project to everyone that they come into contact with. Pursuing a wholesome interview would involve having no intent to deliberately mislead people.

Actions such as adopting a particular type of attire when conducting research interviews are often intended as akin to respecting the traditions of a community that one is visiting, which could facilitate the interviewees taking the research more seriously. Omission of part of the explanation of the research often arises because qualitative researchers do not know all that they hope to reveal (Collins, 2008). Not including all of the evidence collected in written reports is inevitable because of the sheer volume of qualitative research, but as long as there is not deliberate omission of pertinent data with an intention to mislead the reader and there has been an equal chance for all data to be included by reference to the terms of analysis appropriate for the objectives and documented methods of the paper, deception is unlikely to be a product of wholesome interviews.

There are, however, two other comments of importance here about the perceived nature of unequal relationship in interviews. The first is that the arguments above tend to focus on the interviewer-interviewee relationship and ignore the power relationship between the interviewee and wider society. This issue will be discussed later. The second is that the arguments tend to ignore situations where the interviewee is in a more powerful position than the interviewer. This is often the case with business and management research where interviewees are head of multinational corporations or partners in large accountancy or law firms, etc. and have considerable resources at their disposal to mobilise should they not like the research that is being conducted. More generally, there has been the development of a body of literature on interviewing elites (Harvey, 2011; Kezar, 2003; McDowell, 1998). These works tend to define elites by their qualities and position. Some of this work highlights that elite interviewees are less likely to accept the authority of the interviewer, but instead use their knowledge, both to prepare for the interview and to challenge the interviewer and seek control of the interview (Harvey, 2011, p. 439). Others suggest

that the interview is a tool for liberation. For example, Kezar (2003) argues that transformational elite interviews allow the interviewer to understand that interviewees may actually feel disempowered and also facilitate the interviewee reflecting on the prospective impact of their actions from different perspectives and whether they wish to be the type of person that perpetrates such an impact. While acknowledging that elite interviewees may challenge interviewers, especially when those interviewees perceive objections to their powerful position in the research, there must be serious doubts about the value of Kezar's arguments. Not only does her approach misunderstand the nature of structural power – which will be discussed further below – that is often reproduced through mechanisms that are too diffuse for any one individual to exercise any significant control in bringing about change, but it affords the interviewer with a status of a greater agent for change than the combined strength of oppressed groups and their allies that may mobilise against those mechanisms on a broad front.

It is now appropriate to address the relationships between the interviewees and other groups in society and the interventions that an interviewer may make to benefit one group or another. As indicated above, societies may be structured in ways that benefit some groups at the expense of others. In such a context, research projects can either challenge those relationships, or they can accept them. Neither is neutral, as each supports one party or another. While some academics who criticise the current order simply write up their research for academic audiences, this does not mean that an interviewer's responsibilities to interviewees end with the interview. There are a number of ways in which interviewers may challenge how the world is constituted as a consequence of the research that they have conducted. In the research into ULRs, discussed above, that Bill conducted with Catherine Cassell, ULRs provide a challenge to traditional ways in which learning opportunities have been distributed within

corporations because they seek to provide opportunities to develop through their workplace to people who had previously been denied such opportunities. The ULR initiative was, thus, clearly designed to benefit those who previously had limited learning opportunities at work. In the course of this project, Bill and Cathy made a number of interventions to support the ULR initiative. These included: reporting back to the participants; speaking at an event organised by the TUC to which numerous trade union officials had been invited to share expertise with them; writing a report in non-academic language, using many quotes of ULRs, to help popularise the scheme; advising individual trade unions on the merits of the scheme; providing different trade unionists with examples of learning agreements that had been negotiated in support of ULRs at different organisations so that they could formulate their own; writing references in support of funding of individual ULR initiatives for their proponents; and providing written accounts of the UK scheme to proponents of comparable schemes in other countries.

Another project that both Usman and Bill are involved in currently addresses the political inequalities that exist between academics in different countries. After the Second World War, the English language was established as lingua franca for business, cultural and academic endeavours. This was aided by national English publishers, especially of textbooks and handbooks, gaining new markets so Anglo-American authors gained influence beyond their national audiences and became international (Gobo, 2011). This resulted in ethnocentric knowledge about research methods that had been local to a Western context becoming perceived as universally appropriate and suitable for research elsewhere (Gobo, 2011). Consequently, the default assumption of English as a universal language was instrumental in the increasingly widespread adoption of particular methods developed in the West and the preclusion of the development of alternative indigenous

research approaches. As Gobo (2011, p. 419) argues, accounts of research methods mainly written by American experts have been ‘tacitly described, proposed, and publicized as context-free knowledge, as useful and appropriate tools for studying every culture’. In response, there have been calls for the development of ‘glocalistic’ methods that can fuse sensitivity to local conditions with the generation of knowledge that may have broader or global applicability (Gobo, 2011; Lee, 2015), in part to overcome disadvantages suffered by academics that do not have English as their first language and to generate knowledge that is of most use to those outside of countries where English is used predominantly. We are currently engaged in an interview study that seeks to understand the ways in which Western assumptions around epistemology, ontology, theory and method affect the course of projects conducted elsewhere in the world. Our intention is to prevent such factors becoming the means of exercising a form of intellectual imperialism. One of the interventions that we are committed to making is the preparation of teaching materials that will enable the development of glocalistic research strategies for people who conduct research in one country but who address audiences in another.

The two projects discussed here may not be considered too much of a challenge to the most powerful groups in society. There are occasions when interviewers may generate evidence and arguments that those with existing power object to sufficiently to deploy resources to obstruct the research or to prevent its publication and use. This makes it essential that new researchers ensure that they observe the spirit of the ethical code of their own institution when carrying out research and keep records of how they observed ethical guidance so that they retain the support of their institution should their research lead to interventions by powerful opponents. In projects involving wholesome interviews, it is equally important for more experienced researchers to be clear when their research

is designed to challenge prevailing political relationships and to be prepared to be transparent about the intended consequences.

SUMMARY AND DISCUSSION

In this chapter, we have argued for wholesome interviews that pursue alignment of technical, social and political considerations to promote positive outcomes for researchers, interviewees and the research community more generally. Our intention has not been to suggest that research participants do not have their own interests which may sometimes conflict with those of the researcher (Cunliffe & Alcadipani, 2016, p. 2), but instead to suggest the means by which researchers may start from a position where those conflicts are most likely to be minimised and from which researchers may extricate themselves most easily when such conflicts arise and the researchers feel compromised.

Throughout this chapter, we have treated the technical, social and political dimensions as analytically separable but integral to one another in practice. For example, the choice of research questions is a political decision that will affect both the technical issue of which literature to review and the social question of which populations to interact with. Our definitions suggest that different qualities are necessary to realise competence in the respective dimensions of the technical, social and political. Competence in the technical dimension may be addressed by knowing the codes sufficiently well to design a well-executed research study. Expertise in the social dimension may be developed by selecting populations to research with whom the researcher has a prior affinity, anticipating issues and situations that may arise and rehearsing how to deal with those situations, although not in ways designed to mislead the interviewees. Execution of the political dimension will involve an understanding of one’s own values and reflection on the extent

to which one is prepared to accept the prevailing order, the changes that one wishes to see and having the courage to carry that forward when designing and conducting research projects.

A criticism that may be made of this chapter is that it may lead researchers to preclude studies of some agencies and areas that they disagree with (Cunliffe & Alcadipani, 2016, p. 5). Obviously, this is a drawback, but what must be assessed is whether the information that could be collected by studying a site in a covert or less than wholesome way outweighs the costs and is better than having no information at all. Of course, not all researchers will have the same values and attach the same meanings to a single phenomenon. Thus, some information may be available from research conducted by others who do not share a particular researcher's values.

CONCLUSION

In conclusion, this chapter has gone beyond simple classifications of interviews that focus purely on the technical types to provide an understanding of the alignment of the technical, social and political dimensions to achieve wholesome interviews. There may be occasions when it is not possible to achieve the alignment between the different dimensions of interviews that are advocated here. Exploration of the extent to which different interviews vary from the wholesome interviews along the dimensions identified will enable understanding of the suitability of alternatives to wholesome interviews for different situations that may face researchers when they design interview projects.

Group Methods

Tracey M. Coule

INTRODUCTION

Over the last few decades, the use of group methods has become more prevalent within a diverse range of business and management disciplines, including but not limited to logistics (Rodrigues et al., 2010), business communications (Byers & Wilcox, 1991), information systems (Stahl et al., 2011), supply chain management (Rose-Anderssen et al., 2010) and marketing (Fern, 1982; Kehoe & Lindgren, 2003). This disciplinary based literature, however, has concerned itself primarily with the practice of the method, affording little attention to the diverse knowledge constituting assumptions that can underpin its use (although, see Calder, 1977; Rose-Anderssen et al., 2010; Stahl et al., 2011 for rare exceptions). Problematically, such a preoccupation with methods in isolation ‘obscures the link between the assumptions that the researcher holds and the overall research effort, giving the illusion that it is the methods themselves,

rather than the orientations of the human researcher, that generate particular forms of knowledge’ (Morgan & Smircich, 1980, p. 499). More recently, Cunliffe (2011) enriches Morgan and Smircich’s seminal framework, which drew attention to the importance of situating qualitative methods within broader philosophical debates, through her account of the increasing complexity of qualitative research choices. Cunliffe attributes this complexity to developments in metatheoretical perspectives, organization theory, research methods and approaches to theorization. In short, she argues that considering our metatheoretical positioning provides a basis for ‘building crafted, persuasive, consistent, and credible research accounts’ (Cunliffe, 2011, p. 647). It is with this in mind that I attempt to explore and delineate different schools of philosophical thought and their implications for the practice of group methods, as one mode of knowledge production.

Broadly speaking, scholars have highlighted that philosophical consensus does not prevail in qualitative research (Bryant & Lasky, 2007; Johnson et al., 2007), which is characterized by a proliferation of forms underpinned by diverse, and often competing, philosophical assumptions (Guba & Lincoln, 1994; Morgan & Smircich, 1980). The variety of understandings regarding the nature of qualitative research illustrates the possibility that different interpretations, which emphasize particular philosophical and procedural variations, underpin the use of what on the surface appears to be the same method or technique. It is hoped that this chapter can go some way towards developing the practice of group methods within the business and management domain through enhancing researchers' awareness of the relationship of philosophical issues to the design and application of the method itself. I argue that group methods can serve the interests of researchers from a variety of philosophical traditions, but understanding the practical implications of this variability is crucial to appropriate and effective use of group work from any given stance. In taking such an approach, I am working on the premise that engagement with research philosophy is a cornerstone of effective research practice rather than a distraction from the real task of 'doing' research.

The chapter is organized into three core sections. First, the antecedents of group methods are briefly outlined in order to contextualize their origins and uses. Second, the chapter delineates how researchers from diverse philosophical positions may variably conceive the method in order to develop a typology of group methods for business and management research. This section aims to expose the implications of diverse assumptions about ontology and epistemology for the practice of group methods in order that researchers may be better equipped to adhere to the tenets of quality criteria appropriate to their research tradition. Finally, the concluding section summarizes the key lines of argument advanced in the chapter.

ANTECEDENTS OF GROUP METHODS

Much of the business and management literature on group methods limits itself to acknowledging the benefits and drawbacks of the technique(s) (e.g. Byers & Wilcox, 1991; Kehoe & Lindgren, 2003; Rodrigues et al., 2010). Within their methodological accounts, few scholars – even indirectly – attend to the marked differences that reflect the distinctive intellectual priorities of the two fields from which group methods emerged: social psychology and psychotherapy (Morgan, 1997; Rook, 2003; Stewart et al., 2007).

In sum, group methods within the social psychological tradition emphasize within-group research that is evaluative in its purpose, direct in its questions and low in respondent interaction. In this way, it has arguably influenced what is often referred to as the 'group interview', which does not have the explicit interest in-group interaction commonly associated with 'focus groups'. Early uses of group methods within social psychology date back to World War II, where researchers sought to advance understanding of the persuasiveness of propaganda efforts and the effectiveness of training materials for troops (e.g. Merton & Kendall, 1946). Psychotherapeutic uses of group methods emerged from the priorities of clinical diagnosis and treatment, and Moreno's (1934) use of psychodrama and play therapy is considered seminal work within this domain. Here, researchers favour group methods that are more developmental in orientation and design, placing less emphasis on evaluative tasks: 'compared with groups conducted in the social psychological tradition, the clinical approach is more likely to emphasize interactive group discussions and activities; individuals' deep-seated thoughts and feelings, and extensive, wide-ranging and spontaneous expressions' (Stewart et al., 2007, p. 6).

The intellectual tension between the two disciplines from which group methods originate, and the epistemological assumptions of

their advocates, is often obscured by technique driven discussions and only becomes apparent in vague notions about what constitutes ‘scientific research’ or adequate knowledge (Stewart et al., 2007). Consequently, few researchers adopting group methods today are aware of these historically competitive ideologies and that the ‘resulting focus group hybrids reflect varying degrees of psychotherapeutic and social psychological influence’ (Rook, 2003, p. 40). One of my aims here is thus to address the potential methodological and epistemological confusion which may befall business and management scholars by outlining a typology of how researchers from different philosophical traditions might variably conceive group methods. Having outlined the social psychological and psychotherapeutic antecedents of group methods, the chapter now locates the method within commonly debated philosophies within the business and management domain, namely: neo-positivism, interpretivism and critical management studies.

TOWARDS A TYPOLOGY OF GROUP METHODS IN BUSINESS AND MANAGEMENT RESEARCH

The preceding section outlining the origins of group methods suggested the technique (or any given technique) is infused with philosophical commitments; methods are not neutral tools and are tied to different perspectives on how social phenomenon should be studied. In short, group methods can serve the requirements of many different philosophical positions along the subjective-objective continuum (Coule, 2013). This, however, raises significant questions about the design, conduct and analysis of group methods in meeting the demands of associated sets of diverse quality criteria. Indeed, there have been calls for social researchers to adapt and expand the dominant ‘market research’ models of group work to take into

account their own purposes and theoretical traditions (Hopkins, 2007; Kitzinger & Barbour, 1999). In this spirit, I now aim to delineate the implications of various philosophical schools of thought familiar to organization and management researchers for the design, conduct and analysis of group methods.

Group Methods and Neo-positivism

The domain of business and management research has and continues to be influenced by the intellectual and methodological priorities of positivism, resulting in a form of ‘qualitative positivism’ or neo-positivism (Duberley et al., 2012; Prasad & Prasad, 2002). Of particular note in the context of group methods, Calder (1977) considered the method from a philosophy of science perspective within the marketing discipline. Significantly, Calder’s basis for judging the three distinct approaches to group methods, which he terms ‘exploratory’, ‘clinical’ and ‘phenomenological’, is premised on ideal criteria for ‘scientific’ research.

The marketing, logistics and business communications literature is thus awash with concerns about the ability of group methods (and qualitative research more broadly) to form the basis of impartial, rigorous and reliable knowledge (see Calder, 1977; Byers & Wilcox, 1991; Kehoe & Lindgren, 2003 for conceptual discussion of the method and Rodrigues et al., 2010 for conceptual discussion with case examples of empirical group work). Wells (1974, p. 134) depicts this unease by questioning, ‘how can anything so bad be good?’ Yet the method continues to be used, perhaps largely due to its perceived instrumental usefulness to management practitioners (Kehoe & Lindgren, 2003; Rodrigues et al., 2010). Nevertheless, the aforementioned concerns about the subjectivity of group methods often result in them being relegated to a junior, preliminary role

within neo-positivist research endeavours. This manifests in various ways. For example, researchers tend to use group methods to generate or select theoretical ideas and hypotheses for subsequent deductive testing and for developing and piloting operational aspects of future quantitative research, such as the wording of questionnaire items (see Calder, 1977; Rodrigues et al., 2010; Zeller, 1987 for discussion of the nature and application of group methods from a neo-positivist standpoint). For the most part, neo-positivistic researchers see the value of group methods as acting as a precursor to scientific knowledge, subsequently generated by more rigorous and reliable quantitative techniques. Its use is often, therefore, limited to contexts where little is known about the phenomena of interest (Byers & Wilcox, 1991; Rodrigues et al., 2010).

In practising group methods, the methodological rigour and reflexivity emphasized within the neo-positivist stance has resulted in strict protocols and recommendations regarding executional details (Stewart et al., 2007) in order to minimize the chances of ‘technically problematic methodological lapses’ (Johnson et al., 2007, p. 24; also see Haynes, 2012). Here, the management researcher, as moderator of the group, is central to achieving objectivity and the production of quality data: ‘A focus group and its resulting information are only as good as a moderator [and] her or his knowledge of focus-group approaches and procedures’ (Kehoe & Lindgren, 2003, p. 21). Within a neo-positivist approach to group methods, the researcher adopts the position of detached observer during data collection with the goal of reducing threats to the objectivity and value of resulting data (Calder, 1977; Kehoe & Lindgren, 2003; Rose-Anderssen et al., 2010). The priority is control over the output of the group and much has been written about the role of group size (usually 8–10), composition (normally strangers to avoid pollution of data) and level of interaction among participants (low due to structured

topic guide) in contributing to the controllability of group work (Morgan, 1998; Rodrigues et al., 2010). Stage-driven models that outline the steps of group work and the role of the researcher within each step abound the neo-positivist informed management literature that takes group methods as its focus (e.g. Kehoe & Lindgren, 2003; Rodrigues et al., 2010).

Positioning group participants as passive subjects, who hold (objective/factual) opinions and preferences, best expressed under the ‘control’ of the moderator, holds significant analytical implications. For example, a preoccupation with objectivity and neutrality has led some researchers to advocate assigning numerical values to data generated through group methods, which they propose can be manipulated to achieve greater insights into its ‘meaning’ and provide confidence of theoretical saturation (Byers & Wilcox, 1991; Rodrigues et al., 2010; Schmidt, 2010). Such assertions appear to embody the belief that the heart of the quantitative–qualitative debate is philosophical and not methodological (see Trochim, 2000). In other words, researchers may acknowledge some fundamental differences, but assume they lie primarily at the level of (epistemological and ontological) assumptions about research rather than at the level of data.

Table 8.1 provides an illustrative example of how a researcher with neo-positivist commitments may chose to code and analyse group data. The data is drawn from 19 participants across 5 focus groups conducted as part of my doctoral research and concerned with organizational sustainability in the non-profit sector. The opening question within the group sessions encouraged participants to conceptualize organizational sustainability. On reading through this section of the transcripts, a number of themes emerge. For the purpose of this example, seven descriptive categories have been identified and given a short label that represents the theme in the participants’ response (1=human resources; 2=governance; 3=funding; 4=organizational development/

planning; 5=collaboration; 6=strategic relevance; 7=demand for services). The appearance of a '1' under any given theme indicates that the participant mentioned the theme; a '0' indicates that the participant did not mention that particular theme.

Table 8.1 allows the researcher to easily describe certain characteristics of their data, like that theme 3 (funding) was the most frequently mentioned in the consideration of organizational sustainability or that the majority of respondents touched on between 2 and 3 of the themes (the most common number of themes to be mentioned by respondents is 2). This kind of 'quantitative' content analysis can then be pushed further by examining the correlation between the themes based on which respondents addressed them (see Table 8.2):

As depicted in Table 8.2, this kind of analysis shows that themes 1 and 3 are

significantly positively correlated; people who touched on theme 1 (human resource) also tended to mention theme 3 (funding). Themes 5 (collaboration) and 6 (strategic relevance) are also significantly positively correlated. Such an approach to qualitative data is, however, contentious and business and management researchers committed to alternative knowledge constituting assumptions would likely challenge the meaningfulness of 'opinions' or 'attitudes' that have been isolated from the context in which they were generated. The loss of content interaction between group members – and indeed between group members and researchers – is particularly contentious as the defining characteristic of much group work is 'the explicit use of the group interaction to produce data and insights that would be less accessible without the interaction found in a group' (Morgan, 1988, p. 12).

Group Methods and Interpretivism

The discussion of interpretive research is not simple as the label subsumes a variety of genres, but perhaps the unifying feature is the attempt by researchers in this tradition to access and understand participants' intersubjective, culturally derived meanings to explain behaviour in everyday business and management contexts through *Verstehen* (Johnson et al., 2007). In attempting to understand processes of symbolic 'world-making' (Schwandt, 1994), rather than a ready-made world which is awaiting discovery, interpretive research sets itself apart from the neo-positivist tradition. From this standpoint, questions about the reliability and generalizability of group methods that are pervasive among neo-positivist researchers who use the method become less meaningful as the values and preconceptions researchers bring to interpretative acts are acknowledged through reflexive practices. In other words, the researcher's representation of actors' reality is seen to actively contribute to its creation (Haynes, 2012).

A phenomenological approach to group methods is not uncommon within the business and management literature (see Calder (1977) and Kehoe & Lindgren (2003) for conceptual discussion of group methods from this perspective). More specifically, it is perhaps most prevalent within the marketing discipline due to its ability to provide 'A chance to "experience" a "flesh and blood"

consumer. It is the opportunity for the client to put himself in the position of the consumer and to be able to look at his product ... from her vantage point' (Axelrod, 1975, p. 6). Such an approach is positioned as being both instrumentally useful and predicated on the active involvement of the researcher through 'interactive personal contact' (Calder, 1977, p. 359). Notably, however, several scholars who advocate the use of phenomenological approaches to group methods remain driven by positivistic quality criteria for evaluating research and thus have concerns about the lack of prescriptive procedural protocols and extent to which facilitative behaviour is left to the idiosyncrasies of individual researchers. Subsequently, phenomenological group work is argued to produce everyday (non-scientific) knowledge by such scholars (Calder, 1977; Kehoe & Lindgren, 2003), despite the well established idea that interpretive approaches should be judged by criteria that are significantly different from those used to evaluate the rigour of neo-positivist research (Prasad & Prasad, 2002; also see Johnson et al., 2006 for a comprehensive delineation of evaluation criteria for research informed by different philosophical traditions).

Notwithstanding the above tensions and contradictions, we can take from the discussion of phenomenological approaches to group work that the underpinning assumption within this tradition is that the foundation for explaining human action is understanding how people actively establish and re-establish the meanings

they use to organize experiences (Johnson et al., 2007). The resulting implications for group work – when compared to neo-positivist approaches – are less (researcher imposed) structure; less researcher control in facilitating the group and greater interaction between group members; smaller group sizes (usually 5–8 people); openness to groups of strangers, pre-existing groups or both (Bill & Olaison, 2009; Calder, 1977; Kehoe & Lindgren, 2003).

Analytical approaches are likely to involve some form of interpretive content analysis based on the premise that it ‘retains something of the richness of transcript data, while ensuring that the great mass of data thus generated are analysed systematically and not selectively’ (Frankland & Bloor, 1999, p. 145). This technique is based on qualitative data indexing (see Dey, 1993; Coffey & Atkinson, 1996), the purpose of which is to facilitate comparative analysis by gathering all data on a particular topic under one heading, in order to make the study of material manageable for analysis purposes. It is important to note that indexing is distinct from the activity of exclusive coding of material (as in the previous example) in that there is no necessity, at the indexing stage, to settle on a final interpretation of an item of text; rather, each piece of transcript is assigned several, non-exclusive index-codes referring to the several analytic topics on which it may bear. The objective of indexing should be to simply pose a number of possible interpretations, deliberately delaying a final interpretation until the text item can be compared systematically with the entire spectrum of text items carrying the same index code(s). The emphasis in the indexing process is on inclusiveness (including initially all possibly relevant material), rather than on exclusiveness. The indexing process is cyclical. New index-codes may emerge in later transcripts and the researcher then returns to earlier texts to add the new index code to them. Thus, indexing is essentially inductive in nature, with categories emerging from the analyst’s absorption in the text:

Recalling the events of the focus group itself, the analyst has a participant’s ‘pre-understanding’ of the transcript and understanding is deepened by submersion in the text. Analytic categories are generated through this understanding and these categories, applied to the text, deepen analytic understanding, which in turn stimulates greater elaboration of the analytic categories, which are in turn applied to the text, and so on. The process is not reductive: the data are retained in richness and context, but comparative analysis is facilitated. (Frankland & Bloor, 1999, p. 147)

The brief example of data in the extract below (Box 8.1) illustrates how the method could be applied (F is the female facilitator; P1 and P3 are male Chief Executive Officers of non-profit organizations; P2 is a female Chief Executive Officer). Again the example is drawn from a section of the transcript relating to the opening question, which encouraged participants to reflect on how they make sense of organizational sustainability.

Other interpretivist researchers would advocate devoting more attention to group transcripts as ‘talk’ and focusing on the complexity of interaction (Beach, 1990; Kitzinger, 1994; Myers, 1998). There are a number of approaches to conversation, which may differ in some respects, but all tend to share assumptions that identities are negotiated in discourse (and thus focus on how group members set up and work out roles); talk is organized moment to moment by participants (and therefore look at how they define sections, rather than defining sections as analysts); talk is sequenced, one thing after another (each ‘utterance’ is considered in terms of what came before and after) (Meyers & Macnaghten, 1999). Here, consideration will be given to a short example showing how participants redefine topics. It may seem that the researcher’s topic guide sets topics for discussion within-group work. A closer examination of transcripts, however, can demonstrate how participants shift and evolve a particular topic, sometimes in unpredictable ways, so there are often several potential topics at play. Consider the passage below (Box 8.2) from a focus group with the Chairs

Box 8.1 Illustration of data indexing

of three voluntary organizations (P1 and P3 are male; P2 is female; *** indicates that a name/place has been made anonymous).

Note that, at the beginning of each turn, participants acknowledge the topic (human resource sustainability), but, by the end of

their turn, they have often introduced one or more new topics that are to be taken as related. For instance, participant 1 (P1) introduces the topic of human resource (HR) sustainability as being important in the consideration of organizational sustainability, and goes on

Box 8.2 Approaching group work as 'talk'

- P1: Sustainability means personnel sustainability ... that's the key for me, is ... having been through it with the *** project, the health one. We had a fabulous project worker, and because we were on this sort of, bidding for the passing ship of money, the insecurity and the lateness of paperwork coming to us, and the insecurity that she had ... she left us. For her benefit it was actually very good because she ended up with a very interesting career as a result, but, it was our loss and we've got the same issue at the moment. We've taken over this theatre, it's now in the *** Partnership and all these issues about keeping the ... are we going to keep it going ... it's over used by people now, it's got a financial future, but we need priming to get it going and all community issues to do with the charitable aims are there, and yet the priming of the whole thing is held back. So the sustainability is basically keeping people who need a job, want a job, that are useful to our community and our project, and fulfil everything. We don't have that sustainability personally, and I don't see how people, good people like that can you know ... give a commitment, and that's what we need. I don't know what you feel?
- P2: I suppose, that I would support what you've said, but because most of the people I employ are on annual contracts, because that is how social services contract ... until this year, this time we've got a two year for the first time ... I'm used to a turnover of staff because I can never give any more security than that one year. Except within young people, where at one time we would have three years, but that then means as you come to the end of that three years you have nothing, because nobody is going to pick up your funding until you are dead in the water [sigh P1]. So you ... we have actually funded, from within house, for three months to try and cover that period. But even so, we're having to provide hope ... and we have staff that we have grown, trained ... for three years. I've lost one, I've got two left ... I've an idea I'll lose one of those ... come hell or high water I'll keep the last one. But it is ... we've learnt ... [P3s] been there, I've been there, I've seen ... all you can say is you've launched so many good staff out into the sector, that at least we've done something right [laughter P2].
- P1: Yes. Yes.
- P3: Staffing is critical. This short-term question ... I certainly whole heartedly agree with what [P2] says. It's a major problem ... that you get people trained up, keen, working well and all of a sudden ... bang, the funding comes to an end for a particular project and you've lost an absolutely marvellous person. So, in that sense, it's the sust ... sustainability is ... has a big knock in those circumstances. Sustainability is wrapped up also within the ... the problem of doing short, medium-term projects themselves. Because, it takes that length of time to get a good project up and running ... to really get it motivating, and unless you can then get the funding to carry it on after that, then the whole thing shuts down and it's gone. And that's where I would slip in here central government, because central government ... and you can understand why they do it ... but they come up with these wonderful quick fixes to try to solve potential, well existing problems not potential problems, because they're reactive rather than proactive. And ... they will set a whole new range of guidelines and rules for those of us who are desperately trying to make the communities succeed, and then change dramatically and all of a sudden all the work you've done ... because it's moving society in this direction then the other direction ... is lost, and ... which is where I would ... one is, sustainability is also so dependent on the partners that you're working with. And particularly here in the voluntary sector, there are two aspects here I think which all of us have to live with and accept and understand ... and number one is, some ... a voluntary sector organization is usually only as good as the people that are running it at a particular moment in time...
- P2: Mm.
- P3: ...and some organizations will succeed because they've got good people running them, and marching the thing forward. On the other hand, you have others who, for whatever reason, they have a weak person at the top and the thing dies. Because some of them are so small that you are talking about one, two or three people to hold the thing together, and if you haven't got the right people in there, you ... we may lose a partner, a potentially good partner. We are all, whether we like it or not, we are all very dependant upon the partnerships we variously have with the public sectors, and that is getting more and more ... we don't have to like it, but it's, it's there and therefore one has to learn to work with the public sector partners. Because, certainly as far as my organization's concerned, without the public sector, we would not survive ... that's where the bulk of the money comes from ... and one has to learn to work with them in almost a political, with a small 'p', environment to be able to succeed.

Data source: Coule (2008)

to talk about the nature of short-term funding; by stressing the impact that short-term funding has on HR sustainability he presents the second topic (funding) as relevant. Participant 2 follows by acknowledging the impact that the current funding environment has on the HR system, but implies that high turnover of staff is accepted as a 'given', due to her organization's funding arrangements. She does, however, go on to relate the short-term nature of posts – largely due to the short-term nature of funding – to a decline in staff morale, and a situation whereby the organization is having to provide 'hope' to staff through a process of funding posts from the organization's 'reserves'. Again, P3 acknowledges the topic of HR sustainability and the negative impact of short-term funding on this valuable resource. He then goes on to link short-term funding to central government policy initiatives, and introduces the wider external environment in which non-profit organizations operate as an important determinant of their very survival, adding yet more relevant new topics to the debate. Thus, the topic can shift as the discussion develops, while at each stage it remains relevant. Such a set of transitions is typical of many long passages in the transcript in which the moderator does not intervene; each participant marks their contribution at the beginning as relevant to the current topic, but within each turn, the participants can shift the context and interpretation for that topic.

Group Methods and Critical Research

Theoretical resources from Marxism, Labor Process Theory, Frankfurt School of Critical Theory, Pragmatism and Symbolic Interactionism can all be said to inform the 'broad church' of critical management research. Moreover, the principles of critical management underpin a number of intellectual movements such as feminism and environmentalism. The unifying feature of critical

endeavours within business and management research is perhaps the challenge they pose to instrumentalism, structures of domination, asymmetrical power relations and what is naturally taken for granted (Adler et al., 2007). A defining characteristic of critical approaches then, is their attention to promoting emancipation (Duberley et al., 2012; Stahl, 2008) – a foundation that sets them apart from the neo-positivist and interpretivist traditions previously discussed.

The potential of critical group methods has been recognized by social researchers generally (Kitzinger & Barbour, 1999; Webb & Kevern, 2008) and management researchers specifically (see Bill & Olaison, 2009; Stahl et al., 2011 for empirical examples). From this vantage point, the importance of power in social interaction becomes of central importance. In a practical sense, this manifests in researcher's sensitivity to power issues in everyday procedural choices, such as topics. By way of example, Bill and Olaison (2009) propose what they term an indirect approach to group work through utilizing role-play. These authors do not claim that such an approach to producing knowledge removes the power imbalance between researchers and research participants, but emphasize the potential it provides for co-creation between researchers and participants:

A role-play has a script with rules and constraints, but it also leaves room for the group's decision-making abilities, analytical acumen, and, most importantly, the experience, emotions and imagination of its members. Our scripts also had rules ... and the participants started their roleplaying in a specific setting that they could not initially control or co-create ... To solve the task, or 'to play the game', the participants first had to accept the setting and script, and then they had to co-create it and give their own characters life. (p. 9)

What such scholars are attempting to do, is mitigate to some degree the inherent danger that group work 'chases its own tail' by 'offering up its own agendas and categories and getting those same agendas and categories back in a refined or filtered or inverted

Box 8.3 Extract:

P3: Staffing is critical. This short-term question ... I certainly whole heartedly agree with what [P2] says. It's a major problem ... that you get people trained up, keen, working well and all of a sudden ... bang, the funding comes to an end for a particular project and you've lost an absolutely marvellous person. So, in that sense ... sustainability ... has a big knock in those circumstances. Sustainability is wrapped up also within the ... problem of doing short, medium-term projects themselves. Because, it takes that length of time to get a good project up and running ... to really get it motivating, and unless you can then get the funding to carry it on after that, then the whole thing shuts down and it's gone. And that's where I would slip in here central government, because central government ... and you can understand why they do it ... but they come up with these wonderful quick fixes to try to solve ... existing problems ... because they're reactive rather than proactive. And ... they will set a whole new range of guidelines and rules for those of us who are desperately trying to make the communities succeed, and then change dramatically and all of a sudden all the work you've done ... because it's moving society in this direction then the other direction ... is lost...

Data source: Coule (2008)

form' (Potter & Hepburn, 2005, p. 293). Stahl et al. (2011) conclude that group methods, when designed and executed from a critical perspective – can contribute to both researcher and participant emancipation. In respect of participants, the authors advocate attempts to enhance empowerment and the voices of the less powerful through application of rules to promote an 'ideal speech' situation, the strategic placement of participants within the room (based on a pre-group assessment of how timid or dominant participants were likely to be) and involving them in analytical processes. For business and management researchers, the potential for emancipation lies in the role of participant discourses in challenging researcher's assumptions about their topics of investigation. Put differently, group members can (often inadvertently) call into question taken for granted assumptions underpinning particular disciplinary knowledge systems. The nature of group work within this tradition thus calls for critical examination of how researchers make sense of their own field-work experiences. Reflexive processes are designed to pay attention to how group accounts are 'influenced by their authors' social positions and by the associated use of power-invested language and convention in constructing and conveying the objects of

their research' (Adler et al., 2007, p. 11; also see Haynes, 2012).

'Critical' group work often involves small numbers of participants (5–8) from pre-existing groups, as these are the networks in which people might normally discuss (or evade) issues, form ideas and make decisions. In analytical terms, power relations and their corresponding reality constructions are the required foci. In other words, management researchers question both other's truth claims and how they themselves construct meaning and make truth claims (Haynes, 2012). Reflexivity becomes a moral or ethical project that gives consideration to how group context and broader cultural/institutional features encourage or suppress certain points of view rather than a tool for effective research in the neopositivist sense of the term. At a practical level, researchers who take seriously the contextual, situated nature of accounts and how they become legitimized are much more likely to advocate analytical strategies such as conversation analysis (Antaki, 1994; Greatbatch & Clark, 2012), narrative analysis (Maitlis, 2012) and discourse analysis (Dick, 2013). By way of example, let's revisit one section of text from one participant in the previous example with a specific focus on how they orient to and

actively construct an account of organizational sustainability and the different positions adopted in conversations.

Here (Box 8.3), critical scholars would be interested in the way P3 positions his contribution by establishing mutual ground between his account of sustainability issues and the account constructed previously by P2 in lines 1 and 2 through an enthusiastic 'receipt token' (Dick, 2013). Here P3 provides explicit approval of P2's account and warrants her version of reality by endorsing the idea that the source of trouble lies with short-term funding and its impact on staffing continuity. P3 then prefaces the reduced efficacy of his organization's work (lines 15/16) by suggesting that it is not an internal problem within his organization but a consequence of the central state's transient approach to social problems (lines 10–12). Just this very brief illustration is useful in showing how critical group work may be used to examine the ways in which narrative accounts are constructed in order to establish the 'facts' of organizational life on a particular issue within a particular context.

CONCLUSION

I have attempted to highlight in this chapter that group methods – or indeed any data collection method – cannot be viewed as an 'interpretive' or 'critical' method *per se*. The mere adoption of a method does not say much about the philosophical tradition underpinning its use. Decisions regarding group design, conduct and analysis are informed by researcher's knowledge constituting assumptions, which heightens the importance of critical engagement with both the theoretical and practical issues around group work. Neopositivistic approaches for example, which encourage researchers to present themselves as removed, objective nonentities whose role it is to document the 'subject's' point of view, are not commensurate with interpretive

understanding (Cunningham-Burley et al., 1999). As we have seen, however, they remain commonplace within business and management studies. Nevertheless, we have also seen that researchers committed to alternative perspectives are exploring different approaches to conducting, understanding and theorizing group work (Bill & Olaison, 2009; Rose-Anderssen et al., 2010; Stahl et al., 2011; Steyaert & Bouwen, 2004).

In Table 8.3 the typology of group methods presented thus offers an alternative conception of group methods, by seeing them as existing in a field of tensions between different logics (Coule, 2013). This encourages the acknowledgement of ambiguity in the aims, processes and outcomes favoured in particular approaches to group work and goes some way towards bridging the gap between philosophical assumptions and method to encourage considered fieldwork practices. I would encourage researchers adopting group methods to articulate and reflect upon their particular philosophical commitments and subsequent methodological consequences. Questions about the design, conduct and analyses of group work are not simply technical or practical questions, but are rooted in particular theoretical traditions that significantly influence research aims. While group methods are becoming increasingly established, how they are adopted and adapted to serve diverse and often competing philosophical perspectives is of significant importance. In this chapter, I have suggested a typology of group work within diverse philosophical traditions in order to encouraging more informed choices about how researchers relate to group methods. The idea, however, is to encourage productive lines of thinking rather than provide an exact map of the terrain. It is my intention that the ideas suggested should not be seen as another complication or additional burden to researchers, but a way of avoiding becoming trapped in certain ways of thinking about group work and knowledge production.

Table 8.3 Typology of group methods in organization and management research

<i>Philosophical tradition</i>	<i>Purpose</i>	<i>Design characteristics</i>	<i>Analytical characteristics</i>
Neo-positivist	Document subjects opinions and attitudes, which are treated as 'facts' Often a precursor to quantitative study	<i>Role of researcher:</i> Detached <i>Control:</i> Researcher <i>Discursive flexibility:</i> Low due to structured topic guide <i>Group size:</i> Often 8–10 <i>Group composition:</i> Often strangers to avoid pollution of data <i>Reflexivity:</i> Limited to the deployment and monitoring of particular research protocols to ensure methodological rigour, objectivity and data quality	Removal of data from context in which it was generated through the use of quantitative content analysis and/or inductive generation of grounded theory Often aimed at selecting theoretical ideas or developing hypotheses for deductive testing
Interpretive	Access and understand intersubjective, culturally derived meanings in order to explain behaviour in everyday social contexts	<i>Role of researcher:</i> Engaged <i>Control:</i> Researcher/participants <i>Discursive flexibility:</i> Medium/high through semi-structured/unstructured topic guides <i>Group size:</i> Often 5–8 <i>Group composition:</i> Strangers/pre-existing groups or both <i>Reflexivity:</i> Used to enhance understanding by acknowledging the values and preconceptions researchers bring to interpretative acts; researcher's representation of actors' reality actively contributes to creating it	Aim to shed light on substantive issues whilst retaining richness and complexity of data Emphasis on systematic not selective analysis of data, often using some form of interpretive content analysis or conversation analysis that constitutes group transcripts as 'talk'
Critical	Understand group norms and the conformity, consensus, censorship and dispute surrounding such norms	<i>Role of researcher:</i> Engaged co-producer of group discourse <i>Control:</i> Researcher/participants <i>Discursive flexibility:</i> High due to pursuit of discursive democracy <i>Group size:</i> Often 5–8 <i>Group composition:</i> Often pre-existing groups as these are the networks in which people might normally discuss (or evade) issues, form ideas and make decisions <i>Reflexivity:</i> Moral/ethical project that considers how group context and broader cultural/institutional features encourage or suppress viewpoints. Awareness of the (power) location of researcher in relation to group members and topic of investigation	Examination of competing and contested discourses to surface how and why certain accounts dominate and others are suppressed or silenced Common analytical methods include those which enable researchers to take seriously the contextual, situated nature of accounts and how they become legitimized such as conversation analysis, narrative analysis and discourse analysis

Sociomateriality and Qualitative Research: Method, Matter and Meaning

Olivia Davies and Kathleen Riach

INTRODUCTION

This chapter seeks to explore how we consider the sociomateriality of organisational life, emphasising the practical methodological considerations, opportunities and tensions that researchers may face when committing to a sociomaterial approach. As Orlikowski (2006) suggests, organisations are full of ‘stuff’: bodies, furniture, food, technology, waste, natural and synthetic materials, and bacteria and microorganisms that all combine and coalesce to make up the environments and contexts we come to understand as work. However, in many ways the discursive turn of the 1980s marginalised the importance of matter in its own right within Management and Organisation Studies (MOS) through forefronting the symbolic, discursive and ideational aspects that constitute Organisation. This is not to say that the philosophers and social theorists that inspire organisational researchers deny the power of matter, but rather its analytical

force is often relegated to one of ideological significance in how it came to be used within our discipline. This reflects other disciplinary trends, leading Barad to lament that ‘Language matters. Discourse matters. Culture matters. But there is an important sense in which the only thing that does not seem to matter anymore is matter’ (Barad, 2003, p. 801).

Despite this, matter has always haunted the periphery of our horizons in business and management research, particularly when undertaking fieldwork. As Dale and Burrell (2008, p. 205) suggest, ‘although ethnographic descriptions continue to include the material world as the context of organisational life, these then tend to be analysed through the lens of conceptual tools that focus on a predominantly ideational level: discourse, culture and identity’. At the same time, even when the focus of study is text and textuality, researchers are anecdotally aware of the importance of physical mutable objects both to themselves and to those they

engage with during research, from buildings and office layout, to physical aspects of the workplace such as memos, documents and the bodies of organisational members.

In this chapter, we suggest that sociomaterial is an umbrella term that provides a number of possibilities for qualitative researchers who are interested in the melee of matter and meaning that create organisations and organising processes. In particular, it can provide a way of considering the complexity and interdependencies that come to constitute organisational life. As we will discuss, sociomateriality provides us with a range of methodological and analytical imperatives that allow us to explore how practices, subjectivities or modes of organisational knowing emerge through various enactments that take into account matter and meaning as inseparable forces.

To explore the current state of the field in sociomaterial research agendas, we begin by briefly outlining the theoretical underpinnings of sociomateriality, with specific reference to their adoption in qualitative organisational research to date. Specifically, we outline the particular ontological position that sociomateriality ascribes to, identifying three tenets of sociomaterial theory that have consequences for the choices qualitative researchers make: relationality, action and in-situ process. Through reflecting on current studies as well as our own research, we then introduce some of the ways to translate sociomateriality into data collection and fieldwork practices. Finally, we consider how to carry through the theoretical commitments that underlie sociomateriality into processes of data analysis. Throughout the chapter, we seek to draw on exemplars of empirical and analytical work published under a sociomaterial umbrella, although note that the tools employed are often implicit. Subsequently, one of the main aims of this chapter is to open up a discussion of the processes and techniques that make research practice distinctly sociomaterial.

KEY TENETS OF A SOCIOMATERIAL APPROACH IN QUALITATIVE ORGANISATIONAL RESEARCH

Sociomateriality – also referred to as sociomateriality (with a hyphen) – covers a broad theoretical church under which various positions compete and clash in terms of their ontology, epistemology and politics. However, they generally seek to explore how sociocultural aspects of life intertwine with materiality. Inasmuch, sociomaterial methods are predominantly concerned with tracing human and non-human connections, emphasising the relationality and dependency patterns that come to constitute a given phenomenon.

One of the distinctive characteristics of sociomaterial research (as opposed to other approaches that are interested in the physical or material aspects of organisational life) is a commitment to intra-action. Intra-action denies the possibility of any entity/relatum – human, non-human, living, inert – pre-existing their interrelating with other entities. Inasmuch, for the sociomaterial researcher, the emergence and continued existence of all worldly entities/relata and the phenomena they constitute always arises out of, and is contingent on, iterative reconfigurations of relata (Barad, 2007). Consequently, since sociomateriality does not recognise tangible relata and intangible concepts as separable, meaning, agency and subjectivity are never considered as inherent or permanent qualities of an entity. Rather life is considered as the transitory outcome of our entanglement with other entities.

The theoretical sources of inspiration sociomaterial researchers draw on are notable in their diversity and include: Latour and Callon's Actor Network Theory (Latour, 2005); quantum theory and agential realism in the work of Barad (2007); Deleuze and Guattari's assemblage theory (1980); Bourdieu and practice theory (1977); Merleau-Ponty's phenomenological treatise (1945); and Spinoza's theory of affect (1994). However, most influential

in business and management sociomaterial empirical research to date has been two broad trajectories that can be understood as either emphasising the stabilisation of sociomaterial networks, or focusing on the ongoing and contingent dynamics of sociomaterial enactment.

The first strand focuses on the stabilisation of sociomaterial networks and evolves from Actor Network Theory (ANT). Often used as an all-encompassing theory, which was never its aim according to one of its key proponents (Callon, 1999, p. 194), the ANT tradition offers a radical rethinking of the conceptual dichotomies and divisions between knowledge and artefact, nature and culture, human and non-human, and micro- and macro-level phenomena that commonly shape our ontological understanding of the world (Crawford, 2004). Subsequently, every entity is simultaneously an actor (material entity) and network (relational connection) within a greater heterogeneous assemblage of knowledge, technology and sociocultural webs. Therefore, this research trajectory is most associated with studies exploring how various people and objects come together to constitute a given phenomenon.

Central to this concern is how, within the swirls of continually imbricating aspects of life, entities come to be stabilised. For example, Science, Technology and Society Studies (STS) has used ANT as a means of exploring how technological systems are enacted through the imbrication of human and non-human entities, or 'actants' (Jensen et al., 2009). Here we see how research focuses on the 'flows of translation' (Latour, 2005, p. 321) as a means of making sense of a given phenomenon. This has resulted in a focus on the processes of how phenomenon (such as IT systems requiring new technology–human interactive practices) come to enact new performativities.

More recently, Orlikowski' and Scott's work (Orlikowski & Scott, 2008; Scott & Orlikowski, 2012) has developed these tenets in line with a processual view. Here they

emphasise the inextricable 'becoming' of matter and the social. In other words, even the smallest unit of analysis is neither a material nor a social entity, but rather the intra-action of the 'social' and 'material', illustrating that they are not just different, separable elements, but are in fact impossible to extricate or distinguish. In subscribing to this intra-active agenda, sociomaterial research cannot prioritise either the social or material over the other at an ontological level because they are 'mutually presupposing, defining and implying each other' (Santos, 2015, p. 439).

A second area gaining traction within sociomaterial research in business and management emerges from an explicit focus on different modes of being and knowing within sociomaterial entanglements. Such work carries sympathies with the 'body turn' within sociology in the 1990s (e.g. Turner, 1984; Featherstone et al., 1991), and is increasingly influenced by both the posthumanist theories of Haraway (1991), Barad (2007), and Braidotti (2013), and the emerging area of new materialisms (e.g. Coole and Frost, 2010; Pitts-Taylor, ed., 2016). In this alternate stream, researchers seek to consider materiality not just in terms of flesh, but also as encompassing multiple actants that both emerge from and 'make up' other entities (such as bacteria), although emphasise that these may not have equal force or power. Similar to approaches focusing on stability as a sociomaterial accomplishment, authors working in this emerging area share a concern with different modes of agency, emphasising ongoing processes of mutual imbrication. By contrast, however, they place an emphasis on contingency and a lack of fixity as constituting both bodies and the rest of the world. Therefore, the body cannot be anything other than simultaneously corporeal and social. This is captured in conceptions of embodiment that refer to the sociomateriality of the organisational members and the ensuing 'negotiation of everyday life in relation to the material world and to the creation of social life' (Dale & Burrell, 2008, p. 215).

New materialisms is certainly a fruitful area for business and management researchers. Ashcraft et al. (2009) suggest that bodies at work are a particularly ripe site for considering sociomateriality because while we may 'overlay them with meaning, bodies reject the say of symbolism with their susceptibility to injury, illness, hunger, reproduction, aging, and death' (Ashcraft et al., 2009, p. 32). This critiques studies of embodiment that have tended to consider the body as a site for exploring particular phenomenon (such as power), often relegating the ways in which the anatomical and biological aspects of matter come into being. Alternatively, sociomateriality affords a place for these physical elements without reducing them to realist interpretations, as shown by Dale and Latham (2015) who explore a not-for-profit organisation providing technological support for disabled clients. In doing so, they highlight the value of exploring the physicality of matter as integral to the consideration of sociocultural dynamics surrounding embodiment and organising.

While attending to the more nuanced theoretical particularities and competing perspectives within a sociomaterial approach is the focus for another chapter in another book, for empirical researchers, most sociomaterial studies highlight three commitments that we can use as guidelines for developing sociomaterial research designs, fieldwork and data analysis: relationality, action and in-situ process.

Relationality

Rather than considering phenomenon as distinct, self-sealed entities, sociomaterial researchers begin from the assumption that everything exists only in relation through the configuring, cohering and reconfiguration of particular entanglements. This emphasises how all aspects of the world are relationally constituted: continually coiled into relationships that create different phenomena,

effectively held together within relations (Law, 2004). To understand the sociomaterial nature of work, therefore, we have to explore these 'composite and shifting assemblages' (Orlikowski and Scott, 2008, p. 455). Consequently, a lot of sociomaterial research in MOS focuses on these various assemblages involved in a particular aspect of work, paying special attention to the connections, separations or distinctions that constitute a given phenomenon. For example, in a study of employee routines and technology in a US automaker, Leonardi (2011, p. 147) suggests that 'when they [human and material agencies] become imbricated – interlocked in particular sequences – they together produce, sustain, or change either routines or technologies'.

Underpinning this commitment is a concern with 'entanglement'; a concept derived from quantum physics and mostly associated with the work of Barad (2007), although employed by a range of scholars including Hodder (2012) and Ingold (2008). Entanglement speaks to the idea of reciprocal ontologies that deny the possibility of entities existing in and of themselves. As Barad (2007, p. ix) suggests, 'Existence is not an individual affair. Individuals do not pre-exist their interactions; rather, individuals emerge through and as part of their entangled intra-relating'. As such, entities are continually made, remade or transformed through reciprocal relations, exposing the world and all its constitutive entities as hybrids, emergent through 'imperfect stitching'. Elsewhere, Pickering (1995) has echoed similar sentiments through referring to a 'mangle of practice' as a way of exploring patterned networks through which different entities co-emerge to create various performances and practices. This has particular consequences for how we conceptualise action when studying organisations as being neither the property of human or non-human entities, but rather emergent through collective coalescence in a given context (Latour, 2000).

Action

The second characteristic of sociomaterial research is an emphasis on the active work required in order for practices or entities to emerge and lead to particular accomplishments through sociomaterial relations. For example, in early work exploring research laboratories, Callon (1986, p. 20) showed how laboratories ‘simultaneously rebuild and link the social and natural context upon which they act’. In other words, sociomateriality allows us to explore how boundaries, organising processes or ideas are afforded in everyday working practices. However, sociomaterial research focuses not so much on a ‘thing’ itself, but on its ‘use’ (or practice) as enfolded in a web of other uses. In other words, ‘what matters most about an artifact is not what it’s made out of but what it allows people to do’ (Leonardi, 2010). This requires the interrogation of the complex workings of inputs, outputs and the relational effects of these webs and their constitutive entities.

This focus on action brings up some questions surrounding ontology and agency where multiple modes of agency inevitably exist (Pickering, 1995). Sociomaterial researchers consider not simply human-orientated action or capability, but how agency is implicated in the capacities of various sociomaterial relations. For example, attention may be directed to the particular ways of working afforded by the specificities of the human-computer entanglements of an IT infrastructure. Some authors, such as Jensen et al. (2009) in their study of a corporate codes of ethics in an information and communications technology (ICT) firm, choose to narrow their focus to particular modes of ontology (such as focusing only on humans) and the ‘work’ that is undertaken to achieve given phenomena. However, accounts following the work of Barad (2003, p. 808) may argue for paying particular attention to different modes of being and knowing, as these are foundational to understanding the various enactments and accomplishments surrounding the

phenomenon being studied. In our concern with how the ‘missing masses’ of non-human entities (Latour, 1992) come to actively constitute organisational life then, recognising the multiplicity of distributed action is vital, although the extent to which research explicitly discusses the modes of agency in various guises differs amongst MOS scholars. Overall though, sociomateriality accepts that although the world *appears* to be full of ontologically discrete entities and phenomena, they never occur naturally or in isolation, and require work to accomplish or enact particular events, ideas or entities.

In-Situ Process

Contributing to the picture of the sociomaterial world as one of dynamism and constant reconfigurations evolving out of the two above characteristics, the third feature of sociomaterial research is its awareness of situated matter and meaning. In other words, it is not enough to acknowledge the inextricability of the social and material. What must also be taken into account is the entangled ideological, cultural, symbolic, embodied and physical expressions of sociomaterial processes in-situ. Context-rich accounts of practices and assemblages are required since numerous different elements coalesce and dissipate at particular points in time and space. Many researchers, for example, have found it useful to explore sociomaterial flows through tracing the ‘evolution’ of an assemblage. For instance, the implementation of a significantly new aspect of a workplace (such as a technology or piece of equipment) provides a built-in timeline of this new aspect being introduced into an always fluctuating web of relations. This can be seen in the work of Barrett et al. (2012), who trace the introduction and subsequent sociomaterial reconfiguration surrounding a new pharmaceutical dispensing technology. Alternatively, we may focus on particular spatial points of significance in a case study as in Johri’s

(2011) exploration of software developers working across different geographical locations, or investigate how a new clinical information system influences spatial relations (e.g. Jones, 2014).

However, researching in-situ processes should always be mindful of bounding through a particular object. To counter this, Orlowski (1992) developed a theoretical model for taking into account the temporal process of the development, integration and use of a new technology for implementation in organisations. In doing so, she purposefully highlights the pre-introduction phase of the technology's existence that is often excluded from sociomaterial research, drawing attention to the fact that throughout all stages of the technology's existence, it is embedded in a network of human agents, technological processes and artefacts, and institutional properties. The inculcation of these practices, of course, occurs within historical and political legacies that may be deeply embedded in particular organisations or occupations and subsequently must be taken into account in situating matter and meaning. Elsewhere, Boos et al. (2013) emphasise how introducing quality assurance practices as a result of technological developments may undermine historical assumptions customers hold about pharmacies being safe, expert spaces. Similarly, Oborn et al. (2013) show the importance of historical legacies in the medical profession, suggesting they are integral to the enactment of sociomaterial webs in the development of health policy.

These three aspects mean that as sociomaterial researchers we become concerned with Organisation as 'an enactment, a matter of possibilities for reconfiguring entanglements' (Barad, 2012, p. 54), which holds significant implications for our empirical research practices. In particular, to help orientate ourselves to these agential sensibilities within an entangled world, new vocabulary and ways of researching may be required. As such, sociomateriality departs from the idea of people and nodes forming perfect and complete connections, thus suggesting agency can

be 'pinpointed' or bounded. Instead it allows us to think of the (organisational) world as 'meshwork' consisting of 'interwoven lines ... along which materials flow, mix and mutate' (Ingold, 2007, p. 35) in ways that are not fully joined up and where 'nothing ever quite fits' (Ingold, 2012, p. 15). With this in mind, we now consider how this translates into the practicalities of undertaking qualitative research.

COLLECTING DATA

Which actor should be chosen? Which one should be followed and for how long? And if each actor is made of another bee's nest swarming in all directions and it goes on indefinitely, then when the hell are we supposed to stop? (Latour, 2005, p. 121)

What should be clear by now is that the social and material are not mutually exclusive entities but rather mutually intra-acting in the situated practice of work, although not necessarily equal. Therefore, approaches to data collection and analysis must be sufficiently sensitive to this inextricability, mindful not to trivialise or privilege each as a domain, or inadvertently perpetuate a false sense of separation. Easier said than done! So, what is unique about data collection within sociomaterial studies? A closer look at the extant empirical research suggests that the development of a montage of data collection methods helps to provide multiple perspectives that can partly help to avoid descending into either a realist or representational realm. In particular, there is an emphasis on the 'following' of certain aspects when empirically exploring the sociomateriality of organisational phenomenon. Such an approach is based on Latour's work (2005) that suggests tracing actor-networks and the assemblages they are entangled within, requiring researchers to 'follow the actors themselves' (Latour, 2005, p. 12). This is achieved, according to Latour (1999), through focusing on attribution (or characteristics of various agents); distribution

(of different properties); connections (between the various entities); and transformation (to create these different aspects). However, since sociomateriality posits that all phenomena are constituted by a proliferation of dynamic, uncertain boundaries, and diffuse entities, this process requires a number of practical decisions to be made.

How to Follow

Undertaking sociomaterial research requires a particular orientation to the choice of methods. Textual methods (such as written observations and interviews) still dominate sociomaterial research, despite the recognition that this may privilege social and discursive elements, and ‘flatten’ the physicality of practice. As such, in their deployment, sociomaterial researchers are required to avoid either separating or prioritising elements of the sociomaterial landscape. To avoid inadvertently prioritising symbolic or ideational aspects (subsequently reducing matter to a prop in the enactment of organisational life), multi-method approaches are common. Case study approaches have been used to great effect, where multiple forms of data collection help to track different enactments. For example, Styhre (2011) employed multiple methods in his case study approach to explore the ‘production flows’ in construction as constituted by the interaction of tools, routines and different organisational members. Jensen et al. (2009) also used a case study approach to explore the implementation of a corporate code of ethics, drawing on interviews, documents, media reports, an ethics training DVD and participant observation. Dale and Latham (2015) similarly undertook a field-based case study of an organisation that provided disabled people with technology to decrease social isolation. Although presented as a case study, their use of a participant observation diary and semi-structured interviews was more reflexive in nature, integrating the positionality of the researcher

within various enactments. This concern with writing the sociomateriality of the researcher into the research is more common amongst sociomaterial research that uses multiple modes of data collection informed by ethnographic sensibilities, spending a significant amount of time in the field. Beane and Orlikowski (2015) undertook a long-term field study (14 months) of night rounds in an intensive care unit with robotic telepresence technology, with data collection comprised of researcher observations, and formal and informal interviews with staff. An earlier study by Orlikowski (1992) involved eight months of ethnographic fieldwork exploring the development, integration and use of productivity technology employing methods including participant observation, documentation, unstructured and semi-structured interviews, and interactions with participants and with technology. Such an approach helps the researcher gain an insight into the different textures that enact organisational practices from different perspectives and levels.

The use of fieldnotes also provides the opportunity to articulate practice beyond ad verbatim accounts, and the inclusion of images in published sociomaterial research contributes to gaining different insights into different modes of reciprocity that occur within organisations. Within these fieldnotes, researchers focus on the real-time entwinement of various people and objects, allowing them to zoom in on the capacities afforded in the relationship between seemingly discrete entities or practices. Jones (2014) used the example of staff writing on paper towels or kidney dishes. If the physical surface of these objects did not allow individuals to write on them with a pen, and the staff member did not realise its potential to be written on, or had time and spatial limitations that prevented an alternative object being used, then the documentation or note-taking could not occur, at least not in this exact manner. Fieldnote writing thus requires a particular telos or sensibility by the researcher in order to trace different elementals of a sociomaterial network

or web. Jones (2014, p. 897), emphasises this focus must be on practice, rather than discourse. This means not simply exploring what ideologies may support or construct practice, but rather appreciating it as one elemental part that is mutually dependent on other aspects of activity which all lead to organisational accomplishments.

The complexity of these interdependencies and different modes of agency make such research ripe for forms of data collection that embrace multimodality. Yet, despite their evident potential for methods to explore, for example, 'tactile interaction between humans and objects' (Dant, 2005, p. 8), sociomaterial researchers have yet to fully embrace alternative modes of data collection, despite the plethora of different methods covered elsewhere in this book such as photography or more sensual or affective methods. This is surprising given Suchman's (1987) highly influential work using videography as a means of exploring IT intra-actions. One possible reason for this is a hesitance to fetishise the field in any way through mistaking artefacts for discrete objects (such as those 'captured' in photographs) and thus complete and available for individual analytical scrutiny.

Such methods are valuable in many ways, particularly as they provide the potential for researchers to capture ongoing processes of materialisation. This is vital since sociomaterial practices are highly contingent and improvisatory, meaning the researcher cannot predict when important moments of performativity may occur in everyday practice and what elements or subjects are key to these enactments. Moreover, it is often the emergent unintended consequences that are of interest to the researcher, and it is only through retrospective revisiting of data that the processes critical to the explicit materialisation of such consequences may be identified. Consequently, save travelling back in time, there is no way the researcher can know what to focus on prior to, or even during, their observations! The implementation of these non-textual methods, then, may provide

a method that allows us to glimpse (albeit partially) these moments in their multiplicity. Subsequently, techniques such as utilising video recording technology with the ability to capture multilevel data are valuable, as are multiple methods. This helps to arm the researcher with a means of exploring the subtle, organic and often unpredictable processes and practices through which sociomaterial consequences arise and shape organisations, long after they have happened.

What to Follow

Given the emphasis on intra-action and the complexity of organisational enactments, knowing what to focus on in the field is not always obvious at first. For instance, Orlikowski (2007) is critical of the tendency of MOS to only focus on instances when the relationality of organisational materiality is emphasised, such as in times of implementation or change regarding physical or technological structures or systems. Although, '*every organizational practice is always bound with materiality*' (Orlikowski, 2007, p. 1436, original italics), it is often difficult to know exactly where to begin empirical research, since everything may be argued as relationally constituted with everything else, leaving the researcher with no clear beginning or end.

To negotiate this challenge, we may turn to Ashcraft et al.'s (2009, p. 35) reflection that 'Organizational order "materializes" at the dynamic junction of objects, bodies, physical and spatial configurations, economic and institutional imperatives, and Discourses'. In one sense, thinking of these elements as amalgamating to produce ubiquitous practices (such as culture, or change initiatives) may be useful in considering where to start empirically. For example, researchers may choose to follow something that they can see is simultaneously a social and physical object. Jensen et al.'s (2009) study of the implementation of a corporate code of ethics

is one such example, whereby the policy is not simply seen as ‘producing’ documentation, but is enacted through the entanglement of documentation, talk, practices and events. Ashcraft et al. (2009) give another example of an organisational contract. In this instance, the contract appears to be a static collection of paper; however, through its signing a range of compulsions or actions spring forth, and subsequently we see how the contract, mobilised through intent, actually does something. In this sense, the contract is presented as a ‘textual agent’ (Ashcraft et al., 2009, p. 36) – an entity that carries an agential force in its capacities to effect action. This echoes the concept of object-person biographies drawn upon in consumer research, where ‘networks of objects, persons, and practices might interplay with one another’ (Epp & Price, 2010, p. 821). Other researchers such as Dale (2005) focus on an organisational imperative, such as control, and explore the various artefacts that enact control including documentation surrounding building plans and company reports.

Alternatively, if it appears that a certain object presents itself as central to the phenomenon being studied, researchers may choose to commence their research with a specific physical artefact that is perceived as important in their study, such as the product the organisation produces, a uniform or a manual. This may form the basis of initial research interactions through picking what we will term an ‘object-of-convenience’ to denote this as a methodological object, rather than a physical object with immutable qualities. For example, researchers may choose to apply principles of object interviewing, conceptualised by Nordstrom (2013, p. 12) as an ‘entangled conversational interview of objects and subjects, during which I [the researcher] mediated folds of objects, subjects, events, and a life’. Applying this technique may begin to help unpick various webs of significance which are fundamental to the enactment of the entity under study. This can serve as an entry point into the sociomaterial

meshwork of the organisation, but subsequent study should leave open the possibility to displace the initial artefact or show it to be a ‘red herring’ in terms of its centrality to a given phenomenon. This is therefore different to studying an object to understand the symbolism or social meaning imbued within the object by a particular group. Instead, the ‘object’ must be portrayed as not only shaping, but also shaped by, organisational social dynamics.

Other studies may follow a specific event or episode. This provides one way of capturing the simultaneity of physical and symbolic aspects of work across the work of different actors. For example, Nyberg (2009) concentrates on a customer service call as an opportunity for exploring the entanglement of call centre operatives and computers, while Constantinides and Barrett (2012) focus on two emergency call incidents as a way of exploring organisational coordination. These events are presented as encounters that can show the kaleidoscope of sociomaterial enactments required for a task to be achieved. In many ways, this helps to explore intra-action at the initial level of empirical data collection. While particular objects may be identified as central to particular formations and practices, their material agency is subsumed within the context of the event or episode. In other words, a focus on a particular event allows the researcher to explore how various traces of objects, ideas and knowledge intra-act as part of an entity that has particular capacities.

Finally, in choosing what to follow, researchers may wish to focus on phenomena that they think may dramatically morph and evolve through sociomaterial relations, possibly resulting in the emergence of new performativities. Latour (2005, p. 227) suggests that ‘one must follow them when they *multiply* entities and again when they *rarefy* entities’, suggesting that it is in their transformation we can explore the connective sociomaterial strands. This is demonstrated in Scott and Orlikowski’s (2012) account of online travel rating sites, where they show

how online activity surrounding rankings on sites such as TripAdvisor enact new practices for those agents involved, such as how the hospitality services are assessed. Here we can see how the evolution of ‘ranking’ creates new modes of thinking and acting through the capacities of web 2.0 materialities, such as algorithms, databases and the constant update of reviews about the (travel) product (p. 29).

When to Follow

The third empirical consideration arises from the way researchers choose to plot the sociomaterial phenomenon. To articulate this further, we draw on the metaphor of ‘tracking’ as a methodological imperative that speaks to sociomaterial intra-action. Tracking captures the sentiment of observing actions, practices and enactments that progress or move in some way, but the elements that result in the creation of a particular path are inseparable from the path itself. At the same time, tracks are not durable or continuous structures, but are unstable, contingent and constantly shapeshift, transform or disappear. Ingold (2015, p. 63), in his evocative account of lines, emphasises this intra-play:

While a trained eye and touch can read much from a single footprint, even more can be read from a series of prints. Such a series, observed in sequence comprises a track. If the same track is trodden often enough, the many individual prints merge into a continuous path. One cannot, then read individuals movements from a path, but only those commonly or collectively made.

In other words, modes of data collection must enable the exploration of how enactments emerge, move and coalesce within a context, and appreciate the contingency of these various enactments and their embeddedness in a given space and time.

A vast majority of studies use time as a tracking device for two reasons. First, time acts as a diviner to guide data collection pragmatically. However, the challenge of following through time as a way of

exploring sociomaterial dynamics is that due to the always-becoming nature of the world, researchers can never enter into linear investigations ‘at the beginning of things’ (Jensen et al., 2009, p. 534). Instead the lens of pragmatism must be applied. This application is illustrated by Jensen et al. (2009, p. 534) who suggest ‘the researcher has to construct a beginning, to be somewhere and study something, and the illustration starts here with an extract from the introduction in the parent company’s CCE [corporate code of ethics]’. In this approach, care must be taken to ensure the sociomaterial dynamics themselves are not viewed as exclusively working within a linear Newtonian research process, but rather recognise that temporality itself is integral to various enactments, such as speed, intensity, patterning and pauses (cf. Lefebvre, 2004).

Second, time is central to the flow of various enactments. As Ahmed (2010, p. 256) explains, ‘Time “gives form”, which suggests that “matter” is not inert or given but is always in a process of “materializing”’. Ashcraft suggests this is important since different temporalities – not simply a Newtonian linear time – influence enactment: ‘Human-made or otherwise, organizational artifacts do things; their existence and features guide interaction even as they also encapsulate past interactions’ (Ashcraft et al., 2009, p. 29). We can see such sentiments at work in Venters et al.’s (2014, p. 939) study of sociomaterial configurations in the development of a computing grid system for particle physicists through considerations of occupationally and historically embedded conceptions of temporality. Here ‘the future coordination of the grid was entangled with the anticipated future of technology including positive and negative changes in hardware and software’. In other words, different anticipations of the future were important in chains of enactment surrounding the creation and coordination of the system. Moreover, the tensions between particle physicists’ pace of development vis-à-vis the speed preferred by computing specialists was inseparable from the capacities

of the computing infrastructure, demonstrating how 'grid infrastructure emerges through the tensions and interplay between human and material agencies shaping ICT development and grid coordination' (Venters et al., 2014, p. 941).

This focus on movement as a part of empirical following practices in sociomateriality has also led to researchers tracking over space, taking care to ground the work in material place and location as well as abstracted meanings surrounding space. As Leonardi and Barley (2008, p. 167) identify, most sociomaterial researchers have an inherent bias towards the social, to the extent that 'even though they may select research sites based on their interest in a particular technology, data collection typically involves charting patterns of use, interaction and organizing'. To avoid these empirical methods closing down and failing to account for the complexity of sociomaterial dynamics, they allow for the biography of the entity to be conceptualised 'not only as a trajectory in time, but as movement within and between a number of social settings and groups' (Leonardi & Barley, 2008, p. 167). This may often include methods that enable the same enactment to be considered in a number of ways. For example, in their study of the implementation of a clinical information system in a critical care unit, Jones (2014, p. 905) uses diagrams of ward layouts as a means of emphasising the spatiality of wards and sociomaterial practices involved in working around the patient. Data collection may alternatively focus on following at a geographical or topographical level. This is where the changing ebbs and flows of an organisational landscape provide a setting for exploring the sociomateriality of organising. Fenwick (2012, p. 13) drew on this approach in the coproduction of rural policing practice, highlighting how the 'opportunistic leveraging of particular material and social dynamics that emerge in specific situations' was important to accomplishing policing goals. Here we see that the actual physicality of the space (e.g. small communities where people intimately

share leisure spaces, such as the village pub) is not simply about physical location where things are done, or about symbolically important spaces, but rather about how the socio-symbolic and material are woven together in a way that constitute policing capacities.

The final way of tracking that is common within sociomaterial studies is more analytical, whereby researchers attempt to explore webs through the movements of actors and actants across and between different organisational registers, such as physical, ideological and symbolic registers. This is not about considering these various levels as separate in and of themselves, but rather recognising that different kinds of data are likely to reveal different ways of viewing enactment. For example, researchers may consider how formal company documentation may enact different capacities to online chatrooms. In many studies, the blurring between the physical and the virtual is facilitated through the work that occurs between different registers. Elsewhere, Jones (2014, p. 909) discusses how 'the introduction of the CIS [computer-based clinical information system] may be seen as creating a new, digital materiality, a virtual patient, represented by the CIS data, that became increasingly central to care practices'. In other words, the simultaneous existence of the patient as a physical and virtual body results in new performative practices. This is not to preclude one register or another, as such divisions are impossible. Rather, it is to explore how the foregrounding and backgrounding of different sociomaterial configurations emerge in practice, and how this allows particular capacities to emerge. This is explored to great effect by Bechky (2003) who considers how machines and documentation as artefacts coordinate work by enacting relations and task boundaries between occupational communities. As she puts it, 'Artefacts, subject to interpretation, participate in the constitution of the social dynamics in the organization' (p. 746); and this occurs through the cross fertilisation of different organisational registers. Other

technology studies also reflect post-dualistic efforts, often drawing on the work of structuration theories that have influenced scholars including Orlikowski (1992, 1996, 2000) and projects concerned with technology adoption and use (e.g. Barley, 1988; Ciborra et al., 2000). Such research tracks the various texturing of organisational life to identify the bricolage of rules, norms and usage structures that form part of user–machine experiences.

DATA ANALYSIS IN SOCIOMATERIAL RESEARCH

Finally, it is worth reflecting on current approaches to analysing data within sociomaterial research. In some senses, the process of analysis heavily depends on what the researcher is trying to explore. Nyberg (2009, p. 1185) suggests that this varies across sociomaterial disciplines where studies exploring technology in organisations are often focused on how stability occurs, while those more influenced by a new materialisms agenda and the work of Haraway and Barad emphasise the fluidity and contingency of relations. As with any qualitative data analysis, the question of where to begin is also fraught with challenges. The emphasis on grounding analysis in the common, mundane, quotidian of everyday practice remains important. For example, Dale and Burrell (2008) caution that analytical choices aimed at theory building may abstract ‘social’ constructs to the point that the contextually embedded sociomaterial conditions are overlooked. Similarly, Latour (2005, p. 137) cautions about exploring connections in analysis in an abstract manner: ‘If connections are established between sites, it should be done through *more* descriptions, not by suddenly taking a free ride through all-terrain entities like Society, Capitalism, Empire, Norms, Individualism, Fields, and so on’.

For these reasons, it is common to begin sociomaterial research through grounded

coding. For example, Beane and Orlikowski (2015) offer one of the few studies that provides some detail as to their process of analysis. They state that their analysis consisted of an initial round of descriptive coding surrounding work-related themes followed by a second round of interpretive analysis of provisional settlements: moments in which conflict or disagreement were momentarily suspended, allowing work to continue (Beane & Orlikowski, 2015, p. 1556). On closer inspection of these moments, they identified particular analytical coordinates that appeared to be at work in upholding the mutual imbrication of the sociomaterial context. Similarly, in our own research, we have found three points of analytical endeavour important.

Identifying Action

As discussed earlier, sociomaterial research is committed to exploring enactment and the emergence of activity as not simply derived from human interaction, but rather as emerging through the entanglement of various ‘mindful matter’. Recent approaches in the social sciences have taken this point towards a more radical politics of how agency must be considered in all its ontological plurality. In other words, animals, plants and objects exert intentionality in ways that may be both beyond and not immediately connected to humans.

In light of this, one way to commence is a form of ‘actant analysis’ through identifying key elements of a chain of enaction. For example, Orlikowski’s (1992) development of a theoretical model for the analysis of the sociomateriality of organisational technologies lists a number of human agents, technological factors and institutional properties requiring consideration. This is not about simply recognising the outcomes of organisational processes and practices, but identifying who and what are legitimate actors within these aspects of organisational life (Ashcraft et al., 2009, p. 36). Cooren (2008) suggests that in undertaking the latter, a

metaphorical form of *ventriloquism* is necessitated, in that the researcher must interpret and convey what non-verbal entities are ‘already saying’, and their consequent role in constituting the organisation. While human actants can describe their intent and actions, and have the capacity to correct misinterpretations, non-human actants do not, and therefore ‘nonhuman agents act largely *through* those who mobilize their “intent”’ (Ashcraft et al., 2009, p. 36). This may of course hold a danger of undermining a diffuse idea of agency or anthropomorphism.

To avoid this, other scholars have attempted to fully account for the different modes of agency, interested in the variegated ways different forces come together, assert, clash, collide or merge. A fantastic example of this can be seen in Barrett et al. (2012, p. 1458) discussing a dispensing robot in a pharmacy. They write: ‘Through intermittent malfunctions, the robots resisted and challenged the anticipated improvements in service performance. When the robots encountered errors or ceased functioning, work in the pharmacy became difficult to perform as medications housed inside the robot became inaccessible’. Here we see how the ‘robot practices’ are positioned in the research observations as exerting a mode of agency that trickles into and subsequently transforms the daily practices of the pharmacy.

Other processes of analysis look for where different modes of agency enact moments or ‘pauses’ as a way of exploring particular sociomaterial configurations. This is particularly useful in instances where the fluidity and provisional dynamics of sociomaterial relations can mean traditional methods of coding themes might oversimplify the unpredictable, scattered, entangled and intra-active accomplishments. An alternative may therefore be to design analytical frameworks specifically around various instances of coalescing and dissipation known to be recurrent in organisations. For example, as mentioned earlier, Kaplan and Orlikowski (2013) focus on what they term *provisional settlements* – the moment where there is a suspension of

disagreement or tension that allows objectives to be recognised. Nyberg (2009, p. 1182) similarly evokes Barad’s concept of ‘agential cuts’ which he argues ‘create temporal configurations, hinting at how boundaries around actors are delineated’. Such moments may be where there is a temporary emergence of distinctions, separation or boundaries. These momentary ‘local resolutions’ (Barad, 2003, p. 815) do not mean an ontological distinction of different matter, but rather allow us to analyse how particular configurations ‘rest’ and, in doing so, perform a distinction.

Relational Modes of Analysis

Although derived from social psychology (e.g. Robinson, 2011), relational analysis encourages the researcher to explore the possibility of multiple relationships that may exist beyond those where there are immediate thematic ties. This certainly speaks to sociomaterial sympathies in terms of providing a systematic way of allowing researchers to classify points of identification or directionality in a given context. Relational analysis within a sociomaterial context therefore seeks to demonstrate that it is in the continual intra-action of the material and semiotic, and between empirically distinct yet ontologically inseparable sociomaterial entities, that reality comes into being. However, as Haraway (2000, pp. 50–1) argues, ‘you can’t adequately understand the form by breaking it down to their smallest parts and then adding relationships back’. Therefore, the smallest unit of analysis in sociomaterial research cannot be anything other than the relationality between two or more entities, as without this relationality, they could not exist. Echoing this assertion is Oborn et al.’s (2013, p. 259) story of how a health policy was enacted, which draws on relational perspectives to look at how legitimacy and trust were ‘sociomaterially performed in leadership practices’. Similarly, relational analysis may help explore temporary distinctions and

the flow of movements, foregrounding or backgrounding what is taking place within the mutual imbrication of different elements of the workplace, speaking to the idea that ‘every artefact enacts its singularity through delineations of that which it incorporates and those things that are beyond its bounds’ (Suchman, 2014, p. 50).

However, the elusiveness of ‘consistent causality’ within sociomaterial relations can make relational analysis difficult, particularly for those researchers interested in re-presenting the chains of enactment within a given context. An alternative approach we have found useful is to analyse different traces, such as boundaries between human and non-human, understanding them as enactments of inclusion and exclusion. Researchers may also choose to follow Barad’s (2003, p. 803) metaphor of a ‘diffractive’ (rather than ‘reflective’) reading. This is where we focus on the enactment of boundaries through an exploration of ‘a relation of exteriority within’. For example, we may explore how seemingly separate initiatives (such as a human resource policy and the development of a new product) are invariably sociomaterially entangled in the various spaces, practices and bodies of one organisation. Analysing organisational practices through this imperative may help to interrogate seemingly separate aspects of a particular practice through questioning causalities and exploring their interference and interactions. Analysis thus concentrates on ‘how different differences get made, what gets excluded, and how those exclusions matter’ (Barad, 2007, p. 30). For instance, Barrett et al.’s (2012) study of a pharmaceutical dispensing robot analysed the transformation of relations within a healthcare setting through reconfigurations of the boundary relations between different occupation groups. Emphasising how these boundaries are constituted and how they subsequently enact other practices, Barrett et al.’s work reveals how these delineations provide various capacities for various organisational accomplishments (or alternatively, partially

close down or marginalise possible modes of practice). Elsewhere, Ashcraft et al. (2009, p. 39) argue that the circulation of texts is part of similar boundary performances suggesting ‘the texts in organizational circulation (a) form the contours of identification, legitimacy, and accountability; and (b) are affected by the symbolic-material (i.e. the communicative) responses to heterogeneous problem-solving’.

Beyond ‘Reading’ Sociomateriality

The above modes of analysis often focus on fieldwork accounts, or interview data, suggesting a deference to Latour’s rhetorical question, ‘What do we do when we trace social connections? Are we not, in effect, writing down accounts?’ (Latour, 2005, p. 122). And yet, the treatment of sociomaterial phenomena cannot be limited to witnessing, reading and subsequently writing down accounts. In fact, the practice of re-presenting may suggest we assume everything can be ‘known’, grasped, represented and therefore ‘read’ in a similar way. This betrays the complexity of exploring elements of sociomateriality that are not necessarily tangible during the initial stages of analysis, or even remain ambiguous throughout our analysis.

In moving towards modes of data analysis that prevent the intangible being written out of initial coding practices, in our own work we have found the concept of ‘sites’ a useful entry point for analysis. Sites refer to the contingent and diffuse elements of the organisational landscape that are simultaneously constituted by both tangible and intangible or ambiguous elements. However, rather than view these ‘sites’ as a predominantly neutral container for the organisational processes, sociomaterial researchers are required to consider how these sites are an intimate part of the enactment of particular practices. One study that is illustrative of analysing a ‘site’ is Dale’s (2005) work on how the present and absent (physical and imagined) spatial

elements of a workplace were purpose built to compel desired organisational subjectivities, and how this interacted with organisational discourse and patterns of communication. She concluded there to be a co-constitutive enactment in sociomaterial dimensions in which certain ways-of-being at work were afforded.

Analysing sites may help to explore dimensions that are not yet within the realm of representation or configuration but nonetheless are quilted into the phenomenon we are studying. In many ways, this has the potential to speak to the Latourian concept of 'plasma': aspects that are epistemologically ambiguous, described as 'neither behind nor especially hidden. It's in between and not made of social stuff. It is not hidden, simply unknown' (Latour, 2005, p. 244). Questions of course arise as to the extent to which we can grasp these aspects in our analysis, or whether they are, by their nature, impossible to account for, particularly when language is often predicated on reductionist binaries, and is thus unequipped to express the sociomateriality of the world as we experience it. For example, scholars such as Bell (2014, p. 151) are both curious and cynical as to whether textual description can ever truly convey the aesthetic and affective particularities of materiality, such as the gradient of light and dark, or the soundscapes accompanying daily life.

However, there is potential for researchers to begin recognising that elements of sociomateriality may resist conventional modes of knowing, but nonetheless carry powerful purchase in various accomplishments at work. These aspects that resist verbal or textual articulation such as those aspects 'felt on our pulses' (Thrift, 2008, p. 147) may include atmospheres, ambiances, silences or sensual expressions – all dimensions that can be seen as rooted in the lived affective experience of working life, or vital in how various phenomenon come to materialise. The emergence of these elements has begun to be touched on in recent work such as Beane and Orlikowski's (2015) study of the role of

robotic telepresence technology in health-care, which seeks to consider 'other aspects of the work (e.g. spatial orientation, gaze direction, gestures)' (Beane & Orlikowski, 2015, p. 1556). Similarly, Ashcraft et al. (2009) focus their analysis on heterogeneous *processes of knowing* that are co-constitutively entangled with organisational bodies, spaces and materiality, not taking a dominant epistemological position for granted in their analytical processes. Elsewhere, Endrissat and Noppeney's (2013) study shows the importance of the immaterial in sociomaterial practices through the example of perfume production, allowing glimpses of the sensual dimension of their work. From our own research (Riach & Warren, 2015, p. 789), we know that the senses are an important 'affective glue' within sociomaterial enactments that may become more important as sociomaterial processes of analysis continue to evolve in MOS.

CONCLUSION

In this chapter, we have sought to engage with the multiplicity of approaches that constitute the field of sociomaterial research. As a broad church, we hope that this field continues to embrace the changing landscapes of organisational life and research. By means of closing, we posit where we see future possibilities for sociomaterial research.

First, as sociomateriality morphs and coalesces with new research practice, it is inevitable that like the practices we study, it will shapeshift and enact new methodological practices. The growing desire for more multimodal forms of research presentation may be a particularly potent call for sociomaterial researchers to experiment within their empirical research endeavours. For example, embedding audio-visual content into online publications as a means of simultaneously complying with and advancing academic conventions in terms of research format is

likely to allow the sociomaterial researcher not to inadvertently ‘flatten’ or betray the richness of fieldwork where their accounts can become pixelated and fragmented.

Second, sociomateriality exists in a co-eval relationship with a range of other areas of management and organisational research interested in issues of materiality, such as embodiment. Yet, with few exceptions (such as the work of Karen Dale and her colleagues), there has been relatively little hybridity between these research domains. We would argue that although there are invariably theoretical junctions to navigate, the richness of accounts surrounding the multifaceted substance of bodies, affectations and markets that exists beyond the immediate terminology and thematic concern of many sociomaterial scholars may provide the opportunity for new insights into the sociomateriality of organisational practice.

Finally, there is little doubt that given its foundations, sociomateriality is well positioned to explore new technologies that become integrated into contemporary organisational life, such as the potential of new media. However, just as sociomaterial studies reflected the rising importance of technology in organisations, they may continue to provide valuable insights into the changing contours of work. In particular, the increasing recognition of interdependencies between organisations and larger environmental forces suggest that a sociomaterial approach can provide a rich methodological repertoire that allows us to explore the ways in which sustainability and environmental issues are part of the entanglement of corporate life. For example, it may be that rather than think of nature and animals as an addendum to organisations or simply another product or commodity, we begin to explore how ‘companion species’ (Haraway, 2003) are an inextricable part of organisational fabrics. Such a focus may also additionally provide a way of considering how we take account of the plurality of different ontologies and the ethical obligations that emerge from chains of reciprocity

recognised within a sociomaterial imperative. In this sense, sociomateriality may well have the potential to introduce a new politics to the way we consider what really matters in organisations.

ACKNOWLEDGEMENT

Analysing Fiction: The Example of Women's Work in Disney Animations (1937–2013)

Mark Learmonth and Martyn Griffin

INTRODUCTION

Movies can and do have tremendous influence in shaping young lives in the realm of entertainment towards the ideals and objectives of normal adulthood. (Walt Disney cited in Russell & Waters, 2010)

From Aesop's fables to Grimm's fairy tales, fiction has been utilised to help children explore and understand the world around them, to instruct them in moral and ethical ways of behaving or simply excite or frighten them for its own sake (Appleyard, 1991). In the twentieth century, for the first time, fiction could be brought to life on screen and what was once only imagined inside the reader's mind could now be collectively crafted, viewed and experienced. This opened up new opportunities to analyse and understand the text *and* images being transmitted to those viewing the films, decoding effects on audiences and their experiences (for an early example of this, see Eisenstein, 1942, 1949). Walt Disney, and the writers and

animators within his studios, were masters at adapting fiction and bringing it to life through moving pictures in a way that captivated audiences at the time, and continues to do so today. We tend to think about Disney animations as being all about romance and adventure. They are, of course, about such things – but as we show in this chapter the theme of work has arguably been just as dominant albeit much less discussed.

As we see in Disney's first four feature-length animations, the issues of work and of forced labour, in particular, are paramount. In *Snow White and the Seven Dwarfs* (1937), for instance, songs like 'Whistle while you work' and 'Heigh ho!' offer distinct perceptions of work. *Pinocchio* (1940) and *Dumbo* (1941) provide a somewhat chilling (and some have argued, racist) account of forced labour involving imprisoned circus animals, young boys kidnapped to be abused and exploited on stage, and in the mines (in the former) and 'happy hearted' workers who 'slave until [they're] almost dead'³ (in the latter).

Meanwhile, the most memorable and most repeated segment of *Fantasia* (1940), 'The Sorcerer's Apprentice', famously depicts Mickey Mouse struggling with heavy buckets of water and misusing his master's powers to try and make his job easier, with terrible, but somewhat humorous, implications.

And these are by no means the exception. These first four Disney feature-length animations capture a distinct and sequential characterisation of work that, we argue, can be found in a large number of their subsequent productions either through close imitation or, more recently and exceptionally, through clear and conscious rejection. However, whilst numerous studies look at the Disney princess phenomenon (Cummins, 1995; Lieberman, 1972) – and the corrosive effect of their apparent worklessness on young girls' aspirations (Orenstein, 2014) – fewer studies explore what women and girls actually *do* within animations in terms of work. Indeed, they typically overlook work altogether.

In this chapter, we explore the depictions and imitations of gendered work found within Disney 'Classic' animations to provide an insight into analysing fiction within films. We focus upon the first era of Disney from *Snow White* to *The Rescuers* (1937–77), exploring how these and subsequent modern Disney animations have constructed patterns of gendered work through the ideas of Judith Butler (1990, 1993). We feel that her notion of performativity in which 'gender is an impersonation, [and] becoming gendered involves impersonating an ideal that nobody actually inhabits' (Butler, 1992, p. 85) evokes the role that animation plays in the lives of many young girls and boys as they watch and then imitate (or 'do') gender in a particular way. In doing so, we show how animation plays a central role in constructing organisational gender norms in society and argue that learning methods for reflexively and critically analysing films of this kind as cultural texts is essential for students and academics alike.

BUTLER AND GENDER

In *Gender Trouble* (1990) Butler provides a new way of thinking about gender which challenges the natural assumptions about what is to be a man or a woman. Rather than thinking, as is usually done, that the body is a fact of nature – either male or female – Butler suggests that this is a cultural inscription that is performed – in the first instance – upon a child (the midwife says 'It's a girl!'). In this sense, and throughout our lives, our gender is constructed by our own repetitive performance of this role. To this extent, 'gender is a stylized repetition of acts ... which are internally discontinuous ... [so that] the appearance of substance is precisely that, a constructed identity, a performative accomplishment which the mundane social audience, including the actors themselves, come to believe and to perform in the mode of belief' (Butler, 1988, p. 520). Butler's notion of performativity in which 'gender is an impersonation, [and] becoming gendered involves impersonating an ideal that nobody actually inhabits' (Butler, 1992, p. 85).

Indeed, we contend that Butler's performative take on gender is especially productive in the context of animation. After all, there are very few other forms of art that are able to play with gender and destabilise our understanding of it so easily – to reveal its imitations and impersonations – as animation. Many characters are apparently genderless, either because as animals or aliens or objects – or by the character being purposefully left androgynous – no gender is conferred upon them directly (though it may be inferred by the watcher in a more or less unexamined way). In a more general sense, then, animations have a particularly revealing element to them as they are not bound by the usual constraints of non-animated film. They provide almost unlimited scope for individuals to bring their imaginations to life on screen without concerns about whether it is possible in the real world or whether a young actor or

actress is either physically or mentally capable of performing the dialogue or scenes. It is, in short – even more so than other types of film – a place of fantasy, a heterotopic space (Foucault, 1984) in which we argue more is likely to be revealed about often hidden or unexamined cultural stereotypes and norms.

It is possible, in this sense, to understand gender as a performance, a citation of all previous performances of gender, rather than a natural reflection of what it is to be male or female. In Butler's terms, 'one is subjected and subjectified within discourses, and becomes a subject through performativity, which is not an act, nor a performance, but constantly repeated "acts" that reiterate norms' (Butler, 1993, pp. 12, 240 ff.). That is, our repeated attempts to be 'female' or 'male' become normalised over time. In this sense, 'matter is constructed not as a site but as a process of materialization that stabilizes over time to produce the effect of boundary, fixity, and surface we call matter' (Butler, 1990, p. xiii). To be clear, Butler is not suggesting the subject is free to pick and choose the gender that he or she is going to enact. In her discussion of this issue, Salih (2006, pp. 56, 58) compares it instead to a wardrobe in which 'the subject has a limited number of "costumes" from which to make a constrained choice of gender style ... the ripped clothes and the sequins representing my attempts to "do" my gender in subversive and unexpected ways'.

In the context of the Disney princess, this analogy is especially salient. Author 1's daughter has a whole 'wardrobe' of princess dresses ranging from Cinderella to Snow White mixed together with her other pirate and fireman's outfits that she uses to play games on a regular basis. One of her favourite roles is to play the prince – Prince Ashitaka from Studio Ghibli's *Princess Mononoke* (1997) – suggesting there is scope for her to make potentially subversive and unexpected choices. It is only an option though, because she has been exposed to different types of characters and continues to be so without any

expectation of what she *should* be doing. It is interesting to note that the very creation of Disney princess costumes was inspired by young girls wearing home-made princess outfits at *Disney on Ice* shows, that a Disney CEO subsequently noticed as a missed merchandising opportunity (Orenstein, 2014). Many parents might still choose to ban princess costumes (and games) altogether from their children's play in fear of the subtle gender lessons they may be teaching their daughters about things like work – given many of the examples presented in this chapter, it is easy to understand why! (see Coyne et al., 2016). Another option though, might be to explore and embrace a wider array of 'costumes' (broadly speaking) to encourage experimentation that will increase the possibility of disrupting rigid gender norms and roles.

However, we are under no illusion that this will be a straightforward task. In *Men and Women of the Corporation*, Kanter (1993) presents these rigid gender norms as 'role traps'. She argues that role traps – such as the mother, the pet or the seductress – are embraced by women in working roles as they 'offer[ed] a comfortable and certain position ... [and a] category the men could respond to and understand' (Kanter, 1993, pp. 392–3). For instance, and we discuss these further below, many women adopt the role of the mother, attending to the needs of men by being good listeners and the port of call for advice. In Butler's terms, we see Kanter's role traps as discursive formulations – they are attempts at doing gender in the workplace. In this sense, if Butler's theory provides us with a wardrobe of limited size through which to understand how people might perform gender, Kanter's role traps are the costumes that women are encouraged to adopt most regularly or which they are expected to wear. These costumes – shaped by cultural mediums – go towards the performance of gender and create the subject in particular ways.

In order to explore this phenomenon in practice, we will now investigate how

Disney's 'wardrobe' has evolved over time. We will explore the patterns of work it has produced and the repeated role traps that have been produced. An important first stage in this process is to explore the animations in detail to understand the types and patterns of women's work that exist.

METHODOLOGY

The list of Disney animations for the core part of the study was compiled by obtaining the Disney 'classic' feature-length animations that Disney itself has used to distinguish its best work (see Appendix 1 for the full list). These animations (all in DVD format) were watched and coded, pausing where necessary to record longer quotations of interest. The coding itself was divided into two sections. First, recognising the vast benefits of such an approach, a general content analysis was conducted on gender and representations of traditional and non-traditional work (Macnamara, 2005). Work was defined both traditionally – 'oriented towards producing goods and services for one's own use or for pay' (Reskin 2000, p. 3261) and non-traditionally – so to include house-work, unpaid or forced labour as well as other non-paid forms of work as distinct from leisure and play-time or time we take to relax and sleep. Gender was defined in the broadest extent, expanding the female to the feminine to include those times when as Lewis (2014, p. 1847) following Alvesson (1998) suggests 'women and men can successfully mobilize femininity when managing and doing business'. Similarly, animators develop and use what one might characterise as feminised male characters (*Dumbo*, *Pinocchio*) in working situations, which we took into account during the coding stage.

Second, a thematic analysis was conducted that explored issues relating to work within the animations (Boyatzis, 1998). In this part of the study, following previous

investigations into TV and film (Bowman, 2011; Panayiotou, 2010), there was a more specific coding of themes relating to work including violence at work, crying at work or manipulation at work. This set of themes was developed with 20 original thematic codes – reflecting themes that might be expected from previous viewing – but as the first five Disney animations revealed new areas of interest to pursue, additional codes were added (Fereday & Muir-Cochrane, 2006). A full list of general and specific codes can be found in Appendix 2.

There are obvious differences and difficulties of coding moving images rather than interviews or ethnographic observations. One such issue is the interpretation of the person carrying out the coding in terms of what it is they have actually seen. With text, there is still room for interpretation, of course, but with images owing to the speed of change and nuance available, there is perhaps even more so. Often animations can have many different themes and interactions going on at once on screen, so it can appear like multiple texts and subtexts are ongoing and intertwining in complex and multi-faceted ways. It is important then as a researcher to remain even more reflexive about what it is that has been viewed and the ways that the film data is being coded. This is particularly the case once a dozen or so films have been viewed as these viewings may (unfairly) shape how future film scenes and interactions are viewed and interpreted.

In attempting to understand how female work is represented in Disney animations, it was then possible to use the notes and the codes produced to look for repeating patterns that exist within and between the animations. Czarniawska (2008, p. 165) explores the representations of women within finance in popular culture and does so by looking at 'established and repeated patterns of employment'. A five-stage sequence of work was derived from the analysis and related codes which involve: i) separation from parents (by way of codes such as

‘child labour’, ‘forced labour’); ii) subjection to dangerous, dirty or unfulfilling work (through ‘violence at work’, ‘death at work’, ‘boredom’ or being ‘scared/frightened in work’); iii) manipulation and deception by managers (by way of ‘manipulation/deception’, ‘domination’, ‘bullying’); iv) accentuating the positive at work (by way of the corresponding code); and v) being rescued and returned to a safe environment (by way of ‘quitting job’). We endorse this approach and have found clear signs that the *Disney* characterisation of female (or feminine) work is reflected and repeated in a five-stage pattern that appears within or across many of their animations.

THE DISNEY CHARACTERISATION OF WOMEN'S WORK

This section will now consider the five-stage sequence of work in some detail. It involves: i) separation from parents; ii) subjection to dangerous, dirty or unfulfilling work; iii) manipulation and deception by managers; iv) accentuating the positive or ‘whistling while you work’; and v) being rescued and returned to a safe environment.

Separation from Parent(s)

In the first stage of the Disney characterisation of work, individuals – usually children – are subjected to work due to their vulnerability – invariably through the death of (or separation from) one or both parents. Separation from parents is in itself an overriding theme in Disney animations appearing for main characters in no fewer than 34 of 53 of their ‘classic’ feature animations. We might immediately think of well-known animations like *Cinderella* (1950) and *Snow White* (1937) where a loving parent dies, leaving the child at the mercy of a wicked step-mother, or animations like *The Rescuers* (1977) in which a

secret agency is entirely devoted to saving orphaned children who are now being forced to work.

Indeed, separation from parents is a common story device found in fairy tales throughout the ages that allows the author to create a sphere of freedom in which the character can play out their crisis. It plays on the deep-seated psychological fears held by the child and parent about being separated from each other – of being un-attached in a disorganised and dis-orientating manner (Bowlby, 1988; Slough & Greenberg, 1990). In doing so, this device also enables a sphere of *vulnerability* through which the author or the animator can care for the character and help them to resolve this crisis. This is interesting insofar as the writer, the author, is invariably male and the main character left alone is invariably young and female or feminine (but not always, see Mowgli in *The Jungle Book* for instance). It suggests that producers of animations, such as Disney’s *Nine Old Men*, created (and provided the voices for) worlds in which they could paternalistically guide this character through an environment filled with danger. And this danger, according to a large number of these animations ($n = 27$) was no better represented than through the world of work that the character – now alone or otherwise uncared for – is subjected.

Subjection to Dangerous, Dirty or Unfulfilling Work

Second, the work that the character is subjected to is invariably characterised as violent, degrading and frightening, with numerous depictions of characters crying at work or subjected to abuse and domination in the workplace (Courpasson, 2000; Leflaive, 1996). Parker (2006, p. 2) evokes what he calls organisational gothic to remind us that:

[w]orkplaces are often imagined as places of repetitive violence. Bored bodies serving machines;

lowering mills and office blocks; rows of heads bent in sullen silence. Whether in Marx, Dickens, Weber, or Kafka, the image is one of repeated acts of indignity, leaving hidden injuries that last a life time.

No Disney animation better encapsulates this stage of the Disney perspective on work as *Pinocchio* (1940) in which the enslaved puppet – separated from his loving adopted father Geppetto – weeps as he is put to work and then caged by his boss Stromboli who declares ‘Pinocchio you will make lots of money for me, and when you are too old, you will make good fire wood’. It is also reflected in these early Disney animations where female work is either portrayed as forced labour (*Snow White*, *Dumbo*, *Cinderella*, *The Rescuers*) or as unskilled and unfulfilling labour as is the case in animations like *Lady and the Tramp* (1955) and the *Jungle Book* (1967). In the latter, Mowgli – an orphaned boy being raised by jungle animals – spies on a young village girl who fills jugs of water from the river. She sings to herself with a mix of resignation to unfulfilling work and contentment of her place in the order of things: ‘Father is hunting in the forest; mother is cooking in the home. I must go to fetch the water, until the day that I am grown ... Then I will have a handsome husband, and a daughter of my own. And I will send her to fetch the water; I’ll be cooking in the home’. This sense of either normalised monotonous work (Molstad, 1986) or dangerous and frightening work (Jermier et al., 2006) is ubiquitous in these early animations in particular and female work is portrayed in an almost universally negative fashion.

Manipulation and/or Deception by Managers or Overseers

Third, the work being experienced is usually controlled by duplicitous and manipulative individuals – often portrayed as managers or overseers of some description – that pretend to be caring and compassionate towards the

vulnerable but who, in reality, maintain the subjection of the individual both initially and over time (cf. Dutton et al., 2006; Frost et al., 2000). One of the ‘role traps’ (Kanter, 1993) in Disney animations that fulfil this purpose is that of the Queen Bee (Cooper, 1997; Mavin, 2006) – a dominant, aggressive female who will often block the progress of younger females in the process. For example, this is represented in the manipulative wicked stepmother in *Snow White* as the overseer of her dominion, doing all she can (at one stage disguising herself and poisoning her stepdaughter) to remain the prettiest in the land. This same role trap is repeated – or to use Butler’s term ‘imitated’ – in other early animations through characters such as Cinderella’s wicked stepmother (who manipulatively agrees to allow Cinderella to go to the ball if she completes all of her work, knowing this to be impossible), the female elephants (who bully and cast out young Dumbo from the circus act), the psychopathic Queen of Hearts in *Alice in Wonderland* (ordering her guards ‘off with her head’) and, perhaps most famously, Cruella De Vil in *101 Dalmatians* (1961) as the ‘boss’ in charge of her paid henchmen. The characteristics of this role trap are also captured perfectly by *The Rescuers*’ (1977) Queen Bee, Madame Medusa, who explains to her henchman how to manipulate a young girl into mining a rare diamond for her – ‘you must gain their confidence, make them like you’. It is this portrayal of powerful older female work as deceptive, manipulative and underhand that comes across strongly during this stage of Disney’s characterisation of work.

Another ‘role trap’, derived from Kanter’s (1993) study of female stereotypes in the workplace, employed in a similar manner, is that of the seductress – ‘a sexually active, dangerous figure of unclear competence’ (Martin, 1990, p. 349). In the early Disney animations, this is represented through the go-go dancers who flirt with Pinocchio on stage and through the ‘real’ (that is,

un-animated) singing woman and models in swimsuits that Donald Duck is drawn in by and tries to kiss in *The Three Caballeros* (1944). In a short segment of *Melody Time* (1948) there is also the first instance (in a Disney animation) of a female playing the role of what would usually be a male work role (a cowboy). Unfortunately, this is not the first feminist Disney moment. Cowboy Bill meets Sue, 'the first female cowboy Bill had ever seen', who he falls in love with, kisses and agrees to marry. Sue turns out to be very good on the horse which cannot buckaroo her, but eventually she bounces off ('due to her bustle'), and she bounces higher and higher until she goes up to the moon never to return. This somewhat bizarre and sexist portrayal of female work in early Disney animations gives way to modern seductresses in the form of Esmerelda in *The Hunchback of Notre Dame* (1996) – a young gypsy dancer who uses her looks to distract and manipulate men in her work – and Vanessa in *The Little Mermaid* (1989) whom Ursula – a wicked sea witch (a Queen Bee) who describes herself as the 'boss' – transforms into in order to manipulate and deceive the princess Ariel and her prince. In all of these instances we see Disney characterising female work in the form of a seductress who uses her sexuality to manipulate others and get her own way – an archetype that is persistent in the workplace even today to undermine the achievements of women (Baxter, 2012).

More generally, however, the theme of manipulation by managers or overseers is widespread, appearing in no fewer than 33 of the Disney animations, becoming even more common in recent times. Indeed, for a company that is often portrayed as the embodiment of American capitalism: 'Disney constructs childhood as to make it entirely compatible with consumerism' (Smooden cited in Giroux, 2004, p. 105), it is interesting to note a paradoxical running critique of capitalist manipulation and domination that exists in Disney's animations.

As well as the Queen Bee and seductress 'role traps', there are numerous other ways in which these animations portray the bosses as individuals who feign care and compassion to subjugate often unknowing workers to build their status and, in doing so, accumulate wealth (Learmonth & Humphreys, 2011 cf. Dutton et al., 2010). In *Pinocchio*, for example, we encounter various manipulative bosses. There is a theme throughout of male characters tricking the vulnerable (children) into situations where they can exploit them to make money as well as heavy connotations of other forms of exploitation (taking the young boys to 'pleasure island' but then turning them into donkeys and taking them down the mines). In doing so, many of these fairy stories have been couched in managerialist language by predominantly white, male, middle-aged authors and animators in a way that constructs young (usually female) crises through the lens of neo-liberal capitalism.

Accentuating the Positive in the Working Role

The fourth stage of the *Disney* characterisation of work involves the character (or the author) directly responding to this individual crisis. It is here that any potential for a sustained critique of capitalism gives way to conformity. Despite all of the dangers and negative experiences of work described, the characterisation of work suggests individuals should accentuate the positive in the workplace and bravely soldier on in the face of adversity and abuse (Luthans & Youssef, 2007). This theme appears in no fewer than 29 of the feature animations, and is perhaps most famously represented within *Snow White* in which she sings: 'Just whistle while you work, and cheerfully together we can tidy up the place. It won't take long when there's a song, to help you get the pay'. In many respects it is at this stage of work that we encounter the full force of the

role trap which Kanter (1993, p. 393) calls the 'pet' or 'younger sister', reflecting an 'amusing little thing' with 'good humour' about her place in the order of things. This is reflected in subsequent animations, for example, when Cinderella tells herself 'keep on believing and that dream you wish will come true' or in *The Rescuers* (1977) where a young girl in captivity and being subjected to forced labour is told 'faith is a bluebird you see from afar. It's for real and as sure as the first evening star. You can't touch it or buy it or wrap it up tight, but it's there just the same making things turn out right'. It is this blind attachment to the belief that things will turn out okay that is pervasive and imitated within the world of work throughout many of these animations (Rynes et al., 2012).

Being Rescued and Returned to a Non-Working Environment

Finally, the Disney characterisation of work suggests that if individuals persevere in exploitative situations, they will eventually be rescued by well-meaning and decent heroes who will save the day and ensure the individual is returned to a safer and happier environment (Fletcher, 2004). Often this has involved men (usually princes) saving women (usually pet-like in sensibility and from privileged backgrounds) from these situations, as is the case in early Disney animations such as *Snow White* (1937), *Cinderella* (1950) and *Sleeping Beauty* (1959) and more recently in animations like *The Little Mermaid* (1989) and *Tangled* (2010). Numerous critical pieces have been written on the passivity of the Disney princess and her need to be saved or rescued by a man (Lieberman, 1972; Zipes, 1995).

However, another female working 'role trap' can be found here represented at this stage, helping to save those in crisis through the role of the 'mother' (Bowman, 2011).

According to Kanter (1993) this is a woman – in an organisational context – to whom men 'brought their private troubles, and she was expected to comfort them ... [reflecting] ... the assumption that women are sympathetic, good listeners and easy to talk to about one's problems'. The caring mother is represented in 22 of the Disney animations and is no better captured than in *Peter Pan* (1953) in which the children's mother, Mrs Darling, is portrayed as doting and loving and the father as angry and uncaring. When Peter asks Wendy to come to Neverland, she says 'what about mother?' to which Peter replies 'what's a mother?' Wendy explains that a mother 'loves you, takes care of you, reads to you stories' and adds later that she is 'the most wonderful person you could know'. The animation continuously returns to the idea that 'boys [and we are to assume girls] all need a mother' and how important she is for moral guidance and growing up correctly. The pirates are coaxed out of their working roles and blind loyalty to their boss – Captain Hook – and reduced to tears as they listen to Wendy sing about how a mother is 'the helping hand that guides you along whether you are right, whether you are wrong'.

It is easy to forget that these are not the words of Wendy at all but of Disney's 'Nine Old Men' (reflecting the sentiments of the original author J.M. Barrie) who were regularly using the role trap of the mother to resolve crises being experienced by one (or more) of the characters. Good examples of this within Disney animations include the fairy godmothers employed to care for and rescue the princesses in *Cinderella* and *Sleeping Beauty* as well as the Blue Fairy, an aged and motherly character, who saves Pinocchio at various points when he finds himself in mortal danger. Snow White is perhaps the most interesting example of this archetype in early Disney as she is transformed throughout the animation from a pet or a younger sister figure into a motherly role. On finding the dwarfs' house, Snow

White assumes they are orphans because ‘a mother would never leave a house like this’. She naturally assumes the mantle of mother within the household from the outset despite having little known experience in this area, sending the dwarfs off to the mines with a kiss on the cheek, cleaning the house and cooking the dinner. She checks their hands on their return, as a mother might do, ordering them to wash them clean before they enjoy their food, chastising them ‘straight outside and wash or you’ll not get a bite to eat’. The dwarf, Grumpy, complains that ‘her [feminine] wiles are beginning to work, give them an inch and they will take a mile’ and ultimately leading him to state in frustration: ‘women, a fine kettle of fish!’

More generally, the theme of rescuing from unpleasant working experiences is particularly prevalent in Disney, either by mother figures, princes or by other means, appearing in 22 of the feature animations. Classics such as *Lady and the Tramp* (1955) and *The Aristocats* (1970) both follow a similar pattern of taking female animals (a dog – Lady – and a cat – Duchess – respectively) away from their pampered non-working, lifestyles with wealthy owners into a world of poverty and danger. Situations which require their male ‘rescuers’ to grift and use their street-wise skills to survive and return the females (and in Duchess’s case her young fatherless family) back to their homes, whilst in the process saving themselves from this somewhat difficult life as well. This characterisation of work has been repeated numerous times within animations and is particularly prevalent in cases where female or highly feminised characters are taking part in unpaid or forced labour.

The final stage of being rescued from these dire situations within the workplace acts as an end point and ‘happily ever after’ for characters within these movies in a way that disarms all of the previous problems. It often locates safety within the home for the characters either through marriage or other ways that ensure the abandonment

of traditional working roles. Parker (2006, p. 2) argues that ‘the assumption that work is boring and degrading, and that escaping from it can be fun, reflects a wider culture that simultaneously celebrates and denigrates management and organization’. In this vein Disney – and the contradictions found within the Disney stages of work – can be seen as part of a Western culture which celebrates management and organisation, whilst at the same time denigrating it. A fascinating mix of ideas that contributes towards organisational readiness, preparing us for (and warning us about) a capitalist system that relies upon orderly organisational life. In the next section, we will now seek to understand the patterned and sequential view of work described in the first section and understand how this repetitive act of imitation seeks to reinforce a particular way of understanding gendered work. To do so, we consider the ways that modern Disney animations have begun to engage with this sequence directly, citing previous performances of gendered work.

CONTEMPORARY DISNEY ANIMATIONS AND WORK

Disney has reacted to pressure in recent years and has started to widen their own ‘wardrobe’ to include new performances of gender that consciously reference what has (and what has not) gone before. For instance, in recent animations they have portrayed a cross-dressing Asian soldier girl (*Mulan* [1998]), an African-American waitress (Tiana, *The Princess and the Frog* [2009]) and a scientist girl (Jane, *Tarzan* [1999]) all of which have been praised for their somewhat different portrayals of femininity (Lester, 2010; Towbin et al., 2004). There must, of course, be a healthy degree of scepticism regarding the reasons for this, particularly as Disney CEO Michael Eisner is on

record as saying: 'We have no obligation to make history. We have no obligation to make art. We have no obligation to make a statement. To make money is our only objective'.

Nevertheless, it is important also to keep in mind that there is a new generation of artists (writers and directors) involved in the production of these animations who are committed to producing characters that they are comfortable with and proud of. The proportion of women working directly in the writing and directing of animations has also increased since the late 1990s. It will be interesting, therefore, to consider how all of these forces have influenced the five-stage sequence of work in different ways. It is here that Butler's notion of citationality offers a helpful lens to study this issue – that is, to consider how the imitations of previous performances of gender are referenced and in doing so illuminate how the performances have shifted over time. Animation is particularly adept at citationality and of referencing back to former performances, with pioneering shows like *The Simpsons* (1987) referencing all sorts of obscure influences in their work (Groening, 2010; Singh, 2014).

In the more recent Disney productions it is clear that imitation has been sustained but has shifted in terms of how the animations (and the authors or animators) consciously referenced back to previous performances of gender and work. So, in the first instance, we still see the common story device of separation from parents (or a parent) to create a sphere of vulnerability. For example, recent animations such as *Frozen* (2013) and *The Princess and the Frog* (2009) both contain the tragic deaths of parents, none of which are in the fairy tales (or adaptations) that initially inspired the animations. *Frozen* becomes a coming-of-age love-story between two young sisters who – due to the death of their king and queen parents – suddenly have the working responsibility (and associated anxieties) of managing a whole kingdom. One of the sisters, Elsa, has the power to produce snow and ice, but struggles

to control it leading to anxieties that reflect her fears about becoming queen of her kingdom. Jennifer Lee, writer and director of *Frozen*, explains: 'I love Cinderella ... but am I anything like her? No, I grew up and became someone more independent. Elsa and Anna are princesses because they've got the weight of a kingdom on their shoulders not as the solution to a happy ending' (cited in Applebaum, 2014). *The Princess and the Frog*, meanwhile, becomes an animation in which an African-American girl – Tiana – works two menial jobs in New Orleans in an effort to buy her own restaurant, whilst being constantly told she will never succeed. In adopting these narratives, the second stage of work – subjection to frightening or monotonous labour – is integrated into the animations so that the theme is carried on in rather interesting ways that consciously interact with and cite what has gone before.

The third stage – manipulative and deceptive bosses – is just as strong in recent Disney animations. In *The Princess and the Frog*, this feature is represented through the lawyers who disappoint Tiana and accept a rival's cash bid on the premises for the restaurant she wishes to purchase. She is told this is 'why a little woman of your background would have had her hands full running a big business like that ... now you're better off where you are at'. *Frozen*, meanwhile, has numerous manipulative characters including the capitalist trader the Duke of Weselton (mis-pronounced as Weasel town, much to his annoyance) who arrives in the kingdom on learning about the vulnerable princesses. He proclaims that he is excited about the prospect of 'unlocking [the kingdom's/the princesses's] secrets and exploiting its riches [to which he adds] – did I just say that out loud?' And this is by no means the exception – within the 32 animations with scenes of managerial manipulation, bosses are described as 'vampires' (*Lilo & Stitch*, 2002) and 'fat cats' (*The Princess and the Frog*, 2009), embarking on 'hostile take overs' (*Hercules*, 1997) and requiring 'witless

peasants to dig up my gold' (*Pocahontas*, 1995). In doing so, many of these fairy stories have been couched in managerialist language by predominantly white, male, middle-aged authors and animators in a way that continues to construct young female crises through the lens of neo-liberal capitalism (for a full summary of the gender imbalance in the animation teams on Disney films, see Appendix 1).

The fourth stage of work – accentuating the positive – is imitated in the recent animations in various interesting ways as well. In *Meet the Robinsons* (2007), the motto of the lead character's (Lewis's) invention company is 'keep moving forward'. At the end of the movie a Walt Disney quote is displayed: 'Around here, however we don't look backwards for very long. We keep moving forward, opening up new doors and doing new things ... and curiosity keeps leading us down new paths'. This quote captures the Disney attitude to work, and acts as a citation that references an idealised attitude to work on and off screen at the Disney Corporation. In *The Princess and the Frog*, there are elements of accentuating the positive but a new direction or twist on the imitation also takes place. In a flashback to her father, before his death in the war, he says: 'you wish and you dream with all your little heart but you remember Tiana that old star can only take you part of the way. You gotta help it along with some hard work of your own and then you can do anything you set your mind to'. The reference to the 'star' is clearly a citation from *Pinocchio* – of Jiminy Cricket singing 'when you wish upon a star' – but with the added element of individual hard work to achieve one's dreams. In this sense, Tiana inherits a 'capitalist spirit' and meritocratic attitude from her father and in the song *Almost There* proclaims:

I remember Daddy told me 'fairy tales can come true you gotta make 'em happen, it all depends on you'. So I worked real hard each and every day. Now things for sure are going my way. Just doing what I do, look out boys I'm coming through. And I'm almost there, I'm almost there.

In *Frozen*, meanwhile, accentuating the positive is no better reflected than in Elsa's reaction to her inability to control her new powers (as queen and sorceress) and the dangerous implications it has for those around her. Having escaped the kingdom following her coronation (and her inadvertent creation of a perpetual winter), in '*Let It Go*', she sings in isolation:

[i]t's funny how some distance can make everything seem small, and the fears that once controlled me, can't get to me at all. It's time to see what I can do, to test the limits and break through. No right, no wrong, no rules for me. I'm free!

During this scene Elsa not only gives up on trying to be a 'good girl' (and on her responsibilities of work) – accentuating the positive about her dangerous powers – but also begins to physically make a transition before the viewer's eyes from a relatively plainly dressed girl into a glamorous woman. One of the few criticisms of the animation has been the way that during this song Elsa unveils a new costume (from the Disney 'wardrobe') with a new hair style and an attitude to match. One critic, who otherwise 'love[d]' the animation, declares a sense of deflation that *Let it Go*:

[c]ulminates in a vision of female self-actualization as narrow and horizon-diminishing as a makeover. It's a moment I recognize from too many movies in my own childhood – *Grease* was one, *The Breakfast Club*, another – in which the 'good girl' goes over to 'the bad side' thanks to a quick cosmetic fix-up ... These moments always bugged me as a kid, because they seemed to be last-minute reversals of the foregoing movie's message, which was that the character in question ... was fine just the way she was. (Stevens, 2014)

It is this transformation by Elsa into what might ordinarily be considered a Disney princess – she looks not too dissimilar to Cinderella, if she were a seductress – that reflects an updated imitation, a citation of previous performances of gendered work.

Finally, for the fifth stage of Disney's characterisation of work, there is a clear

reaction to the notion that the lead character – usually female or feminine – needs to be rescued from work. *Frozen*'s interaction with this stage is interesting insofar as Elsa is saved from danger not by the love of a prince, but of her sister. Moreover, she is saved from her situation – her anxieties about managing her kingdom – but is not delivered away from them but confronts them head-on with her sister by her side. There is a similar situation in *The Princess and the Frog*, to the extent that a wise voodoo priestess and mother role-type, Mama Odie, guides Tiana and the prince Naveen – both bewitched and turned into frogs – to realise that love is more important than material gain. This ends up setting them both free from the spell and to a situation where Tiana marries the prince but also achieves her dream of owning and opening her own restaurant. In this sense, whilst previous 'rescuers' such as the prince and the mother are imitated in these more recent animations, there is a clear integration of self-determination and independence for the female work being portrayed. The message shifts towards the idea that love (whether from a sister, a mother, a prince or a friend) is the most important supporting influence as we try to achieve (and become comfortable within) a working role that we aspire to, or find ourselves expected to fulfil.

It is through a crisis of work (or their capacity to achieve fulfilling work), therefore, that these characters (helped by various people) begin to understand more about themselves and to construct a more stable identity around this. Another recent Disney animation, *Wreck-It Ralph* (2012), similarly reflects this shift in attitude towards gendered work. Set in the video game world of an arcade, the animation follows Ralph and Vanellope who both find themselves unhappy with the working roles that they have been given within their games. In the final section of the animation Vanellope learns that she has been tricked and should in fact be the lead racer and princess of her own video game.

Vanellope – a feisty, independent character – is transformed into a princess with a stereotypical dress and pretends for a minute to act like a princess, changing her voice and mannerisms, closer to that of Cinderella or Snow White. This playful citation by Disney is then revealed to be a ruse as she rejects her new princess outfit 'Oh Ralph, what are you nuts? This isn't me! [she spins around out of her gown and into her normal clothes] This is me! The code may say I'm a princess but I know what I really am, I'm a racer with the greatest super power ever'. In this sense, Vanellope is helped – this time through platonic friendship and love – to achieve a stable working identity in the same way Tiana, Anna and Elsa are, as they all struggle to find their own ways in the world. She breaks free from a role trap and, like Elsa, the resolution of the crisis comes hand in hand with a wardrobe change – albeit temporary in this case. The female crisis being experienced is still framed through the lens of neo-liberal capitalism, but there are more options available to help them through this process than early Disney animations. Moreover, the eventual outcome is not usually escaping work but finding a way of working that is fulfilling and which appears to reflect who they really are inside.

CONCLUSION

There is a complicated relationship between culture and capitalism. In their discussion of the mass marketisation of – and capitalist critique found within – *The Simpsons*, Rhodes and Parker (2008, p. 628) note that 'culture and commerce collide and interperse in a symbolic connection and reversal that upsets any monolithic meaning of the values associated with the ethics of managerialism'. Disney reflects this complicated relationship extremely well, providing a consistent critique of managerial and capitalist practice whilst offering (and later

challenging) a vision of female work that is caught up within a maelstrom caused by neo-liberalism. Lewis (2014, p. 3) in describing Acker's (1990) 'transformative' approach to understanding gender in organisations, explains how 'a masculine norm is literally "built into" management and aspects of organization, requiring an individual to enact a masculine identity if she is to be deemed to be abiding by organizational requirements or doing a management job properly'. In many respects, Disney reinforced this message through the five-stage sequence of work that is repeated across their earlier animations, suggesting that females (or feminine characters) will need rescuing from this dangerous world of work.

And yet, exploring Disney's five-stage characterisation of work through Butler's gender theories has enabled us to demonstrate clear opportunities for resistance in Disney, as authors and animators have unconsciously and more recently consciously played with our knowledge of previous performances of feminine work. In doing so, they work on different levels to help children and adults see the ways in which gender norms can be destabilised through radical interpretations and performances which have the potential to blur the lines of gender and illuminate bias and discrimination. As Butler (1990, p. 148) suggests, 'the task is not whether to repeat, but *how* to repeat, or, indeed to repeat and, through a radical proliferation of gender, to displace the very gender norms that enable the repetition itself'. In her reading of Butler, Salih (2006, p. 58) points out that this is problematic as Butler has already asserted that the subject is trapped within a discourse which determines how she acts. However, if we think about these sorts of radical acts as opening up a space (or a wider space) of experimentation, it might begin to destabilise gender norms in an interesting way – a

way that contributes to Butler's desire for a more emancipatory politics (Butler, 2004).

Animations offer society a hugely influential opportunity to conduct these sorts of experiments with gender in a way that influences children in significant ways. As Giroux argues, 'this isn't just about entertainment, it's about education. We have to take pop culture seriously and put it into our curriculums ... Students have to learn to read culture. We're not just dealing with friendly Walt'. In this sense, reflecting on Disney's characterisation of work and the ways that women find roles and role traps within this process is an effective tool for helping young girls and boys to think critically about gender and organisations. Indeed, a recent report by the American Academy of Pediatrics (2013, p. 958) suggests that 'young people now spend more time with media than they do in school – it is the leading activity for children and teenagers other than sleeping'. We consider it essential therefore that students and academics alike develop methods for studying fiction portrayed within films that utilise our capacities to 'read' culture more critically.

If, as Disney himself said, 'movies can and do have tremendous influence in shaping young lives in the realm of entertainment towards the ideals and objectives of normal adulthood', this task is as essential as ever. Not only in becoming more aware of the assumptions and expectations built into films about things such as work and organisational life, but in deconstructing notions like 'normal adulthood'. If fiction – inspired by powerful and wealthy individuals and corporations like Disney – is shaping how young girls and children more generally view how they should act within wider society, reading culture and fiction within films reflexively becomes an essential capacity that should undoubtedly be developed within school children throughout their education.

APPENDIX 1 – LIST OF FILMS ANALYSED AND COMPOSITION OF WRITER/DIRECTOR TEAMS

Table 10.1

Year	Studio and film		Gender list			
	Walt Disney		Adaptive writers	Original writers	Total male	Notes on female contribution
	Film	Directors				
1937	<i>Snow White and the Seven Dwarfs</i>	6 of 6	7 of 8	2 of 2	15 of 16	Dorothy Ann Blank (story adaptation)
1940	<i>Pinocchio</i>	7 of 7	7 of 7	1 of 1	15 of 15	
1940	<i>Fantasia</i>	11 of 11	23 of 25	n/a	34 of 36	Sylvia Moberly-Holland/Bianca Majolie
1941	<i>Dumbo</i>	7 of 7	8 of 8	1 of 2	16 of 17	Helen Aberson co-wrote the original book
1942	<i>Bambi</i>	7 of 7	7 of 7	1 of 1	15 of 15	
1943	<i>Saludos Amigos</i>	4 of 4	9 of 9	n/a	13 of 13	
1944	<i>The Three Caballeros</i>	5 of 5	13 of 13	n/a	18 of 18	
1946	<i>Make Mine Music</i>	5 of 5	15 of 16	n/a	20 of 21	Sylvia Moberly-Holland (story)
1947	<i>Fun and Fancy Free</i>	n/a	6 of 6	1 of 1	7 of 7	
1948	<i>Melody Time</i>	4 of 4	12 of 12	1 of 1	17 of 17	
1949	<i>Ichabod and Mr Toad</i>	3 of 3	6 of 6	3 of 3	12 of 12	
1950	<i>Cinderella</i>	3 of 3	8 of 8	1 of 1	12 of 12	
1951	<i>Alice in Wonderland</i>	3 of 3	14 of 14	1 of 1	18 of 18	
1953	<i>Peter Pan</i>	4 of 4	8 of 8	1 of 1	13 of 13	
1955	<i>Lady and the Tramp</i>	3 of 3	7 of 7	1 of 1	11 of 11	
1959	<i>Sleeping Beauty</i>	1 of 1	7 of 7	1 of 1	9 of 9	
1961	<i>101 Dalmatians</i>	3 of 3	1 of 1	0 of 1	4 of 5	Dodie Smith wrote the original novel
1963	<i>The Sword in the Stone</i>	1 of 1	1 of 1	1 of 1	3 of 3	
1967	<i>The Jungle Book</i>	1 of 1	4 of 4	1 of 1	6 of 6	
1970	<i>The Aristocats</i>	1 of 1	7 of 7	2 of 2	10 of 10	
1973	<i>Robin Hood</i>	1 of 1	8 of 8	n/a	9 of 9	
1977	<i>M.A. of Winnie the Pooh</i>	2 of 2	9 of 9	1 of 1	12 of 12	
1977	<i>The Rescuers</i>	3 of 3	9 of 9	0 of 1	12 of 13	Margery Sharp wrote the original novel
1981	<i>The Fox and the Hound</i>	3 of 3	8 of 8	1 of 1	12 of 12	
1985	<i>The Black Cauldron</i>	2 of 2	17 of 18	1 of 1	20 of 21	Rosemary Anne Sisson (additional dialogue)
1986	<i>The Great Mouse Detective</i>	4 of 4	10 of 10	1 of 2	15 of 16	Eve Titus wrote the original book
1988	<i>Oliver & Company</i>	1 of 1	21 of 21	2 of 2	24 of 24	
1989	<i>The Little Mermaid</i>	2 of 2	6 of 6	1 of 1	9 of 9	
1990	<i>The Rescuers Down Under</i>	2 of 2	4 of 4	0 of 1	6 of 7	Margery Sharp wrote the original novel
1991	<i>Beauty and the Beast</i>	2 of 2	9 of 11	0 of 1	11 of 14	Linda Woolverton (screenplay), Brenda Chapman (story) and the original novel is by Jeanne-Marie Le Prince de Beaumont

(Continued)

Table 10.1 (Continued)

Year	Studio and film		Gender list			
	Walt Disney		Adaptive writers	Original writers	Total male	Notes on female contribution
	Film	Directors				
1992	<i>Aladdin</i>	2 of 2	18 of 20	1 of 1	21 of 23	Sue Nichols and Rebecca Rees (story)
1994	<i>The Lion King</i>	2 of 2	22 of 28	n/a	24 of 30	Linda Woolverton and Irene Mecchi (screenplay), Brenda Chapman (story supervisor), Lorna Cook (story), Jenny Tripp and Noni White (additional story)
1995	<i>Pocahontas</i>	2 of 2	26 of 27	1 of 1	29 of 30	Susannah Grant (written by)
1996	<i>The Hunchback of Notre Dame</i>	2 of 2	4 of 6	1 of 1	7 of 9	Irene Mecchi and Noni White (screenplay)
1997	<i>Hercules</i>	2 of 2	15 of 18	n/a	17 of 20	Irene Mecchi (screenplay), Kelly Wightman and Tamara Lusher-Stocker (story)
1998	<i>Mulan</i>	2 of 2	25 of 30	1 of 1	28 of 33	Rita Hsiao and Eugenia Bostwick-Singer (screenplay), Lorna Cook (story), Linda Woolverton and Jodi Ann Johnson (additional story)
1999	<i>Tarzan</i>	2 of 2	21 of 24	1 of 1	24 of 27	Noni White (screenplay), Carole Holliday and Kelly Wightman (story)
1999	<i>Fantasia 2000</i>	8 of 8	8 of 11	n/a	16 of 19	Brenda Chapman (story), Elena Driskell (concept for a segment), Irene Mecchi (host sequences)
2000	<i>Dinosaur</i>	2 of 2	10 of 12	n/a	12 of 14	Shirley Pierce and Tamara Lusher (additional story)
2000	<i>Emperor's New Groove</i>	1 of 1	10 of 10	n/a	11 of 11	
2001	<i>Atlantis</i>	2 of 2	7 of 7	1 of 1	10 of 10	
2002	<i>Lilo & Stitch</i>	2 of 2	2 of 2	n/a	4 of 4	
2002	<i>Treasure Planet</i>	2 of 2	7 of 7	1 of 1	10 of 10	
2003	<i>Brother Bear</i>	2 of 2	26 of 26	n/a	28 of 28	
2004	<i>Home on the Range</i>	2 of 2	19 of 19	n/a	21 of 21	
2005	<i>Chicken Little</i>	1 of 1	8 of 11	n/a	9 of 12	Sara Parriott and Josann McGibbon (additional screenplay material), Sandra Tsing Loh (additional dialogue)
2007	<i>Meet the Robinsons</i>	1 of 1	9 of 11	n/a	10 of 12	Michelle Bochner (screenplay), Shirley Pierce (additional story material)
2008	<i>Bolt</i>	2 of 2	4 of 4	n/a	6 of 6	
2009	<i>The Princess and the Frog</i>	2 of 2	13 of 13	0 of 1	15 of 16	E.D. Baker wrote the original book
2010	<i>Tangled</i>	2 of 2	2 of 2	2 of 2	6 of 6	
2011	<i>Winnie the Pooh</i>	2 of 2	7 of 10	2 of 2	11 of 14	Clio Change (story), Kendelle Hoyer (story), Nicole Mitchell (story)
2012	<i>Wreck-It Ralph</i>	1 of 1	7 of 8	n/a	8 of 9	Jennifer Lee (screenplay)
2013	<i>Frozen</i>	1 of 2	3 of 4	1 of 1	5 of 7	Jennifer Lee (screenplay) and (Director)
Total		148 of 149	542 of 588	38 of 45	728 of 782

APPENDIX 2 – GENERAL CODING THEMES

- 1 Number of characterisations of traditionally defined work
- 2 Gender of individual(s) characterised in traditional work
 - Male
 - Female
 - Undefined
- 3 Type of traditionally defined work
 - Routine manual (labourer, cleaner, field picker)
 - Man
 - Woman
 - Undefined
 - Skilled manual (a tradesperson – plumber, carpenter, builder)
 - Man
 - Woman
 - Undefined
 - Professional worker (doctor, lawyer, etc.)
 - Man
 - Woman
 - Undefined
 - Business owner/manager
 - Man
 - Woman
 - Undefined
 - Sales/shopkeeper/vendor/seller of goods
 - Man
 - Woman
 - Undefined
 - Armed forces/warrior/protector/assassin
 - Man
 - Woman
 - Undefined
- 4 Characterisations of non-traditional work
 - Childcare
 - Man
 - Woman
 - Undefined
 - House (or garden) work
 - Man
 - Woman
 - Undefined
 - Royalty
 - Man
 - Woman
 - Undefined

- Slave/forced labour
 - Man
 - Woman
 - Undefined
- Show business/celebrity/actor/actress
 - Man
 - Woman
 - Undefined
- Sportsperson
 - Man
 - Woman
 - Undefined
- Wizard/witch/magical person
 - Man
 - Woman
 - Undefined
- Criminal/outlaw/thief
 - Man
 - Woman
 - Undefined

Specific themes – marked as M and F to denote gender involved in each characterisation

- Apprenticeship
- Forced/slave labour
- Crying at work
- Pay discussed/identified
- Working in teams
- Laughing at/enjoying work
- Violence in work
- Manipulation/deception
- Complimenting others' work
- Concern over fellow workers
- Humour in work tasks/role
- Romanced pursued in/through work
- Appearance changed for job
- Doppelganger effect
- Death in job
- Training/skills development
- Profiteering/capitalist spirit
- Changing jobs discussed
- Child labour
- Boredom
- Illness at work, mental or physical
- Scared/frightened at work
- Domination
- Accentuating the positive
- Moral guidance
- Quitting job
- Workplace bullying

Dramaturgical Methods

Peter Birch

INTRODUCTION

The chapter considers how the practice and language of theatre provide a basis for an array of qualitative research methods, drawing upon the qualitative nature of the relationship between life and theatre. Rather than offering direct instruction about the use of dramaturgical methods, the chapter introduces a new organizing framework for such methods, showing how different dramaturgical methods may be situated within this framework. In consequence, it should be easier to test assumptions about the relationship between life and theatre and to consider the impact such assumptions have on the selection and design of dramaturgical methods. Examples of dramaturgical methods are discussed and situated within this new framework.

Common definitions of dramaturgy refer to the art and techniques of theatre, especially the writing of plays. Hence the word dramaturgical implies language and action

that derive from the art of theatre. A number of questions are begged from this definition, including what constitutes the art of theatre, what is dramaturgical writing and how might we understand these in the context of management and business research and research methodology? A full discussion of the first two questions is beyond the scope of this chapter, although it is necessary to give a view here as to what is meant by theatre as a frame of reference and the discussion begins by briefly considering the nature of theatre. In response to the second question, dramaturgical writing may be considered not only as the written word but also as improvisation and arguably as social ‘scripts’ that are constructed through social interaction. The third question entails a discussion of how dramaturgical concepts have been used methodologically within a business and organizational context. Such a discussion is somewhat problematic in that first, whilst there is a growing literature about the use of dramaturgical and theatre-based techniques

within the field of organizational learning and development, there is less attention given to the use of dramaturgical methods in management research. Second, there appears to be no organizing structure or framework whereby different dramaturgical methods may be compared in terms of their use and application. This chapter seeks to address this issue by offering such a framework.

The framework draws upon two different strands of writing in the organizational literature. The first is about the nature of theatre in performance, or in action, particularly noting the reciprocal triadic relationship between actor (or performer), performance and audience. The second strand is about how theatre provides us with a qualitative perspective on 'life', that is to say, on social interaction. In attempting to interweave these two strands, the chapter looks at the organizational literature for variance in how writers regard the metaphorical association between life and theatre.

This variance in the literature about theatre in the context of business and organizations arguably inhabits five dramaturgical perspectives: *life is like* theatre, *life is modelled* by theatre, *life is revealed* by theatre, *life and theatre are interdependent*, and lastly, *life is* theatre. The chapter briefly introduces each of these five perspectives in order to show how they might influence qualitative methodology. The five perspectives are then cross linked with the triadic view of the nature of theatre in order to produce an organizing framework for dramaturgical methods. A number of dramaturgical methods are then introduced and related to the framework to show how they differ in approach and application. More details about particular methods may be found by referring to the individual studies discussed. The new organizing framework is populated with the different methods that have been introduced. The chapter concludes by briefly discussing advantages and disadvantages of dramaturgical methods with a note about future directions.

THE NATURE OF THEATRE

A common understanding of the nature of theatre comes from Hamlet's advice to the players in Shakespeare's *Hamlet*, Act III, Scene 2, that the purpose of playing (acting) is to hold 'the mirror up to nature' and this seems self-evident and intuitively correct. The Hamlet quote continues: 'the purpose of playing is to hold the mirror up to nature: to show virtue her feature, scorn her own image, and the very age and body of the time his form and pressure'. Thus Shakespeare sees theatre as a means of showing not only the full panoply of human nature but also the way human nature is displayed within the political, economic and social conditions of the time in which the audience lives. This gives a hint as to why theatre might be a useful qualitative vehicle for an exploration of social interaction in a business context.

Yet theatre is not just about mirroring the mundane reality of social interaction. Theatre is regarded as an art form that expresses more than words can convey (Meisiek & Barry, 2010; Taylor & Ladkin, 2009), that it enables 'the transformation of ritual action into theatrical awareness' (Mangham & Overington, 1987, p. 50). Theatrical awareness entails a willingness to accept the reality of what is presented before us on stage or on screen (a suspension of disbelief), *because* it is in the context of theatre and because we expect to see and hear something 'more' than the mere mirroring of mundane reality. Cole (1975) argues that theatre enables imaginary truth to have a physical presence. For example, when Oberon, the king of the fairies in Shakespeare's *A Midsummer Night's Dream* tells us 'I am invisible' whilst continuing to be present before us in the flesh, we in the audience accept his invisibility and therefore that other characters on stage cannot see him. Thus theatre is not only a 'mirror up to nature' it also embodies an exploration of the imagination. In a sense, theatre enables an unhinging of our expectations about what can be given physical presence in our mundane

social reality, and hence enables an imaginative exploration of our own human nature.

For instance, Boal (1995) talks of actors in theatre as exploring their souls, which in effect is the mirroring and enabling of the audiences' own explorations at this profound level. Yet, for the most part, the actors' explorations are interpretations of dramaturgical texts that have been given them to enact. However, nothing of what the script says and nothing of what the actors do to reveal those scripts has any significance if the audience cannot sense how the physical action witnessed in theatre reflects their own experience, or informs and enables their own exploration. Novitz (2002) points out that theatre has actual lived experience rather than artistic invention as its source, and in the theatre audiences are alert to the extent to which theatre is truly reflective of their actual and imaginary experience.

The audience is also physically present to the actors and as Ian Mangham notes, adept performers remain acutely aware of the response of their audiences and refine their interpretations to those responses (Mangham, 1990). Thus for Mangham the total theatre performance entails a reflexive, triadic reciprocity between actor (performer), script and audience (Mangham, 1990, p. 108). I would go further to suggest that 'script' here is more than the text of the drama. Rather, I refer to 'script' as the total content of the performance that is seen, heard and felt by the audience. This includes text, plot, staging, lighting, costume and a whole range of aesthetic experiences.

We have therefore the sense of theatre as comprised of performer, performance and audience, that together enable the mirroring of human nature and experience, but also the imaginative exploration of that nature that goes beyond the reflection of mundane reality. The wide scope of such an exploration needs to be considered in relation to the development and use of qualitative research methodologies in the specific context of business and management. With this in mind, and

before turning to an exploration of dramaturgical methodology, the discussion turns briefly to business and organizational literature that spans a nuanced range of views from life as being like theatre (metaphor) to a view that life *is* theatre (ontology). It is necessary to consider this distinction for it has a bearing on how theatre might be used as a research vehicle and more especially on the epistemological nature of dramaturgical methods as qualitative organizational research.

THEATRE AS METAPHOR AND ONTOLOGY

When theatre is viewed merely as a metaphor for life then qualitative, dramaturgical studies of actual social interactions seek understanding of those interactions by the use of dramaturgical coding or labelling. Thus we might have labels like actors and audience, roles and performances, acts and scenes, assigned to aspects of the interaction. Actual theatre does not need to have taken place in this perspective for it is the language of theatre that is being used metaphorically to characterize actual events and interactions in the sense that 'life is like theatre'. This is seen especially in the sociological work of Erving Goffman (1959, 1961, 1963, 1967), as well as in a range of more specific organizational studies looking to bring insight to organizational dynamics such as power relations, leadership and management (Mangham, 1986, 1990). Dramaturgical language is used to denote various roles and dynamics within organizations. For example, Czarniawska-Joerges and Wolff (1991, p. 538) equate leaders with actors: 'successful leadership ... is a dramatic performance which fulfils the expectations of both audience and co-actors ... and, above all, a skilful use of stage set and a talented improvisation, tuned to prevailing moods'. In this regard, there is especial interest in Shakespeare's plays as a source of analogy, particularly in relation to

leadership issues (e.g. Augustine & Adelman, 1999; Corrigan, 1999; Shafritz, 1999; Stevenson, 1996; Whitney & Packer, 2000).

Dramaturgical analogy may be used not only to characterize events but also to model them. Here one might envisage studies where dramatic performances are made in order to present particular social and organizational issues in metaphorical form and thence to study actual responses to those issues. In the organizational literature, the rise of what has been described as organizational theatre (Schreyögg & Höpfl, 2004), which is the direct use of theatre in organizational development and learning, has seen theatre processes used as a basis for direct modelling of how organizational life might be (e.g. Vera & Crosan, 2004; Posner, 2008). Here one thinks of 'life as theatre' (e.g. Czarniawska-Joerges & Wolff, 1991; Mangham, 1986). Further, it has been claimed that in presenting life as theatre it is possible to see more in the presented performances than is permitted by a purely cognitive analysis of social interactions; that theatre permits an aesthetic understanding of organizational life and reveals an 'essence' of meaning and significance that cannot be easily grasped by familiar analytical methods (Taylor, 2003). In other thinking, there is what might be termed interdependence between theatre and life (Sinha, 2010), where each reflects and informs the other. This is especially so in Victor Turner's notion that atypical breaches in the normal course of social interactions may be characterized as social drama that follows a processual path from the acknowledgement of breach to resolution of crisis (Boje, 2003; Turner, 1980). In this view, social conflict is not just like theatre but *is* theatre, following a familiar dramatic journey from crisis to hiatus to resolution, and blurring the distinction between views of 'life as theatre' and 'life is theatre'.

In the ontological view that life is theatre we are not *like* actors on the stage but *are* actors on the social stage and that the fundamental basis of life is dramatic action (Burke, 1969). This is to say that the use of dramaturgical

language moves from labelling and coding used to organize data, to language that explains data, and from the use of dramatic performances to represent social interactions to the study of social interactions as performances in themselves. We see therefore an evolution from the use of theatre as metaphor to elucidate social interactions, to theatre as a model of social interactions and thence to social interactions as theatre. These distinctions are important because the way we view the relationship between life and theatre has a crucial bearing on choice of dramaturgical methodology. Indeed, as we will see, each of the five perspectives that has been elucidated on this relationship provides a different lens through which to look at methodology, with corresponding differences in methodological approach.

In sum, we have five variants of the relationship between life and theatre with an indication of how this variation might give rise to differences in methodology:

- 1 'Life is like theatre' – the use of descriptive, dramaturgical categories to organize interaction, e.g. 'frontstage, backstage'.
- 2 'Life as theatre' – the notion that dramatized action has some equivalence to lived action. Thus dramatized action provides representative and equivalent data.
- 3 'Life is revealed by theatre' – dramaturgical analysis provides insight into social reality.
- 4 'Life and drama are interdependent' – for instance, dramaturgy can be used to map processual movements of social disruption (social drama).
- 5 'Life is theatre' – dramaturgical analysis reveals, describes and explains social reality.

A FRAMEWORK FOR DRAMATURGICAL METHODS

This is not to say that these epistemological options are exhaustive and contain all potential dramaturgical research methods. Rather, they inform the development of a framework

Table 11.1 A framework linking views about theatre and life to different elements of theatre

<i>Actor</i>	<i>Performance</i>	<i>Audience</i>
Life is like theatre		
Life as theatre		
Life is revealed by theatre		
Life and theatre are interdependent		
Life is theatre		

within which to organize these methods, especially in consideration of the triadic nature of theatre that was discussed earlier – actor, performance and audience. Thus, each of these three elements might be considered separately in relation to the five different views of the relation between life and theatre from metaphor to ontology. This is clarified in Table 11.1, empty as yet, but showing the template for a later organization of different dramaturgical methods to form Table 11.2.

It is the contention in this chapter that different dramaturgical research methods can be positioned within this tabulation in order to identify the specific dramaturgical elements being addressed within any study as well as assumptions about how the relation between life and theatre is to be regarded. It may have been noted that the hermeneutics of the relationship and interconnection between ‘life’ and ‘theatre’ are complex and to an extent, defy definition and categorization. Yet, ultimately, theatre and a dramaturgical perspective provide a frame for the active exploration of human expression and of human sense making (Alexander, 2005) as well as an evocative language that is said to facilitate finer analysis (Cannon, 2012) and hence is a potentially rich resource for qualitative research. It is with this in mind that I now consider specific instances of how dramaturgy has been used in qualitative research in business and organizational studies and how these may be situated within the framework in Table 11.1.

DRAMATURGICAL METHODS

In what follows, the intention is not merely to list and describe different dramaturgical research methods but to show how different methods can be organized according to the five different views of the relationship between life and theatre. Further, the intention is to bring a critical eye to this kind of methodology and to point the reader to literature that introduces different studies using different dramaturgical methods. This entails a non-exhaustive review of literature so as to explore how different methods might be positioned on the framework in Table 11.1. This is in order to establish a basis on which to compare and contrast different dramaturgical methods as well as to indicate the potential scope of dramaturgical methods that has to date been insufficiently explored.

LIFE IS LIKE THEATRE

Erving Goffman’s metaphorical frame for life as being like theatre produced a rich vein of sociological study in the second half of the twentieth century (Denzin, 2002; Prasad, 2005) and in particular provides underpinning for research into impression management (e.g. Gardner & Avolio, 1998; Sharma & Grant, 2011). Goffman’s dramaturgical analysis gives us terms such as ‘role’ and ‘role distance’, ‘playing a part’ or ‘routine’, and he describes attempts to influence others as

'performances'. 'Front stage' refers to what is intentionally performed by individuals and 'back stage' to that which is intended to remain hidden from others in interaction. Goffman's emphasis is on the social actor as performer of 'self' and consequently this and similar dramaturgical analyses may be positioned in the 'actor' cell within Table 11.1 on the row 'life is like theatre'. A danger here is that attractive as it is to use metaphor to simplify explanation of behaviour, there is a view that Goffman's terms presuppose an underlying 'reality' for which Goffman's dramaturgy provides a different language, but little more (Denzin, 2002). Thus Goffman's analysis, viewed as structural rather than interpretive, is seen as unequal to the task of accommodating partial, plural, incomplete and contingent understandings in a changing world (Denzin, 2002). Nevertheless, dramaturgical analysis from a metaphorical standpoint continues to hold some attraction (McCormick, 2007), albeit mainly in the context of leadership studies (Down & Reveley, 2009; Gardner & Avolio, 1998; Harvey, 2001; Sharma & Grant, 2011; Sinha, 2010).

Mangham brings his knowledge of theatre to bear on an interpretive understanding of organizational issues, particularly of power relations and is unhesitant about coding individual leader behaviour in theatrical terms (Mangham, 1990, 2001). Gardner and Avolio (1998) position leaders as actors and followers as audience. They propose that the communication of charismatic leaders follows a process of impression management that includes explicit dramaturgical language of framing, scripting, staging and performing. Harvey (2001) uses Gardner and Avolio's scheme to analyse the communication style of Apple's Steve Jobs and highlights conflict as a key, dramaturgical tension. Harvey uses this tension as a frame to explore the way Jobs manages to present himself as both 'one of us' and as individual and separate; how he manages both to respect and disdain his competition; and how he manages to convey

an identity that is both 'nerd' and artist. Here again, we see the focus on 'the actor' within the three elements of theatre.

Although the 'actor' is central in these studies, dramaturgical metaphor can also be applied to script and audience. For example, texts can be analysed for plot, scene, story, hiatus, dramatic development and tension and so on. Indeed, the audience has a place in Goffman's thinking in so far as on the one hand the audience is also giving off performances of self, but on the other is assessing the veracity of the performances of self by other social actors; in this view, we are all audiences of each other.

Dramaturgical metaphor remains useful methodologically and it is unsurprising that it seems to have attached in particular to leadership research, in so far as leadership studies using a dramaturgical frame tend to stress the leader/actor–follower/audience axis (Sinha, 2010). It is arguable, however, that engaging as the dramaturgical metaphor might seem, rather than the metaphor providing a vehicle for expressing that which is difficult to express by other means, it is merely one of many possible languages that might reveal and express the analysis. This is the view of Biehl-Missal for example (2011), who demonstrates a different use of dramaturgical method, eschewing the metaphor of life as being like theatre and instead working with the aesthetics of organizational performances that are not like theatre, but which may be construed *as* theatre and in this respect, amenable to research of the theatrical and aesthetic components of such performances.

LIFE AS THEATRE

Several writers have expressed the view that organizational life is akin to theatre in a number of ways (Czarniawska-Joerges & Wolff, 1991; Mangham & Overington, 1987; Pine & Gilmore, 1999; Vaill, 1989). For example, Mangham and Overington (1987,

p. 52) show how the preparation of role, character, motivation and techniques of presenting underlie the subtle negotiation of power and the authentic nature of performance. In the theatre, we may become aware of inconsistencies and disruptions that expose the artificiality of what is presented. Mangham and Overington show how the same applies in socially constructed realities like the boardroom of a company, and thus theatre makes us aware of the relation between intentions and acts, context and resources for action.

The Aesthetics of Performance

Biehl-Missal (2011) expands this thinking by positioning certain managerial acts as ‘performances’ that can be interrogated as such rather than viewed through the lens of theatre. This still entails the study of the relation between ‘intentions and acts, context and resources for action’, but by framing her research as the study of the aesthetics of performance she is able to ‘zoom away’ from the dramatic interest in actor and audience and observe the more detailed interplay of a range of different agents and agency such as scenography, lighting, clothing, managers’ performance style, rhetoric, audience interaction and so on. Yet all these elements still have dramaturgical significance for it is common within dramatic texts for writers to specify aspects of staging and playing style, hence this methodology may be centred on ‘performance’ and ‘life as theatre’ in Table 11.1.

Performance Analysis

In highlighting the aesthetics of performance, Biehl-Missal introduces a new tool for performance analysis, which provides a method for data collection and data organization as well as for data analysis.

This performance analysis tool is developed from the work of Pavis (1985, 2003)

and adds atmospheric and bodily sensations to the more familiar visual and linguistic experiences and texts of theatre to produce an over-arching, non-hierarchical ‘performance text’ that enables the researcher to experience and absorb as much as possible of what is both signified and materialized in the performance, without needing to convert this into an ‘abstract and fixed sign’ (Biehl-Missal, 2011, p. 622).

Biehl-Missal takes Pavis’s tabulation of standardized components of aesthetic analysis of performance (Pavis, 1985) and adapts it for her research of staged corporate presentations, reducing the emphasis on more overtly dramatic components like text and storyline and translating these elements into an analysis of the rhetorical devices used. She also accentuates the aesthetic rather than theatrical perspective, including for example, ‘smell’ in the analysis and stressing the aesthetic contribution to the experience of the co-presence of the audience. Biehl-Missal visited seventeen AGMs and nineteen press conferences and completed her adapted catalogue for each event. The data production and collection were based on dramaturgical principles and then expanded and articulated in a number of ways that are familiar in qualitative research. For example, she added data from archived records of the events in question and then looked for recurring patterns and motifs across all the data through constant iterative comparison.

Biehl-Missal claims that she has moved the analytical ‘script’ away from explicit theatrical terminology that tends to privilege traditional theatre roles, towards an understanding of the aesthetics of performance in an organizational context. At the same time, she has not relinquished the implication that organization may be viewed as theatre. Bearing in mind the sense of theatre as a triadic collusion of performer, performance and audience, one might discern in her analysis that she has reflected in a non-hierarchical way upon performance regarded as the total aesthetic content of performer-audience interactions. Her

study is essentially of the aesthetic impact of performance on the audience. The discussion now moves to methodology that looks at this same performance-audience interaction but through the means of explicitly staged theatre.

LIFE AS REVEALED THROUGH THEATRE

Staged Theatre

Thus far we have considered dramaturgical methods that look through a dramaturgical lens at 'real-life' situations but not at explicitly staged theatre. In this latter case, plays are made and performed on stage in order to effect discussion and change in the audience. One of the most prominent forms of staged theatre in organizations is adapted from Augusto Boal's Forum Theatre, which is a core instrument of Boal's Theatre of the Oppressed, designed to prime and catalyse direct action against social injustice (Boal, 1979). It is not the intention to discuss Forum Theatre in depth here because whilst a form of it is much used in a training context and has been researched as such (Meisiek & Barry, 2007; Rae, 2011, 2013) it seems barely to have been used as an instrument for intentional qualitative research in an organizational context, although Sommerfeldt (2015) offers Forum Theatre as a research method for investigating teams and team-working in North American health care.

Staged theatre has been used intentionally as research instrument in a number of ways. For instance, Taylor (2003, 2008) makes theatre in both academic and organizational contexts advancing an epistemology that derives from aesthetic, sensory knowing, which in turn informs rational thought (Taylor & Hansen, 2005). This aesthetic approach emphasizes the study of experience rather than the study of objects and is deemed to be more appropriate than a conventional, 'scientific'

approach for capturing how organizational audiences 'feel' about aspects of academic and organizational life (Strati, 1996; Taylor, 2008). Taylor's approach is about the making and presenting of staged plays followed by post-event discussion and written communication with audience members. Performance is used creatively and ironically in order to reach out to the aesthetic sensibilities of the audience, and it is the impact upon the audience that is of research interest. A denser and less artistically creative research methodology that seeks to engage audience response is that offered by what researchers term *ethnodrama* (Miencaowski & Morgan, 2006).

Ethnodrama

In *ethnodrama*, scripts and plays about social issues are evolved and written after careful ethnographic research with those implicated and involved in the social problematic. It has been used for instance in research of the treatment of rape victims and of alcoholics in Australia. Examples of interviewees' written and spoken accounts may be transferred directly into the scripts of staged plays. Great care is taken to engage participation of key stakeholders at every stage of the process, of which the intended outcome is to negotiate and construct new understandings and meanings both for participants and audiences. A grounded theory approach is taken to the gathering of accounts from all stakeholders. Triangulated material is returned to informants for comment, with the question, 'What do you want to tell an audience of health workers, health service providers, care-givers or young people about the experience of ... whatever the subject of research is?' (Miencaowski & Morgan, 2006, p. 177). From here a list of themes and scenarios is drawn up with continuing informant-led discussion and feedback before scripting of the play begins. Thus, the intention of the researchers, as with much action research, is to give voice to the informants, and indeed

theatre provides a site for the projection of a polyphony of voices around any chosen theme. The researchers feel it crucial to represent that genuine voice and will not depart into fictionalized narrative without validation by informants as representative of their experiences (Mienczaowski & Morgan, 2006, p. 178). As the researchers note, 'This is not theatre for artistic pretension, aesthetic appeasement or entertainment' (Mienczaowski & Morgan, 2006, p. 178). Rather, their intention is to use familiar dramaturgical devices to communicate issues to concerned audiences as a means of generating debate at the end of the performance. This then provides opportunity for debrief, for learning, for reflection and for reflexivity and may lead to post-event surveys. Throughout the process the dramaturgical action research method used is embedded in rigorous and ethical qualitative research practice, always foregrounding the voice of the informants who are often representatives of the intended audiences for the work.

Performance Ethnography

A somewhat different approach that overlaps with ethnodrama but foregrounds the performer as opposed to the voice of the informants is performance ethnography. Performance ethnography has a complex philosophical base that has its roots in performance studies, regarded as a dialogic engagement between self and other through both performance and ethnography (Alexander, 2005). Performance ethnography situates performance as the experiential setting in which participants gain ethnographic understanding of 'the variables that shape and affect cultural knowing' (Alexander, 2005, p. 430), whilst ethnodrama is more about ethnography that is represented and accentuated through the mirror of drama. In a sense, the centre of gravity of the research endeavour might be said to move from the representative audience in ethnodrama to the performer in performance

ethnography. In the former case, the work is to foreground the voice of the other. In the latter case, it is for the performer to have an embodied experience of the cultural predicaments and associations that underpin, inform and construct the other's voice and in so doing come to a greater understanding both of other and of self.

Radical Performance of 'the Other' in Business?

Do these methodologies that use theatre to come to greater understanding of other and self, have a place in organizational research? The answer is yes, but there are likely to be difficulties in creating a space in organizations for this kind of research to take place. Forum Theatre for example, has been used widely in organizational training if not in research and so there seems to be an appetite for viewing plays as a training methodology, especially as Forum Theatre tends to emphasize conflict and dysfunction and in particular explores behaviour that addresses conflict. Consequently, Forum Theatre has potential as a research methodology to explore actors' responses to political and cultural tensions, perhaps even oppressions, within organizations. Were theatre to be seen as more equivalent to and less metaphorical about actual world experience, dramaturgical methods of enquiry might be seen as less radical and more relevant in business and organizational settings. In other words, an acknowledgement of the interdependence of theatre and life might make methods such as ethnodrama and performance ethnography seem more valid in a business context.

LIFE AND THEATRE ARE MUTUALLY INTERDEPENDENT

The sense of life and theatre as being interdependent underlies Victor Turner's 'social

drama', which looks at the drama of political and cultural tensions. Turner describes social drama as 'constituting isolatable and minutely describable units of social processes that arise when interests and attitudes of groups and individuals stood in obvious opposition' (Turner, 1974, p. 33). For Turner, the drama first manifests itself as 'a breach of a norm, the infraction of a rule of morality, rule of etiquette, law, custom, or etiquette in some public arena' (Turner, 1980, p. 150). To an extent social drama is a focus on 'plot' – the dramatic structure of the story. As noted above, plot is considered to be contained within the category of performance. Turner's social drama has four phases of public action summarized by Boje (2003) as:

- 1 Breach of norm-governed social relations that have liminal characteristics, a liminal [space] between more or less stable social processes.
- 2 Crisis, during which there is a tendency for the breach to widen and in public forums, representatives of order are dared to grapple with it.
- 3 Redressive action, ranging from personal advice and informal mediation or arbitration to formal juridical and legal machinery, and to resolve certain kinds of crisis or legitimate other modes of resolution, to the performance of public ritual.
- 4 Reintegration of the disturbed social group, or of the social recognition and legitimation of irreparable schism between the contesting parties.

Each of these phases institutes the premises for the next phase (Turner, 1985, p. 48), thus the process is on the one hand more dynamic than Goffman's dramaturgical analysis but is also less mundane in that for Turner dramaturgical analysis is initiated when crises arise in the usual flow of social interaction; when there is 'breach', and a mismatch in perceptions about what constitutes 'usual flow'. Sinha (2010) suggests that Turner's social drama can be used particularly in leadership research because 'it provides a form of activity through which leaders and followers can jointly confront their normal ways of perceiving organizational issues, valuing organizational goals, and recognizing behaviour

and actions that are causative and preventative of crisis' (Sinha, 2010, p. 199). There is a potentially wider research application in organizations where an understanding of the processual path of social drama enables an insightful penetration into a range of organizational tensions and dissonances, not merely those on a leader-follower axis and consequently presents as a potential analytical research tool for interrogating obviously dissonant or disruptive performances but also less apparent tensions. Weick (1995, p. 8) points out that ambiguity and discomfort are ever present even within normative relations within organizations. Novitz (2002) suggests actual life is the prime source of theatre and if Weick is correct, ever present ambiguity and discomfort and their impact on human behaviour are potent seeds for theatre and may even be regarded as constituting theatre in themselves.

LIFE IS THEATRE

Thus far we have considered theatre and the dramaturgical language of theatre as metaphorical vehicles for extended thinking about social relations and how that might be used methodologically. Moving to consideration of 'life is theatre' entails a profound shift in ontological positioning. It means that dramaturgical language is as much the 'writing of life' as it is the writing of theatre and that dramaturgy is not so much a mere terministic screen (Burke, 1969; Fox, 2002) through which to describe action, as a potential comprehensive explanation of social relations. The philosopher Kenneth Burke attempted such a comprehensive explanation.

The Dramatistic Pentad

Burke sees life as little distinguishable from drama in the way we make sense of the world (Burke, 1969) and hence how we

explain human relations and the way we enact them. For Burke the success of our interactions is connected to the causal conditions of Act – the deed or event done, Agent – the doer of that deed, Agency – the means by which the act was done, Scene – the background to the Act, and Purpose – why the deed was done. These five causal conditions constitute the dramatic ‘pentad’ (Burke, 1969). Although Burke generated these causal principles for the analysis of text, they have been extended as a resource for understanding any human activity. Overington (1977) explains that it is only through an understanding of the interaction of the pentad that a true picture of causality emerges. The pentadic language of what is referred to as dramatism is not to be seen as a simple, metaphorical transfer of dramaturgical language into the analysis of non-theatrical contexts, but as the interplay of pentadic terms that constitutes an explanation of social action. The terms are linked in that there is an insistent, dramatic requirement that one pentadic element gives rise to another (Overington, 1977). As Burke himself points out, ‘It is the principle of drama that the nature of acts and agents should be consistent with the nature of the scene’ (Burke, 1969, p. 3). Thus a particular setting or Scene creates expectation for certain Agents and Acts to be present therein. Similarly, a particular Agent creates expectation for certain Agency and Acts to be associated with that Agent. Burke expresses these associations as ‘ratios’. The ratios give rise to assumed cause and effect sequences where for example, if someone kills another person and that act is called a ‘murder’, the term itself requires (causes) a search to be made for a ‘murderer’ (Overington, 1977, p. 134). Mangham and Overington (1987, p. 70) insist that a Burkean analysis is incomplete without consideration of both the single pentadic terms and the pentadic ratios.

In the pentadic ratios one sees an extended, systematic examination of how different dramaturgical elements interact. We have

seen in the methods already outlined that there tends to be an emphasis on a particular element of the actor, performance, audience triad and how this impacts on one or both of the other elements. Exploration of the pentadic ratios ranges across all three theatrical elements, though one has to be wary of simplistic reduction particularly as a number of writers comment on the complexity of Burke’s thinking that makes it difficult to approach and handle methodologically (Fox, 2002; Mangham & Overington, 1983; Overington, 1977; Sinha, 2010). Nevertheless, a number of studies have attempted to use the pentad and pentadic ratios in organizational research.

Empirical Use of the Pentad

These studies include reflections on the study of leadership (Sinha, 2010), the study of a family business in America (Graham-Hill & Grimes, 2001), the analysis of a company outing (Walker & Monin, 2001), the analysis of a case study of technical writers (Fox, 2002) and in the analysis of the use of professional actors in organizational training (Birch, 2014).

Walker and Monin (2001) used the individual categories of the pentad in the analysis of the cultural and political tensions that adhered to a ten-year anniversary celebration of a New Zealand based company. This study demonstrated the application of the pentad in simple, categorical terms, but the authors recognized a synthesis of their analysis through a ratios treatment might have provided deeper understanding of the ambiguities that surrounded the event.

Taking this cue, Fox (2002) applied the pentad as ratios in the critical analysis of a ‘workplace drama’ in order to avoid the reductive nature of a single ‘terministic screen’ (Burke, 1969). Fox regards the pentad as providing multiple screens whereby to grasp but not reduce, ‘the messy and complex nature of human interactions’ (Fox, 2002, p. 367),

arguing that the pentad is generative rather than reductive and capable of disclosing multiple truths beyond 'the real'. This use of multiple screens would seem to have some methodological value, though the use of the pentadic ratios in analysis remains interpretive and to date there appears to be little guidance or rule as to how to apply the pentad methodologically. Overington notes that dramaturgical method offers little on the subject of sampling and data collection, and that the interpretation of connotations between pentadic terms is influenced by the analyst's experience. Yet for Overington (1977, p. 150) there are two distinct methodological criteria to be followed in a dramaturgical analysis: 'First, identify the key analytic terms in the explanation; and second, explore the connotational links in dialectical clusters formed by these key analytic terms under the pentadic rubric'. These were the two principles adhered to in my own doctoral research of the use of a specific organizational theatre method, which I have termed Forum Conversations (Birch, 2014), and in the next section I briefly outline how I applied the 'pentadic rubric' and the connotational links.

The Use of Burke's Dramaturgical Pentad in the Analysis of Forum Conversations

Forum Conversations (FCs) is a means of helping people to role-play and rehearse their own difficult real-life conversations, using professional actors to stand in for the difficult others involved. My own research interest was in understanding the impact of this method. The identification of the key analytical terms (those which could be represented as the individual pentadic elements) in preparation for the ratio analysis seemed straightforward in that the process of FCs is in itself a dramaturgical method where the 'Agents' – professional actors and organizational actors – come together to reproduce and rehearse the organizational actors' own difficult

conversations. 'Scene' is a gathering in a neutral space of no more than six organizational actors with one professional actor; stage and audience areas are demarcated merely by separating individual participants from the main group for the rehearsed conversation. The Act(s) in question are the improvised conversations followed by discussion, and Agency is constituted by the skill of the professional actor to recreate real events. The Purpose of the event is to help organizational actors deal with difficult others at work.

The determination of the key analytical terms, labelled as the five different pentadic elements, is akin to the reductive labelling in Goffman's analyses. However, it is the exploration of the interaction of these elements via the pentadic ratios that introduces consideration of causality. There are ten possible pentadic ratio pairs (Burke, 1969, p. 15). However, the selection of the pentadic ratios to be examined is a matter of research design. I chose only five ratios: Scene-Purpose, Scene-Agent, Scene-Act, Agent-Act and Agent-Agency because I was interested in the influence of FCs as 'Scene' on the Purpose of the event, and on how FCs as a dramaturgical process connoted certain types of Agent and their consequent Acts and finally on how these Agents effected their Acts – their Agency. In other words, how does this process that brings together professional actors and organizational actors to produce an improvised enactment of the organizational actors' difficult conversations, actually help the organizational actors? And what are the roles of the different actors in the process; how do they see themselves and how do they behave?

The chosen pentadic pairings enabled a further key aspect of the analysis, which was to follow Burke's suggestion (Overington, 1977) to consider any contradictions thrown up by the ratios. Thus one contrasted the anticipated and unanticipated connotations within the ratios. For instance, one might anticipate that professional actors act, but not

necessarily that they behave as organizational development consultants. Also one might anticipate that organizational actors perform, but not that they are the dramaturges of the performance.

Although Fox (2002) argues that this extended ratio analysis presents multiple, terministic screens and hence minimizes reduction in the analysis, I found reduction to be unavoidable even though dealing with paired ratios, rather than single categories. At the same time, I found that shifting perspective from one ratio to the next helped to accumulate a more complexly nuanced total understanding of the FC's process. The analytical connotations of each ratio were not separate or simply additive, but rather, to use Burke's word, were 'spun' into the overall analysis (Overington, 1977, p. 145). This is in the sense of spinning a web and hence the analysis could be regarded as generative rather than reductive (Fox, 2002). A pentadic analysis is essentially interpretive. But because it looks at a situation from different dialectical clusters anchored in the ratios, it enables the development of multiple, terministic screens through which to sift the data. Analysis is spun together to create a generative interpretation that seems to escape reduction and rather to overspill the initial frame of the research.

This sense of generative could also be applied to the reflexivity in the participants' experience. Participants in FCs often experience the very things they anticipate will make their difficult conversation 'difficult' – for example, feeling emotional or out of control. Instance the female manager, who thought she must not express emotion at work and via her FC became aware of the tension between her constrained emotion and her presented 'emotionless' self. Consider too, the project manager who followed the rule that the customer is always right, but who in so doing became a victim of bullying by a customer, something that he also 'saw' in his FC. This is reflexivity beyond 'the mirror up to nature'.

POPULATING THE FRAMEWORK FOR DRAMATURGICAL METHODS

All of the dramaturgical methods mentioned here might seem at times to struggle to contain this overspill of analysis within their research frames by virtue of the dynamic reciprocity between the different elements of actor/performer, performance and audience that arguably constitute what we think of as theatre. If the research focus is on leaders as performers or actors, it is difficult not to consider the effect of their performances on their audiences. If one focuses on the audience one must consider that which they observe. If one focuses on performance, as perhaps in the cataloguing of the aesthetics of performance (e.g. Biehl-Missal, 2011), one has to consider the impact of those aesthetics on an audience. This dynamic drift across all three elements of theatre is further complicated by the different epistemological nuances of life in relation to theatre, and we have seen how theatre may be viewed as metaphor, model, revelation, social process and 'life'. Thus it is difficult to hold things fast in our research methodology especially in view of what Schechner calls 'the myriad contact points and overlaps, tensions and loose spots' (1988, p. 362) in the comparison between performance in theatre and performativity in life.

Nevertheless, in an attempt to bring some kind of order to this looseness, the various methods outlined in this chapter are now positioned on the outline framework in Table 11.1. This produces Table 11.2, which should be seen as exploratory rather than definitive, but shows how different methods might be positioned in terms of epistemological assumptions and in the emphasis they give to different aspects of theatre. In Table 11.2, different methods with example literature are circled and positioned in relation to where their emphasis lies. Arrows indicate where, for example, an emphasis on the 'actor' leads to consideration of their performance(s), or where a study of performance leads to

Table 11.2 Dramaturgical methods in relation to perspectives about the relationship between life and theatre and to three elements that constitute theatre

Actor		Performance	Audience
Life is like theatre	Presentation of 'Self' <i>Goffman, 1959</i>	→	
	Impression Management <i>Sharma & Grant 2011</i>	→	
	Leaders are like actors <i>Gardner & Avolio, 1998</i> <i>Harvey, 2001; Mangham, 1990</i>	→	
Life as theatre	Analysis of Corporate Life as Theatre <i>Mangham & Overington, 1987</i>		
	Aesthetics of Performance <i>Biehl-Missal, 2011</i>	→	
	Staged Theatre <i>Taylor, 2003</i>	→	
Life is revealed by theatre	Ethnodrama <i>Miencaowski & Morgan, 2006</i>	→	
	Performance Ethnography <i>Alexander, 2005</i>	→	→
Life and theatre are interdependent	Plot: Social Drama <i>Turner, 1974, 1980</i>		
Life is theatre	Pentadic Ratios <i>Burke, 1959</i> <i>Fox, 2002</i> <i>Birch, 2014</i>		

research of the audience response. It will be noted that pentadic ratio analysis sits across all theatre elements in the 'life is theatre' row. This is because the pentadic ratios emphasize all elements of theatre. Whilst this framework for the organization and comparison of different methods remains speculative, one can see that there are a number of potential areas for research that seem to have been less explored. For example, if there is credence to the notion of dynamic reciprocity between the three elements of actor, performance and audience, then there is opportunity to look more at the influence of audience on performances and performers. In a business context, it is common to research the customer as audience but perhaps less so the 'follower' as audience and perhaps neither is explored very much in dramaturgical terms.

CONCLUSION

Dramaturgical methods offer a range of qualitative tools for researchers. The dramaturgical metaphor enables a coherent and integrated organization of data within an intuitively understood frame of reference (arguably key to the success of Goffman's analysis), but as such is especially sensitive to basic assumptions as with all qualitative methodology. If nothing else, the dramaturgical metaphor provides a ready-made coding system (e.g. Saldaña, 2009). Dramaturgy is essentially the language of action and hence is useful in the description, if somewhat less so in the explanation, of behaviour. Further, the 'actor/audience' axis has been used to translate as 'leader/follower' and hence dramaturgy figures in research and writing about leadership. Dramaturgical method enables research to be shown to others as for example in ethnodrama and performance ethnology, and this is a powerful means of sharing research findings to a broad and diverse audience, and thence to further research. Moreover, the staged performance

of research findings, particularly in the context of social need, can give a voice to those who find it difficult to be heard and for making portrayal of need vivid and inescapable and this further adds to the qualitative strength of dramaturgical method.

As dramaturgical research has moved towards performance studies and the aesthetics of performance, a yet finer analysis has been made possible as we see particularly in Biehl-Missal's work. It has enabled the dramaturgically based study of performance and behaviour to move beyond simple metaphor to a deeper, qualitative examination of questions about 'essence' and meaning that some contend cannot easily be attempted by quantitative methods (e.g. Taylor, 2003). Also Miencaowski and Morgan (2006) for example, have shown how to integrate a grounded theory approach with theatre performance and thus to an understanding of how dramaturgy can display and enhance rigorous qualitative work.

Whilst the Burkean pentadic approach perhaps remains tenuous in application, the starting point of analysis has an accessible approach whereby key analytical figures are identified first as metaphor. Thence ratio analysis of the connotations between analytical metaphors provides multiple perspectives that might be said to fold into each other, enabling finely nuanced qualitative insights to be spun from the analysis, and this warrants more exploration and application.

The question still remains as to whether dramaturgically based analysis merely provides another, albeit interesting, language for expressing what other qualitative methods and other analytical languages can also express. The selection of dramaturgical method might then be regarded merely as a matter of taste. Further, researchers need to be fully cognizant of dramaturgical terms, along with their implications and associations, to be able to use them effectively. There is also conceivable limitation in scope of research application in that because dramaturgy is fundamentally about action, it tends to be used to explore

behaviour and performance. In respect of performance it is no surprise therefore to see how dramaturgy is often used in leadership studies, but in few other contexts. Goffman's metaphors and Burke's pentad have been used outside of leadership studies, but there remains doubt about the validity of the transfer of pentad analysis from its intended use in the analysis of text with its emphasis on language and rhetoric to the direct examination of action and social interaction (Overington, 1977).

Interesting as the use of performed theatre is in presenting research, it can be exacting and onerous to create, also requiring special skills and knowledge to align research with performance. Further, it requires resource and time that might not easily be at most researchers' disposal. Drama can also be used to convert meanings into performance and thus potentially to transform them erroneously, where for example, attempts to present real accounts creatively might distort the original meanings (Miencaowski & Morgan, 2006).

This last point also has ethical significance and Miencaowski and Morgan (2006) are alert to performances that use ethnographically derived material as a creative platform that is not true to the original material, something that requires constant discipline and scrutiny as with all qualitative research. Miencaowski and Morgan also note instances of performances that have exposed naïve performers to discomfort, as where schizophrenic patients in the audience have not understood theatrical conventions about the separation between performance and audience spaces and disturbed the action on stage. Where performance ethnography encourages the exploration and performance of difference in order to increase awareness of self and other, one surely has to be wary of the extent to which others might be used merely as educative props for self-discovery. Theatre in general has the potential to be disruptive for audiences and participants alike and this needs to be carefully managed.

When considering the future of dramaturgical methods, if, as has been suggested, life is theatre, then dramaturgical-based framing and accounts are increasingly appropriate as a qualitative means of expressing and examining social interactions. The move towards performance studies and aesthetics in the understanding of behaviour in organizations presents a basis for a more finely nuanced use of dramaturgical language in qualitative research, beyond the simple use of dramaturgical metaphor, revealing as this might be about behaviour and motive. Cole (1975) is of the view that theatre is a site for making imagined truth a present reality. This means that dramaturgical methods represent a potent qualitative research site for interrogating imagined truth and present reality in organizational life – for showing 'the very age and body of the time his form and pressure'. The qualitative methodologies highlighted in this chapter might serve to support that research.

Capturing the Complexity of Daily Workplace Experiences Using Qualitative Diaries

Laura S. Radcliffe

INTRODUCTION

We are all familiar with diaries; from diaries we rely on to effectively plan our time, to more extensive journals capturing our daily experiences, thoughts and emotions. Researchers, particularly those who tend to utilise qualitative approaches, frequently keep personal reflective diaries with the aim of enabling greater critical awareness of their own impact on the research process, therefore enhancing the quality of qualitative research (e.g. Johnson & Duberley, 2003; Nadin & Cassell, 2006). In this way diaries are acknowledged as useful ways to record and analyse our personal experiences, encouraging introspection and reflection, and, in doing so, learning more about ourselves, our feelings, our thoughts and our behaviours.

Thinking about diaries in this manner allows us to easily consider how they might also be useful in collecting interesting participant data, encouraging participant introspection and permitting in-depth insights into daily

experiences and processes. In this way, diaries offer clear potential in terms of their ability to uncover and explore the meaningfulness of participants' ordinary lives in everyday situations, enabling our understanding of events from their perspectives. In thinking about the purpose and aims of a substantial amount of management and organisational research, we are often concerned with processes, including how and why people behave in the way they do. Indeed, editorial boards of leading journals, including the *Journal of Organizational Behavior* and the *Journal of Occupational and Organizational Psychology* have made calls for more dynamic research in the field of organisational behaviour. For instance, a call for papers issued by the *Journal of Organizational Behavior* (Hofmans et al., 2016) asks for contributions that 'capture the dynamics of work', noting that there is an increasing awareness that much organisation and management phenomena are inherently temporal in nature and therefore that it is vital that we capture, explore and subsequently

begin to understand, how such phenomena evolve and change over time.

Such calls, and a parallel awareness of the importance of approaches that can capture temporal elements of experiences in moving organisation and management research forward, are increasing in frequency. For instance, Spector and Meier (2014) have expressed concern with the infrequency with which research in this area focuses explicitly on exploring processes as they unfold over time, but instead relies heavily on cross-sectional research. They concluded that repeated assessments afforded by daily diary studies could be particularly useful in illuminating organisational behaviour processes to explore how sequences of events, and related states, unfold. Qualitative diaries have also previously been recognised for their capacity to enable deep analysis of individuals' internal processes and practices within organisations (Plowman, 2010; Symon, 2004), as well as of the internal workings of organisations themselves (Plowman, 2010).

When considering such research aims, along with the capacity of diaries to achieve these aims, it might initially be somewhat surprising that diaries, particularly those that are qualitative in nature, are utilised relatively infrequently. One apparent reason for the underutilisation of diary research in the field of organisations and management is that, while highly rewarding in terms of their capacity to capture dynamic organisational phenomena, there are also numerous challenges in using this approach; from acquiring participants who are willing to give up their time on a regular basis, to ensuring that diaries are effectively completed without the presence of the researcher (Radcliffe, 2013). Such challenges will be discussed later in this chapter, while also arguing for perseverance in order to achieve the rich data collection benefits that this method affords. While currently underutilised, diaries are increasingly recognised as a valuable method in organisational and management research (van Eerde et al., 2005) and in recent years we have seen

a resurgence of interest in this approach. This perhaps reflects a time where the monopoly of positivistic notions of rationality has been weakened within the social sciences, and an increased appreciation of the role of narrative in enabling us to uncover new ideas and connections between events, has come to the fore (Roe, 2008).

The chapter begins by providing a brief overview of prior research utilising diaries in the management field. It then focuses on making a case for greater use of qualitative diaries in management and organisational research, with the aim of highlighting the importance of capturing, and understanding, complex daily processes, practices and experiences. Next, the practicalities of conducting qualitative diary research are discussed, with the aim of making such research more accessible to those interested in using the approach. This includes exploring some of the challenges that might face researchers when using qualitative diaries, as well as some potential ways to address these challenges. In order to more effectively illustrate these practical issues, I make reference to my own experiences of using qualitative diaries throughout. Towards the end of the chapter I briefly explore some of the new and potential future developments related to the use of technology in qualitative diary design, considering how this might revolutionise diary research of the future. Finally, the chapter concludes by highlighting how this methodological approach can help move management and organisation research forward by gaining fresh and original insights into important issues that affect people in the workplace on a daily basis.

PREVIOUS DIARY RESEARCH IN THE FIELD OF MANAGEMENT AND ORGANISATIONS

Diaries have been used since the beginning of social research and are therefore not a new method as such. Take for instance the mining engineer and subsequent sociologist Frédéric

Le Play (1806–82) who collected information about family budgets in a diary of earnings and expenditures, expressing the family's life in figures (Seger, 1970, p. 181). Despite the aforementioned challenges of conducting research using diaries, researchers in the field of management who have utilised this method have achieved a variety of interesting findings.

Diaries can be qualitative or quantitative, or a mixture of both. To date the majority of diary studies conducted in this area have employed quantitative diaries, which consist of surveys completed by participants on a daily basis, or perhaps more regularly. Such diaries have been used to explore a variety of work-related issues including stress at work (Beattie & Griffin, 2014; Daniels & Harris, 2005; Daniels et al., 2009; Jones & Fletcher, 1996; Sonnentag, 2001), affective experiences at work along with subsequent behaviours (Beal & Ghandour, 2011; Ilies et al., 2006; Miner et al., 2005; Ouwenel et al., 2012; Weiss et al., 1999), workplace gossip (Waddington, 2005), fairness at work (Conway & Briner, 2002; Loi et al., 2009), job resources and work engagement (Bakker & Bal, 2010; Xanthopoulou et al., 2009), goal-setting (Claessens et al., 2010; König et al., 2010) and work-family spillover, conflict and facilitation (Butler et al., 2005; Derks & Bakker, 2014; Jones & Fletcher, 1996; Judge & Ilies, 2004), including across couples (Doumas et al., 2003; Ilies et al., 2007; Williams & Alliger, 1994). Such quantitative diaries provide a useful way of capturing the dynamic nature of daily experiences as they highlight daily changes, which other more retrospective techniques would be unlikely to recognise. The use of quantitative diaries has therefore received increasing attention in recent years, including being the core subject of text books in related fields (e.g. Mehl & Conner, 2010) reflecting the diary researchers' predominant focus on quantitative methods. However, because such diaries use self-report scales, each consisting of a small number of pre-defined items, they can overlook other important factors, neglecting valuable insights participants might have

to offer, and therefore limiting the potential in-depth findings that diary research has the capability of capturing.

Despite qualitative diaries being utilised much less frequently within the field of management and organisations, there are some notable exceptions, including qualitative diaries exploring stress at work (Clarkson & Hodgkinson, 2005), transient work patterns (Crozier & Cassell, 2015), organisational change (Balogun & Johnson, 2004), transfer of learning (Brown et al., 2011; Sadler-Smith & Shefy, 2007), gender and power in organisations (Plowman, 2010), work-family conflict decision-making (Radcliffe & Cassell, 2014), and experiences of flexible working (Poppleton et al., 2008; Radcliffe & Cassell, 2015). The use of such qualitative diaries to capture daily events and experiences is the focus of the remainder of the current chapter.

WHY USE QUALITATIVE DIARIES?

Authors across the organisation and management field have raised concerns that the most frequently used methods with management research cannot adequately capture the complexity of the numerous interactions that are essential to our understanding of organisations (e.g. Guest, 2011; Kiessling & Harvey, 2005). Everyday organisational realities are dynamic, existing within an uncertain and changeable world where moods, experiences and behaviours fluctuate daily, or perhaps more frequently (Ohly et al., 2010). It is this daily element that many frequently used data collection methods are less able to capture (Radcliffe, 2013). Qualitative diaries have the potential to offer several key benefits for management and organisational research; the ability to capture the specifics of events and processes, including thoughts, feelings, considerations and reactions; the ability to capture these events as they happen to avoid the problems associated with retrospect; and their

capacity to do this over numerous days therefore enabling a longitudinal research design. Such an approach can lead to the revelation of new and interesting insights and details that remain unnoticed when employing other methods of data collection. Beyond this, research has demonstrated that involvement in qualitative diary research can have therapeutic effects on participants (e.g. Suedfeld & Pennebaker, 1997). This section will explore each of these key benefits in greater depth.

Qualitative Diaries Enable a Detailed Exploration of Events, Experiences and Processes

Qualitative diaries allow researchers to explore events, experiences and processes within the natural and spontaneous context of daily life in a way that is not possible using more traditional methods (Reis, 1994). This approach, in conjunction with the qualitative nature of the research, allows participants to express their own perception of their experiences of a specific event without restriction, therefore providing the opportunity to uncover thoughts and feelings that have not previously been exposed, generating enormous amounts of detail which would be difficult to achieve using other methods (Symon, 2004). As mentioned earlier, diaries that have been employed in previous studies in this area (e.g. Butler et al., 2005; Doumas et al., 2003; Weiss et al., 1999; Williams & Alliger, 1994) tend to be quantitative; in other words they are surveys that are completed by participants on a daily basis, therefore losing their capacity to collect rich, in-depth data. Conversely, those studies that have utilised qualitative diaries have demonstrated how the rich, introspective data acquired from participants about their particular daily experiences, has led to important new insights.

For example, Plowman (2010) demonstrated the value of qualitative diaries within her research where staff and managers, within a case study organisation, were asked to

record their individual self-reflection of daily events in the workplace. Her findings from this application of the diary method affirmed the value of qualitative diaries for uncovering the internal workings of organisations by revealing what goes on in the unofficial organisational sphere, which would normally remain undiscovered. The use of qualitative diaries enabled her to achieve a deeper understanding of the meaning of 'gendered' organisational culture and consequently this enabled her to identify what needed to change within the organisation, as well as being able to support her suggestions with a clear rationale.

Within my own research exploring how dual-earner couples manage daily work-life conflict (Radcliffe & Cassell, 2014), taking a qualitative, episodic approach enabled the discovery of thought processes and concurrent feelings leading to, and predicting, the selection of particular strategies for dealing with these conflicts. One example of this was the negotiation of reciprocal arrangements with others, which involved building and maintaining agreements of mutual reciprocation both within couples and externally with other parents. This was predicted by the estimated ability to reciprocate and maintain such relationships equitably and was also stimulated by various emotions including stress and guilt. I would suggest that such depth of understanding regarding the complexity of how these strategies were (de)selected by participants would not have been possible using other, more traditional approaches to data collection.

Qualitative Diaries Take a Non-Retrospective Approach

The most consistently noted benefit of diary methods, both qualitative and quantitative, is the lesser time lapse that exists between event occurrence and event recording. An increasing body of literature from the cognitive sciences draws attention to the complexity of the recall process required when participants

are asked to respond to retrospective questions (e.g. Schwarz & Oyserman, 2001). Retrospection can lead to lapses in memory in terms of specific details of experiences, thoughts and feelings, to the degree that for some events, little useful or relevant information will be available to participants attempting to construct a response. In such instances, individuals might resort to drawing on personal theories or ideas regarding what they believe is likely to be the case (Christensen et al., 2003). There is also a propensity for state-congruent recall, where the participant's current mood or frame of mind leads them to draw on similar instances from the past, rather than drawing on instances that more accurately reflect their daily experiences, as well as recall of past events being distorted based on knowledge of subsequent event outcomes (Robinson & Clore, 2002).

When considering qualitative diaries specifically, this reduced retrospection offers the opportunity for as much detail as possible to be recalled and reported. This enhances the benefits of the approach by not only capturing the specifics, but by capturing as many of the specifics as possible, and in as much detail as possible, due to increased effectiveness of participant recall. A better recollection of thought processes and emotions attached to events, experiences and decisions is much more likely if these events are recorded as soon after they happen as possible (Bolger et al., 2003). By allowing participants to express their own perception of their experiences of a specific event or process freely, and with a lesser time lapse between the event occurrence and recording, qualitative diaries are able to uncover the previously undiscovered (Radcliffe, 2013).

The use of this approach in my own research (Radcliffe & Cassell, 2014) enabled the discovery of previously unrecognised factors that are important to participants when making decisions in incidents of work–family conflict (e.g. Powell & Greenhaus, 2006). For instance, participants frequently recalled making fairly intricate fairness judgements

regarding others when deciding how best to manage specific conflicts. This might include decisions to seek support from an available party being influenced by the amount of support they had already provided over a particular time period, their reaction to support-giving in the past, and their own personal circumstances at that particular time. Such considerations had not previously been explored in relation to work–family conflict (Radcliffe & Cassell, 2014). It is unlikely that these factors would have been recalled within an interview, at a time far removed from the actual event, as it is less likely that participants would be able to remember their exact thought processes at that time, as well as recalling all the influencing factors that led to a specific outcome (Radcliffe, 2013).

In this way, qualitative diaries offer not only the advantage of immediacy (Symon, 2004) offsetting the problems of retrospective accounts but also enabling recent events to be recalled in the kind of rich detail that permits new insights into complex phenomena (e.g. Poppleton et al., 2008; Radcliffe & Cassell, 2014, 2015).

Qualitative Diaries Permit a Longitudinal Element

Research has long shown that there is substantial variation in people's experiences on a daily basis, including their moods, experiences and interactions with others (e.g. Bolger et al., 1989; Eckenrode, 1984; van Eerde et al., 2005). Life in organisations is also far from static, consisting of events and behaviours that fluctuate in frequency and intensity over time (van Eerde et al., 2005). Rather than examining one specific occurrence at one specific point in time, the qualitative diary enables researchers to examine unfolding processes, within-person variations, and how individuals respond to changes in events or behaviours over time, therefore gaining rich insights into such regular fluctuations. In this way, they are able to capture context by

demonstrating the impact of past experiences on subsequent experiences. Taking events, feelings or decisions in isolation often gives an incomplete picture, therefore capturing immediate, and not so immediate, outcomes is important in terms of viewing the big picture. Outcomes can be thought of in two senses: the actual behavioural arrangement, or the subjective evaluation of those arrangements (Szinovacz, 1987). A within-person analysis over time, exploring both practical and emotional outcomes over numerous days, permitted by the qualitative diary method, can lead to deeper insights, particularly in terms of emotions and the impact that these emotions have on a person over time. The more in-depth recall of specific events and related feelings permit the mapping of the impact of such emotions on events on subsequent days.

For example, previous literature has highlighted mixed results regarding the benefits of flexible working. Some studies have reported that 'family-friendly' policies, such as flexible working arrangements, actually demonstrate positive relationships with family to work conflict (Hammer et al., 2005; Lapierre & Allen, 2006). Employing qualitative diaries, I also found that those who used flexible working experienced a greater number of conflict incidents (Radcliffe & Cassell, 2015); however, what previous studies have not shown is the longer-term daily impact on the employees themselves, and subsequently the organisation. My research demonstrated how a lack of flexibility can continue to be damaging after the event due to the constraints this puts on daily decision-making. Although a lack of flexibility at work often meant that participants were more likely to take part in the work domain, when faced with a work–family conflict, such constrained decision-making often led to further work–family conflicts. For example, one participant reported experiencing constraints placed upon her decision-making by an inflexible work context that prevented her from being able to start work at 10am rather than 9am on an occasion where she was required to work away from home. Her concern about

this situation continued to have a knock-on effect on both her work and personal life over the following days. The longitudinal nature of the qualitative diaries employed enabled the observation of the impact that imposing such constraints on decision-making can have over time. Beyond this, the necessity to continuously make decisions under such constraints was shown to lead to individuals leaving their organisation or intending to do so (Radcliffe & Cassell, 2015).

Specific events and experiences are inextricably linked to previous and subsequent events, and how these are experienced. Qualitative diaries provide an opportunity to capture and explore these links in a way that other methods cannot.

Positive Impact on Participants

Diaries can be used not only as a research tool but also as an intervention having the capacity to enable reflection and raise consciousness about the reported topic, allowing a deeper understanding and space for thinking and acting on change (Alford et al., 2005; Plowman, 2010). Self-reflection has been well-documented as having positive therapeutic outcomes, as well as being important for personal learning and development (e.g. Moon, 2013; Suedfeld & Pennebaker, 1997). The process of maintaining regular qualitative diary entries within research practice, permitting space for such personal reflection, has therefore been linked to therapeutic outcomes for individuals, due to this process of recollection and self-reflection (Milligan et al., 2005; Proff, 1992; Suedfeld & Pennebaker, 1997). Furthermore, it has also been linked to organisational learning and change (Symon, 2004).

Within my own research, participants expressed how the process of keeping a qualitative diary, 'made me think more about what I actually do' with some suggesting that it led to greater self-awareness such as enabling them to 'analyse my motives and realise that they are usually family orientated' and others

expressing greater awareness of their partner's roles and responsibilities, 'realising more what the demands are on each other'. For some participants, this led to decisions to change behaviour, such as one participant who worked from home realising that much of his stress emanated from trying to engage in work and home roles simultaneously: 'It causes stress doing something and then going back and checking my emails and then doing something so I'm not doing it anymore'. In this way, qualitative research diaries also have the potential to positively impact participants by encouraging self-reflection, self-awareness and subsequent learning, development and change.

CONDUCTING QUALITATIVE DIARY RESEARCH: POTENTIAL CHALLENGES AND PRACTICAL SUGGESTIONS

In this section I will outline some important considerations when employing the qualitative diary method, beginning with the design of the study, before considering recruitment of participants, maintaining participant commitment throughout the study, and finally discussing some relevant ethical issues. I will also draw on my own personal experiences of conducting qualitative diary studies, exploring how dual-earner couples experienced and resolved work–family conflict, as a way of offering useful practical examples. In doing this, I will address some potential challenges that researchers might face as well as making practical suggestions, with the aim of providing some guidance to researchers who are beginning their journey with qualitative diaries.

Designing the Qualitative Diary Study

Before beginning qualitative diary research, it is important to consider the design of the study as a whole, as well as the design of the diary itself. Such design considerations are

particularly important in the context of diary research to ensure that significant details are recorded in sufficient depth by participants. When using other, more frequently employed qualitative methods of data collection, such as the interview, the researcher is usually present throughout the duration of the data collection process. This enables them to ask and answer questions, prompt participants, or request a more detailed response where necessary. However, this is not the case during qualitative diary completion, as the researcher cannot be present throughout this process. In order to prevent the loss of important information, and to retain the detail and depth that the qualitative diary method has the potential to afford, the various design details of such research must be carefully considered.

Diary Study Design

Using diaries in conjunction with interviews has been considered, by various researchers, to be highly beneficial in terms of the quality of data collected (e.g. Plowman, 2010; Radcliffe, 2013). The diary-interview method was first described by Zimmerman and Wieder in 1977, where structured diaries were designed to record daily interactions and were followed by an in-depth and intensive interview reviewing and exploring each aspect of the diary in order to gain additional details, as well as to check the internal consistency of diary entries (Toms & Duff, 2002). In this way, Zimmerman and Wieder (1977) suggested that the follow-up interview should focus on expanding what was reported in the diaries in order to ascertain further details, as well as to uncover the meaning and significance of what was recorded. Incorporating such follow-up interviews in the design of diary studies therefore provides opportunities to clarify and discuss in more detail the issues raised in the diaries. Beyond this, when using qualitative diaries, which encourage

participants to engage in reflection over time, it is good practice to discuss impact with participants. Follow-up interviews also offer an opportunity to do this; to discuss what impact, if any, keeping the diaries has had on participants.

Plowman (2010) refers to the diary-interview process as 'the diary project' making reference to the idea that initial briefings and follow-up interviews are usually considered to be important elements of qualitative diary research. Initial interviews prior to diary completion are an opportunity to discuss the research with participants in person, provide them with the opportunity to ask questions, and ensure that they have a clear and specific understanding regarding specifically what they are expected to report, and in how much detail. Detailed instructions, including a clear definition of triggering events where appropriate, are essential, because any ambiguities may cause participants to omit relevant information and detail (Bolger et al., 2003).

For example, in my own research, I used the initial interviews to emphasise the importance of recording minor and routine work-family conflicts, including the discussion of specific examples, to emphasise the amount of detail required in their entries. As part of this initial interview I employed the critical incident technique (Chell, 2004) asking interviewees to recall a recently experienced work-family conflict incident. This provided me with the opportunity to talk through this incident with participants, identifying their decision-making process and any impacting factors, and encouraging them to express the level of detail that I was looking for them to record within their future diary entries. This allowed me to make clear links between this discussion and their recording of such incidents in their diaries, therefore enabling participants to understand the type of incidents that should be recorded, as well as the importance of including adequate detail in terms of their decision-making process and all the factors involved.

Designing the Diary

In order to encourage effective recording, it is also important to consider the design of the diary carefully. There are three general categories of diary methods in the literature (Eckenrode & Bolger, 1995; Rönkä et al., 2010). These are:

- 1 Interval-contingent, where experiences are recorded at regular, predetermined intervals of time;
- 2 Signal-contingent, where participants report experiences whenever they are contacted by the researcher;
- 3 Event-contingent, where participants report every time a pre-established event takes place.

Considerations regarding which of these is most appropriate for any particular research must, of course, be based on the research aims of that particular study. For instance, within my research, I employed an event-contingent schedule, as this made most sense given that the purpose of the research was to explore specific work-family conflict incidents, since providing reports at fixed times each day would not ensure that a specific incident had occurred and could be reported.

A related issue, when considering the design of qualitative diaries, is how much structure, if any, to incorporate. It is important to focus the research, drawing a line around what will, and will not, be investigated within a particular study. However, considering one of the aims of utilising a qualitative approach is to permit expression of participant experiences and perceptions, imposing a structure onto participants which is not their own should be avoided. Keeping diaries unstructured prevents participant's discussions being confined, in any way, by the researcher's preconceived ideas, an important benefit of utilising qualitative, rather than quantitative, diaries.

Conversely, participants faced with a blank page may feel daunted, particularly those who have not written for a significant period of time, whereas the inclusion of a number of

open-ended questions can make diary completion more efficient and straightforward (Radcliffe, 2013; Toms & Duff, 2002). It is also important that the diary is designed in a way that encourages the reporting of as much relevant information as possible and there is the danger that less focused diary structures may lead to participants recording fewer relevant events (Johnson & Bytheway, 2001; Radcliffe, 2013). For instance, when pilot testing an unstructured/ blank diary, along with a semi-structured diary containing four open-ended questions, my participants explained that without the prompts of the semi-structured diary, they 'would just have written what happened, and not any feelings or why'. They also commented that they 'did think about it more' when completing the semi-structured diary. As a result, I employed a semi-structured diary but with an additional blank space for participants to record any details that did not fit within the four daily questions but that they considered to be relevant and important. In this way, pilot studies are particularly useful when designing qualitative research diaries, as they allow for the consideration of the structure most effective for the particular aims of the research.

As well as considering the most effective and appropriate structure for qualitative diary design, there are also a variety of mediums that can be utilised for diary reporting including traditional paper and pencil diaries, diaries completed electronically and sent via email, audio diaries (e.g. Boyd et al., 2004; Crozier & Cassell, 2015), video diaries (e.g. Gibson, 2008), and the more recent development of smartphone diary apps (e.g. Chong et al., 2014). Paper and pencil diaries are still the most commonly used diary medium, as some authors claim that they are the easiest for participants to use (Bolger et al., 2003). However, as technology capabilities continue to develop at a rapid pace, increasing benefits of more modern diary mediums are being recognised (Green et al., 2006). Such technological advancement, and their potential

implications for qualitative diary research, will be discussed later in this chapter.

When considering the most appropriate and effective diary medium to utilise in a particular research study, in order to further facilitate regular and detailed responses, it might be useful to provide participants with the opportunity to select from a variety of options therefore enabling them to select the approach that is most comfortable and convenient for them personally. For example, the use of a diary format heavily reliant upon technology may be difficult and less than comfortable for participants who are not used to using technology, whereas other participants who utilise technology readily within their daily lives might find diary reporting much easier and more convenient using such mediums. Therefore, where possible, considering providing participants with the option to select from diary mediums such as traditional paper and pen, electronic, audio or even mobile diaries, is likely to enhance commitment to the study and therefore continued detailed recordings over time. Issues surrounding participant commitment will be discussed in more detail in the following section.

Recruiting Participants and Maintaining Commitment to the Study

One of the biggest challenges of using qualitative diaries is recruiting willing participants, and subsequently maintaining the level of participant commitment and dedication required to successfully complete regular diary entries over a prolonged period of time. As such a level of commitment is rarely required in other types of research (Bolger et al., 2003), the challenge of finding participants willing to commit to being involved in such research is one of the first real hurdles that researchers are likely to encounter. Agreement to take part is most likely to occur if personal contact with the researcher, or with others who are already involved in

the research, is already somewhat established (Bolger et al., 2003; Radcliffe, 2013). Snowball sampling can work particularly effectively, as participants who are already taking part in the research can recommend relevant others with whom they will then share their own knowledge of the experience of being involved. This can encourage others based on the positive experiences of current participants engaged with the research, as well as providing them with an opportunity to ask existing participants questions about the process.

This also provides a further rationale for qualitative diaries being utilised as part of research strategy involving other methods, which enable initial face to face contact between the researcher and participants to establish and build rapport. It might be that interviews, for example, can be the initial step in a research process, where participants subsequently have the opportunity to take part in additional research elements, should they be happy to do so. Here researchers have the opportunity to explain the purpose and importance of the research, as well as any potential benefits, directly to the participant, as well as to address any initial concerns that participants might have about taking part. Downplaying the commitments required might be tempting when trying to recruit participants for qualitative diary research; however, it is important to be transparent from the beginning, not only ethically, but also in order to decrease the likelihood of participants dropping out of the research later (Radcliffe, 2013).

Once participants have been recruited, maintaining commitment to the research becomes the next challenge. Without the continued presence of the researcher, it is quite possible that forgetfulness, lapses in participant motivation, as well as external constraints to diary completion, may occur. It is therefore necessary for a high level of commitment to be maintained throughout, and for the research to remain in the minds of participants if they are to complete

the type of substantive daily diary entries required to ensure the effectiveness of qualitative diary research. When diaries are not completed on time this not only slows down the process of data collection and analysis but can also lead to concern that participants resort to completing diaries in retrospect, which can potentially undermine one of the key benefits of using the diary method; the minimisation of effects of retrospection on recall of daily experiences. This is referred to as 'backfilling' (Piasecki et al., 2007), where participants might potentially even resort to recording numerous diary entries on the final completion day, immediately before they are to be returned to the researcher.

As a means of addressing this problem, it is especially important to maintain contact with participants throughout the period of diary completion. Previous research has highlighted that 'personal contact retains participants more so than monetary incentives or dependence upon goodwill towards science' (Bolger et al., 2003, p. 595). It is therefore important to contact participants regularly during diary completion to ensure any concerns are raised by providing further opportunity to ask questions. This helps to ensure that issues are dealt with as they occur as well as preventing loss of data due to misunderstandings or disillusionment with the study. Prior to the commencement of the diary study it can be useful to agree with participants how they would like to be contacted during this period with the hope of avoiding, or at least minimising, the disruption to their daily lives (Radcliffe, 2013). During my own research, I contacted participants via telephone, text or email, depending upon preference, several times during the four-week period to provide the opportunity for further questions and to make sure they were happy to continue.

Another useful strategy is to agree exactly when and how diaries entries should be made. Some modern electronic diaries have signalling features with the ability to

inform participants of when to record an entry, which can be useful where researchers can employ signal-contingent, or even interval-contingent, design into their study. Such technological advancements will be considered in further detail within the following section. However, if participants are being asked to report events as they occur, these signalling features are less likely to be useful. In such 'event-based' studies, it should be considered whether or not it is reasonable to ask participants to report an incident in their diaries immediately after the event has occurred. This can often be unrealistic; therefore, a more realistic approach might be to allow participants to postpone responding until a more opportune moment. A discussion regarding when participants would complete their diaries during an initial interview or meeting, along with encouragement to report events as soon as possible, can help to reduce fabrication due to highly retrospective accounts. For instance, Symon (2004) suggests that a participant regularly completing their diary on the train on the way home from work was free from distractions, therefore producing concise, diary entries that were consistently recorded at the same time each day. It can also be helpful to ask participants to record the date and time of their diary entries, as well as an approximate time of the event to which they are referring, or to note how much time has passed between the event and the recording. This not only gives researchers a clearer picture of the degree of retrospection within the account, but may also encourage participants to make greater efforts to record their experiences as close to the event as possible.

Considering Ethical Issues

From a researcher's perspective, when qualitative diaries fulfil their potential in terms of leading to the exposing and reflection of in-depth personal issues and insights, this is

extremely beneficial in terms of the rich data that can be attained. As previously discussed, there may also be potential benefits for participants in terms of enabling reflection, personal development and change. However, this can also heighten ethical issues with regards to the impact that such in-depth reflection could have on participants, particularly if the topic under discussion is of a personal and sensitive nature. Such issues are further enhanced when the researcher considers conducting follow-up interviews with participants after reading personal disclosures within their diaries.

As previously mentioned, follow-up interviews can often be an important element of the qualitative diary method as they provide vital opportunities to clarify and discuss, in more detail, the issues raised in the diaries, in order to gain a more complete and in-depth understanding. However, bringing emotive issues to the surface can potentially have a negative impact on participants' emotional state (Corbin & Morse, 2003) and, in some cases, where sensitive issues and conflicts arise, it may not be ethical to raise the topic in the follow-up interview. Some authors have chosen not to conduct follow-up interviews because of such issues, deciding instead to only undertake single interviews (e.g. Gatrell, 2009). As qualitative researchers, it is vital that we prioritise the interests of participants above our own desire to collect data and, in accordance with this, ethical guidelines iterate the need for researchers to protect participants from potentially harmful effects of qualitative research interviews (e.g. British Psychological Society, 2010). Subsequent follow-up interviews should be conducted with careful consideration regarding whether it is appropriate to raise issues that could potentially cause harm to participants. The medium through which follow-up interviews are conducted could also be considered here, in terms of those which permit some degree of personal distancing for participants, such as via telephone (Gatrell, 2009; Radcliffe, 2013).

THE FUTURE OF QUALITATIVE DIARY RESEARCH: CONSIDERING NEW TECHNOLOGICAL DEVELOPMENTS

As a result of the increasing application of technology within research projects, debates have begun to emerge in the literature regarding the most effective tools for conducting diary research (Green et al., 2006). Such debate regarding innovation in diary design has also been stimulated by the greater potential to assist in maintaining participant commitment, encouraging continued regular responses. Technology-based mediums for collecting participant responses have been discussed as potentially being more reliable than paper and pencil approaches (e.g. Green et al., 2006; Mehl & Conner, 2012).

Currently, personal digital assistants (PDAs), hand held computers presenting custom-designed questions, are the platform most widely used to collect diary entries electronically. Database software permitting researchers to design diaries using PDA platforms can now be readily purchased (see Mehl & Conner, 2012). However, custom-designed PDA-based diaries are likely to be too cost prohibitive for smaller scale research projects (Piasecki et al., 2007), and more importantly, at present, the use of such programmes has been focused on quantitative diary formats (e.g. Barrett & Feldman Barrett, 2000). Therefore, their feasibility for incorporating open-ended responses required for qualitative diaries currently remains difficult, yet perhaps there is room for adaptation in the future.

Diary data may also be collected via the internet by creating online diaries, providing participants with the relevant web-link and passwords, and asking them to log on to complete their diaries. Such online diaries have the advantage of centralised data collection (Piasecki et al., 2007), meaning that data cannot be lost, or found by others, in the same way as might be possible when using PDAs if they are lost or broken. However, such methods require participants to have access

to a computer that is connected to the internet in order to complete their diary entry, which may be inconvenient (Anhøj & Nielsen, 2004). Greater potential may exist for those online diaries that can be created specifically for use on mobile phones or tablets.

Considering the potential created by the extensive use of smartphones by the public also provides possibilities in terms of 'diary apps' that can be easily accessed by participants as they are 'on the go'. This is an area that as yet remains fairly underutilised, particularly in terms of qualitative diary research, but offers great future potential. One example of such innovations is research by the Digital Brain Switch team who have created 'squeeze diaries' where participants are given a squeeze sensor that can be squeezed for a short duration to trigger an event instance in the related smart phone app (Chong et al., 2014). The instance is then logged (along with relevant cues, such as location and time) on the mobile phone allowing the user to record a qualitative reflection on the recorded instance, at a more convenient time. There are clearly issues of cost and programming here, as well as extra time needed for training participants on how to use these devices. While some may be very familiar with such technology, others could be less comfortable. However, it certainly does offer interesting and fruitful possibilities for innovative diary studies moving forward, which could help to address some of the aforementioned challenges of qualitative diary research.

CONCLUSION

This chapter highlights the numerous benefits of using diaries, particularly qualitative diaries, as part of management and organisations research. It also explores some of the practical considerations required when designing qualitative diary research, including addressing some of the associated challenges. Although the use of the qualitative diary method can entail numerous challenges, it is

argued here that the benefits far outweigh the difficulties and, in this respect, perseverance and determination are advocated due to the rewards that this method affords.

Using qualitative diaries enables the in-depth exploration of everyday situations therefore increasing our understanding of experiences, events and processes from the perspectives of various individuals, permitting within- and between-person analyses of detailed descriptions of experiences. In my own personal experience, using qualitative diaries enabled novel findings due to the substantial amount of detail attained using a non-retrospective, episodic and longitudinal approach, permitting participants to record their own perception of experiences freely and as they happened. Beyond this, the use of qualitative diaries enabled thoughts and emotional experiences to be captured at the time of event occurrence, the details of which could otherwise have been lost or diluted using more retrospective techniques (Symon, 2004). The longitudinal nature of qualitative diaries also offers insights into the impact that both practical and emotional outcomes, experienced at a particular time or on a particular day, can have on subsequent experiences, thoughts, feelings and actions in the future. Such findings can throw new light on important workplace issues, enabling new insights into complex daily experiences and processes. When considering these substantial benefits, in terms of the rich understanding of organisational issues that have the potential to be uncovered using qualitative diaries, it can only be argued that qualitative diaries are extremely useful tools for researchers looking to add new and valuable contributions to the management and organisations field.

Going with the Flow: Shadowing in Organisations

Seonaidh McDonald

INTRODUCTION

In 1997 I undertook my first shadowing in an organisation. I had already been researching the organisation with a team of colleagues for more than a year. Despite the fact that I had already spent many long weeks in the organisation, travelling to all their sites in the UK, interviewing over 100 individuals, observing hours and hours of meetings and taking part in project feedback sessions for middle and senior management, nothing prepared me for the shadowing data. It is well documented that shadowing is a physically and mentally exhausting process (see, for example, Gill et al., 2014; Urban & Quinlan, 2014) and at first I thought it was this, and the richness of the torrent of data that was unleashed that was what made the experience so different. However, as the weeks passed, I began to realise that I was ‘seeing’ the organisation in a new way. That the data I was collecting were somehow different than the data I had collected before. This shed new

light for me on the limitations of other methods and started a process of trying to articulate these subtle and slippery differences to myself and to others.

I began by ransacking the literature. When I couldn’t find what I was looking for to explain my new insights to myself in the research methods literature, I started to look in wider and wider circles, including more and more disciplines. In Education (Earley & Bubb, 2013; Polite et al., 1997; Roan & Rooney, 2006; Wolcott, 1973) and in Nursing studies (Frandsen, 2010; Johansen & Forberg, 2011; Vukic & Keddy, 2002) I found glimpses of similarity with what I had done, but their natural acceptance that shadowing was a legitimate approach and their descriptions of shadowing didn’t help me, beyond reassuring me that shadowing was being conducted elsewhere. This extended review process also helped me to see that what I called shadowing was actually called different things in different literatures and that what other people called shadowing often wasn’t the same as

what I had done at all. I found a raft of studies where, like me, researchers had followed organisational actors around over the course of their working days, but noticed that sometimes their methodological focus was on the co-constructed narratives developed between researcher and organisational actor (see, for example, Dewilde & Creese's (2016) discursive shadowing), and sometimes on the perspective created by the movement itself (see, for example, Evans & Jones' (2011) walking interviews). I found shadowing studies where the focus of the researcher was not on actors at all. Some have taken physical objects as the focus for their shadowing. Bruni (2005), for example, shadows patient records as they move physically through a hospital as well as through the hands of many organisational actors and are subject to, and simultaneously produced by, its organising processes. Other studies shadow less tangible objects, such as organisational policies. Gehman et al.'s (2013) study of how honour codes develop within organisations included 'shadowing the honor code in action' (p. 88) in a department of a large public university as one of their data collection strategies. I began to understand shadowing as a family of following methods, rather than a single data collection technique.

I found that shadowing in organisations had a long and distinguished history in my own discipline, going back to Mintzberg (1973) who collected both qualitative and quantitative data whilst following managers around. The qualitative element of this work had been somewhat forgotten, whilst the quantitative element became structured observation (Mintzberg, 1970). The qualitative work emerges later in the work of Barbara Czarniawska (2007) who took her inspiration from a more European tradition of organisational behaviour research (Sclavi, 2007). Czarniawska's work focuses on the need for new data collection techniques to keep up with the accelerated pace and new forms of organising, and sees shadowing as

part of that arsenal of approaches that are becoming more necessary.

The rise of shadowing may also be due in part to changes in the academy. The twin pressures of reduced research funding and the increased publication rates necessary for both institutions and individuals to survive in the academic marketplace have made some of the traditional techniques of sociology and anthropology less attractive. There is neither the time (in terms of either diaries or careers) nor the funding available for researchers to undertake long-term, open-ended ethnographic study of organisations (Cooren et al., 2008; Couldry, 2003; Kostera 2007). Shadowing supplies a way of evidencing some of the research questions associated with an ethnographic view of the organisation in a more focused, faster paced way and this may be one reason for interest in these approaches growing in recent years.

When I started gathering literature on shadowing as a research method and reviewing studies that had used shadowing approaches, I thought that it was an uncommon technique. Through my reading and through the community of shadowers I have come to know over the intervening years, I realise that I was quite wrong. There is evidence of shadowing approaches to data collection across the social sciences. However, perhaps because the precise nature of the difference between these approaches and their better known sister techniques is so hard to articulate, what *is* lacking is a literature to explain them in detail and examine them critically (Bartkowiak-Theron & Sappey, 2012; Quinlan, 2008). What follows then is not a description of how to shadow (see Czarniawska, 2007 instead) or a catalogue of the different types of shadowing, and their purposes (McDonald, 2005; Meunier & Vásquez, 2008). In this chapter I will set out some of the methodological and epistemological characteristics of shadowing and the extent to which these are shared by and distinct from other qualitative data

collection techniques. I do this with the aim of demonstrating ways in which shadowing approaches can contribute to both specific debates within, and the general development of, organisation studies.

The data gathered by shadowing techniques are in many ways very similar to those that can be surfaced through other qualitative research methods in terms of the physical form they take, the data streams they access and the methods that can be used to analyse them. For an example of shadowing data and a discussion of how they differ in form from data gathered by other common data collection techniques, see McDonald and Simpson (2014). Shadowing data contain observational data about the setting and norms within an organisation, in much the same way that an observation study would. They include the opinions and beliefs of the individuals within the organisation, just as a study based on a series of interviews would. They also incorporate a stream of researcher reactions to the unfolding organisational action that would be easily recognised by any participant observer. However, in shadowing, these data streams are both distinct and concurrent. As these data are elicited all at once, they have different (inter)relationships to each other than the same data elicited through three separate studies would have. At the very least, shadowing records two points of view that are simultaneously moving through organisational time and space. Bartkowiak-Theron and Sappey (2012) suggest that shadowing is in itself a multiple method. This is an interesting proposition with implications for various forms of triangulation.

These similarities with other data collection techniques and the data they produce can make it hard to conceptualise the subtle differences and therefore articulate the unique contribution that shadowing approaches can make. In the sections that follow I will focus discussion on some of the salient characteristics of shadowing in order to form a picture of how shadowing approaches and shadowing

data are similar to, but also how they are different from, other research methods. In particular I will consider:

- voice and perspective;
- relationship with the research context and the organisational actor;
- movement and real time; and
- interruption of organisation.

I will both draw on organisational theories and suggest ways in which different kinds of organisational inquiry can be facilitated through shadowing approaches.

I will conclude that shadowing approaches are not entirely distinct from other techniques used to collect data in organisations. They share a range of characteristics at the level of practice, methodology and epistemology with other qualitative organisational research methods. However, what makes shadowing approaches different is the unique way in which those characteristics are combined. These fresh combinations of methodological attributes allow an active, explicit, reflexive and dynamic co-production of situated organisational knowledge by the shadower and the organisational actor she follows.

VOICE AND PERSPECTIVE: A THEORY OF NARRATOLOGY

One of the aspects of the data gathered through shadowing that feels different from other qualitative approaches is the relationship between the voice of the researcher and the voice of the organisational actor. If shadowing is essentially two points of view simultaneously moving through organisational time and space, then this has implications for the story that is (and can/not be) told and raises the question of how, and by whom, that story is being narrated. In the study of literature, Genette (1983) offers a theory of narratology which can be used to examine

the relationship between the narrator and the plot. Genette (1983) theorises that each narrative position is underpinned by a different combination of two fundamental elements of the text: perspective and voice.

Narrative perspective mediates the relationship between the narrator and the story they tell. In other words, it tells us what the narrator can see and, thus, in what relation they stand to the story. Some narrators will be able to offer their audience an internal analysis of the events in the story as they unfold, whilst others, having a different narrative perspective, will present an external analysis of events. *Narrative voice* on the other hand is concerned not with ‘who sees’ but rather with ‘who says’ (Genette, 1983). Voice is about the relationship between the narrator and the narrative act itself. It is concerned with whether or not the narrator is a character in the story that they are telling (see Table 13.1).

In her work on the role of the researcher, Hatch (1996) uses this notion to examine the researcher’s position in relation to his or her research work. In this way, she frames ‘research as narrative performance’ (Hatch, 1996, p. 361) and identifies four different possible relationships between the researcher and what they are studying. Shifting these insights to the domain of methodology, it is possible to see that different qualitative data collection techniques offer researchers different combinations of ‘who sees’ (perspective) and ‘who says’ (voice).

When the results of an interview study are reported, the reader is often (implicitly) offered to share the assumption that the researcher has ‘seen’ the organisational

stories that are presented unfold. In fact, the researcher is reporting to the reader what has been reported to them by the organisational actor (McDonald & Simpson, 2014; Potter & Hepburn, 2005) and there is no direct relationship between the researcher and the organisational action. In narrative perspective terms, it is the interviewee, and not the interviewer who ‘sees’ the organisation. By the same token, although the researcher reports, edits and organises the data for the reader, the decision about which data are relevant to the study and how they are reported in the first place also belongs to the interviewee. Ultimately then it is the interviewee’s ‘voice’ that is represented in the final account. Although the researcher is an instigator and recorder of these organisational narratives, they are held at one remove from the organisation itself. At the other end of the spectrum, within an observation study, the researcher ‘sees’ the organisation first hand for themselves and exercises a lot more control over the data, owning both perspective and voice, albeit a voice based only on an external view of the organisational action without access to organisational narratives. Within a participant observation study there are two forms of both perspective and voice present: *researcher as organisational actor* has access to both organisational action and organisational narrative from an internal stance; and *researcher as researcher* has access to both from an external position relative to the organisation. Both voices and perspectives, however, belong to the researcher. Shadowing brings a fourth combination to these three traditional positions that researchers can take in

Table 13.1 Genette’s (1983) theory of narratology applied to data collection methods

Data collection method	Narrative elements	
	Perspective: <i>Who sees</i>	Voice: <i>Who says</i>
Interviews	Organisational actor	Organisational actor
Shadowing	Both	Both
Participant observation	Organisational actor as researcher	Organisational actor as researcher
Observation	Researcher	Researcher

relation to the organisation they study. Here the researcher ‘sees’ the organisational action from an external perspective at the same time as the organisational actor ‘sees’ it from an internal one. Done well, there are also two separate voices recorded in the data and subsequent reports of the study: the voice of the researcher and the voice of the organisational actor offering concurrent but distinct narratives of the organisational action they are part of. This description of narrative perspective and narrative voice is of course exaggerated here in order to draw these distinctions. All research accounts are to some extent co-constructed and don’t exist independently of the researcher-organisational actor relationship (Gill, 2011). The point here is that shadowing techniques allow the researcher to have a different relationship with both the organisational narratives and the organisational action, leading to different data and different insights (Shotter, 2006). They are neither better nor worse; they are simply different.

RELATIONSHIP WITH THE RESEARCH CONTEXT AND THE ORGANISATIONAL ACTOR

As shadowing within an organisation sets up a different relationship with that organisation than other research approaches, it is useful to work through some of the implications that this will have for the researcher and for their data. One important difference is that the shadower remains an outsider to the organisation as an interviewer would, and yet can see the organisational action directly, first hand. This

significantly reduces the distance between the researcher and the organisation and therefore increases the data about the physical and social contexts that the researcher is able to record about any given action. This would also be the case for an observer, of course, but they do not have the benefit of access to organisational narratives, as the interviewer does. Neither do they have the chance to both access respondents’ organisational narratives and develop one of their own, as the shadower does, reducing distance between organisation and researcher in another way whilst retaining ‘outsider status’. See Table 13.2 for a summary of relationships a researcher may have with organisational actions and narratives.

Goffman’s (1967) discussion of social performance and his distinction between front stage and back stage is useful here. An interview is very much conducted within the ‘front stage’ of an organisation where the interviewee performs the organisational narratives for the benefit of the researcher, who forms the audience for the performance. The shadower is of course also the audience of a performance, but here they are allowed access to a wider range of organisational spaces, some of which may include the ‘back stage’ areas, allowing glimpses behind the scenes (Monahan & Fisher, 2010). The performance is also materially different because it is (or certainly becomes) less rehearsed and instead it is improvised in the moment. Another performance is happening in shadowing of course: the researcher’s performance. As the shadowing goes on, the researcher’s performance also becomes less practised and formal and the person being shadowed finds themselves seeing elements

Table 13.2 Relationships between researcher and organisation

<i>Relationship</i>	<i>Organisational action</i>	<i>Organisational narrative</i>
Insider role	Participant observation	Participant observation
Outsider role	Observation, shadowing	Interview, shadowing
No direct relationship	Interview	Observation

of the researcher's back stage too: the motivation and mechanics of the research act are partially revealed and discussed, each actor becoming part of the other's performance.

In the previous section it was demonstrated that shadowing sets up a different relationship between the researcher and the organisational narrative. This will also have implications for the data collected through shadowing. To use a lens from organisational theory, the interviewer and shadower both have access to what Argyris and Schon (1996) call 'espoused theory' or what people say does (or should) happen in their organisation, but shadowing also has access to 'theory in practice' or what actually happens. In this way, shadowing research can move research participants beyond discussions of the general or ideal ways of doing things, to sensemaking around the specific and concrete episodes they witness and or take part in together.

Taken together, these relationships between the shadower and the organisation and the shadower and the organisational actor underline the extent to which researcher and researched are engaged in the co-production of knowledge about the organisation. This is true in every research study (even in post-positivistic studies where it can be read as problematic), but the balance between the researcher and the researched in both the production and sensemaking of the data is perhaps unique in a shadowing study. This allows for a different view of an organisation which is well placed to inform questions about organisational practices (e.g. Gehman et al., 2013), processes (e.g. Blake & Stalberg, 2009), roles (e.g. Gilliat-Ray, 2011) and interactions (e.g. Fenton et al., 1997) in a detailed and specific way.

These different relationships between researcher, context and organisational actor also permit the articulation of the mundane, every day, unsaid, unsayable and taken for granted which can be accessed through the combination of trust and insight built up in both directions between the researcher and the researched. This gives organisational research

access to new possibilities for research questions that would be harder to answer through other research relationships as a number of researchers have demonstrated.

In their introduction to their special issue on invisible work, Nardi and Engeström (1999) describe different kinds of work in contemporary organisations that have become invisible. These include work that is done behind the scenes which is un(der)valued because it is done out of sight, leading to assumptions that it is very straightforward, unimportant or not done at all. The special issue also discusses work that is informal in nature, defying quantification. This kind of work, such as snatched conversations in corridors, jokes told between team members, regular lunch meetings without specific agendas and organisational stories recounted to new recruits have a real and profound effect on organising processes, but they do not appear on any job descriptions or strategic plans. This makes them both hard to manage and vulnerable to being weakened or lost when visible tasks are reallocated, personnel change or restructuring takes place. In her piece from this special issue, Westerberg (1999) elects to shadow organisational actors in order to understand some of the invisible nature of their work because 'From different meetings, interviews and written comments in the questionnaire we had a description of what the managers *thought* and how they *felt* about their work but we didn't know what they actually were *doing*' (p. 99). By taking this approach, Westerberg is able to demonstrate that although some kinds of managerial decision rely on the formal hierarchy of the organisation, others are made through information gathering and opinion seeking through an informal, experience (rather than position) based social network approach that enhances, and enables the official decision-making process.

In another study, also set in a healthcare context, Quinlan (2008) uses shadowing as a data collection technique to operationalise her institutional ethnography approach.

She uses shadowing to ‘step into’ the world of the Nurse Practitioner and allow her as a researcher to see the organisation through the standpoint of that specific role. Through this work, Quinlan (2008) was able to take what the Nurse Practitioner actually did as a starting point for their exchanges, building up her sensemaking of that role from the actions she observed, rather than from any preconceived idea of what the Nurse Practitioner should do, or from an official job description. They were able to set up a relationship that was ‘not encumbered by the established protocols governing the relationships between researcher and researched used in traditional sociological research methods ... [and that they] ... were relatively free to craft ... [their] own terms of interaction’ (p. 1489). By developing a purposeful combination of closeness and distance with the organisational actors she followed, Quinlan found examples of how actors can significantly facilitate important organisational processes that on paper have nothing to do with their job titles or responsibilities (Quinlan, 2008). Seeing the organisation in this way can lead to powerful and meaningful suggestions for change or improvement because they are informed by an understanding of what people actually do and what it is like to do that. This aspect of the shadowing process makes it particularly helpful for institutional ethnographers and action researchers (see e.g. Sclavi, 2014) who want to see the organisation from the inside out and seek improvements that serve the people directly involved in the ‘doing’ of that organisation.

Shadowing can also provide evidence of political work done within or between departments, or work that is undertaken in order to make a badly designed organisational process work despite the official procedures. Van Hulst and his team (van Hulst et al., 2012) were interested in producing research which focused on individuals operating in extremely complex environments where ‘what seems to be needed are creative ways to mediate and at times redesign the multidimensional

interface between (groups of) people, (formal and informal) policies and (sub)-systems’ (p. 436). They were looking at policy from the perspective, not of what had been decided by important stakeholders, but rather in terms of how these decisions could (or could not be) and were (and were not) implemented through the practices of key individuals. Their shadowing approach helped them to draw detailed accounts of the ways in which people making a difference to disadvantaged neighbourhoods went about solving real problems. These practices involved rule breaking, trust building, improvisation and boundary spanning practices that would have been difficult to ‘witness’ using other techniques.

Shadowing can also show how individuals in an organisation, whilst appearing to work within the rules, block the work or progression of others or how organisational resistance being employed can lead to innovative, negotiated ways of organising (Waddell & Sohal, 1998). Work of this kind is not so much invisible as deliberately hidden. Without knowledge of the hidden organisation, scholars cannot see the full picture of organisational practices and potentially produce less robust and authentic accounts of organising to underpin their theorising of, and interventions in, organising. The kinds of relationships that shadowing brings to the nexus of context, actors and practices are particularly well placed to articulate the invisible in an organisation, whether the invisibility is due to the fact that the work is mundane, informal, undervalued, rule breaking or hidden.

MOVEMENT AND REAL TIME

One of the distinguishing factors of shadowing techniques is that it is infused with movement. The movement is not controlled by the researcher, but by the person, or in some cases the policy (Gehman, et al., 2013) or object (Bruni, 2005) that they are shadowing. This raises a number of practical issues for the pair.

The question of access of the researcher to the organisational actor and to the organisation becomes something that cannot be negotiated in a one-off way at the outset of the research. This is partly because it cannot be entirely predicted in advance. Instead it must be continually negotiated between researcher and organisational actor. If a customer turns up unexpectedly to discuss the pricing of a prototype, it might raise questions of commercial confidentiality that had not been anticipated and must be resolved in the moment. There is a range of situations which a shadower might come across where her presence might feel uncomfortable for the shadower and/or the organisational actor and/or their organisational colleagues. These situations often have an informal or personal element and are usually not foreseen when the initial access negotiation takes place between shadower and organisation and/or organisational actor. To illustrate this point using situations from my own shadowing work, consider what the shadower should do and how she might feel whilst the director of production: calls her husband; arranges a meeting to discipline an underperforming colleague; comforts a distressed friend from another department who has been wrongly blamed for missing a deadline; uses the shadower's presence to ensure that a colleague doesn't bring up an issue in a performance meeting as part of a long-held rivalry; stays late into the night to buy her team beer and take away pizza, and work with them to meet an important deadline; pretends to meet a client and instead goes to the dentist in the middle of the day. All of these things are part of her day and help the researcher understand her role within the organisational space, but none of them are things to which most of us wish to bear witness. The level of relevance the researcher will see in shadowing a specific event may well be influenced by their own academic discipline. An ethnographer, for example, might view all of these episodes (and her own feelings about them) as legitimate data, whilst an occupational psychologist might see some of them as less pertinent

to their study. Sometimes the organisational actor will wish to rescind access to a specific event or episode and sometimes the shadower will wish to withdraw. When they are in agreement about this it is straightforward, but where there are differing opinions about what it is appropriate to shadow then this can become socially difficult.

Although a researcher may theoretically distinguish between shadowing an individual and shadowing an individual as a single locus within a network, in practice the difference is artificial. Shadowing work will inevitably extend its gaze far beyond the opinions and actions of a single person, taking in a wide range of organisational actors with which the individual being shadowed has interactions, no matter how trivial. In effect, the shadower captures the practices of the organisational actor, their team, their boss, their friendship groups, the people who make the rules about where they can park and the people who serve their lunch. The organisational actor is the lens through which the organisational context and practices are viewed by the researcher, rather than the locus or even focus of the research.

The lack of control the researcher has over where, and with whom, the research will be conducted and the fact that access is continuously negotiated and renegotiated, also has important ethical implications. Most qualitative researchers have approaches which include repertoires of informed consent. Like organisational access, informed consent is something that is established at the outset of the project for a whole department or organisation, for an observation study for example, and/or at the beginning of the relationship with individual organisational actors, in the case of an interview study. In a shadowing study, consent can be granted on behalf of the organisation as a whole by senior management and informed consent can be deliberated by the person(s) being shadowed in a thorough and appropriate manner. However, the range of people that are met momentarily through the shadowing process, included in the research

account and gone again before they have the chance to wonder who that person following their colleague was, reaches throughout the organisation as well as across its boundaries. Some participants, such as a client at the other end of a telephone call, might be wholly unaware that they are being included in research at all. This presents a series of ethical dilemmas for shadowers who have promised their university Ethics Committees something that they are unlikely to be able to deliver in practice: informed consent from all research participants. See Johnson (2014) for an excellent discussion of this issue.

Shadowing techniques focus on lived experience, like many other qualitative approaches, but they are interested in understanding them in the now. Unlike interviewing approaches which focus on actors' narratives about what has happened, these accounts focus on what is happening. Although shadowing techniques record much data (what is being said, where the organisational actor goes, who they speak with, how they approach issues, which issues consume their day) as it unfolds, not all shadowing data are situated in the present. The shadowing techniques that include eliciting a running commentary from organisational actors (see, for example, Bartkowiak-Theron & Sappey, 2012) or one to one interview debriefs at the end of each day (see, for example, Bruni et al., 2005), will often find that explanations for some observed actions, opinions or reactions will include data set in the recent or even remote past as well as hopes, fears and plans for the future. As well as current actions being set within the immediate, physical organisational context, then, they are often framed in the context of past and future organisational narratives (Schultz & Hernes, 2013).

This movement through the organisation and the fact that a significant proportion of the data are situated in the unfolding present is what makes shadowing techniques so physically and mentally demanding. The researcher is not only creating a contemporaneous record of speech and actions, and doing this whilst they are moving through organisational spaces

at the speed of a sophisticated organisational actor, but they are simultaneously engaged in the preliminary data analysis required to construct a series of questions for the person with whom they are running to catch up.

Although both the movement through the organisation and the contemporaneous nature of the data collection present practical, methodological and ethical challenges to the researcher, they do allow for the generation of data which can answer a useful set of research questions related to organisational time and space. Researchers have used shadowing approaches to examine how organisational actors apportion their time to different kinds of tasks. Earley and Bubb (2013) were able to develop a detailed understanding of how and why new headteachers divided their time between competing managerial, administrative and leadership tasks. In a similar vein, Vie (2010) was able to answer questions about how the work of middle managers is changing. Czarniawska (2004) advocates shadowing techniques as necessary to take the examination of organisational time further (Evans et al., 2004). Her shadowing data raise questions about how time is experienced and recounted within organisation narratives (Hernes et al., 2013). Equally, work which regards organisational spaces as active in framing organisational processes (Yanow, 1998) will benefit from shadowing techniques that can critically examine the relationships between organisational actors and the spaces they inhabit (Evans & Jones, 2011; Taylor & Spicer, 2007).

INTERRUPTION OF ORGANISATION

One of the most powerful features of shadowing is that it captures actions and perceptions of these actions not just in context, but in the moment that they take place. In other words, this is researching at the pace of organising (Czarniawska, 2007) and in the moment of organising. As well as providing access to a

less rehearsed performance from organisational actors, this has the added benefit of not interrupting the organising it is seeking to research to the same extent. Having argued that both the organising and, to an extent, the researching become co-produced in a shadowing study, it would be disingenuous to suggest that shadowing does not influence the organising practices it studies. Shadowing would interrupt the organisational action to a greater extent than an observation study would, for example. However, it creates much less interruption to organising than any of the interviewing techniques used in organisational research. Most interviewing techniques take place outside of organising, in prearranged meetings which are scheduled in such a way as to invite the interruption and/or suspension of organising for the duration of the interview. This is a useful approach in that it helps separate the narrative being offered to the researcher from the organising itself, making it much easier for the interviewee to package and the interviewer to manage. However, the very characteristics that make it more straightforward make it less immediate and potentially, because the researcher has access to a performed rather than lived experience, less (or perhaps just differently) authentic (Peterson, 2005). Shadowing then has the ability to research organising without asking actors to stop organising. As such, it has much to offer scholars engaged in researching organisational presence (Cooren et al., 2008).

As shadowing is less apt to interrupt organising, and perhaps in part also because of the sheer volume of the data flow(s), the data themselves tend to be less directed by the interests and intellectual agenda of the researcher than data in an observation study would be and, at the same time, less packaged by the organisational actor than the data from an interview study might be. This can give the impression that shadowing data are more 'grounded' than those gathered by other qualitative approaches. However, paradoxically, whilst the data themselves may

flow relatively freely from actual organisational practices, only a fraction of what is experienced can ever be recorded and even then the huge quantities of data that are captured by the researcher must be drastically reduced in size through analytic and interpretative processes in order for them to be presented through academic vehicles such as books and journal articles. It may be that this heavy editorial, analytical, sensemaking hand in fact adds more rather than less researcher interpretation to the shadowing accounts than would be necessary for other studies. In other words, the shadower should not be regarded as a neutral vehicle through which organisational data are collected, neither should the influence of the researcher be regarded as stopping when she leaves the field. It is important to consider within such discussions of researcher influence that our discomfort with researcher influence stems from a positivistic ideal that the observed and the observer should or could be separate. Instead, researcher influence should be both illuminated and celebrated (Monahan & Fisher, 2010) within qualitative research traditions.

CONCLUSION

In summary, researchers have been shadowing practitioners in organisations since organisational research began (Walker et al., 1956). Since the mid-2000s, more scholars have been writing about shadowing approaches, and crucially, discussing and comparing them critically. This work has enriched and expanded our repertoires as qualitative researchers. Shadowing organisational actors gathers data in the tradition of (and in turn is part of) the enacted organisation and, as such, it can inform a wide range of organisational research approaches which regard both knowing and doing as mediated, situated, provisional, pragmatic and contested (Blackler, 1995). It has an important

Table 13.3 Shadowing compared to other qualitative research methods

<i>Research method</i>	<i>Voice</i>	<i>Movement captured</i>	<i>Distance from organizing</i>	<i>Research relationship</i>	<i>Production of knowledge</i>	<i>Time perspective</i>	<i>Control over data collected</i>	<i>Setting</i>
Interviews	Actor	Time	Medium	Actor	Facilitated by researcher	Retrospective (possibility of prospective)	Shared	Outside normal work context
Shadowing	Actor and researcher	Continuous across time & space	Low	Actor in context	Co-production (actor and researcher)	Now (possibility of retrospective and prospective)	Actor	Within natural flow of organising
Participant observation	Researcher (actors reported)	Time & space	Low	Researcher in context	Researcher (active)	Now (possibility of retrospective and prospective)	Researcher	Within natural flow of organising
Observation	Researcher	Time & space	High	Context	Researcher (passive)	Now	Researcher	Outside natural flow of organising
Focus groups	Multiple actors	Time	Medium	Actors with each other	Co-production by actors	Retrospective (possibility of prospective)	Multiple actors	Outside normal work context

role to play in the development of the many strands of organisational research which pursue these views of organising. It also has much to add to the accumulating interests in how actors move through organisational space over time that Costas (2013) characterises as the gathering momentum of a 'mobilities turn' in organisational research. More application of shadowing approaches and more critical debate will be needed for their full potential as research instruments to be realised in organisational research.

Shadowing is essentially interviewing and observing at the same time, but it is much more than the sum of its parts. In this chapter I have argued that shadowing fosters a dual narrative of the organisation borne of two perspectives and two voices; it offers the researcher different relationships to the research context and to the organisational actor than other qualitative approaches; it takes account of movement through the organisation and allows the researcher to operate in real time; and it takes place within the flow of organising. Perhaps most important of all, it raises the possibility of two-way reflexivity for both the researcher and the organisational actor, adding a naturally hermeneutic layer to qualitative inquiry (Bartkowiak-Theron & Sappey, 2012).

In Table 13.3 I offer a visual summary of the arguments presented within this chapter, which serves a dual purpose. First, it sets out a simplified version of the arguments that have been made about the similarities and differences to other research methods throughout this chapter. However, it also provides a visual reminder that although shadowing may not be completely unique in terms of any single aspect of research design, it represents a different combination of research strengths and weaknesses to other qualitative research methods. It is this unique *combination* of methodological characteristics that makes shadowing such a distinct and powerful tool for unlocking a particular set of research questions. By side stepping the methodological, and to some extent

epistemological, sleight of hand of reporting 'what people do' on the basis of asking them what they do and conflating reported actions for actual practices, shadowing offers something quite simple. It supplies different (not better, just different) answers to the question: what do people do all day? These answers are co-produced, changing and novel forms of knowledge of organising borne of a different kind of relationship between researched and researcher that moves through organisational time and space. Moreover, the answers to this question turn out to be powerful in finding new ways to understand.

Thematic Analysis in Organisational Research

Nigel King and Joanna Brooks

INTRODUCTION

Thematic analysis is ever-present in qualitative organisational research – it appears in methods textbooks, in empirical articles across the breadth of the discipline, and is taught to business, management and organisational studies students at all levels. Despite this, there remains a good deal of inconsistency and confusion around the topic. As experienced qualitative researchers, we are frequently asked questions such as:

Is it a methodology or a method?
How can we make sense of the differences between various approaches to thematic analysis?
Is there a particular philosophical position that underpins thematic analysis?
How do we know – and demonstrate – that we've done it well?

We are not so naïve as to believe that in this chapter we can come up with definitive answers to these and other questions that will be acceptable to all. We will, though, present

our view of how the nature of thematic analysis in qualitative organisational research is best understood, arguing for the distinction between methodology-specific and generic approaches, with the latter being our principal focus. We will emphasise the importance of considering one's particular philosophical position when using thematic analysis and critically compare a number of commonly used approaches. In our conclusion, we will examine some of the main critical arguments raised in relation to thematic analysis, and consider the overall strengths and weaknesses of the method.

THEMATIC ANALYSIS: DEFINITIONS, DISTINCTIONS AND KEY ISSUES

What is Thematic Analysis?

For us, the term 'thematic analysis' refers to forms of qualitative data analysis that principally focus on identifying, organising and

interpreting themes in textual data. We refer to ‘forms’ in the plural because we argue that it is not a single method but a broad approach which encompasses many different styles. This of course begs the question as to what is meant by ‘themes’. Following King and Horrocks (2010), we define themes as ‘recurrent and distinctive features of participants’ accounts, characterising particular perceptions and/or experiences, which the researcher sees as relevant to the research question’ (p. 150). To unpack this definition further, the first element is that a theme is intrinsically recurrent – something distinctive and characteristic in a particular research text (such as an interview transcript). A one-off comment could not constitute a theme, but we have no problem in principle in identifying a theme that is unique to a single case – in other words, themes do not necessarily have to be identified across cases. The final part of the definition emphasises that themes do not exist independently from the researcher carrying out the analysis. They are not like a fossil hidden in a rock, waiting for someone to come along and break it open to discover them. While there are different philosophical positions on how themes relate to the actual experiences of research participants (which we discuss further shortly), we maintain that even in the mostly strongly realist approaches they cannot be considered as objective entities.

Literature on thematic analysis commonly refers to ‘codes’ and ‘coding’ as well as themes. We take ‘code’ to refer to short comments or abbreviations linked to passages of text to indicate material of relevance to the research aims. Such codes may be developed as analysis proceeds into themes. Coding is therefore the process of indexing text with codes and in due course themes. There is some variation between approaches and disciplines in exactly how these terms are used, so it is important to consider how a particular writer is employing them.

Why Choose Thematic Analysis?

Thematic analysis is often considered the ‘basic’ method for identifying and analysing patterns in qualitative data (Braun & Clarke, 2013), and as we have noted, is very widely used in qualitative data analysis. Qualitative research often produces large amounts of detailed data: all approaches to thematic analysis seek to identify, make sense of and highlight the key themes in a rich qualitative data set so that important features of the research phenomena can be communicated to and understood by a wider audience. Part of the appeal of thematic approaches to qualitative data analysis lies in their potentially broad application. Thematic analysis methods can be applied to very different qualitative data sets: from first person accounts such as in traditional research interviews, through larger group interviews perhaps obtained in a focus group settings, through to secondary data sources such as media resources. Thematic analysis approaches can be used with data sets of varying sizes, and can be applied to a wide range of research interests and topics. Depending on the particular form of thematic analysis chosen, it can be used from a number of theoretical perspectives, and so applied to usefully answer a wide range of research questions. We will turn now to consider the different approaches within the thematic analysis tradition, and to highlight key considerations that should be taken into account when choosing a particular thematic analysis approach.

Styles of Thematic Analysis

There are many different ways in which thematic analysis can and has been carried out, which makes it difficult for an inexperienced qualitative organisational researcher to choose which to adopt. The tendency we suspect is for researchers to opt for the

version that is most familiar to them, and/or most commonly used in their own area of activity, which may not always be the one that is best suited to the needs of a particular study. While we are not going to propose a full typology here, we will highlight key features that researchers should consider when making a choice of thematic analysis method.

A key distinction is between *methodology-specific* and *generic* forms of thematic analysis. In the former case, one or more types of thematic analysis are used as an integral part of a wider methodology. For instance, Interpretative Phenomenological Analysis (IPA) uses a type that moves from a detailed within-case to a cross-case thematic analysis (Smith et al., 2009). Grounded Theory incorporates several forms of thematic analysis, including open coding and axial coding (Corbin & Strauss, 2008). The crucial point about these is that the researcher cannot simply use the mechanics of the thematic analysis method without adhering to the wider requirements – both philosophical and methodological – of the methodology. One cannot with any credibility decide, after a study has been designed and data collected, to analyse the data using IPA or Grounded Theory.

Generic forms of thematic analysis are, as the name suggests, not tied to any one philosophical, theoretical and/or methodological position. We tend to refer to the various versions of generic thematic analysis as ‘styles’, rather than treating them as distinct types. This is because there are significant overlaps between them and we would expect researchers to adapt and sometimes blend them to meet the requirements of their study. For the rest of this chapter our main focus will be on generic forms. We will focus on some of the more widely used styles in organisational research – Template Analysis (King & Brooks, 2016); Braun and Clarke’s (2006) version of thematic analysis; Matrix Analysis (Nadin & Cassell, 2004) and Framework Analysis (Ritchie & Spencer, 1994). But before turning to particular styles, we should first highlight an issue of particular relevance

to those using a generic style of thematic analysis. Such approaches are often more flexible and adaptable than methodology-specific forms because they are not bound by particular theoretical or philosophical commitments. However, this does not render such commitments irrelevant or inconsequential. As such approaches are not tied to a particular philosophical or theoretical position, this creates the necessity for the researcher to work out their own position and ensure that analysis is carried out in a manner that is coherent with it. The risk is that researchers may fail to do this and go through the mechanics of the method without any consideration of the position that underpins it. In the following section, we will highlight some useful ways that researchers using generic forms of thematic analysis can think about and describe the position of their work.

Philosophical Underpinnings of Generic Thematic Analysis

Since generic styles of thematic analysis do not come with an inherent philosophical foundation, it is essential for any researcher to consider the philosophical assumptions that underpin their work. In particular, they need to consider their assumptions about *ontology* – the nature of the reality they are investigating – and *epistemology* – what it is possible to know about that reality. With reference to the Template Analysis style of thematic analysis, we have found it useful to classify positions according to whether they adopt a realist or relativist ontology, and a realist or constructivist epistemology (King & Brooks, 2017). We feel this can helpfully apply to generic thematic analysis more widely. Any typology of positions inevitably presents clear boundaries where in fact there is blurring and overlap; with that warning in mind, we suggest four broad categories of philosophical position: qualitative neo-positivist, limited realist, contextualist and radical constructionist. In Table 14.1 we summarise the ontological and

Table 14.1 Different philosophical positions for research and their implications for the use of generic styles of thematic analysis

<i>Philosophical position</i>	<i>Ontology</i>	<i>Epistemology</i>	<i>Implications for use of generic thematic analysis</i>
Neo-positivism	Realist	Realist	Seeks to build or test theory, minimising impact of researcher subjectivity Use of independent coders to verify accuracy of themes May use strong, theory-linked a priori themes
Limited realism	Realist	Constructivist/relativist	Seeks to develop an account that is credible and potentially transferable, while recognising conclusions will always be tentative Often uses a priori themes informed by theory or evaluation criteria Quality checks to stimulate critical thinking, specific to needs of particular study Reflexivity in analysis important, to go beyond researcher subjectivity
Contextualism	Relativist (or indeterminate)	Constructivist/relativist	Seeks to understand participants' meaning-making within the specific research context Focus on induction and emergent themes; highly tentative use of a priori themes (if at all) Reflexivity: researcher subjectivity integral to whole process
Radical constructionism	Relativist	Strongly relativist	Seeks to critically examine how the phenomena of organisational life are constructed, including how organisational research itself constructs knowledge Scepticism about any quality criteria in analysis Focus on themes as aspects of discursive construction rather than of direct experience

Source: adapted from King & Brooks, 2017

epistemological stance of each of these and highlight key issues which need to be considered in utilising a generic form of thematic analysis from each position.

Assuring Quality in Thematic Analysis

There is an extensive literature on quality in qualitative research, much of it focusing strongly on analysis (e.g. Symon & Cassell, 2012; Tracy, 2010; Yardley, 2008). It is beyond the scope of the present chapter to review this literature in detail. However, we will provide some brief thoughts on the relationship between quality assurance and philosophical position, before moving on to highlight some of the main quality procedures used in various forms of thematic analysis.

The diversity of philosophical positions underpinning qualitative organisational research inevitably means there can be no universal prescriptions for quality assurance. We agree with previous authors such as Johnson, Buehring, Cassell and Symon (2006) that the approach to quality needs to be contingent upon the philosophical roots of a study. For example, with reference to Table 14.1, while a case can be made for calculating statistical inter-coder agreement in a neo-positivist study, with a strong realist ontology *and* epistemology, it would make no sense at all in radical constructionist study. The starting point for any decisions about quality assurance in thematic analysis must therefore be a consideration of the implications of the study's ontological and epistemological stance.

There are numerous strategies used to ensure the quality of thematic analysis, most of which can be adapted for most philosophical positions. We will briefly discuss three of them here; *inter-coder comparison* (in various forms), *respondent feedback* and *audit trails*. Starting with the first of these, researchers who use inter-coder comparisons do so with the involvement of different types of coder and at different stages in the

analysis. Independent coding may be carried out between members of the research team, and/or with people outside the team who may be experts in the topic, the methodology, or both. It may take place at a very early stage to see what preliminary codes and potential themes both parties identify. Alternatively, it may be conducted once a first version of a coding framework has been developed, to test it out. In realist approaches, such comparisons will be seen as addressing the accuracy of coding to themes and/or clarity of their definitions. In contrast, relativist approaches will normally see inter-coder comparisons as a way to stimulate fresh perspectives on the data and to support the researcher(s)' reflexivity.

Participant feedback refers to any attempt to involve some or all of a study's participants in the analysis process. This can involve anything from 'blind' checking of a sample of coding up to highly participatory approaches where participants are truly co-researchers. We prefer this term to 'member checking' as that sounds too limited in scope or 'respondent validation' which implies that participants can objectively certify whether a researcher's interpretation is 'correct'. This latter kind of claim only makes sense from a qualitative neo-positivist position (see Table 14.1), and even here researchers need to be aware that the idea of validation is a complex one. The participant's view of their experience is of necessity not the same as the external gaze of the researcher, however empathetic. Also, participants may be influenced by the desire to please the researcher, or alternately be unwilling to 'admit' to the validity of interpretations that they find unflattering. In most qualitative analysis, therefore, respondent feedback is seen as an additional source of information which enriches the analysis but is itself subject to critical reflection as much as the original data.

As well as ensuring that participant feedback is used in a manner congruent with a study's overall assumptions, it is vital to consider the ethical implications of its use.

In some circumstances, it may be seen as ethically very positive, as a means of acknowledging participants as more than just a source of data. However, it may sometimes be ethically problematic – for instance, where it may require participants to re-visit difficult or painful experiences.

An audit trail is a record of how the analysis developed over the course of a study. It would normally include successive versions of the thematic framework developed in the study, noting changes to themes, their use and the way they are structured to relate to each other. Annotating such versions to capture the reasoning behind changes is advisable; such details are easily forgotten over the often extended time period needed to complete analysis. It can also be helpful to keep a research diary in which the researcher reflects on the ongoing research process and their place in it. Cross-referencing from this to the audit trail can help build a strongly reflexive understanding of the analysis. Because most forms of thematic analysis have a fair degree of structure to their procedures and practices, keeping an audit trail should be relatively straightforward. For instance, in our writing about Template Analysis we always encourage researchers to retain and keep notes on each iteration of their template (e.g. King & Brooks, 2017).

USING THEMATIC ANALYSIS IN QUALITATIVE ORGANISATIONAL RESEARCH

Now we have introduced the distinction between generic and specific forms of thematic analysis and established key principles to ascertain and assure quality across a range of thematic analysis approaches, we will move on to look at some of the various generic approaches to thematic analysis used in organisational research. There are, as we have noted, a number of different styles, and in this section, we will look at some of those

more commonly used in organisational research. We will describe how to undertake thematic analysis using the example of one particular approach, Template Analysis (King & Brooks, 2017). We will then consider some other alternative approaches commonly used in qualitative organisational research: Braun and Clark's style of thematic analysis (Braun & Clark, 2006); Matrix Analysis (Nadin & Cassell, 2004); and Framework Analysis (Ritchie & Spencer, 1994). We will conclude with a critical comparison of these four styles of generic thematic analysis.

Template Analysis

Template Analysis is a generic style of thematic analysis which has been widely used in organisational and management research as well as in many other disciplines, and applied to a broad range of different research topics (King, 2012; King & Brooks, 2017). As a generic thematic analysis style, Template Analysis is not wedded to a particular philosophical position, and has arguably been used from a wider variety of epistemological positions than other styles of thematic analysis (see Brooks et al., 2015, for a description of its use in three studies with quite different approaches).

All styles of thematic analysis include two core processes: *defining themes* and *organising themes* into some kind of structure that represents conceptual relationships between them (King & Brooks, 2017). While particular styles of thematic analysis may define themes and arrange structures in different ways, there are some steps in the coding process that are very similar across pretty much all of them. We will use Template Analysis as an example to guide the reader through the main procedural steps of analysis. However, there are certain features of the method that diverge from approaches, and we will highlight these shortly. Additionally, it is important to note that descriptions of how to undertake analysis

should not be seen as prescriptive. The real strength of generic approaches to thematic analysis is that they provide structure to the task of undertaking analysis while allowing the analyst to adapt them to the needs of their particular study. This is certainly true of Template Analysis.

Let us identify first some of the features of Template Analysis which may not be common across all generic approaches to thematic analysis. Template Analysis involves the development of a *coding template*, often based on a subset of data, which is then applied to further data and revised and refined. Although there is an emphasis on hierarchical coding, Template Analysis does not (unlike some other approaches to thematic data analysis) suggest a particular set sequence of coding levels, and is flexible regarding the style and format of the coding template produced. This means that researchers using Template Analysis often develop particular themes more extensively, enabling them to capture the richest and most detailed aspects of their data. Some approaches to thematic analysis distinguish between descriptive and interpretive coding, whereas Template Analysis does not insist on such an explicit distinction: indeed King (2012) suggests that ‘it is debatable whether there is ever such a clear distinction between [the two]’ (p. 429). Template Analysis takes a similarly pragmatic approach to inductive versus deductive coding. Rather than insisting on coding using either a ‘bottom up’ approach (in which themes are derived inductively from the data) or a ‘top down’ approach (in which themes are informed by previously determined concerns – either theoretical or practical), Template Analysis allows the use of either or both. In Template Analysis, it is permissible (although not obligatory) to define some themes in advance of coding (known as *a priori themes*). *A priori* themes are identified as potentially helpful and relevant to the analysis, by corresponding to key concepts and/or perspectives for the research. However, the number of *a priori* themes should usually be limited, and they should

always be used tentatively, and redefined or removed if they do not prove useful.

The first step in Template Analysis is to *become familiar with the data* to be analysed. However, unlike some other approaches, Template Analysis does not require that the entire data set be read in full at this stage. Certainly, in a smaller study (perhaps with ten interview participants) it would be reasonable for the researcher to read through their data in full. However, in larger studies, it is recognised that this may be an excessively challenging and lengthy undertaking – in any case may not be possible in where data collection may be ongoing over some time and analysis planned concurrently with data collection. In a larger study, it would be reasonable for a researcher to familiarise themselves with a subset of the accounts to be analysed as a start.

Next, the researcher undertakes *preliminary coding* using the first item of data (an interview transcript, a set of diary entries or fieldnotes, and so on). Every section of the text that seems to offer something of relevance or contribute to understanding in relation to the research question is highlighted, and the researcher makes a note in the margin summing up what it is that is of interest here. Short code titles should be used to the content of these notes. If *a priori* themes are being used, the researcher should have these listed on a separate sheet to which they can easily refer. Sections of the text that appear to relate to *a priori* themes are also highlighted, and indexed to the relevant theme. *Parallel coding* (classifying the same segment of text under two different codes) is permissible. At this stage, researchers are advised to code inclusively – codes which turn out not to be relevant can always be discarded at a later point.

Although in most styles of thematic analysis it is common to carry out preliminary coding on the full data set before moving to subsequent stages, in Template Analysis it is normal to carry out the early stages of analysis a subset of the data. The aim is to produce an initial version of the template, which

can then be used to code subsequent data and modified in the light of it. The number of transcripts (or other data items) that need to be included in the initial analysis will vary from study to study. As a rule, the more diverse the perspectives and experiences of the sample, the more data will be needed in the initial sub-sample. We would always recommend that the initial sample is as diverse as possible; failure to do this can lead to a ‘skewed’ initial template which does not work well at later stages of the analysis process and which may even need discarding entirely.

The next step towards the initial template is known as *clustering*. Here, the preliminary codes that represent emerging potential themes, plus any *a priori* themes that have proved useful, are grouped together into meaningful clusters. Redundancies amongst them are removed and themes defined more clearly. Hierarchical relationships between themes may begin to be identified, but it is important not to rush to ‘tidy up’ the clusters; experimenting with different ways of capturing the data and relating themes to each other will pay dividends in terms of a robust and nuanced interpretation. We find it helpful to use Post-It notes to try out different ways of clustering themes, with theme names and line numbers indexing text written on them. Of course, researchers may use whatever means they find useful to help maintain an open, creative attitude to the task, which could include the use of specialist qualitative analysis software (CAQDAS: Computer Assisted Qualitative Data Analysis Software) such as NVivo, Atlas.ti, MAXQDA and many others.

Once the researcher is confident that their clusters are providing a good representation of the sense they are making of the data, analysis moves on to the stage of developing the initial template. This will certainly involve establishing hierarchical relationships between themes (with narrower themes nested within broader ones) and may also include lateral relationships across clusters. Sometimes, certain themes may pervade

much of the data, cross-cutting many or sometimes all of the other distinct thematic clusters: these are referred to as *integrative themes*. While integrative themes are not as widely used (or even permissible) in many other approaches to analysis, identifying themes as integrative rather than treating them simply as another top-level theme can usefully draw attention to ways in which some themes may operate as ‘undercurrents running through participants accounts; often, perhaps, not addressed explicitly but very apparent to the careful reader’ (King, 2012, p. 432). In our own work, when we undertook an evaluation of a service providing end of life care in the home environment, we identified the perceived uniqueness of the service as an integrative theme: seeing the service as unique and special was an undercurrent pervading all other themes identified, indicating respondents’ typical stance towards the service (Brooks & King, 2014).

Once an initial template has been constructed, the researcher’s next task is to apply it to further data, and thereby *modify and develop the template*. The researcher works systematically through the rest of their data, identifying those sections of text that contribute to addressing their research question, marking the text with one (or more) appropriate thematic from their initial template. Where data of interest are not captured by existing themes on the initial template – either because the data is not a ready ‘fit’ or because there is no theme representing this aspect of the data at all – modification of the template is undertaken. Necessary modifications may include inserting new themes, redefining existing themes, or deleting themes entirely where it becomes apparent they are redundant. Rather than reorganising the template after examining each new account, it is common to ‘group’ accounts and to work through these noting possible revisions before constructing an updated template. For example, in a study consisting of twenty interviews, a researcher might choose to design their initial template based on their preliminary coding of

five transcripts, then design an initial template before working through a further five, modify the template, then proceed with another five transcripts and so on.

This iterative process of constructing and trying out successive versions of the template continues until the researcher is convinced that they have a template that provides a rich and comprehensive representation of their interpretation of the data. While such decisions will be unique to each particular piece of research (and in any case practical time and resource constraints will usually play some role in limiting the number of iterations possible), the most important point here is that all sections of the data relevant to the research question should be adequately captured by a *final template*. Once this *final version* has been constructed, the researcher then applies it to their full data set. The final template can be useful in structuring the writing up of a piece of research and can provide a visual reference in dissemination, although it is important to keep in mind that constructing the template itself is not the end point of analysis. The researcher needs to use the coding to the final template to draw together their interpretation of their data. Template Analysis does not specify procedures for this *final interpretation* stage, as the requirements will vary according to the philosophical and/or methodological approach taken. Nevertheless, there are some common strategies that can prove useful. Searching for patterns in themes across cases is often useful – for example, do certain themes tend to dominate (or to be absent from) the accounts of certain types of participants? Prioritisation is essential – it will never be possible to talk about every theme at every level of hierarchy; even if it were, the result would be a report that lacked focus and was drowning in detail. Themes (or groups of themes) that clearly address the research question and feature strongly in participants' accounts are likely to warrant close consideration. Note that simple frequency counts should never be seen as meaningful in and of themselves; what they can do is draw

the researcher's attention to interesting issues to explore further in their data.

Appendix 1 provides an example of a published study that utilises Template Analysis.

Braun and Clarke's Style of Thematic Analysis

In an article that has become a benchmark paper, psychologists Virginia Braun and Victoria Clarke (2006) present an accessible and well delineated version of thematic analysis. Their approach is widely referenced in psychology generally and beyond, including in the field of organisational research. Braun and Clarke describe a six-step procedure for undertaking analysis, but are clear that what they provide are suggestions for practice rather than a set of fixed rules. They emphasise that analysis is a recursive rather than a linear process, and that the six phases they describe should be seen as basic precepts to guide researchers. The onus then is on researchers themselves to reflect on how best to apply these to fit their own research question and their data.

According to Braun and Clarke (2006), a researcher should be clear from the outset about what type of analysis they are setting out to undertake, and the claims this will enable them to make in relation to their data set, be that a rich description of the entire data set or a detailed account of one particular aspect. Analysis may be *theoretical*, coding for a very specific research question and more explicitly driven by the researcher and their particular concerns. Alternatively, the research question can emerge through the coding process itself: coding can be *inductive* and driven by the data in a bottom up approach to analysis. Braun and Clarke additionally suggest that the focus of an analysis can either be on identifying explicit or what they term *semantic* themes, or on identifying themes at a more interpretative or *latent* level. Their view is that thematic analysis typically focuses exclusively or

primarily on one or other of these options. They stipulate that consistency is key here: what matters is that researchers are explicit about their decisions and their definitions, and consistent about how they apply these in their analysis.

The six steps identified by Braun and Clarke are: (1) becoming familiar with the data; (2) generating initial codes from the data and starting to organise it into meaningful groups (*codes* are defined as a feature of the data that seem interesting to the researcher: they differ from *themes* which represent broader units of analysis); (3) searching for themes (the end result of this stage of analysis is a collection of what Braun and Clarke term *candidate themes* and all data extracts coded to these); (4) reviewing themes (this involves review both at the level of the coded data extracts and at the higher thematic level to produce, at the end of this step, a *candidate thematic map*); (5) defining and naming themes (at the end of this phase, the researcher should be able to clearly define their themes by succinctly describing their scope and content); and finally (6) producing the report.

Appendix 2 provides an example of published work utilising Braun and Clarke's style of thematic analysis.

Framework Analysis

Framework Analysis was developed by Ritchie and Spencer (1994) as a pragmatic approach to the analysis of qualitative data, particularly in applied social policy research. The authors sought to develop a method that was systematic enough to offer rigour and clarity in analysis, but retained flexibility to enable it to be adapted to different types of study. The kind of work in which they were engaged was almost always carried out in teams, so it was important that their method would facilitate team-working in analysis. They also had a strong commitment to an applied orientation that could produce answers

for those commissioning social research. There are five main stages to the approach.

Familiarisation with the data:

Researchers immerse themselves in the data: reading and re-reading transcripts and field notes, listening to recordings of interviews. For larger studies – or those with very tight deadlines – the team may select a sample of the data with which to familiarise themselves; care must be taken to ensure this is from a cross-section of organisational settings, participant types, time periods and so on. Notes should be taken of features of the data that strike researchers as being of interest, but there is no systematic coding at this stage.

Identifying a framework:

On the basis of the work done at the previous stage, researchers develop a framework of themes and subthemes with which to code the full data set. A priori issues that informed the research aims will feed into the framework alongside those emerging from the content of the data. Researchers are advised to keep the framework (which is sometimes referred to as an 'index') relatively simple at this stage, as the contents of the main thematic categories will be elaborated in the latter stages. Commonly there are just two hierarchical levels of themes at this stage.

Indexing:

Here the whole data set is coded (or 'indexed') to the framework developed at stage 2. New themes may be added to the framework at this stage, though the norm is that the framework will be well-developed before indexing starts.

Charting:

Indexed data are moved into 'charts' – essentially tables that cross-reference units of analysis (e.g. individuals, groups, organisations) against themes. The aim is not to simply cut and paste each relevant quote into the appropriate chart; rather, all the material relating to a particular theme for a particular

participant (or other unit of analysis) is distilled into an analytical summary. Units of analysis should be displayed in the same order on each chart, to help facilitate ‘eyeballing’ of the emerging analysis to detect patterns of interest.

Mapping and interpretation:

At this stage, the analyst reviews the charts and all research notes made in the previous stages, looking for patterns in the data and identifying key insights that help address the original research questions. Ritchie and Spencer (1994) emphasise that there is a wide range of strategies available to carry out this task, and success relies on intuition and creativity as much as following procedures. Researchers may variously use activities such as defining concepts, mapping the range of phenomena, developing typologies and so on.

Framework Analysis has been used very extensively in health services research, though much less often in business, management and organisational research. Examples of its use in the latter setting include Gray et al.’s (2011) study of coaching for SME managers, Sturges’ (2008) examination of career self-management, and Osgood’s (2004) research into professionalism amongst early years practitioners. Unfortunately, none of the organisational research studies using Framework Analysis that we identified in the literature provided much detail of their analytic processes; researchers are advised to turn to social policy and health fields for more detailed accounts of this style of analysis in action (e.g. Gale et al., 2013; Ward et al., 2013).

Matrix Analysis

Matrix Analysis (Nadin & Cassell, 2004) is based on the work of Miles and Huberman (1994; see also Miles et al., 2014), and centres on the use of different types of table (or ‘matrix’) to display and develop analysis across cases. There are many different ways

in which matrices may be organised; for example, by time period, to trace chronological developments (e.g. Cassell, 1989), by organisational case examples (e.g. Mahmood-Yousuf et al., 2008) or by data collection method where multiple forms were used in one study (e.g. Kislov et al., 2012). It is common for one study to use several forms of matrix. Matrices tend to present the outcomes of coding at quite a broad, summary level, to enable the researcher – and indeed the reader – to step back and ‘see the wood for the trees’. The style is therefore particularly useful for relatively large studies, especially where multiple cases (such as multiple organisations or job roles) need to be compared and contrasted. There is a risk that case-specific detail may be lost, though it is not uncommon for matrices to be used alongside more fine-grained forms of analysis; indeed, in their original chapter, Nadin and Cassell describe a study where they moved from Template Analysis to Matrix Analysis.

There are rather fewer studies in the literature which identify themselves as principally using Matrix Analysis than the other three styles we have described, though many more draw on some of the ideas initially advocated by Miles and Huberman (1994) in how they organise their data. Articles which explicitly use Nadin and Cassell’s (2004) formulation of Matrix Analysis include Leithold et al.’s (2016) study of new product development in SMEs, which utilised an analytic matrix strongly based on previous research. In contrast, Savage et al.’s (2013) study of logistics in Namibia derived its main analytic matrix in a much more bottom up manner, based on categories emerging from close reading of the interview data.

Comparing Generic Styles of Thematic Analysis

Reading our descriptions above of four different versions of generic thematic analysis, it is very apparent that there is a good deal of

overlap between them. As noted earlier, this is why we prefer to refer to 'styles' rather than 'types'. We argue that these are not distinct and discrete methods of analysis, but rather variations on a common set of key activities: identifying themes, coding data to them, organising them into some kind of structure and producing an interpretation of the data.

Looking at differences between the four styles, there is a clear distinction between Braun and Clarke's version and the other three. Template, Matrix and Framework analyses are all examples of what Crabtree and Miller (1992) call 'codebook' approaches, in which a coding structure is constructed from a mixture of a priori interests and initial exploration of the data, then refined and developed through further application to all the data. Template Analysis arguably emphasises the development of an initial structure from a sample of the data in a stronger manner than the other styles, highlighting the move from 'initial template' to 'developing the template' as a significant transition in the process. In contrast, Braun and Clarke's thematic analysis is typically carried out in a more 'bottom up' way throughout the analytic process, rather than focusing effort on the development of a 'codebook'.

Template Analysis tends to encourage a more fine-grained analysis than the other two 'codebook' styles, mainly through its encouragement of depth of coding – studies using Framework or Matrix analysis rarely code to more than three levels, while it is common for coding relating to the richest and most revealing aspects of the data to extend to four or more levels in Template Analysis. This encourages a high degree of attention to nuance and detail, but the price to pay can be a very complex coding structure and findings that can be difficult to manage in their extent. Indeed, for this reason, Nadin and Cassell (2004) argue for combining Template and Matrix approaches, and give an example of this in their definitive chapter.

The strongest similarity in styles is between Template and Framework Analysis; the

sequence of recommended procedures has a good deal in common, though there are variations in emphasis and focus. Template Analysis places more emphasis on the process of developing the coding structure than Framework Analysis, and as we have seen, marks the production of the initial template as a key step. Conversely, Framework Analysis describes 'charting' and 'mapping' processes that are not essential to Template Analysis (though not in conflict with it). As also noted above, Template Analysis encourages greater depth of coding than Framework Analysis. These two styles evolved in parallel from around the early 1990s to address similar concerns for a flexible but structured approach to analysis in applied qualitative research. The differences between them to a large degree reflect the different disciplinary areas in which they developed, as Brooks et al. (2015) discuss.

Given the overlaps between them, one might question whether there is much purpose to defining specific styles of thematic analysis. There is certainly a danger that when methods are packaged in distinct ways, they encourage researchers to be more concerned about following the procedures correctly than thinking through what is needed for their research. All the same, we feel there are good reasons for qualitative methodologists to offer particular styles of thematic analysis. They help clarify what some of the important choices are for researchers trying to design their own analytic strategy. This is especially true where there is a substantial body of published work that researchers can consult for examples, as is the case for the styles we have discussed (though somewhat less so for Matrix Analysis than the others). Distinct, identifiable styles also aid clarity of communication about analytic procedures, especially in refereed journal articles where often there is very little scope for detailed descriptions of method. Finally, our experience as teachers and supervisors of qualitative research is that it is helpful for novice researchers to have detailed guidelines for analysis that have been well-tested in practice.

CONCLUSION

There is a paradox regarding the place of generic thematic analysis in qualitative research. On the one hand, it continues to be widely used – for example, as we write, Braun and Clarke's (2006) article has received nearly 33,680 citations on Google Scholar. On the other, there is a paucity of critical discussion in the literature – especially in refereed journal articles, which remain the most important medium of publication in the social sciences. We agree with Braun and Clarke (2006) that this lack of critical scholarly attention reflects the relatively low status of thematic analysis, which (despite the advances brought about by their work and that of other authors we have cited here) is still perceptible. Much of the critique of thematic analysis is informal – we find it in offhand comments in conference presentations or everyday dialogue between academic researchers, where 'mere thematic analysis' is dismissed as simplistic, descriptive and philosophically or theoretically ungrounded. There are some critical points that are somewhat developed in the literature and we will attend to these below, before concluding with our view of the strengths of generic thematic analysis for qualitative organisational research.

Proceduralism and Methodolatry

There has been a good deal of discussion of the notion of 'methodolatry' in qualitative research. The term goes back to at least the early 1990s, and refers to a fetishisation of the purity of methods with the implicit assumption that this will in some way guarantee good research. Relating specifically to qualitative research, Janesick (1994, p. 215) defines it as 'a preoccupation with selecting and defending methods to the exclusion of the actual substance of the story being told'. In relation to qualitative analysis, these concerns tend to focus on 'proceduralism', where analysts focus on meticulously following set

procedures rather than responding creatively and imaginatively to data. Because thematic analysis is intrinsically procedural, it is often the focus of such criticisms. Atkinson (2013), for example, laments the deadening effects of fixed formulae and procedures:

Worst of all is the endless, repetitive emphasis on *coding* data. As if ideas were going to emerge from mechanistic trudging through one's data and repeatedly coding it. (p. 58)

Chamberlain (2000) points to the danger of thematic analysis procedures amounting to little more than a descriptive content analysis that simply classifies and illustrates what participants have said with no interpretive depth. On a rather different tack, some advocates of thematic analysis (including the present authors; Brooks et al., 2015) have warned of the danger that researchers become over-concerned with perfecting their thematic structure, rather than seeing it as a means to the end of interpreting the data.

Concerns about proceduralism need to be taken seriously by those writing about and using various forms of thematic analysis. We have certainly seen examples where authors talk about procedures as if simply following them precisely will inevitably produce a successful analysis. However, while any approach that describes a sequence of steps or stages may be interpreted in a mechanistic way, all the authors cited above writing about styles of thematic analysis are explicit that this is not how their guidelines should be used. Equally, we can readily point to numerous good examples of published researching using any of the styles we have discussed that show appropriate flexibility and creativity in how analysis is conducted. There may well be a case for better teaching of thematic analysis, but we do not agree that the fact some people use it poorly means it is inherently flawed.

For those who remain convinced that procedural guidelines will always channel people away from creative and imaginative engagement with data, we would offer a parallel counter-argument. Researchers may choose

to enter the analytic process without any procedures to guide them, but we contend that they would still have a procedure – in that they do a series of things in a particular order to understand and interpret their data. The danger when they do not use any system to guide them is that their ‘procedure’ is haphazard, unreflectively selective and near impossible to report, so that the reader gets little sense of how the researcher got to their destination other than perhaps a vague reference to ‘immersing themselves in the data’. Our argument here is not that this kind of very open approach is necessarily wrong, any more than we accept that following procedural guidelines is wrong; it is simply that any strategy for analysis brings its own risks with it.

Fragmentation of Accounts

A second important critique of thematic analysis is that it leads to a fragmentation of accounts, resulting in analysis that loses the context of the particular circumstances in which data were collected. There are a number of different concerns that lie behind this argument. One is focused on the interactional context, particularly in interviews. Silverman (2013), for example, maintains that the meaning in any segment of talk is bound up in the ongoing interaction between interviewee and interviewer; to remove thematically-coded extracts from the sequence of interaction will inevitably result in an impoverished interpretation. Related to this point is the argument that lack of analytic attention to the interview as interaction results in the interviewer’s part in the production of ‘data’ being neglected. Potter and Hepburn (2005) illustrate how participant quotes are commonly displayed without the inclusion of the interviewer’s question. This can make the participant’s talk appear to be an abstract statement of their position on the topic at hand, rather than a particular answer to a particular question.

Critiques of thematic analysis in terms of the loss of context, above all interactional context,

mostly come from those adopting what we might describe as a language-based position: conversation, discourse or narrative analysis, generally from a constructionist position. This is understandable, as in such approaches the details of interaction and its sequence within a text are crucial. Silverman (2013) argues that attending to such matters is still important in other types of qualitative research, and we would agree. However, we would also stress that the process of narrative construction *per se* is not the main focus of all qualitative traditions – for example phenomenology, grounded theory or realist evaluation. We would argue that good thematic analysis takes notice of context by insisting that the interpretation of individual sections of the data is informed by an understanding of the text (such as an interview transcript) as a whole. Thus in coding a section of text to a theme, the researcher is not just considering that section in a vacuum but is making sense of it in the context of the participant’s whole account.

A further concern about fragmentation is the potential to lose the holistic sense of individual participants’ experiences in cross-case analysis. This is especially an issue for experiential approaches such as phenomenology and personal construct psychology. To an extent this is inevitable in any qualitative study with more than a few participants, but there are strategies that can mitigate the problem. One is to present selected case studies to illustrate different positions within the cross-case analysis, highlighting key themes within these cases. Another is to combine thematic analysis with other forms of analysis that retain the integrity of individual accounts; this kind of methodological pluralism is attracting growing interest in qualitative research (Frost et al., 2010).

Strengths of Thematic Analysis

We argue that despite the critical points discussed above, thematic analysis has some important strengths to offer qualitative

organisational research. First, it provides a useful balance of flexibility and structure for the analyst. As a generic method, with a variety of well-established styles to serve as a starting point, it enables researchers to adapt and develop analytic strategies that fit the needs of their studies. This includes ensuring that philosophical foundations and theoretical orientations are followed through in the detail of analytic procedures, as well as enabling analysis to achieve its desired outcomes. At the same time, the various styles of thematic analysis provide clear (but not rigid) sequences of procedures that can reduce the risk of finding oneself lost in the sheer volume of data that qualitative research produces.

Linked to that last point, thematic analysis can help researchers to see the wood for the trees; that is, to get a sense of what the main messages are in extensive and often complex data. As we mentioned earlier, this ability does not need to be at the expense of retaining a sense of individual positions within the data. In addition, the growing literature on generic thematic analysis helps to provide a common language for sharing methodological insights and reflections, as well as disseminating the findings of such research to a wide audience.

In sum, thematic analysis remains a powerful and flexible tool that used appropriately, facilitates the kind of sensitive, nuanced examination of organisational phenomena that qualitative research seeks to achieve.

APPENDIX 1: AN EXAMPLE OF TEMPLATE ANALYSIS (RADCLIFFE, 2013)

This example comes from an article by Laura Radcliffe, published in *Qualitative Research in Organizations and Management* (2013). Her main focus is an evaluation of the use of diaries as a data collection method in the study of how couples manage the complexities of work-life decision-making. Within

this, she provides a substantial example of her own empirical work, including a thorough account of her use of Template Analysis to analyse the diary contents and accompanying interviews.

Radcliffe recruited a diverse sample of 24 heterosexual couples who each completed a diary over a period of 28 days. The diary took an ‘event-contingent’ form (Bolger et al., 2003); that is to say, participants completed an entry every time the target event occurred – in this case, an incident where there was a ‘work-family conflict’. For each such incident, participants completed a semi-structured proforma structured around four broad questions: what the incident was, what they decided to do about it, how they arrived at this decision and what the outcome was. Before the start of the diary period, Radcliffe conducted dyadic in-depth interviews with each couple, to help her get to know them and their circumstances, and to explain what would be required in the diary task. After the diaries were completed, she carried out a telephone interview with each individual participant, checking their understanding of the research and exploring their reactions to participation.

Template Analysis was used to analyse the diary data. Radcliffe cites the utility of the approach for examining different perspectives on a phenomenon as one of the reasons for choosing it, as she needed to make comparisons within and between couples, and look at temporal patterns over the diary collection period. She used four a priori top-level themes, reflecting the focus of her research questions: type of conflict, decision made, reason for decision and outcome of decision. These may be seen as ‘soft’ a priori themes in that they represent quite loose foci for developing the template, rather than tightly-defined theory-driven ‘hard’ themes (King & Brooks, 2017).

In keeping with normal practice, Radcliffe developed her initial template on the basis of close analysis of a subset of her data – in her case the full diary data from both

members of one couple. She describes adding new themes, and moving others within the template; for example, she added the theme *unofficial work agreements* to capture a form of support that she did not observe in her analysis to construct the initial template. In a late iteration of the template, she grouped together the themes *availability of support, job requirements and expectations*, and *financial considerations* in a broad top-level theme of *enabling and constraining factors*. It is quite rare for journal article authors to provide such detail of template development beyond the initial version, and she is to be commended for helping the reader gain a grasp of this key aspect of Template Analysis. Even more useful, though, is her illustration of how she captured the temporal nature of her diary data. All too often this is not addressed in a very adequate way in thematic analysis of any kind. Radcliffe uses flow chart diagrams of each individual conflict, with each box capturing a distinct comment (or set of comments) in the diary as the episode unfolded. Key themes from the template are indexed on the charts at relevant places. This strategy enables her to make comparisons between participants in a couple or across time, and link these specific instances to the broader Template Analysis.

APPENDIX 2: AN EXAMPLE OF BRAUN AND CLARKE'S STYLE OF THEMATIC ANALYSIS (LANGENHAN ET AL., 2013)

Langenhan et al. (2013) used Braun and Clarke's (2006) style of thematic analysis to explore different stakeholder perspectives regarding the extent to which psychosocial risks are incorporated into strategic risk management practice at both the business and policy level. Langenhan et al. acknowledge 'risk' as being conceptualised rather differently in different contexts, but for the

purposes of their own work, they draw on previous definitions identifying risk as 'an effect of uncertainty on objectives' (p. 87). They describe psychosocial risks as representing a new and emerging notion of 'risk' for organisations, relating to issues such as work-related stress, violence, bullying and harassment. According to Langenhan and her colleagues, managing psychosocial risks effectively alleviates many of the known negative consequences of stress which affect productivity, constitute a threat to the viability of organisations and have large implications for the national health and benefit costs to wider society. Strategic risk management, as understood by Langenhan et al., involves the identification, assessment and prioritisation of risks, followed by the allocation of resources to minimise, monitor and control the likelihood and consequences of these. Risks are therefore not necessarily eliminated: the focus is often rather on identifying risks most associated with negative outcomes and addressing and managing these. Stakeholders in this process are understood to be multiple and broadly defined.

Langenhan and colleagues used qualitative methods so that they could fully explore the varying understandings and application of this new and emerging concept, and they used the guidelines provided by Braun and Clarke (2006) to thematically analyse their data. They recruited fourteen participants, which included a range of stakeholders they considered as 'key' in relation to their research. Semi-structured interviews were conducted with four participants representing four different employer organisations, five 'experts' (with 'national or international experience, or knowledge of general and psychosocial risk in business and/or policy making'), three policy makers and two trade unionists.

Four main themes are identified: understanding of risk, understanding psychosocial risks, barriers and opportunities. Each theme includes subthemes, and succinct descriptions of each subtheme are included in the article.

Langenhan et al.'s article presents some useful insights for those working with the relatively new notion of psychosocial risk in the field of risk management. They suggest their findings reflect a need to close the gap between policy and practice in relation to psychosocial risk management, and that erroneous and inaccurate understandings of psychosocial risk often mean that management of such risks are a low priority for organisations. Their use of Braun and Clarke's style of thematic analysis evidently facilitated the extraction of key themes related to the topic which are each individually elucidated and linked into a convincing overarching narrative, effectively evidenced by participant quotes.

Photography in Qualitative Organizational Research: Conceptual, Analytical and Ethical Issues in Photo-Elicitation Inspired Methods¹

Samantha Warren

INTRODUCTION

This chapter addresses what Meyer et al. (2013, p. 513) refer to as the ‘dialogical approach’ in visual research – where images (in this case photographs²) are used as a way for researchers and participants to *generate* data rather than images as artefacts for ‘archaeological analysis’ (ibid, p. 502) in and of themselves – for example, those produced by organizations for strategic purposes such as advertisements, in brochures, on websites and as part of company annual reports.³ The methods I discuss below fall under the broad umbrella of ‘photo-elicitation’ (Collier & Collier, 1986) which encompass variations including ‘photo-voice’ (Wang & Burris, 1997), respondent/ participant-led photo-interviewing (Warren, 2002; Shortt & Warren, 2012; Vince & Warren, 2012) and native-image making (Wagner, 1979). All have slight nuances, but generally involve either the researcher or the study participants making,⁴ selecting, sharing, viewing and discussing photographs that are specifically

generated for the needs of the project (Hurworth, 2003). A common concern from colleagues intrigued by – but also fearful of – using photographs in research is that there is no robust theoretical foundation from which to justify their use. However, ‘the image’ has exercised just about every philosopher and influential thinker from antiquity to (post) modern times (Warren, 2016) and contemporary essays on photography abound in disciplines such as art history, film, media and cultural studies as well as anthropology and the social sciences. These have already provided a firm base for organizational scholars to draw on, albeit in a disparate and rather scattered way, so in this chapter, my aim is to bring together multidisciplinary, conceptual and theoretical insights with empirical examples of photographic organization studies and reflection from my own visual research experience over the past 16 years. I hope it will be an inspiration to readers who are curious to know more about how to incorporate photography into their own qualitative research practice.

For the first time in organizational research methods literature, this volume includes an entire section on visual methods, which shows how far the field of visual methodology has matured in business and management studies in recent years (Davison et al., 2012). It also means that each chapter need not map out the general terrain of visual and image-based research before getting into more nuanced methodological discussion. With this in mind, I turn directly to discussing the heritage of, and drivers for, the use of photography in business, management and organizational research before outlining some pertinent issues to consider when planning a photo-elicitation inspired research project. Next, I discuss how photographic methods enhance qualitative organizational research, before discussing the data analysis and research ethics issues related to their use.

PHOTOGRAPHIC QUALITATIVE RESEARCH METHODS: HERITAGE AND DRIVERS

Sociology and anthropology have used photography to generate data about social and cultural settings, almost from photography's inception (Becker, 1974). However, as the social sciences became increasingly focused on quantitative methods and positivistic 'natural science' principles during the early to mid twentieth century (Buchanan & Bryman, 2009), photographs fell out of favour as scientific data, on account of their polysemic qualities. It is hard to pin down the meaning of a photograph and claim any kind of objectivity for it, for instance (Becker, 1974). This may go some way to explaining why organization studies – and particularly business and management research – has been slow to take up visual research in general, but especially photography since our disciplines sought to emulate the positivistic/objectivist methods of early social science. Hedges and Beynon's (1982) and Harper's (1986) photographic

studies of UK and US manufacturing are two early examples that buck this trend, having more in common with photo-journalism than the 'management studies' of the time. A handful of organization/work related articles using photography appear in the early 2000s (e.g. Gallo, 2002 and Buchanan, 2001) but it was not until the twenty-first century is well underway that interest really seems to pick up as part of a broader 'visual turn' (Bell & Davison, 2013). Strangleman (2012) gives a good overview of the relationship between photography and work from the perspective of a sociologist investigating labour processes, and literature reviews of 'the visual and organization' more generally can be found in Bell and Davison (2013) and Ray and Smith (2012). Davison and Warren (2009, 2017) also map the field of visual studies in accounting. Yet despite a growing 'instructional' methodological literature on photo-elicitation methods (e.g. Vince & Warren, 2012; Warren, 2009), there are still relatively few published empirical studies *using* photo-elicitation methods.

I contend this will soon change, however, as journals become more receptive to photography-based work,⁵ and doctoral projects come to fruition (e.g. Betts, 2015; Mørgensen, 2012; Shortt, 2010; Warnes, 2015; Watts, 2014). Furthermore, an increasingly visually mediated, organizational world coupled with new technological capabilities has led to the conceptual, empirical and methodological conditions for photography to be taken seriously in business and management studies. This is itself part of a broader turn towards the visual occurring across a range of disciplines at the turn of the twenty-first century (Bell & Davison, 2013). As noted above, I do not intend to further review these developments here and would direct the reader to Davison and Warren (2009), Puyou et al. (2012), Bell and Davison (2013), Ray and Smith (2012), Meyer et al. (2013) and Bell et al. (2014) for varied and wide-ranging coverage. *inVisio: The International Network for Visual Studies in Organizations* is a useful

resource too, with an online repository of advice and guidance for visual researchers in the business and management disciplines (www.moodle.in-visio.org). For this chapter, what's significant is that photography is a qualitative research method whose time has come and the visual organization studies field has developed sufficiently to warrant a chapter in this *Handbook* dedicated to the practice of researching with a camera.

DESIGNING A PHOTOGRAPHIC RESEARCH PROJECT: PRACTICAL CONSIDERATIONS

Photo-elicitation techniques all involve reflection and/or discussion about a set of photographs made to communicate a topic of interest to researchers and/or the communities they are working with (e.g. Wang & Burris, 1997). The photographs could be made by the researcher, participant or a combination of the two – with participants directing a researcher (or even a professional photographer) towards certain shots and scenes (Ray & Smith, 2012). Once the photographs have been gathered, a further research encounter takes place, to allow the photographer(s) or participant director(s) to elaborate further on their choice of shot, modes of expression, motivations, experiences and anything else that arises for them in dialogue with the researcher. These could be during one-to-one interviews (e.g. Shortt, 2015; Slutskaya et al., 2012; Warren, 2008) or in a group setting (Buchanan, 2001).

Camera Equipment and Photographic Formats

Early photo-elicitation studies used single-use disposable cameras, but these are now relatively hard to come by and it is expensive to get the film processed. Nowadays, it is more common to ask participants to use their own

photographic equipment, which would probably be a smartphone or personal digital camera. However, using film cameras does mean that it is not possible for anyone to see the photographs as they are made, which prevents editing, manipulation or the remaking of shots to get the 'perfect' photograph. This may not be an issue where the research is investigating abstract concepts where the photographs are intended to be symbolic or metaphorical aids to expression during an interview (e.g. see Watts, 2014), but might be significant in a study looking at a particular time-frame or event, for example. Next, a decision needs to be taken as to whether to view the images digitally on a screen, or print the photographs as physical artefacts. This may seem insignificant, but there are a number of analytical affordances of both approaches I will discuss later in the section on 'analysis'.

Photographic Storage and Organization

For publication, files sizes of around only 500Kb (360 × 360 dpi) are sufficient, yet some cameras on high quality settings (which are often the manufacturer's default) generate image files of 5gb or more in size.⁶ There are now free plug-ins and apps for most operating systems to resize images quickly and easily on a personal computer (such as Microsoft's Image Resizer tool), thereby preventing excessive storage requirements or difficulties in transferring files between computers. The way in which images are categorized and stored in your personal filing system is also a point to consider as such things can be time consuming to change. Will the files (or hard copy images) be saved in the order in which the participant made them? Or a different arrangement that makes more sense to you as a researcher (such as by code or location)? Pink (2013) reminds us that how information is archived affects the ways in which we remember events, and the meaning that might then be attached to the images and sets of images after

time has passed. This last statement hints at the value of photography in qualitative research – to generate and communicate meaning in ways that go beyond a researcher's traditional repertoire of text-based methods, a discussion to which I now turn.

PHOTOGRAPHY AS A PERFORMATIVE METHOD

A camera encourages its user to be more aware of the world around them since they are making active choices about what's important and significant enough to record (Sontag, 1979, p. 4). These choices are infused with the photographer's 'there and then' motivation for choosing that particular shot, but they also draw in personal and cultural historical precedents about what counts as a 'good' photograph (Burgin, 1986), and imaginings of what the photographer thinks he or she is likely to want to be reminded of when viewing the photograph in the future (Crang, 1997). Photography is therefore a *performative* practice because it involves the storying and enactment of the photographer's journey through time and space for later consumption, rather than the more straightforward documentation of reality that is commonly assumed as the character of everyday photography (Bramming et al., 2012; Hölm, 2008).

Researching Process: Issues of Space and Time

The ease with which photographs can be made at set intervals, or at sites that have undergone change makes photography a useful tool in 'freeze framing' process. Buchanan's (2001) study of operations in a hospital made use of researcher-produced photographs which were then viewed and discussed by groups of hospital staff to investigate the effectiveness of the 'patient trail' from admission to wards. A major problematic of process theories of

organization is the extent to which you can halt the ongoing flux in order to study it (De Cock & Sharp, 2007), and I would argue that contextual discussions 'beyond the frame' of the photograph can help in this regard. For example, Buchanan's photographs were familiar enough to the hospital staff to enable meaningful discussion, but as they were made from the researcher's perspective they also sparked questions about why he had not photographed scenes and settings that were deemed to be significant but missing.

Removed Observation

Asking participants to make photographs is potentially less intrusive than a more traditional ethnography, yet subsequent discussions of these photographs still generate rich and detailed data. Participants in Shortt's (2010) ethnography of hair salons, for example, made photographs to show the importance of 'off-stage' spaces such as cupboards, corridors, alleyways and stairs – places the researcher would not have thought to go herself. These 'liminal' locations had largely been ignored in organizational space research, so using photographs generated a whole new way of thinking about the topic (Shortt, 2015). Likewise, Warnes' (2015) participants photographically represented elements of their unusual workspace (a UK cathedral) to show how they navigated the tensions between the sacred and increasingly more commercial uses of the building.

Agenda-Setting

Qualitative researchers are usually particularly interested in investigating what is important to research participants from *their* perspective and so allowing them to choose what to make photographs of (or direct us to make them) is also an excellent way of focusing the research agenda on what matters to them, rather than us (Wang & Burris, 1997;

Warren, 2005a). In health and social care, for example (for a review, see Catalani & Minkler, 2010), there are many studies that utilize photographs generated by study participants to chart their progress through the agencies they must interact with as a result of severe illness, e.g. Frith and Harcourt's (2007) study of undergoing chemotherapy among breast cancer patients.

PHOTOGRAPHS CONVEY HIDDEN AND/OR ALTERNATIVE KNOWLEDGES

Asking people to 'select' small parcels from their world to turn into photographs, requires them to draw on a variety of conscious and unconscious cultural knowledges around how best to frame and compose their photographs (Burgin, 1986). What we deem significant enough to make pictures of, position and size of the main subject in the photograph, use of (a)symmetry, camera angle and so on, are conditioned by the photographer's visual culture we have been raised within (Berger, 1972; Shortt & Warren, 2012). A salient outcome of this is that we should not regard photographs within the research process as truth, or evidence of a reality that is objectively 'out there' just ready to be snapped up by the camera's lens (Goldstein, 2007). Nonetheless, photographs remain very seductive as 'proof' in everyday life, e.g. passports, driving licences, student IDs, etc., so it is easy to forget that we are dealing with a socially constructed artefact. Photographs have a striking resemblance to reality (as opposed to say, a drawing of the same scene) and we have learned to regard them as 'evidence'.

Photographs as Truth?

The status of the image as either 'true' or 'false' is a charge that visual researchers often have to defend against sceptical reviewers more used to dealing with text (see

Wagner, 2001 for a debate on realism in photographic research). We need to remember that such accusations are usually motivated by an assumption that there *is* a truth to the photograph that we can 'get at' if only the participant is prevented from 'interfering' in the process. However, photographs' fluid meanings are precisely why they are so good at surfacing research participants' subjectivities – even if they are digitally or otherwise manipulated. Croghan et al. (2008) include a thoughtful discussion of the ways in which photography can be used by participants to quite deliberately craft certain identities to present to the researcher, as has also been established about the visual presentation of identity on Facebook (Uimonen, 2013). I advocate that we see this as a strength for qualitative research – and particularly that which is constructivist in character – since the process by which images are made, remade, cropped, altered and adjusted by the photographer can be explored with them as part of the research process.⁷ This might include asking questions about the underpinning – and often emotional – motivations behind the participant's choices of subject, shot, angle, framing and so on, mining for additional layers of data (Warren, 2002).

Interrogating the Photographic Process

Particularly from a psychoanalytical viewpoint, organizational life is riddled with people's unconscious drives and defences that shape their behaviour (Armstrong, 2004; Gabriel, 1999). Questioning how and why particular photographs were made can encourage what is below the photographer's 'surface' to rise up for analysis (Sievers, 2007; Warren, 2012a). An example of this from my own research is given in Figure 15.1, drawn from a study of professional identity and stereotype resistance among early career accountants (see Parker & Warren *in press*; Warren & Parker 2009). Participants were asked to make

Figure 15.1

a set of ten photographs – five that communicated ‘this is me’ and five to show ‘this is not me’. These were later discussed with the researcher. Figure 15.1 was a ‘not me’ photograph made by Martin,⁸ a gregarious young man in his late twenties, to show me how surprised he felt to have ended up working in a corporate environment in the City of London instead of using his accounting skills in a smaller firm, with a social agenda, perhaps.

However, when I questioned him about why he’d shot the photograph from behind the plants outside the frontage instead of directly from the street, Martin explained how it was against company policy to photograph the buildings and so he hid to avoid detection by security guards. He then went on to talk at some length about feeling highly controlled and treated with suspicion by his organization for who he was (i.e. not conforming to others’ stereotypical perceptions of accountants). He agreed that this picture was a good symbol of these feelings – as well as a more straightforward depiction of his company premises.

The Photograph as Aesthetic Communication

The photograph in Figure 15.1 was a conduit for Martin’s more emotional knowledge about his situation because the aesthetic dimensions of the image (camera angle, composition and framing, etc.) caught my attention and prompted me to explore this further with him. Aesthetic feelings are also hard to express in words, so researching these dimensions to organizational life demands a more sensually redolent method, which is where photographs can be especially useful (Strati, 1999; Warren, 2008). Photographs bring the viewer into a direct and forceful relationship with what is depicted and act almost as proxies for the object/scene in question. They fire our senses through imaginings of what it might be like to be there (Pink, 2009, p. 101; Warren, 2012b). Watts (2014), in her research on stress among women police officers in the UK, used photography as a ‘surrogate’ for her participants’ bodily experiences of stress

to encourage them to move away from the more rational ‘common sense’ reconstructions encouraged by interview dialogue alone. This immersive quality means photographs hold ‘information’ beyond what they straightforwardly represent. Yet, despite the personal and subjective nature of photographs, their technical and ‘representational’ character nonetheless renders them useful as documentary methods – subject to the caveats I include in the discussion below.

PHOTOGRAPHS INCLUDE A LOT OF DETAIL: THE ‘INVENTORY FUNCTION’

Some of the earliest scientific uses of photography can be found in anthropology, for example Bateson and Mead’s (1942) famous study of the Trobriand Islanders in which photographs were ‘taken’ to document the differences between the islanders’ bodies, dress, adornments and rituals from those of ‘the West’. The photographs were intended to be ‘accurate’ representations of ‘how it was’ on the Trobriand Islands and in common with much anthropology and sociology of the time, the value of photography was assumed to be in its capacity to record enormous amounts of detail in an instant (Collier & Collier, 1986). Subsequent writing on photography has been quite critical of this ‘realist tale’ (Harper, 1998, p. 26), recognizing the constructed character of a photograph as I discussed earlier (e.g. see Becker, 1974; Harper, 1998; Scott, 1999).

Nonetheless, it is still true to say that film (and now digital) cameras remain great recording devices for qualitative researchers for taking an inventory of the scenes they are confronted with (Collier & Collier, 1986), or as aide memoires from the field (Pink, 2013): ‘photographs ... minimally claim to be true in that what they show actually existed in front of the camera for at least the time it took to make the exposure’ (Becker, 1974, p. 14; see also Barrett, 2006, pp. 162–73 for a good discussion of this).

Photographs as Historical Records

Moreover, photographs are ‘inventories’ that last. They are enduring representations of the past which allow ‘windows’ onto how photographers chose to construct working life at the time. Parker (2009) sees great possibilities in company photographic archives for qualitative research agendas that elicit views from organizational stakeholders (past and present) about historical events and change. In juxtaposing historical photographs with contemporary visual expectations, the differences between our present cultural milieu and the visual cultures of the past seems all the more striking and easy to talk about (Sørensen, 2014). Strangleman’s (2012) research on the Guinness Brewery site in West London, UK, used archival photos with interviewees ‘as a prompt to memory, as ways of understanding corporate image making. Further they allow[ed] us to understand how work was done, how it was valued and portrayed’ (Strangleman, 2012, p. 4.2). Likewise, Bell (2012) undertook a visual analysis of her photographs of the Coventry Jaguar plant’s closure in the UK to highlight processes of ‘memorialization’ by workers. Helms-Mills (2005) also investigated archival photographs from the annual reports of a Canadian utility company. Although in this case she carried out a content analysis to make inferences from the photographs about gender and change within the firm over time, she could easily have used the photographs for elicitation with stakeholders instead.

Photographs as Triggers and Visual/Material Fieldnotes

In research projects with contemporary timeframes, the ‘inventory’ function of photographs can also direct the researcher’s attention to detail hitherto unnoticed by the participant as in my question to Martin about ‘hiding’ in the plants depicted by Figure 15.1

Figure 15.2

(see also Shortt & Warren, 2012). This makes photographs ideal for exploring the minutiae of lived experience at work. Betts (2015), Halford (2004), Parker and Warren (2012), Shortt (2010) and Warren (2006) have all used photo-elicitation methods to help research participants express personal and professional identities through making photographs of objects from their material environments. Bramming et al.'s (2012) study of Danish teachers and their perceptions of what constitutes a 'good day at work'; Slutskaya et al.'s (2012) project on masculinities and skills in butchery in the UK; and Molotch and McClain's (2008) research on resistance with New York subway workers all hinged on the small details identified and discussed from participant-produced photographs. In addition, the 'inventory function' of photography reduces the time-consuming and potentially challenging need to write down details of a scene in a traditional field note journal (Collier & Collier, 1986), e.g. recording the detail included in Figure 15.2!⁹

PHOTOGRAPHS PRESENT HOLISTIC IMPRESSIONS

Following on from the 'inventory' function of photographs discussed above, images also communicate meaning as an integrated whole as well as through their detail. In Figure 15.2, the overall effect of the messy (busy?) office on the viewer is more than just noting all the items on all the desks, for example. The configuration of the room, the type of furniture, colour scheme all 'say' something about what happens there, how, why and by whom, regardless of whether we know it for certain or not.

Presentational Symbolism

Using a photograph displayed in a graduate recruitment brochure, Hancock (2005) explains that we cannot reduce the photograph's impression(s) to just one or a few of its features, since an image is an *integrated* regime of signifying resources – parts that

Figure 15.3

perform as an ensemble of their constituent parts (Kress & van Leeuwen, 2006). Trying to describe the photograph's effect on us using language alone is hard – if not impossible – to do because we apprehend the elements of photographs¹⁰ simultaneously, rather than in the linear manner that language requires. Langer (1957) refers to this as 'presentational symbolism'. This is especially so for abstract or particularly aesthetically rich photographs as in Figure 15.3 (taken from the workplace fun study), which seem to 'speak' to us on a level that is different to logical/rational comprehension. Meyer et al. (2013, p. 491) describe this as the 'visual mode of meaning'. Looking at this image, it is just about apparent that an office of some kind is depicted, with two computer monitors, a desk, a person sitting with his/her back to us, with a backpack and a take-away drinks cup resting on a long table in the foreground. But what is more striking about this image are the 'zoomed out', stretched and blurry aesthetic effects the photographer has added somehow which lends the scene a dream-like, intoxicated, or

perhaps futuristic air. It is much harder to break these down into the precise details within the image that triggers them – and, one might argue, superfluous to do so.

Photographs as Dissemination: Images and Text

It is for these reasons that photographs can be very useful in the dissemination of research as well as vehicles for generating data. Both Barthes (1982) and Ranci  re (2007) have made claims for the peculiar character of photographs to arrest us on what feels to be a pre-conscious, aesthetic and/or emotional level – Barthes with his concept of the 'punctum' and Ranci  re's notion of 'silent speech'. We might be able to explain why a photograph strikes an emotional chord with us, but this is always a post hoc rationalization after the event of apprehending it, and the image itself exceeds our ability to capture it in language as Langer (1957) attests. An alternative view is that there is no such thing as a photograph without

"...we had a laugh on the micro scooter a while back, we got told off by the site services guy, [because] we had a race around the [department] with the micro scooter. There was only one person on it but there was a crash and it all got really ugly! [LAUGHING] ...we got a whiteboard and somebody with a stopwatch and we had to go round the circuit and see who could do it quickest. And about half way through one of the site services guys came round - who's a very very miserable man and has no joy... and someone was going a bit too quick to make the corner and did a huge sort of like falling action over the settees and stuff [MIMES SLOW MOTION FALLING] over the end and this guy jumped out and said 'Stop! Health and Safety!' and we were all [MUCH LAUGHTER!], we dissolved into fits of laughter on the floor and er so the most the biggest laugh I've ever had in the office came out of the micro scooter."

Figure 15.4

words – even if an image is not captioned, it is through language that we try to understand its features and make it have meaning for us (Burgin, 1986; Scott, 1999). Thus the way in which a photograph ‘speaks for itself’ will differ depending on the attributes of the viewer and the context in which it is viewed and is fundamentally a political process (Berger, 1972). A photograph hung in a gallery could claim itself as ‘art’ (and therefore of value), whereas the same photograph appearing on an Instagram feed probably couldn’t (and is therefore worthless).

In my own work, I have found Mitchell’s (1994) threefold classification of the relationship between images and/or text to be very helpful (Warren, 2002, 2008). He uses the label ‘image/text’ to describe a separation between an image and accompanying text, for example the kind of caption seen below the photos included in this chapter; ‘image-text’ to denote an assemblage of image and text whose relation to one another is not explicitly stated but alluded to so that the viewer/reader takes meaning from both that is greater than

or different from either alone (e.g. see Matilal & Höpfl, 2009); and ‘image-text’ as a name for photo-montages or photo-essays where the images are left uncaptioned to ‘speak for themselves’ (although note Scott’s (1999) caveat above). As Marcus (1995) notes, these ‘messy texts’ are often frustrating for the viewer who is unsure what they should take from them and are more usually used in the art-world than research reports. That said, in some critical research, the aim is often to provoke uncertainty or discomfort in viewers/readers and so this might be a useful dissemination approach or even method for generating new insights through the juxtaposition of images (Sørensen, 2014). The example shown in Figure 15.4 is drawn from my research on workplace fun (Warren, 2005b) and is an example of what I refer to as an ‘image-text’. The text is much more than a captioning of the image (as would be the case with an image/text arrangement), but the image is also more than just an illustration of the text. The images and the text add something to one another and although the relationship

between the two is not explicitly spelled out (we are left to assume that the scribbled-on whiteboard depicted is what the story refers to, for example), it is also not confusing, as might be the case with an image-text.

MAKING AND SHARING PHOTOGRAPHS ENHANCES FIELD RELATIONSHIPS

Earning research participants' trust and 'buy-in' is an important precursor to generating rich qualitative data (e.g., see Ch.6, volume 1). Gaining access to occupational communities and building a sample are also challenges for qualitative researchers given the time and commitment usually required for an interview, ethnographic or other reflexive study (Neyland, 2008). Yet Shortt (2015) found herself with a waiting list of willing participants when she undertook photo-interviewing with hairdressers working in UK salons, because the research was regarded by the hairdressers as fun to take part in and several approached the researcher themselves asking to be involved.

Involvement and Immersion in the Task

As well as being enjoyable, photography offers the participant a greater degree of control and creativity than is possible in traditional (verbal) interview-based studies. As noted above, they can set the agenda for subsequent discussion by making or directing the photographs themselves. The 'directing' approach was used by Ray and Smith (2010) in their investigation of how organizational strategy is translated into practice, because although participants were willing to tell the researchers what they should make photographs of, for various reasons they did not wish to do so themselves. This highlights how photo-elicitation techniques allow

participants discretion over what they are happy to reveal about their working lives, showing a view from their world. In my own practice with participant-made photographs, I have found this translates into a high level of commitment to the research agenda with care taken over composition of shots and reports that participants enjoyed the process and the level of reflection it entailed.¹¹ For example, in Figure 15.5 – from the accountant's stereotype resistance research mentioned earlier, a plate of different coloured dried pulses resembling a pie chart was painstakingly assembled in order to show me that its creator was 'not a beancounter'! This evidently took a lot of time and thought and conveys a playful sense of irony around the participant's views.

The 'photo-voice' variant of photo-elicitation methods (Wang & Burris, 1997), is particularly concerned with foregrounding the experiences and views (literally) of disenfranchised or otherwise powerless individuals and groups in society. It was developed in health and social care, but is also very commonly used in participatory community research and is explicitly intended to bring about change (Hergenrather et al., 2010), often through exhibitions or other presentations back to those in positions of power. Kramer et al.'s (2010) project to tackle obesity in a US community involved policy-makers to suggest venues for exhibiting the participants' images as well as in joint viewings of them with the research team, for instance. The principle of raising the 'voice' of marginalized groups by attempting to 'see the world through their eyes' has resonances with the critical management studies project that also explicitly attends to the quieter, overlooked, oppressed or exploited members of organizations (Warren, 2005a). Studies include Gallo's (2002) research with immigrant workers, and Mizen's (2005) study of child workers in the UK. As with process research above, there are a wealth of articles beyond organization studies to consult for inspiration, and which offer great potential for organizational research with an emancipatory agenda (see Catalani & Minkler, 2010).

Figure 15.5

Helping Abstract and/or Sensitive Discussions

Interviewing with photographs also connects researcher and participant over a concrete artefact that can help lubricate conversation (Vince & Warren, 2012). The image can facilitate the sharing of abstract emotions and empathy surrounding sensitive topics (e.g. Scarles, 2010) or as Parker (2009, p. 1119) notes, it can act as a ‘third party’ between researcher and researched putting a safe distance between them in the event of discomfort or embarrassment. A photograph has an ‘immediate’ character which is a combination of its perceived realism and presentational symbolism, both discussed above, and which strikes an emotional chord with the viewer (Barthes, 1982). As such, photographs are well suited to evoking emotional responses on sensitive subjects that may be hard to express in language – such as redundancy or bullying perhaps – or are far from the researcher’s experience – such as homelessness. Slutskaya et al. (2012) found that their working class, male participants were

more willing to open up about emotional or seemingly gendered dimensions of butchery (such as the aesthetics of preparing the meat display or love of the job) when asked to make and discuss photographs. More acutely, in Scarles’ (2010) study of the ethics of tourist photography, the affective power of a participant’s photograph depicting child poverty precipitated an emotional exchange between participant and researcher that repudiated the need for a verbal one. This rests on the photograph’s ability to ‘speak’ alternative languages as discussed earlier.

HOW CAN PHOTOGRAPHS BE ANALYSED AS PART OF QUALITATIVE RESEARCH PROJECTS?

So far, I have concentrated discussion on the benefits photography brings to a qualitative research project. I have been keen to stress that photographic research is a performative, active practice involving making, viewing and sharing photographs. But what kind of

qualitative data does this process generate and how can it best be analysed – particularly given my opening caveat that photographs are sometimes viewed from the mainstream as dubious sources of social science data? A systematic approach to photographic analysis has become necessary to demonstrate, as qualitative research becomes increasingly ‘systematized’ by institutional pressures (Cassell & Symon, 2012, pp. 4–5). These include the imperative to publish in high ranking journals that insist on codified, analytically precise expositions of findings, and ethics review boards that grant approval to undertake research (Cassell & Symon, 2012). This in turn puts pressure on researchers to undertake and justify the validity of their work in ways that mimic more positivist, quantitative, studies – for example, clear, unambiguous steps that explain exactly how the researcher went from data to findings – even if the reality of qualitative interpretation is – and should be – a much more intuitive and messy process. Yet analytical techniques for participant-generated images are not very well developed, and have certainly not kept pace with conceptual and practical methodological commentary on participatory photography (Prosser & Loxley, 2008). With the above in mind, this section highlights some key problems in analysing participatory photographic data and outlines some approaches undertaken by researchers using photo-elicitation methods.

Placing Participants/ Photographers’ Meanings at the Heart of Data Analysis

Catalani and Minkler (2010) reviewed 37 photo-voice articles on health and social care topics and found ‘very little’ discussion of data analysis. They identify this as a shortcoming, noting ‘essential information about how researchers went from photographs to findings is rarely mentioned’ (Catalani & Minkler, 2010, p. 447). Hergenrather et al.’s

(2009) review article of 31 photo-voice studies in the discipline of ‘community studies’ also found no mention of data analysis beyond the degree of researcher-researched interaction. Shortt and Warren (2018) contend that this is mostly likely because participatory approaches – and especially photo-voice – have a clear ethical commitment to building upon the meanings photographers attribute to their photographs. What the participant says the photograph is ‘of’ and what it means to them is at the heart of the research design, and this continues when the photos are viewed and/or discussed during subsequent research encounters (e.g. interviews or focus groups, for example). Meyer et al.’s (2013, p. 513) description of photo-elicitation techniques being valuable uses of the visual due to their ‘dialogical’ character, admirably sums up their analysis. Returning to the idea that photography is performative, viewing and discussing photographs with participants are ‘event[s] of seeing’ (Belova, 2006, p. 47) mingling the subjectivities of the photographer(s) and researcher(s), layered over and through the photograph itself (see also Croghan et al., 2008). I have already mentioned some examples of how data is co-created in this manner (e.g. Figure 15.1 ‘behind the plants’).

Analysing Photo-Interview Data: A Dialogic Approach

Photo-interviews are usually audio-recorded and then transcribed to produce lengthy texts of the dialogue, which is coded, themed or analysed as a narrative according to analytical protocols for more traditional qualitative interviews (e.g., see Chapters 4 and 13, this volume.) If interviews are not possible, for geographical or other logistical reasons, participants could be asked to provide a statement or short written commentary about their images instead. Bramming et al.’s (2012, p. 59) ‘snaplog’ method involved participants sending their ‘snap[shot]s’ of ‘a good

day at work' to the research team with a few words about why they made the photograph and how it related to the research theme (the 'log' part). In both photo-interviews and snappings, photographs could take digital or print form, but other variations on the use of photographs to generate dialogue in interviews require them to be printed as hard copies.

Because the visual element of a photograph is so salient to its definition, we tend to forget that when printed, photographs are also material objects to be handled, passed around and capable of being arranged in different ways which add to our understandings of the topic being studied (see Edwards & Hart, 2004). The decision to print photographs or view them on screen is therefore not inconsequential, as I noted earlier. For example, in the case of Shortt's study, she developed the concept of 'identityscape' (Shortt, 2012) to describe the ways her participants arranged their photographs as montages that represented different facets of themselves. The term 'identityscape' was inspired by David Hockney's photo-collages and the word 'landscape' – as a backdrop against which we make sense of salient environmental features. The 'identityscape' effectively and visually mapped the multiple selves of Shortt's (2012) participants by showing the fragmented ways identity at work is expressed, yet also understood as a whole. Another technique exploiting the material qualities of photographs was used by Betts (2015) in her study of meaningful workplace objects. She extended Kelly's psychological method of 'repertory grids' into the visual domain by randomly placing three photographs in front of her participants and asking them 'how are any two of these alike, and one different?' This method aims to excavate the underlying constructs people use to structure their experiences by forcing them to make choices between disparate artefacts. In doing so, the 'schema' they draw upon in making sense of the world become clearer to see. In Betts' (2015) case, this was a stark contrast between a 'work self' and a 'non-work self' that underpinned

their values and which didn't come through as clearly during the more discursive dialogue about their photographs.

Avoiding Analytical Blindness: Returning to the Visual In Analysis

Photographs are valuable vehicles through which to generate talk and allow the participant greater input into the research process. However, an emphasis on dialogue in the analysis of photo-elicitation data leads to a tendency to assume that in the end, all that matters is the text (Shortt & Warren, 2018) leading to the ironic outcome that photo-elicitation studies can be strangely 'blind' to their visual data (Drew & Guillemin, 2014). While some study photographs are usually included in research outputs for their power to disseminate, these are generally used to illustrate themes derived from analysis of the photo-interview texts (e.g. Kramer et al.'s, 2010 obesity research discussed earlier). But what do we miss when we discount the *visual* features of the photograph in *analysis* – when coding and theming as well as writing up research findings? As already outlined, the performative character of photography means photographers' subjectivities are foregrounded through the conscious and unconscious choices they make when executing the task. Their aesthetic, embodied, spatial and other material 'knowledges' leave traces in the composition, content and framing of the photographs research participants make, so mining this 'visual mode of meaning' (Meyer et al., 2013, p. 491), in addition to the discursive meanings attributed during photo-interviews, offers a lot of potential to qualitative researchers (c.f., ch. 8, this volume). Shortt (2015) found this to be the case in her study of hairdressers' spatialized identities outlined above. By returning to the details of the photographs her participants made (once the text generated during photo-interviews had been interpreted into themes) and importantly taking a sample-wide view of these

images, she was able to recognize interesting *visual* patterns in her data. In particular, it was apparent that her participants positioned themselves in liminal spaces within their workplaces when making photographs to convey elements of their selfhood at work (e.g. standing in or on the entrances to cupboards, toilets, doorsteps, stairways, etc.). As this was regardless of the type of hair salon they worked within and the kind of role they performed at work, it led her to conclude that these ‘in between’ spaces were important sources of identity construction for workers who lack personal space (such as an office, desk or other ‘territory’) – a finding which made a major contribution to literature on materiality and organization, and which was awarded ‘Best Paper’ prize in an internationally leading organization studies journal¹² (Shortt, 2015).

Shortt and Warren (2018) term this approach ‘grounded visual pattern analysis’ and it combines the strength of dialogic analyses of the text generated through photo-interviews, with a more ‘archaeological’ (Meyer et al., 2013) investigation of what the *visual content* conveys when photographs are grouped together in themes. In Shortt’s study, the significance of the visuals was inferred using a holistic, impressionistic method in which the researcher pays attention to the striking patterns and more subtle nuances of the images when laid out in thematic sets (Collier, 2001). Shortt and Warren (2018) break this down further into ‘symbolic’ and ‘compositional viewing’ to direct the researcher’s attention to both the manifest content of the photographs (e.g. what they are ‘of’) and their stylistic features (framing, camera angle, focus, any filters and effects, for example). If a more detailed, structural analysis of images is required, protocols are well established in communication and media studies and include semiotic and content analysis, for example, both of which can be applied to qualitative data (see Rose (2013) for excellent introductions to these). In organizational research, these methods have been used for

analysing strategic organizational images such as advertisements, annual reports, websites, etc. and so helpful advice can be found in published articles. For good examples from accounting, marketing and HRM, respectively, see Davison, 2009; Garland et al., 2013 and Swan, 2010. However, in using these methods with participatory photo-elicitation data it is important that the participants’ meanings are not lost in favour of the researcher’s analysis and/or the contextual meanings surrounding the generation of the photographs (Wang & Redwood-Jones, 2001, p. 568). This is just one of the ethical issues that arise when incorporating a camera into qualitative research designs – how much say do the photographers, or indeed subjects of photographs, have over how their images are categorized, captioned and used? I now turn to consider ethical issues in photo-voice methods in more depth.

POINT AND SHOOT? ETHICAL CONSIDERATIONS

Despite all the opportunities I have discussed so far, we cannot escape the challenges that the immediate, powerful and evidential nature of photography also brings – particularly with regard to its instantaneous identification of people, places and of course organizations. Coupled with the conservatism and power of ‘new ethical bureaucracies’ (Boden et al., 2009, p. 728) that grant project approval in research institutions (such as universities, funding councils and public sector bodies, e.g. the NHS in the UK), it would be tempting to think it too problematic to even ask to use photography. When I run researcher development workshops on the use of photography, it is questions of ethics that are most commonly raised, but these revolve around well-established concerns: consent, anonymity, safety, and respect for the individual – to name the most common ones. However, the approach I take in this

section is that we must not overlay the idea that photographic methods are intrinsically more ethically problematic than any other qualitative method.

The Challenges of Ethical Bureaucracy

Wiles et al. (2012) conducted empirical research to explore current practice with visual researchers working in UK universities and found strategies of ‘creative compliance’ were used to obtain ethics committee approval (Power, cited in Wiles et al., 2012, p. 4.2). In their dealings with research ethics committees, Wiles et al.’s (2012) participants either reported (1) normalizing the issues raised by visual methods as being no different to any other qualitative method; (2) making a case for the peculiarities of visual methodologies arguing they should be treated differently from the assessment of other qualitative methods; and/or (3) presenting a version of the research process that bore only loose resemblance to how the research was actually carried out in reality in order to secure ethics committee approval. These findings suggest that despite increasing institutional control, visual researchers *are* finding effective ways to retain professional judgement over how to design ethically sensitive field studies that treat participants with respect and care and ensure ethical regulations do not scupper the progression of visual research. Vince and Warren (2012) noted that practice-based protocols for the ethical conduct of photography-based management and organizational research had yet to emerge, echoing concerns raised by Wiles et al. (2008) about visual ethics in the social sciences more generally. Around the same time, the International Visual Sociology Association (IVSA) drew up a code of ethical conduct for researchers (Papademas & IVSA, 2009) and this is an invaluable guide when preparing grant applications or designing research, particularly where a committee

or review board will pass judgement on the ethical aspects of a project. The following sections focus in more detail on the two major issues researchers might need to consider in more depth when using photography as opposed to more traditional interview or observation based methods.

Consent, Safety and Harm

As in all social research, subjects should be asked whether they agree to being involved in the project. In that regard, photographic research is no different from more traditional qualitative research with participants signing a consent form.¹³ In photographic research, this equates to two elements: (1) consent of the participant undertaking the photography task (and particularly obtaining their permission for the researcher to use their photographs in publications) and (2) consent of people likely to be, or actually photographed – whether they mind being photographed, with the option of having their identities concealed if they wish. However, where does the need to gain consent begin and end? In the first instance, consent is fairly clear-cut, but things are more complex in the second scenario. Is it enough to just ask the study participant? How about people who might inadvertently be captured in photographs without their knowledge? How could they be consulted as to their willingness to be involved? With the above in mind, the *in-Visio* network referred to earlier in the chapter has assembled multidisciplinary links, papers and video case-studies on the ethics of visual research – and particularly photography. This resource is intended as an inspirational collection of advice and sensible debate in order to overcome the common perception that the issues involved are insurmountable, and is an excellent source of authority to which organizational researchers can make reference when preparing their applications for funding or institutional ethical committee approval for their visual research projects. These include

examples of ‘disclaimers’, text for writing statements to allow participants to ‘opt out’ of certain research activities, media release forms and guidelines for responsible photography.

Respect for the Individual

Given that most photographic research is now digital in nature (even if print based, the images need to be scanned to be stored on computers or used in publications), it is important to consider data security, especially when using cloud storage or file sharing systems such as Dropbox or Google Drive. Project-specific advice can be sought from the UK Data Archive (www.data-archive.ac.uk/) but there are some generic security precautions that apply to all projects, such as password protecting files and using an encrypted file transfer service where available. The rest of this section deals with what Langmann and Pick (2014) refer to as the balance to be struck between the dignity of the research subject and the institutional demand for de facto ethical practices in every case, such as requesting consent or ensuring anonymity. They usefully distinguish between ‘dignity-in-context’, ‘dignity-in-process’ and ‘dignity-in-outcome’ to delineate the differing issues that might arise at the time of photographing compared with later viewing (*ibid.*, p. 710). Dignity-in-context stresses a ‘cultural and relativistic’ sensitivity to involving participants in how, when and where they will be photographed (or asked to make photographs) and dignity-in-process reminds us that ethical issues should be ongoing conversations (*ibid.*, p. 713). Scarles’ (2013) investigation of the ethics of tourist photography is also a useful resource in highlighting the power dynamics and explicit negotiation that photographers and subjects enter into, set against more covert photographic practices. Dignity-in-outcome (Langmann & Pick, 2014, p. 712) refers to the extent to which research processes impact

upon participants after the research has ended (either positively or negatively), e.g. the capacity for photo-voice type projects to bring about social change as critiqued by Wang and Redwood-Jones (2001), and considering how publishing an image may impact on its photographer and/or subject’s life and relationships. Given the ease with which digital images can be manipulated through blurring, cropping or covering identifying features within a photograph, it is perhaps tempting to think these should be used in all cases. However, Allen’s (2015) thought provoking article problematizes this by arguing that removing the heads and faces of photographic subjects can be dehumanizing, reduces the agency and/or voice of the photographer and their subject, and for certain research agendas can reduce the utility of the data since facial expressions and visual identities are part of the data analysis. However, she concludes by reiterating the need for an ethics-in-situ and accepts that impoverished photographs in research are better than no photographs at all.

CONCLUSION

In sum, the state of the ‘visual research’ field has changed greatly over the past ten years (Davison et al., 2012) leading to a growing corpus of methodological critique for contemporary organizational researchers to draw upon. This chapter has given an overview of the major fault lines in debates around the use of participative ‘dialogic’ (Meyer et al., 2013, p. 513) photography in qualitative organizational research and slowly but surely more empirical studies using photographic methods are being published with increasingly analytical reflection and exciting social and technological vistas opening up for future research (Favero, 2014). The early twenty-first century saw a revolution in the role of photography in social life – particularly among younger generations – from

documenting events, to using photographs in everyday communication, particularly ‘selfies’ (Iqani & Schroeder, 2016; Richter & Schadler, 2009; Uimonen, 2013). Organizations are not immune from such developments; they are made up of the people who are embracing these technologies and new visual cultures (Rettberg, 2014), and so need to become more visually astute in their practices in order to appeal to markets, clients and target audiences who increasingly expect to be engaged with in this way. Furthermore, it is organizations and their actions that fuel and enable the circulation of images in a myriad of forms, e.g. it is now *de rigueur* for firms to have Facebook pages, Twitter accounts and YouTube channels in addition to the ‘old-fashioned’ website (Leonard, 2014), which itself has changed dramatically over the past ten years (Elliot & Robinson, 2014). Perhaps more significantly is the manner in which organizations’ stakeholders expect to be able to interact with the firm, sharing images and videos of themselves using – and even unboxing! – products on social media (Buist, 2014) helping to co-create the value of brands and engage in viral marketing in ways increasingly uncontrolled by the firm (Price et al., 2008; Rokka and Canniford 2016). Of course, this interaction is not always positive for the company or its brand and the management and reconciliation of visual social media with the firm’s desired brand identity is a significant issue (Bell & McArthur, 2014). All these developments suggest a vibrant and fascinating future for qualitative organizational researchers wishing to incorporate photography into their research practice, either as an object of study in itself or as a method to excavate meaning in any research project. Technology changes fast and this is not a reason to shy away from innovative methods, but instead to find ways of incorporating new media into our existing practices in a manner that helps us generate richer, more useful and perhaps different data than we might be able to with our existing arsenal of qualitative methods.

Notes

- 1 I am indebted to the anonymous reviewer and Prof. Gina Grandy for their extremely helpful comments on earlier drafts of this chapter. I would also like to thank the hundreds of students and researchers who have taken part in my workshops over the years whose questions and experiences have continually shaped my thinking into what you are about to read here.
- 2 Throughout the chapter I use the terms photographs and images to refer to different aspects of the visual research process. Where I use ‘photograph’ it is to refer to a specific attribute of photography or to the photograph as object within the research process. I use the term ‘image’ where the discussion refers to visual qualities that are not medium-dependent. That is, where the important point is with the *visual character* of photographs rather than the fact they are photographs (and not drawings for instance).
- 3 Several excellent texts exist for the analysis of strategic images including Kress and van Leeuwen’s (2006) *Reading Images: The Grammar of Visual Design*, Rose’s (2013) *Visual Research Methodologies* and several contributions to the *Routledge Companion to Visual Organization* (Bell et al., 2014).
- 4 In order to better convey the constructed, subjective character of participatory photography, throughout the chapter I use the terms ‘make’ and ‘making’ instead of the more usual verb ‘to take’ (Warren, 2002).
- 5 Publishing photographs as part of my article was not a problem for *Organization Studies*, for example (except they insisted on captions), and there are a number of articles in *Organization and Consumption, Markets and Culture* featuring photographs (e.g. Garland et al., 2013; O’Guinn, 2015) and special issues on the visual have recently been commissioned by *Accounting, Auditing & Accountability Journal* (2009), *Qualitative Research in Organizations and Management* (2012) and *Organizational Research Methods* (2016).
- 6 The *inVisio* website also has a useful guide to technical and practical issues for novice researchers <http://moodle.in-visio.org>.
- 7 To gain a feel for what’s possible in this regard, see Widder (2016) for a review of current ‘selfie apps’ that fine tune and alter images.
- 8 All names in this chapter are pseudonyms to protect the identity of the research participants.
- 9 Selected from my collection of images made during research on fun workplaces.
- 10 Langer (1957) was writing about the arts and in particular the performing arts but her arguments

remain plausible for photographs too given their similarities as performances.

- 11 This is also usually the case when I run research methods workshops on reflexive photography with all levels of student and researcher.
- 12 I mention this to show how receptive high ranking journals are becoming to visual research reports.
- 13 See www.moodle.in-visio.org for examples of consent forms and other supporting documents for ethical visual research practice.

Drawing

Jenna Ward and Harriet Shortt

INTRODUCTION

Visual images are one of the most powerful, versatile and egalitarian forms of communication in both modern and historical society. Drawing was the first form of communication used by all known human cultures, predating written language by thousands of years. Yet, despite drawing being engrained in the foundations of our social, technological, cultural and language systems and therefore, an arguably innate human activity, it is uncommon, if not unusual, to see them used in organisational, business and social research. Methodological pluralism in organisational research has indeed expanded and deepened our understanding of the relationships, correlations and appreciations of a variety of business and management issues. And yet, with respect to the research of lived experiences of work and organisations that reflect participant's feelings, reflections and stories, interviews, of one variety or another, remain hegemonic. In 1982, Faulkner stated in relation to researching human subjects that the

'complexity of design and analysis has far exceeded complexity (and innovativeness) of data collection' (1982, p. 72).

There are, however, some exceptions to these general observations; more recently there has been something of a 'visual turn' in social and organisational research (Banks, 2001; Kara, 2015; Mitchell, 2011; Pink, 2007; Rose, 2012; Stanczak, 2007) with a number of scholars turning to a variety of visual methodologies to explore aspects of social life and lived experiences, often with difficult to reach or vulnerable groups. In this chapter, we briefly explore this 'visual turn' to consider the variety of ways in which these scholars are engaging with methods that involve something other than cognitive, verbal responses. Whilst there have been developments in the breadth of visual methods utilised there is a continued paucity of projects that make use of drawing as a method of research. Specifically, here we are referring to participant-produced drawings (Guillemin &

Drew, 2010; Kearney & Hyle, 2004; Kirkham et al., 2015; Vince, 1995).

Upon that basis, we turn the focus of our attention in the remainder of this chapter to exploring the disparate extant literature that has employed participant-produced drawings as a research method. In particular, we focus on the literature from healthcare, education and art therapy to trace the origins of this marginalised method of enquiry. By drawing together the literatures and methods being developed in a number of disciplinary silos, we present a range of processes and practices in relation to the use of participant-produced drawings before turning to a discussion of some of the observed benefits and challenges to these methods of research. On the basis of our critical review of the use of participant-produced drawings, we offer our thoughts on the likely future developments in their use in business and management research. Let us begin, then, with a turn to the visual.

THE 'VISUAL TURN'

Research that adopts constructionist approaches assumes perceptions of everyday life are multi-layered, complex and individual and is therefore concerned with appreciations of subjectivity. This understanding of the world often gives way to collaborative studies where research is conducted *with* those that are *part* of the investigation. Methods employed within these types of research project often include ethnographic approaches, action research or narrative methods. Importantly, the validity of these research designs lie in authenticity and fairness (Lincoln & Guba, 2003), plausibility and criticality (Golden-Biddle & Locke, 1993) and, as such, are frequently linked to studies involving difficult to reach or vulnerable groups, the less powerful members of society and organisations (Easterby-Smith et al., 2012, p. 53), communities and stakeholders.

Over recent years, studies in business and management have developed approaches so

that they too might include these participant voices and stories to present and represent those they work with. Bell and Davison (2013) outline this shift and document that the move away from more positivistic research methodologies was broadly through the 'linguistic turn', which brought a 'major shift in 20th century thought, seeing language as constituting meaning and reality' (2013, p. 169). Nevertheless, they further debate that this privileging of language and narrative has now 'gone too far' and what our field faces is the 'under-explored' opportunities that *visual* methodologies may provide in accessing the voices of the over-looked.

It is the 'visual turn' in social and organisational research that is growing to be an accepted and indeed vital way in which these participant voices and stories are raised and heard (Banks, 2001; Kara, 2015; Mitchell, 2011; Pink, 2007; Rose, 2012; Stanczak, 2007). Amongst advocates of the visual, Guillemin and Drew (2010) define these methodologies as those that both empower and enable, be it through the use of drawings or photographs, material objects or collage. These methods make space for inclusion. Of particular note, the visual turn in business and management research has recently seen a variety of management journals publish research with both photographic images and drawings included and publish a number of 'visual' special issues (see, for example, Stiles, 1998, 2011; Ward & Shortt, 2012; Warren, 2002, 2005, 2008). Investment has been made by the ESRC for a funded series of *'inVisio'* (International Network for Visual Studies in Organisations www.in-visio.org) workshops/ seminars (2008–9), as well as an RDI (Researcher Development Initiative, 2010–12) project to advance the use of visual methodologies in the field of business and management research and build a solid foundation from which existing and future researchers can build their work.

Visual methods in management research is certainly growing and gaining pace, but within this particular field we find that a

bias and a hierarchy of visual methods has emerged. In the visual studies that are evolving, it is often photographs and photography that appear to attract researchers. Perhaps this is due to the ease with which technology makes this method accessible or perhaps it is connected to the visual culture in which we are immersed, but whatever the reason some find this photographic dominance problematic. Emmison and Smith (2000, p. 2) argue that 'the major impediment to the development of a vibrant research tradition in visual research' has been the focus on photography whilst other visual methods such as collage, textiles and crafting, and drawing require equal attention. Indeed, participant-produced drawings in organisation studies are rare to find. Consequently, the method continues to require development in key areas such as ethics and analysis, which are vital in building acceptance, in terms of authority and standing in the methodological domain, and ergo a more widespread use of the method. We examine some of these challenges later in the chapter.

That said, in the broader landscape of qualitative methods, participant-produced drawings hold unique potential for the business and management researcher. Rich, deep discussions can be accessed by providing participants with opportunities to recount events without a reliance on words alone. Emotions and emotional narratives are accessed through drawings, and consequently this method often allows researchers to explore sensitive or difficult topics within their studies. In addition, drawings allow researchers to address a variety of power dynamics within the researcher/participant relationship, something that is not often or easily addressed in other research methods. We will explore these benefits later in the chapter but first, in order to understand how we might encompass participant-produced drawing more readily in our repertoire of constructivist and visual inquiries, we need to turn to alternative disciplines. We begin this process with a focus on drawing's legacy in art therapy.

DRAWING

In our experience, the moment you mention drawing in the context of research you get one of three reactions: 'I can't draw!', 'I haven't done this since I was at school!' or 'What are you going to make of my deepest, darkest thoughts?' Despite these comments being light-hearted jibes, they represent the very important and often over-looked legacy of art therapy's experimental use of drawings as a method of psychological and emotional analysis and treatment. With this in mind, we felt it important to briefly review the history of drawing in the context of the discipline of art therapy before moving on to explore the disparate extant literature on drawing as a 'research method' per se.

Art therapy is a relatively new discipline. It emerged during the Second World War, when artist Adrian Hill, began to use his art to alleviate the boredom of the institutional regime. Consequently, other patients began to draw and paint their war experiences. The horrifying scenes of human suffering, violence and destruction created by these war veterans became vehicles for dialogue about their experiences, pains and fears (Waller, 1984). Hill (1945, 1951) went on to campaign on the importance of art in therapeutic settings. In 1946, Netherne Mental Hospital in the UK employed Edward Adamson as the first art therapist; however, it was not until 1980 that professional training standards were established. Art therapy is now defined as 'the use of art and other visual media in a therapeutic or treatment setting' (Dalley, 1984, pp. xii–xiii).

Given its comparative infancy as a therapeutic practice, art therapy has become increasingly popular, particularly with hard to reach groups (Laing, 1984; Riley, 1999); sensitive topics (Malchiodi, 1999) and with those who are less verbally literate, e.g. children (Diem-Wille, 2001), disabled (Stott & Males, 1984) and the geriatric (Miller, 1984). According to Fuller (1984, p. ix) 'the theoretical assumptions underlying art therapy have sometimes seemed vague and ill-defined',

which has led to a wide-ranging set of practices being developed on a global scale. Despite such a plurality of practice, there is no dispute that in one way or another art therapy has its theoretical origins in Freudian thinking, particularly Freud's distinction between primary and secondary processes, i.e. that art is a form of non-verbal communication (Freud, 1973). This has led to the use of art in psychologically therapeutic settings and processes to be used as a diagnostic tool, in that art produced or interpreted by patients give psychoanalysts a pictorial representation of their unconscious emotions and state of mind. Psychoanalytical approaches, including clinical psychology, to drawing and art, are underpinned by the belief that they facilitate access to a deeper, more emotional side of an individual's thoughts and actions (Diem-Wille, 2001). Those who work from this perspective see the patient-produced images as material for objective interpretation and analysis by Freudian and Jungian specialists (Reitman, 1950). In a comprehensive review of projective techniques (e.g. Rorschach Inkblot Test, Thematic Apperception Test and human figure drawings (Adler, 1970)) used in clinical and forensic settings, Lilienfeld et al. (2000, p. 27) are at pains to point out 'a curious discrepancy between research and practice' in that these techniques lack empirical support in relation to validity, reliability and utility, but are consistently popular in clinical practice. Such controversies surrounding these psychoanalytic projective techniques no doubt contributed to a theoretical and practice-driven split in the way art therapy was being thought about and practised in the UK and US in the late 1980s.

Riley's (1999) and Dalley's (1984) seminal texts demarcate classical art therapy (discussed above) which is a more common approach in practice in the US, and post-modern approaches that are being developed and practised particularly in the UK. Post-modern approaches to art therapy are underpinned by a social constructionist epistemology. Here then, art continues to be seen

as a 'potent way ... to communicate conflicting emotions and confusing questions of identity' (Malchiodi, 1999, p. 11). However, the emphasis is placed on the artistic process as a method of tapping into 'natural creative potentials to problem solve, to restore and repair the self, and to forge a meaningful therapeutic connection' (ibid.) to the therapist through the medium of the images via a process of transference (Freud, 1951). Importantly, the distinction lies in the way the images are perceived and analysed. Classical, psychoanalytic approaches to art therapy see drawings as a method of diagnosis through the objective analysis or pathology of the images produced by the patients. Post-modern, socially constructed, appreciations of art therapy view the production of the images as therapeutic to the patients whilst simultaneously working as an additional lens through which the therapist can 'get to know' the emotional and psychological sense-making processes of the patient. Sir Thomas Burton's articulation is neat in this regard:

It is not the therapists who tell the patient what to draw, or what has been drawn, for they are not interpreters of dreams, like Moses, but rather mouthpieces for the patient, leaving it to the patient to describe what he or she feels or has expressed. (Burton, 2005, p. xxi)

It is perhaps unsurprising given drawing is the foundation of art therapy, in one form or another, that its development into a research method has been seemingly most popular in health (Cross et al., 2006; Guillemin, 2004; Guillemin & Drew, 2010; Kirkham et al., 2015; Morgan et al., 2009) and education contexts (Kearney & Hyle, 2004; Muñoz et al., 2011; Ward & Shortt, 2012). Although 'drawing' as a research method has been undoubtedly most popular in health and education research, it remains a secondary or supportive research method. Even the strongest advocates of the method argue that it is 'best used in conjunction with other research methods' (Guillemin, 2004, p. 287). Reading across studies, much of this insecurity stems from issues of analysis and our continued

Figure 16.1 Drawing to record experiences

‘reliance on words for analyses of visual research methodologies’ (ibid.). We will return to issues of analysis later in the chapter; however, before we do it is also important to reiterate that drawing as a research method is very much in its infancy, in that there has been limited use of it being adopted across disciplines, not least in business and management research. Interestingly, Guillemin (2004, p. 274) makes a poignant observation regarding the legacy drawing and the arts have in therapeutic contexts. Namely, she argues by using drawings to diagnose and treat those who are ill, disabled or unable to, or proficiently, communicate verbally, they have taken on a negative association with those outside of the health and psychology disciplines. Essentially, this argument implies that the therapeutic potential of drawings is perceived negatively, or carries a stigma (Goffman, 1963), in so-called ‘healthy contexts’. Another significant drawback to the propagation of drawing as a research method

has been the diversity of approaches to the actual processes and methods of analysis used. It is to these issues that we now turn.

DRAWINGS IN BUSINESS AND MANAGEMENT RESEARCH

Although the use of drawings in business and management research is relatively rare, where they have been used we can see a variety of useful approaches that have been developed by organisational researchers for a number of reasons. For example, drawings can be produced by researchers themselves, within the field, in order to record personal experiences or as an aide memoire. Acevedo (2015) frequently uses sketch pads, notebooks and felt-tip pens to visually record and represent personal interpretations of conference papers, thoughts and ideas during fieldwork, and personal reflections on her work (Figure 16.1). Much the

same as Chaplin's work with photographs (2004), drawings used in this way can help to develop a 'visual diary' that usefully records the researcher experience.

Other researchers, whilst embracing a more realist ontology, might draw in order to depict and record organisational or social events and activities. For example, during Shortt's (2010) doctoral fieldwork that explored the spaces used by hairdressers in hair salons around the UK, she often recorded spatial maps and the movements and spatial practices of those who worked there (Figure 16.2). In a similar vein, Heath and Cleaver (2004) explore the use of space within shared household life. During their discussion of the visual methodologies used in the research, they include sketches of the living spaces and the context, content and layout of the houses they visited.

In recent work, drawings have also been used by researchers to overcome issues surrounding copyright and the challenges that often face visual researchers with regards to the reproduction of images. For example, in Rippin et al.'s work (forthcoming) on dress and the female professional, the authors use a visual social semiotic approach (van Leeuwen, 2005) to analyse the 1980s publication *Working Woman* magazine. As they note, 'permissions issues that arise from reproducing original media images, especially since tracing copyright holders for a thirty-year out-of-print magazine, proved problematic', thus, one of the author's 'side-stepped' this issue by *drawing* a series of sketches 'based on specific images from the magazines' (Figure 16.3).

Importantly however, Rippin et al. also identify that producing drawings in such a way allows the researcher to illustrate key aspects of an image and accentuate the parts that are felt to be most significant. This 'hand-drawn' approach to analysis and sense-making, they suggest, can be 'used as a "working-through" of possible forms and associated meanings by the researcher themselves' (forthcoming).

Thus far, from the examples above, we can see that drawings can be a useful

methodological approach for the researcher, yet in all these examples the drawings are either produced by the researcher themselves or already exist. What, then, of drawings produced by participants *Participant-produced* drawings are those images produced (often hand-drawn) by those researchers are working *with*. Participants are asked by the researcher to draw, typically using pens, pencils, crayons and paper, an image that relates to the topic in question. This participatory method, broadly asks those the researcher is working with to capture and project their experiences, feelings, emotions and thoughts onto paper in an attempt to explore and make sense of the image. For example, Guillemin (2004) asks women to draw their experience of heart disease and to 'draw how they visualized their condition' (p. 276), Cross et al. (2006) ask participants to draw their experiences of spinal injury. More specifically, in management research, Ward and Shortt (2012) explore the learning experiences of students in a UK business school, where amongst other findings the drawing method revealed a clear differentiation in the way students perceived their learning in tutorials and lectures (Figure 16.4).

PARTICIPANT-LED DRAWING: PRACTICES AND PROCESSES

Despite the relative paucity of studies across disciplines that have sought to employ 'participant-produced' or 'elicited' drawing as a research method, its disparate emergence has meant consistent and strategic approaches to the methodological procedure is often lacking. This is, however, paradoxical given most published pieces using these method predominantly describe, in quite some detail, the approach taken. Reading across the disciplines, it becomes apparent that there are three main differentiations in the way participant-produced drawing methods are employed; namely context, process

Figure 16.2 Recording Spatial Maps and Movements

Figure 16.3 Sketching existing images

and analysis. In this section we briefly review, and give examples of, the variety of ways in which these context, process and analyses can differ in the implementation of drawing research methods.

Context

As previously mentioned, participant-produced drawings are rarely, if ever, used as the primary method of data collection in a research project. Instead, they are used as either an ice-breaker activity or as part of a broader, qualitative approach. There are three main research methods to which drawings have played a supporting role; individual interviews (Guillemin, 2004; Kearney & Hyle, 2004; Kirkham et al., 2015; Meyer, 1991; Morgan et al., 2009; Nossiter & Biberman,

1990), focus groups (Vince, 1995; Vince & Broussine, 1996; Ward & Shortt, 2012) and reflective logs (Weber & Mitchell, 1995).

Asking participants to draw during an individual interview is the most common way in which drawings have been used as a research method. However, even here there are differences in technique – some researchers prefer to ask participants to draw at the beginning of the interview, whilst others prefer it as an activity to bring the interview to a close (Guillemin, 2004) arguing that by such a point the researcher will have built up a good rapport with the interviewee thereby reducing the anxiety, awkwardness or shock that might arise as a consequence of being asked to draw. Whichever approach is adopted, the use of drawing in these contexts has been said to elicit deep feelings, personal narratives,

Figure 16.4 Participant-Produced Drawings (Ward & Shortt, 2013b)

reflection and even distance (Betensky, 1995; Morgan et al., 2009) from the issues and feelings – particularly with sensitive topics (Morgan et al., 2009).

For those who have integrated drawing into small-group research designs, the uses have been two-fold; first, the drawing activity is used as an ice-breaking exercise, thereby reducing the formality associated with non-anonymous research contexts, and second, the drawings themselves stimulate conversation and discussion. Drawing in group contexts acts as a catalyst (Zuboff, 1988, p. 141) to the ‘sharing [of] collective meanings, emotions and experiences’ (Ward & Shortt, 2012, p. 439). In group settings, then, discussion is generated by the group participants and the researcher rather than by the researcher alone. This has been argued to encourage reflections that challenge the tacit assumptions held by individuals regarding particular ‘truths’. Seeing the images produced by others can also be reassuring and confidence building but also encourage critical engagement and elicit more complex, multi-faceted narratives. Finally, participant-produced drawings have been used in reflective logs (Weber & Mitchell, 1995), but this is much less well documented and proliferated. We now turn to issues of process, that is, how the method has been practically employed.

Process

Processes or techniques adopted in participant-produced drawings can also vary a significant degree. Again, across multiple disciplines we have observed three participant-produced drawing techniques being employed: structured, semi-structured and unstructured techniques.

Structured techniques provide the participant with a drawing or diagram which they are asked to populate, amend or label in response to a series of questions (Meyer, 1991). The structured approach does offer more by way of comparative applicability in that all images share a basic framework from which the analysis can begin; however, the explicit structuring of the images means that researcher involvement and influence is much greater than with the unstructured or semi-structured techniques.

Semi-structured techniques, or ‘metaphorical analogy fantasising’ (Nossiter & Biberman, 1990) essentially ask participants to represent their feelings, organisations or whatever it might be, in a particular way. For example, participants might be asked to ‘represent your firm as an animal of any kind’; in this way, researchers are partially structuring the ‘visual encoding process’ (Meyer, 1991, p. 225). Nossiter and Biberman (1990) used

this approach in a study on corporate culture, and Weber and Mitchell in exploring popular cultural images of teachers. Indeed, the usefulness of metaphor has also been extended beyond visual images to include 3D representations of identity, life histories and relationships with the social world in Lego (see Gauntlett, 2007) and other media.

Unstructured approaches are by far the most common processes adopted in participant-produced drawing methods (for examples, see Kearney & Hyle, 2004; Kirkham et al., 2015; Morgan et al., 2009; Ward & Shortt, 2012; Zuboff, 1988). An unstructured approach provides participants with a blank sheet of paper upon which they are asked to respond to a particular question. They are often explicitly discouraged from labelling or using words but are reassured from the beginning of the process that they will have an opportunity to describe and discuss what they have drawn. This process is often referred to as a 'draw and write' technique (Mair & Kierans, 2007), in that participants can be asked to turn their completed image over and write a list of five to ten words associated with the image on the reverse. Unstructured techniques arguably limit researcher involvement by empowering participants to shape the research agenda (Ward & Shortt, 2012). In this sense, unstructured participant-produced drawing methods may be one of the most egalitarian forms of collaborative inquiry.

Analysis

Data analysis of visual methodologies has been, and continues to be, a murky area in that there is no consensual framework, approach or method that has been applied universally. This has led to a divergent approach to the analysis of visual images, including photographs, cultural artefacts, video and film. We will return to some of these issues in more depth, including the impact they have potentially had on the development of drawing as a visual method later in the chapter. In this section, we set out to review one of the most comprehensive and

detailed approaches to the analysis of participant-produced drawings, as set out by Guillemin (2004), which is a modification of Rose's critical visual methodology (2001).

There are two ideologies that relate to the use of participant-produced drawings, the first being psychoanalytically informed and the second a form of collaborative inquiry. Psychoanalytically informed approaches treat the visual artefact as material to be analysed by subject 'experts' with a view to uncovering, diagnosing or treating a subject's unconscious emotions and drives. Such methods of analysis are not reviewed here as they are beyond the scope of this chapter and have not constituted a 'research method' in business and management contexts to date. The second ideological framework, collaborative inquiry, regarding participant-produced drawings, will instead be the focus of the remainder of this section.

Collaborative inquiry is argued by some to be part of a broader feminist approach to research (Morgan et al., 2009) in that its aim is to reduce or eliminate hierarchies (Campbell & Wasco, 2000) within the research process in order to empower participants to share their own personal narratives, voice unspoken feelings and emotions, and feel comfortable enough to discuss sensitive topics. In pursuit of these goals, feminist-collaborative forms of inquiry are often open to more innovative research methods such as drawing as they offer an opportunity for deeper reflections. In this sense, drawings are seen 'as a way to explore the multiple and complex nature of human experience' (Morgan et al., 2009, p. 130). They offer another way of seeing and sense-making (Weick, 1979). Key to this approach, then, are the methods of analysis used to make sense of the drawings created by the research participants.

Drawings produced as part of a collaborative inquiry method are not to be treated as visual artefacts for objective deciphering. Instead the drawn images must be interpreted by the participant or artist themselves and not by the researcher. As Guillemin

(2004, p. 285) neatly articulates, ‘the drawings are both products and processes’, they are a snapshot of how that person is feeling at a particular point in time. In drawing the image, they may come to feel or see things differently, but this can only be understood with the help of the producer of that image. This sense-making or interpretation process is often carried out verbally, either in a group setting or in an individual interview, but can be done in the form of a reflective log or draw and write style exercises. What is most important, though, is that the visual artefacts are never seen or analysed in isolation – they must inform and be informed by the voice (either written or spoken) of the person who produced the work. Within the interpretivist paradigm of understanding this collaborative sense-making process is a matter of epistemological importance. Alleviating the burden of interpretation from the researcher makes it a collaborative exercise, thereby eliminating any risk of misinterpretation. A case in point example is illustrated in Figure 16.5 from Ward’s collection of drawings elicited from a yet unpublished study of Samaritan volunteers (see McMurray and Ward (2014) and Ward and McMurray (2016) for details of the wider project with Samaritans).

Samaritans is a UK-based listening charity whose purpose is to provide a non-judgemental space in which callers can explore their feelings. They are a volunteer run organisation that help support those in emotional distress, often suicidal, self-harming, depressed, lonely or in crisis. In 2012, Ward asked Samaritan volunteers to draw in response to the question ‘How does it feel to be a Samaritan?’ Figure 16.5 is an example of one of the images elicited from this process. This image of a man with the ideographic image of a heart on his chest could be objectively interpreted in many ways ... that Samaritans need to have a heart perhaps, the fact that there is only one person depicted might be seen to represent Samaritan volunteering as a lonely experience. Yet the verbal description of this image is perhaps much

more individual, touching and expressive of what being a Samaritan volunteer is like for this particular volunteer:

I often draw the person I am talking to in the first few minutes of the call ... it makes them human ... it reminds me that I am sitting in a room and so are they. (Samaritan volunteer)

In this way, the coupling of the image with the research participant’s voice not only generates a multi-sensory impact on the reader or audience which helps in communicating just a little more of ‘what it feels like to be a Samaritan’, but it also, as we and others have argued elsewhere, brings these emotional narratives to the fore. The act of drawing allows participants to access a different type of self-knowing, or at the very least, feel more willing and able to share those often hidden, private parts of their subjectivity.

In an attempt to provide a comprehensive approach to the analysis of the drawings produced by her participants, Guillemin’s (2004) modification of Rose’s critical visual methodology framework, coupled with a thematic analysis of the participant’s visual and verbal data, is one of the only attempts to formalise an approach to the analysis of participant-produced drawings. All other studies using the method have chosen to pursue more traditional thematic analyses of the verbal data alone, supported by replications of the images being described. Guillemin (2004) replicates Rose’s focus on the three sites of meaning that can occur in visual methodologies, these being in the production of the image, the image itself and the relationship between image and audience. These are said to overlap with another three ‘modalities’, i.e. technological, compositional and social. In Figure 16.6 below we reproduce Guillemin’s modification of Rose’s critical visual methodology framework (i.e. a list of questions that can offer fruitful areas for reflection and analysis), but stress that it should be used in conjunction with a thematic analysis of the participant’s own verbal interpretations of their own images as part of a collaborative

Figure 16.5 'How does it feel to be a Samaritan?'

inquiry process. For us, a better way of thinking about the questions in Figure 16.6 is to see them as a loose interview guide for supporting and guiding participants through the analysis and sense-making process involved in discussing their own drawings in relation to the topic of research.

BENEFITS OF PARTICIPANT-PRODUCED DRAWINGS AS A RESEARCH METHOD

Why should we use participant-produced drawings as a research method? In what ways are such methods beneficial for research? And more specifically, what benefits do participant-produced drawings offer those who study *organisations*? We argue that participant-produced drawings enhance our understanding of the working worlds of the individuals and groups we research. If our aim is to collaboratively make sense of organisational life as we attempt to 'understand the phenomenon through the lived experiences of those who

live it. The aim, to represent the actor's construction of their lived experience ... to give them voice' (Thomas & Linstead, 2002, p. 76), then such a method makes this possible. Here, we suggest five core advantages to using this research method and why, when researching particular topics or settings, these methods should indeed be a necessary part of our scholarly endeavours.

The first advantage this method offers is the depth of discussion. Asking people to draw their experiences or feelings elicits rich stories, personal histories and individual journeys, and foregrounds the voices of participants. This is, of course, fundamental to constructionist claims and visual research more broadly. In particular, the stories participants tell when discussing their drawings, are commonly narratives that explore experiences over periods of time; the past, present and future are often included (Cross et al., 2006; Ward & Shortt, 2012). Such autobiographical, temporal accounts allow the researcher to delve deep into contexts and events the participant might not have been able to recount using words alone (see Weber & Mitchell, 1995). For example, by using participant-produced drawings with business school students we were able to acknowledge the temporal aspects of their learning and thus appreciate the experience of learning as fluid and dynamic (Ward & Shortt, 2012).

This takes us to the second advantage of using participant-produced drawing: the ability to access emotion. As Jensen et al. (2007) argue, 'non-rational forms of self-expression can elicit the non-verbal, tacit, emotional knowledge' (p. 359). It may not be that the drawing itself depicts emotion, as Kearney and Hyle (2004) suggest, it is in fact the subsequent narratives from participants that are emotionally charged. This is evident, for example, when researching managers' responses to change (Vince & Broussine, 1996) and in Guillemin's work researching women and their experiences of heart disease (2004). Giving participants space and *time* to draw before discussing the topic in question

arguably gives them time to provide a more considered response and one that articulates feelings and emotions rather than one that simply answers a researcher's question. Indeed, Kearney and Hyle (2004) advocate that this approach reveals 'more meaningful and honest verbal reports' (p. 380). Noted characteristics such as these are reminiscent of those rehearsed in art therapy (see Dalley, 1984). In relation to medical art therapy, Malchiodi (1999, p. 16) argues that 'art has the capacity to provide patients ... with a non-verbal voice to express both the rational and less rational beliefs about their perceptions ... 'In this sense, it is perhaps important for those who employ visual methods such as participant-produced drawings to consider what we might learn from art therapy and art-therapists (Kapitan, 2010).

Third, participant-produced drawings give the researcher the opportunity to access sensitive or difficult topics. Perhaps this is why participant-produced drawings have been used with some frequency in the field of art therapy and health and illness in order that researchers are able to discuss topics such as spinal injury (Cross et al., 2006), menopause (Guillemin, 1999), heart disease (Guillemin, 2004), chronic vaginal thrush (Morgan et al., 2009) or post-natal depression (Guillemin & Westall, 2008). Asking participants to draw something provides an outlet where they are able to articulate feelings around personal and private experiences and as Guillemin and Drew (2010, p. 5) suggest, they are able to 'express the unsayable' which, again, might not have been possible using words alone. This, in turn, leads us to our fourth advantage: by eliciting rich stories that reveal emotions and encourage a more 'affective' response and enable us to access more sensitive topics, participant-produced drawings help us move our research beyond the cognitive domain.

Fifth, participant-produced drawings allow us to address power dynamics. Traditional positivist management research can often be driven by the political interests of those in positions of power, yet in the case of

Production of the image:

- The context in which the image is produced
- When was it made?
- What events preceded the drawing, both in terms of the participant's condition and the relationship established between participant and researcher?
- Where was the image made?
- Who drew the image? Was the participant able to draw the image her- or himself, or was assistance required?
- What was the response of the drawer to the request to produce the image?
- What are the relations between the drawer and the subject of the image?

About the image:

- What is being shown? What are the components of the image? How are they arranged?
- What relationships are established between components of the image?
- What use is made of colour? What colours are used? What is the significance to the drawer of the colours used?
- What do the different components of the image signify? What is being represented?
- What knowledges are being deployed?
- Whose knowledges are excluded from this representation?
- Is this a contradictory image? (to other data collected, for example in interviews)

Relationship between image and audience:

- Who was the original audience for this image?
- Where is the viewer positioned in relation to the components of the image?
- What relation does this produce between the image and the viewers?
- Is more than one interpretation of the image possible?
- How is it redisplayed?

Figure 16.6

Source: Guillemin, 2004, pp. 284–5

constructionist, collaborative research, relationships with participants differ and we are able to access marginalised groups or those who are often powerless. As Packard (2008) argues, visual methodologies rebalance the

power dynamics between the researcher and participant(s), and since the pen (or camera) is in the hands of the participant, we are able to 'bridge the gap' between the two parties and shift authority away from the researcher. This in itself emphasises a point made in Lincoln and Guba's discussion on validity as authenticity within constructivist research whereby the 'authenticity criteria', they suggest, has 'strong moral and ethical overtones' (2003, p. 278).

Furthermore, as drawings are often used as part of a face-to-face interview, where the drawings are made by participants and an interview then conducted in order to explore why the participant drew that particular image, what it means to them, what it represents, how it makes them feel and so on, the drawing itself acts as a third party within this discussion. Both researcher and participant are usually looking at the image, exploring and examining it together. As an artefact then, the physical drawing becomes the focus and once again we see a 'redistribution of power' (Shortt & Warren, 2012, p. 24) between researcher and participant as the *participant* describes the image. Indeed, as Ward and Shortt (2012) found, the use of drawings within interview settings allows participants to shape their own agenda and direct the conversation according to their own feelings, reflections and responses to their drawings.

Outlined above are five benefits of participant-produced drawings; however, they are inherently connected by their overarching concern for enabling and empowering participants and, to a certain extent, researchers themselves (Gauntlett & Holzwarth, 2006; Guillemin & Drew, 2010). One final consideration in relation to the benefits of the use of participant-produced drawings, is perhaps to participants themselves. As researchers of organisations, business and management seek to dig deeper beyond the surface of 'logics of representation' (Czarniawska, 1999) or 'officialisations' (Bourdieu, 1990) to explore the messy, emotional and often challenging narratives and experiences that reside below the surface and yet are central to organisational

life, we perhaps need to consider an ethics of care (Ward & McMurray, 2016) and responsibility regarding the emotional welfare of our participants (see <http://visual-sociology.org/about/ethics-and-guidelines.html> and <http://eprints.ncrm.ac.uk/421/1/MethodsReviewPaperNCRM-011.pdf> for more information on ethics and the visual). If we want them to open up about their emotions and feelings, we need to be prepared to handle them in empathetic, sophisticated and considerate ways (see Taylor and Statler (2014) for commensurate links to the practices of art-therapists). The documented therapeutic nature of art might be one way in which we can seek to support our participants through difficult times or experiences. As Malchiodi (1999, p. 15) states, 'opening up through self-expression can help people explore, release, and understand the source of emotional distress, ameliorate and alleviate trauma, and repair and resolve conflict'. This is not to say that participant-produced drawings are without their challenges. In this next section, we outline a number of challenges researchers seeking to employ these methods should be aware of.

CHALLENGES OF PARTICIPANT-PRODUCED DRAWINGS AS A RESEARCH METHOD

What challenges and issues should researchers seeking to employ participant-produced drawings as a research method be aware of? And more specifically, what challenges do they present for those studying *organisations*? Here we suggest five core challenges to using participant-produced drawing methods.

First, participant's fear and insecurities regarding their graphic aptitude is always going to be a feature of drawing as a research method. Some have argued that such fears act as a barrier to engagement (Kearney & Hyle, 2004; Stiles, 2004) whilst other have argued that drawing creates anxiety within

participants (Guillemin, 2004; Morgan et al., 2009). Morgan et al.'s (2009) study of women's experiences of chronic vaginal thrush revealed that in that context participants felt drawing exposed more of themselves and their lived experiences than the spoken word. In this sense, it could be argued that drawing involves a greater perceived risk for research participants than other verbal methods. It is for these reasons that researchers implementing these methods need to do so with care and sensitivity – continually being mindful of where and when individual participants are feeling particularly uncomfortable or challenged.

Second, drawing methods and the related approaches to analysis rely heavily on the spoken word of participants. Often, the primary empirical data for analysis and theory building are the verbal accounts elicited via the process of drawing. In that way, drawings play a supportive role to verbal cognitive data. Prosser (1998) goes so far as to argue that images are used to just break up written data, whilst Harrison (2002, p. 859) questions what visual methods provide that is different to or unavailable through words. Perhaps these types of critiques are rooted in a more well-versed challenge to visual methods, which relates to the scarcity of a formalised consensus on approaches to analysis.

Earlier we outlined a number of ways in which different research teams have approached their analysis of visual methods, but this continues to be something of an emergent and individualised approach. Thus, coupled with the continued dominance of positivistic epistemologies underpinning business and management research and organisational thinking, – drawing stands in stark contrast to the manipulatable, manageable, calculable and modelable quantitative data employed within this paradigm. Yet, as we discussed previously, perhaps the visual turn and growing number of studies embracing visual methods more broadly will, in time, redress this balance.

The fourth challenge that belies drawing as a research method in business and management contexts is, perhaps controversially, its

therapeutic legacy. It has been suggested elsewhere (Guillemin, 2004, p. 274) that drawing in a research context has potentially been stigmatised by its association with therapeutic or diagnostic methods employed in fields of clinical psychology or learning development. Drawing's long-standing association with children, those with learning disabilities and mental health conditions has perhaps tainted its use as a research method in non-health and education contexts, particularly business and management research. The extent to which this is a sensible analysis of the situation remains unclear; however, it does flag-up a related point that we have touched upon above. Drawings are argued by many to be a route to accessing emotions and feelings (Cross et al., 2006; Guillemin & Drew, 2010; Kearney & Hyle, 2004; Vince, 1995) – therefore researchers choosing to employ drawing as a method of research need to acknowledge, be mindful and be prepared for the emotional responses and reactions of participants. They may elicit great data in the form of the visual image and accompanying narratives, but ethically caring and managing that emotional process is a significant responsibility. This raises the broader question as to whether business and management researchers are qualified and prepared for the potential emotional and emotive responses that might be elicited by participant-produced drawing as a method of research. A challenge as significant as this may be usefully seen as a call for action, in relation to research that seeks to explore emotional, difficult and challenging aspects of organisational life, in that business and management scholars may require further support or training in developing the skills to responsibly and ethically cope and manage their own emotions and those of their participants. Perhaps there is scope in considering interdisciplinary collaborations with art therapy?

Fifth, is the pragmatic management, handling and publication of this type of data. Where participants are asked to apply pen to paper, researchers face the challenge of having to manage and store these original pieces

of artwork in their physical form. This is set against a backdrop of recent technological reform in data capture, handling, storage, privacy and analysis techniques. Hand-composed drawings require photographing and integrating into the transcriptions of the verbal data to which they purport. This can be a long and arduous process and few transcribers are used to or skilled in the transcription and integration of arts-based methods. With respect to the publication of visual images, including drawings used to be a significant issue in the dissemination of research findings, as academic journals and book publishers deterred or prohibited researchers from including drawings or images because of the associated cost. However, with the increased, if not ubiquitous, use of electronic publication platforms, this challenge has essentially been mitigated, making academic journals some receptive to alternative data.

CONCLUSION

Business, management and organisational research has been reluctantly receptive to the incumbent 'visual turn', particularly in relation to photography. Other visual and arts-based methods, however, have received comparably less attention and use within the discipline. At the same time, certain strands of organisational research have come to focus their efforts on exploring the complex, messy, dark, emotional and human experiences of work and employment contexts. Yet, perhaps paradoxically, such intellectual projects have, in the main, continued to employ 'traditional' research methods, i.e. participant observations and semi-structured interviews. In relation to future developments in the continuation of work that seeks to push deeper in explorations of the nature and texture of work, it is worthwhile for researchers to consider the use of arts-based and visual methods – in particular – drawing. We call for business and management research designs to be more confident in their

employment of drawing and acknowledge the benefits of this research method, as we have done, when exploring the human side of organisational life.

In terms of the future of drawing as a research method, what is apparent and inevitable is the transformation and evolution of methods through technological development. Being able to capture participant-produced drawings on tablets, for example, might enable researchers to capture and integrate images directly into transcripts and other data analysis packages, e.g. NVivo. This may well make the method more efficient and could even mean that participation could be widened geographically. For example, focus groups could be run virtually with drawings streamed onto the researcher's own tablet for viewing and discussion. However, decisions regarding the use of these types of technology also need to be counter-balanced with what they take away from the process, e.g. the physical and embodied act of drawing with a pen/pencil and paper, being able to fold the paper, scribble out without erasing, etc. Just as Edwards and Hart (2004) argue in their discussion of the materiality of photographs, examining how the material aspects of an image is integral to their meaning and use, and Taylor and Statler's (2014) thought-provoking exploration of the impact the medium of art (e.g. clay v Lego) used in therapeutic and education contexts has on the emotional energy of the patient or participant, are key reminders of just how important our choices of materials and mediums are in our research design. Particularly for researchers exploring the darker sides of organisational life, it is important to remember our responsibilities both to ourselves as researchers but also to our participants. Digging too deep can sometimes be painful, wearing and long-lasting.

Finally, drawing as a research method in business and management has the potential to help bridge disciplinary silos. In our pursuit to understand more about the complexity, darkness and lived experiences of work and organisational context, we have a greater duty of care to responsibly work through our own and also our participant's

difficult emotions. Perhaps, in recognition of this responsibility it is time to acknowledge that we might not have the expertise or experience to offer sufficient emotional support. Instead, art-therapists, councillors and other professionals with such expertise might be useful co-investigators to business and management researchers seeking to move beyond the surface or work and organisational life.

Whatever the future might hold for research into business and management contexts and issues, we would hope to see more researchers having the confidence, expertise and energy to explore a range of alternative visual and arts-based methods such as drawing.

Analysing Web Images

Katrina Pritchard and Rebecca Whiting

INTRODUCTION

Having been relatively neglected in business and management research there is now increasing interest in researching the visual in a variety of forms. Within business and management, visual research has been used to analyse the way in which organizations use images, particularly in formal reporting (for example, Davison, 2010) and, via participatory approaches, as a means of exploring the experience of day to day work across a range of organizational contexts (for example, Shortt & Warren, 2012).

Within the confines of this chapter it is not possible to provide an exhaustive or even extensive review of the burgeoning literature on visual analysis in general. There is a wide range of useful resources which offer advice and guidance on different approaches, including many excellent books and journal papers (see, for example, Acevedo & Warren, 2012; Bell & Davison, 2013; Davison et al., 2012; Margolis & Pauwels, 2011; Meyer et al., 2013).

Researchers have also considered the importance of the internet to contemporary organizing and recognized that understanding how organizations use the internet (in recruitment, marketing and research activities, for example) has the potential to offer insight into many areas of concern to business and management scholars. The specific relevance will of course vary between different research topics and approaches. Some researchers may want to focus on organizational use of the internet, while others might be interested in employees' online commentary on organizational life. However, it is also apparent that the internet represents a critical communicative context for understanding organizing as an emergent activity that also takes place outside traditional work places. Web images are of relevance to researchers interested in any and all of the above, not least because they are integral to much internet usage.

However, to date, business and management studies of the web have largely focused on textual rather than visual aspects of the

internet (Pauwels, 2011). Perhaps similarly to the way in which the embodied experience of an interview is often reduced to a textual transcript, so engagement with the internet via web interfaces has often been reduced to an analysis of the textual components. Given the ever-increasing visualization of web media (see Hodgkin, 2016 for examples of 1990s websites for comparison), it is becoming harder to ignore the volume of data discarded when such an approach is applied. Despite extensive exploration in other fields, web images are not commonly investigated within business and management research and there is correspondingly less discussion of their analysis (Bell & Davison, 2013; Emmison et al., 2012).

While there are many similarities with other forms of visual analysis, there are also important differences for the researcher to consider. In particular, the variety and fluidity of web images create particular research challenges (Pauwels, 2011), especially when considered alongside moves towards quantitative 'big data' (Dutton, 2013) understandings of the web. Such moves are of course themselves producing new forms of web imagery (see www.keywebmetrics.com/2013/07/big-data-visualizations/ for examples as varied as plate tectonics to the evolution of crayons).

After discussing the broad methodological issues in the early sections, later in this chapter we use examples from our own research (Pritchard & Whiting, 2015) which explores constructions of age at work, to provide a more detailed explanation of our experience of analysing one form of web image, the stock photograph. Used widely across the web and across a range of organizational processes, these images are potentially influential in the (re)construction of understandings of age and ageing at work. While there are inevitable limitations in focusing on one particular form of web image, this does allow us to explore more specific methodological issues so that readers can then adapt and apply these to their own research contexts. Therefore, drawing on our own experiences we offer some

preliminary guidance for researchers in this area while recognizing that the internet is a constantly evolving and sometimes unstable research context which requires re-appraisal in each new research encounter. Before this discussion, we first consider the research opportunities offered by web images.

WHY SHOULD BUSINESS AND MANAGEMENT RESEARCHERS BE INTERESTED IN WEB IMAGES?

As highlighted previously, the internet has become a prominent part of contemporary life (Kiesler, 2014) and the web has become a key area of business and commercial activity. In addition to companies that provide internet services (such as, for example, Google, Facebook and Twitter), many organizations use the internet to recruit employees, promote their products, orchestrate brands, obtain customer feedback and gather data related to their commercial activities (Loader & Dutton, 2012). In this way internet usage has become embedded in key organizational processes which may involve the use, circulation and consumption of web images.

In a wider context, topics of relevance to organizations and organizational life also feature in debates and discussions on various web media as groups and individuals engage with the internet to debate, promote or campaign with respect to management issues (Muralidharan et al., 2011; Waters & Jamal, 2011). Again, images are embedded in such debates. Take, for example, debates regarding the future of the Port Talbot steel works in Wales in 2016. Coverage on a range of social media and news websites includes still and moving images of the plant at sunset, aerial photos of the area, pictures of protestors and banners, photographs of gleaming steel products and grimy furnaces along with individual photographs of key players in the government and industry (e.g. Kelsey, 2016; White, 2016). Various infographics, maps and other forms of image also feature

across a wide range of internet sites and media (e.g. BBC, 2016). All of these images are produced and consumed as understandings of the steel industry in the UK are constructed and reconstituted across organizational boundaries. Researchers interested in a range of institutional, organizational and employee-related aspects of business and management research might all conceivably be interested in such images. In sum, it is important to recognize that key issues of interest to business and management research are entwined with internet use. This has 'impelled scholars to expand their view of organization ... [re-examining] fundamental questions of organizational boundaries' (Sproull et al., 2007, p. 277).

Historically, internet research originated with examinations of corporate websites as business and management researchers tried to understand how organizations went about representing themselves on these new media. This has developed as researchers examined how organizational practices such as evaluation (Orlikowski & Scott, 2013) and recruitment have moved online, with interest in recruitment particularly prompted by increased use of social media (Brown & Vaughn, 2011; Madera, 2012). Here we can see how boundaries of organizations and organizational processes are challenged when web use is the topic of exploration, as a variety of actors may be involved. For example, recruitment activities might involve traditional job advertisements but also other forms of marketing and organizational promotion across a variety of channels. While such research in organizational use of the internet has continued, others have considered how issues as varied as generations at work (Pritchard & Whiting, 2014), corporate social responsibility (Coupland, 2005), diversity (Meriläinen et al., 2009, Singh & Point, 2006) and work–life balance (Mescher et al., 2010) are socially constructed on the web. Thus research is starting to move beyond traditional organizational boundaries.

However, it is still the case that most studies focus on textual aspects of web representation

and/or communication, as in the above examples which examine constructs of interest to management scholars. While many studies include consideration of the ways text is represented and the presentation of website interfaces, web images have received less attention, despite explicit calls in areas such as gender studies (Acker, 2012). This is not the case in fields such as sociology, communication or media studies for example (Bell & Davison, 2013). Here, studies cover considerable breadth ranging from investigation into young girls' consumption of media images (Jackson et al., 2012) to representation of disease (Asberg & Lum, 2010), child poverty (Fink & Lomax, 2014) and the digitalization of war (Chouliarakis, 2015). Others in these fields have looked at the role of the web image in communication processes more broadly, considering new genres and analysing forms of representation (Adami, 2015; Caple & Knox, 2012; Koliska & Roberts, 2015). These citations merely hint at the range and scope of literature available since an extensive review is beyond the scope of this chapter. Individuals researching specific topics should bear in mind the need to venture beyond traditional boundaries of business and management studies to explore literature relevant to their particular undertaking.

Where research in business and management studies has included a consideration of web images, our review suggests that a common approach is to categorize and count the visual elements (Elliott & Robinson, 2014). For example, Delmestri et al. (2015) present an analysis of the emblems and logos of 821 universities in a study of web-branding which uses content analysis to produce a typology of representations. This offers a useful consideration of a particular genre, but sees the image translated and quantified, taking it beyond the scope of a volume which focuses on qualitative research.

Therefore, while Emmison et al. (2012) recently highlighted how using web images poses both advantages (wide range and vast quantity of accessible images) and disadvantages (danger of overload and problems

of authenticity) to researchers, it remains an under-researched genre of visual image in business and management studies. However, before we can consider the analysis process in detail it is important to unpack the form and variety of web images available.

WHAT ARE WEB IMAGES?

Before considering what we might do with web images within a particular research project, it is first worth considering what sort of data we are dealing with. At first glance the answer to this question might appear simple since surely a web image is any image that is accessed via the web, but this hides a huge complexity.

We start with what we mean by ‘the web’. Here we are using this term as shorthand for Web 2.0, which refers to the evolution of the internet into a more interactive space (Coover, 2011; Fleischer, 2011). The terms web and internet are very commonly used but belie the variety of technologies involved and the myriad ways we might engage with others via these technologies (Markham, 2008). In some cases, web media recreate or make more easily accessible familiar print formats (such as a newspaper or company brochure). However, new forms of web media and means of communicating (such as blogging and tweeting) are now available. Organizations might use the internet to simply move an organizational process online, but new processes and means of organizing might also emerge, all of which can incorporate a wide variety of images.

How we interact with the content and each other (as we like, share, recommend or retweet for example), both within and between different media, creates a dynamic context (Pauwels, 2011) across which images are scattered (Bell et al., 2014). The constantly changing nature of what might be available as data makes this a particularly challenging environment in which to conduct research (Hare et al., 2014).

As the web has evolved and is used in ever more complex ways by an increasing array of users (inside and outside of organizations) for a seemingly endless list of purposes, so images are spread and shared across our interactions (Bell et al., 2014). Our engagement with web content thus becomes more complex as Fleischer suggests that ‘a new type of active subject emerges: the prosumer (producer and consumer)’ (2011, p. 538). This complicates our understanding of who has created or produced an image on the one hand and who consumes or views it on the other. At the same time, it is suggested that boundaries between the online virtual world and our offline experiences are becoming increasingly blurred (Tonks et al., 2015). Images (along with many other forms of content) may move between these ‘worlds’ as we share them both virtually and in other forms of interaction. Within this complex context, Rămö goes so far as to suggest that in ‘today’s hyper-mediated society, images are in higher circulation than words and print, and there is a shifting relationship between word and image’ (2011, p. 374). To illustrate this, taking an example of one form of image and one form of sharing, Tonks et al. (2015) report that at least 250 billion photos have now been uploaded to Facebook.

From our own experience, we suggest that reflexivity in a research project involving web images needs to start with an appraisal of our own understandings of the internet. In particular we suggest that as researchers we should unpack our own use and understanding of these complex digital contexts (Pritchard & Whiting, 2012a). We found that our personal and research use of the internet shaped our views on how we ‘saw’ different images and regarded them as data. Indeed, as our research in this area has progressed so our own use of various social media such as blogs (see, for example, our own research blog: <https://ageatwork.wordpress.com/>) and twitter (e.g. via @ageatwork) has increased as we use these to share and discuss our research. In this way, the internet has become both the subject of and the medium for our own reflexivity.

Having considered the complex context of the web, we now review our understandings of web images. Given the variability and complexity of web images, it is useful to apply a framework that can help us make sense of these data as we encounter them. Baetens (2013, p. 180) suggests that we can take three different approaches to understanding a web image depending on whether we focus our attention on ‘the image properties, its use and or its social or cultural status’. Looking broadly at these areas is often the first step as the researcher seeks to unpack or discover what can seem rather basic information about the image before it is subjected to what we might think of as analysis proper (Pauwels, 2011).

Below we use these different foci as prompts to pose questions that enable us to unpack a web image:

- Image properties: What form does the image take? What do we know about the origination of the image?
- Image use: How does the image sit within a particular web context? How are images experienced differently via different forms of access?
- Social/cultural status: What is the purpose of the image? How is it being re-used or remarked upon?

What Form Does the Image Take?

At the most basic level this involves deciding that we know what we are looking at. Making an initial assessment of the form of image is a useful starting point. For example, it is important to consider whether the image is still or moving and what medium has been used. It might be possible to assign an image to a particular genre such as a cartoon, a map or a photograph (or a specific sub-genre such as the stock photo, as we explore later). Indeed, it has been suggested that we are seeing new genres emerge, such as the selfie (Koliska & Roberts, 2015). However, this categorization may not always be straightforward. An image may be a composite of forms either originally or because it has become composite as it is

posted to the web (for example, a photograph of a painting). Further changes can occur as an image moves across the internet and is shared in different ways.

Different visual media have well-established research traditions and it will often be necessary to consider these further once an understanding of the form of web image is reached. For example, Barthes’ (1977, 1981) work on photography is still very much in use when analysing photographs on the web despite predating widespread internet usage for the posting or sharing of photographs. However, when web images comprise complex or composite forms and are not easily categorized or fit into many categories, they may need to be analysed from multiple perspectives. This may have implications for how the research project proceeds and in particular for the number of images that can be analysed. Later on, we explore these implications in an example of our own research practice.

What Do We Know About the Origination of the Image?

We might suppose that an image used in a particular web context has been created specifically for that purpose. However, it is common for images to be purchased (from a stock image agency for example), or acquired via other (sometimes unofficial) means and then re-used. Some images may have been shared and circulated many times and perhaps been modified with each use. In our own research on age at work, we have found images were sometimes manipulated to increase the apparent age differences of those portrayed. In one example from a news site, we found that an image posted to illustrate a story about the battle between generations which was very different from the original found on the photographer’s own webpages, which was labelled as showing a different sort of battle, one between political parties. The terms ‘airbrushing’ and ‘photoshopping’ are now in common use to refer to the general practice of digitally editing

photographs. Such digital editing may also include cases where an image has been censored via cropping, removing elements, pixelation or other form of redaction.

We might be tempted to assume that those images used by organizations are indeed images of that organization, its members, its buildings or materials. However, it is important to consider that usage is no guarantee that we know the origin of an image. Similarly, we might assume that images posted on a personal webpage or social media account are taken or developed by the person to whom that account belongs. A popular news story (BBC, 2015) covered (with use of web images) the argument about ownership and rights to a ‘selfie’ produced when a monkey took its own photograph by pressing a camera left on a tripod, illustrating the range of actors that might need to be considered. Moreover, we are seeing an increasing blurring between off and online contexts as it becomes ever easier to repurpose images (for example, by scanning) for use on the web. The issue of authenticity is thus a common area of discussion amongst those that analyse web images. For example, Rawlinson and Perraudin (2015) highlighted the issues that arise when stock photos are used to represent ‘real’ people (in this case individuals in receipt of what the UK government terms ‘out of work’ benefits) in promotional materials (here such accounts were later described as illustrative stories). Although originally part of a printed leaflet, both images and text were widely shared on the web via various social media as their authenticity became the subject of widespread debate.

How Does the Image Sit Within a Particular Web Context?

We can no longer talk of the web or the internet in singular or static terms. An image might be encountered in a huge variety of ways on the web, sometimes intentionally but also unintentionally (for example due to autoplay, malware or pop-up adverts while

browsing). Indeed, the autoplay (in which a video plays automatically when the website is loaded) of moving images on some websites has been hotly debated, particularly when the individual might not otherwise choose to view the footage (for example, the autoplay on some websites of footage of a shooting, Tomchak & Wilmer, 2015).

For those interested in researching management and business, an image might be the gateway to an organization’s website or might offer an interactive means of following a particular news story about an employment-related issue (Coover, 2011). Some images might be permanently available, but others might appear only for a short space of time. An image may only be visible for a few days before being replaced by a more recent representation or perhaps disappear as the accompanying text or other web elements are deemed redundant. In our own research, we encountered a situation where an organization released a report related to the topic of age at work via their website. Our initial view of the report showed an image (stock photograph) of ‘hoodies’ had been used to illustrate a group of young people on the report cover; however, when re-visiting the organization’s webpage a few days later we found that the image had been changed to one of smiling, smartly dressed young people.

How Are Images Experienced Differently Via Different Forms of Access?

The web, and therefore web images, can be accessed via many different technological means. At one time a desktop or laptop computer was the primary means through which we experienced the internet. Handheld devices such as smartphones and tablets are now common place with wearables¹ seen as the new emergent technology. However, other fixed access devices such as game consoles and smart televisions are also increasing in popularity.

To explore the differences, we can compare our experience of using a web or social media site via, for example, a computer and a hand-held device such as a smartphone. How we are able to view the image and interact with it will differ depending on the device capabilities. However, the web context surrounding an image is often context sensitive and may also reflect our personal internet usage. In our research, we found a wide variety of advertising appeared depending on which of us had accessed the webpage to download the image, advertising that was also influenced by other family members' use of our devices.

What Is the Purpose of the Image?

While this can be the subject of in-depth analysis, it is also useful to ask this question at a high level, perhaps when the researcher first encounters the image (Schroeder, 2007). Often we infer the purpose of an image based on our personal experience of the web and the norms that we are familiar with. We have already commented that a reflexive review of our own assumptions is a useful starting point in the research process. However, a further question to ask here is what we assume about the purpose of the image when we first view it; did we categorize it in some way as for example an advertising image, as a photo of a particular person such as a CEO, or see it as capturing an event that is reported in the news. In this way our initial assessments could lead us to considering the ways in which the web image is being positioned in relation to organizational processes. So extrapolating from the above: an advertising image in relation to marketing; an image of a CEO in relation to leadership; or an image used to illustrate debates about senior management pay. As well as viewing the image itself, this assessment may involve consideration of the positioning of the image in relation to text and, in particular, if there are textual cues surrounding the image. Captions and sub-headings can be of critical importance here (Caple, 2006) as

well as relations to other images or features of the webpage. At this stage it may become essential to consider the focus of the image itself in relation to the research question and consider whether analysis of other elements might be included. Most commonly in business and management studies this might include adopting a broader discursive approach to consider text and images together (Bailey et al., 2009) or extending this to a multimodal analysis which reflects an interest in 'different modes and media of communication' (Bamberg, 2010, p. 897).

How Has It Been Re-used or Remarked Upon?

Rose has highlighted the need to pay attention to the online circulation of web images (2015) in addition to her previously identified 'three sites of production, the image itself and its audiencing' (2012, p. 19). In the examples above of selfies (whether by animals or humans) and those in receipt of government benefits, we have already seen how circulation and comments online can provide a further focus of analysis. This recognizes that images that might start off within a particular organizational process or context do not necessarily remain contained within it. This may require a research approach that moves beyond downloading or collecting an image for analysis to one which involves tracking or following an image over a period of time. This may pose further challenges for the researcher in deciding where and for how long such tracking might continue although the availability of free tools such as Google image search (which enables search by uploaded photo as well as text search term) can prove useful here.

Asking these questions about the image properties, use and status (Baetens, 2013) offers a useful starting point for exploring web images. The answers to these questions may not be straightforward and several iterations may be necessary during a research

project as the researchers' understanding shifts and changes as they become more familiar with the research context. However, it is also important for a researcher to consider in detail the particular area of web imagery they are planning to research. Our own interest in web images has to date focused on a particular form – the stock photograph.

Stock images tend to be deliberately constructed using actors to depict a scene which may utilize props or staging (Ward, 2007). They are generally used to avoid the cost and time implications of commissioning a new photograph; this is especially useful for organizations who wish to quickly access a range of quality images. Organizations such as Alamy and Getty act as a mediator between photographers (both professional and amateur) and those seeking to use the images (van Dijck, 2008). Indeed, it is usually possible to identify a stock image by the attribution to a photo agency which may appear either instead of or alongside the photographer's name when the image is displayed. A successful stock image needs to be highly saleable; it must therefore fit a broad range of requirements and thus they may be generic and stereotypical (Ward, 2007). There are several stages or constructions of the image. First, the photographer's own ideas of what the image might represent, but, second, this may then be reviewed and repositioned (for example, by tagging the image with a variety of popular labels) by the stock image agency to maximize sales. Third, those purchasing the image do so with a particular use in mind. Therefore, it is important to consider that 'the purchased image goes through a stage of recontextualization – combination with texts and other images and graphic elements during which it is often substantially altered' (Frosh, 2001, p. 634). Finally, of course, the image is subject to interpretation as we view it alongside other elements via the web. (See both Frosh (2001, 2002) and Machin (2004) for a more extensive consideration of the stock image industry.)

Stock images are regarded as significant 'cultural text[s]' (Milestone & Meyer, 2012, p. 3)

since 'we gradually come to accept them as showing us how the world really is' (Machin & van Leeuwen, 2007, p. 157). Stock photos are also important to organizational life particularly as they become enrolled in the construction of relevant subject positions such as, using an example from our own research, the 'older worker'. Frosh highlights that despite their wide use across a range of media, there has been an 'alarming scholarly and critical neglect' (2001, p. 626) of stock images across a range of fields. In the next section we provide a more detailed example of our own research of this type of web image.

ANALYSING WEB IMAGES: AN EXAMPLE

In this section, we offer our own research as an example of analysing web images. This is not presented as ideal or best practice, but rather as a means of reflexively exploring the opportunities and challenges. Our overall research project includes consideration of a range of textual and visual data and recognizes these as discursive resources which encompass a range of 'semiotic activity' (Fairclough, 1995, p. 54). Within this research we examine web data that represents a critical communicative context for understanding constructions of age and ageing at work. From this perspective, images can normalize particular ways of being; legitimating some categories of identity or subject positions (Maguire & Hardy, 2009) in relation to age and work and denying and problematizing others. It is important to highlight therefore that our research does not take place within a particular organization, but rather examines how understandings of age at work are constructed via web media that in turn shape and are shaped by day to day organizational life.

As part of this broader research project on age at work, one particular investigation explored web images of men and women of various ages to answer the research question:

Table 17.1 Key stages in analysing web images

Stage 1: Sample review	Detailed review of the whole data set was necessary to refine the sample to focus on the specific research question posed in this part of the research. Practical and ethical considerations (see also Whiting & Pritchard, 2018) were also taken into account.
Stage 2: Visual analysis approaches selected & applied	The approaches to visual analysis were selected based on fit and appropriateness given the range of images within the final sample. Researcher analysis was carried out applying three visual analytic frameworks to the sample.
Stage 3: Photo-elicitation exercise	Group photo-elicitation was conducted with a sub-sample of three images.
Stage 4: Drawing together analytic insights	Thematic analysis of participant responses with photo-elicitation prompted a further iteration of our own analysis. Findings were developed.

How are understandings of gendered ageing constructed and interpreted via stock photos? (see Pritchard & Whiting, 2015).

Elsewhere we have discussed our approach to collecting and analysing a variety of web data to examine understandings of age at work (Pritchard & Whiting, 2012a, 2014). Our overall study involved the systematic collection of web material about age at work using internet tools in a daily automated search process over 150 days during 2011–12 (see Pritchard & Whiting, 2012a and also Whiting & Pritchard, 2018). Table 17.1 summarizes the key stages of our subsequent research in relation to analysing web images.

In the following sections we expand on these stages to describe our approach to analysing web images.

Stage 1: Sample Review

The first step was to sort the data identified by the automated tools. This was manually reviewed and downloaded. Various visual images including photographs, cartoons, video and infographics were included in these data. Using the research question as a guide, the process of sample review included:

- A review of web image forms collected. Based on this review, we made a decision to include only still photographic images within this particular analytic process.
- A review of practical and ethical issues. Practical issues considered included image quality and

availability of subject and copyright information. Images were excluded from the sample where there was no identifying information enabling us to track the copyright of the image, where the image was poor quality or comprised named individuals (since these would be difficult to obtain permission for use and would likely present ethical issues).

- A content review of the 120 images remained in the data set after the first two stages of sample review. Working separately at first we each reviewed visual content and image properties (as discussed earlier in this chapter and drawing on Baetens, 2013). We then met to share our initial impressions of each image via an initial stage of description that is often recommended in visual analysis (Schroeder, 2007).
- A decision to focus on stock images was reached. While there were many different types of still photographs within the initial sample, our review identified that the majority of the images being used in online news stories that most closely related to our topic of interest were stock photographs. We then moved on to consider questions of image use (as outlined earlier and based on Baetens, 2013). This prompted us to look further at the literature on this image type (for example, Machin, 2004) and as a result we decided to focus on stock photographs in subsequent stages of analysis.

This decision to focus analysis on a particular form is a common approach adopted in research that aims to offer an in-depth analysis. We suggest this is sometimes a necessary pragmatic decision to make the subsequent analysis more manageable and to deliver outputs within a reasonable timescale.

All stock images were then reviewed to ensure relevance to our research question; we then selected those portraying a range of ages and that encompassed some aspect of work. For example, we excluded images of students in education and of older people pursuing leisure activities in retirement. The resulting sample size (16) was not set as a target but emerged from an iterative review as we worked separately and then together to review the images. Each researcher first completed an independent review and then we compared our selections. Photographs identified by both researchers were earmarked for further analysis and we then debated other selections before making a joint decision on their inclusion or exclusion. At this stage, our discussion expanded to consider many of those questions presented earlier as we reviewed and debated image properties, use and status (Baetens, 2013).

From this description it can be seen that we went through a fairly lengthy process to select our final 16 images for more detailed analysis. At each stage it is important to consider how this process of selecting images might impact the focus or scope of the research and of course the ability to generate insight relevant to the research question at hand.

Stage 2: Visual Analysis Approaches Selected

Having refined our sample, we then needed to decide how to approach the visual analysis of these web images. It is of course possible to use a wide range of methods depending in part on the type of image that is the focus of analysis. Indeed, depending on the broader focus of research it may be that a decision is made to approach the analysis from a perspective in which the image is considered in conjunction with other web elements. As already mentioned this might involve adopting multimodal analysis (Caple & Knox, 2015; Kress, 2010) or some forms of discourse analysis. For example, Bailey et al. (2009) offer an explanation of using critical discourse analysis as an approach to looking at images and text, although here in

a printed form. Our own analysis employed different perspectives of visual analysis which were selected based on an extensive review of the literature and on trying out different approaches with our sample to assess the different insights generated. This reflects Hook and Glaveanu's (2013) suggestions that visual analysts often apply a variety of approaches to generate different perspectives on an image. The three analytic frames applied were:

- Davison's (2010, p. 165) framework which particularly emphasizes paying attention to 'visual portraiture codes'. This fitted the portrait-character of our stock photos and is also widely used within the business and management literature.
- Rose's (2012) areas of investigation of the image: technological, compositional and social modalities particularly because of the applicability of her 'sites' of investigation to web images.
- Machin's (2004) developments of Kress and van Leeuwen's social semiotic approach (1996; van Leeuwen, 2005) as this specifically focuses on the generic and abstract potential of stock images.

In addition to these visual analytic approaches our analysis also considered the relationships between a stock photo and its surrounding web setting, in particular the headlines and photo-captions which establish the links between the image and text, offering a suggested framing for each. In terms of carrying out the analysis, we first divided the 16 images between us. We then each used the above ideas to guide our interpretation and produced a (textual) analytic account. These accounts were then passed to the other author who added, annotated and questioned the account to add further interpretative depth, again using the concepts above as analytic prompts. An initial analytic account was written up and presented at a conference (Pritchard & Whiting, 2012b).

Stage 3: Photo-Elicitation Exercise

It would have been possible to conclude our analysis at this point. However, when we presented our conference paper, discussions and

questions from participants highlighted the potential of incorporating others' reactions to these images to develop our contribution. Parker has commented on the use of this approach to 'elicit individual and social constructions of different parties involved in the framing, content and/or viewing of photographs' (2009, p. 1115). Therefore, we subsequently undertook group photo-elicitation to gather others' views and to explore what Rose (2012) has called the site of 'audienicing'. This reflects our broader research concern with the ways in which understandings of age and ageing at work are constructed via web media, understandings that in turn shape and are shaped by day to day organizational life. For this particular stage of our research we further refined our sample and selected three images, choosing those that depicted a range of ages and genders in poses that depicted their relationship to employment (see Pritchard & Whiting, 2015). Our selection was therefore purposive, but selecting a small number of images is typical for photo-elicitation so that participants can have sufficient time to review and respond to each image (Feighery, 2009; Meyer et al., 2013). At this point we also decided to purchase the rights for the use of these images in research and publication. This also gave us access to high quality images which were of further benefit to our own analysis and enabled us to provide clearer images to our participants. There is much debate about the extent to which researchers can rely on the fair dealing provision under copyright laws in respect of images reproduced for the purpose of research. However, at the time we took the decision we had access to a limited amount of funding and decided that the benefit of high quality images was worth the cost involved.² We decided on a group rather than the more common one-to-one photo-elicitation interview (Kelan, 2012; Parker, 2009) as we had an opportunity to present the images during several forthcoming workshops. Overall 39 participants who self-identified as working in human resources or occupational psychology participated in the photo-elicitation stage.

A key challenge was the extent to which we might be able to recreate in these workshops a sense for the participants of how we ourselves encountered the images on the web. Based on a consideration of the practical implications, we decided to adopt the approach of both displaying the (colour) images on a large screen and providing a (black and white) printed copy to participants. In both formats, participants were shown both the high-resolution image on its own and a copy of the downloaded image in its original web context (via screen capture). We decided to show this so that participants could get a sense of the surrounding web context including the accompanying news headlines. However, because of display limitations they could not read the detailed text of the accompanying news story. In each workshop, the paper copy provided to participants detailed their ethical rights and included an open response box under each image for them to complete individually. As the images were displayed, participants were asked simply 'what are your impressions of these photos' and to write their thoughts on the paper provided. We did not provide any additional guidelines as to what elements to focus on or how to structure their response, so that participants were able to consider the photograph from whatever perspective they wished. In most cases this led to participants considering the scene that was depicted (for example a team meeting) and the role of different characters; some wrote notes while others constructed more elaborate stories about the scene (see analysis and images presented in Pritchard & Whiting, 2015 for examples). Participants could chat to others in the room and ask questions. We subsequently shared our own analysis of each image and discussed similarities and differences with the participants, though these discussions were not recorded. However, it is important to reflect that such discussions (here and indeed elsewhere as we discussed our research with colleagues) fed into further iterations of our own analysis.

Stage 4: Drawing Together Analytic Insights

Given the free format approach adopted during the photo-elicitation, we applied thematic analysis (King, 1998) to explore the participant data collected. Once we had analysed these data separately we then used the themes generated and mapped them onto those from our own initial analysis, noting where they compared or contrasted. This provided a further reflexive prompt for our own analytic review of the images. Our full analysis of the images and participants' comments and the contribution to academic knowledge have been published elsewhere (Pritchard & Whiting, 2015). Methodologically we learned a great deal during this exercise. For us a key benefit of including participants' views of the images was the variety and richness of interpretations that this generated, sometimes challenging our own analysis or offering alternative ways of seeing. Combining this with our own analysis gave a sound base from which to draw conclusions. However, during this process we inevitably focused on few images. Moreover, a further challenge was the rather limited way in which we were able to present the images to participants as removed from their web context. It would be useful to explore ways in which mobile devices could be used in future, perhaps even via providing links to websites for participants to explore from their own devices. Of course, it would also be possible to broaden a study beyond the web image itself and discuss with participants their response to other elements of the web interface, moving to a multi-modal approach. Elsewhere we have found that this presents new challenges in managing the range and types of data while maintaining focus on a particular research problem (Whiting & Pritchard, 2015).

CONCLUSION

It has been suggested that across all disciplines researchers 'struggle to keep up'

(Tonks et al., 2015, p. 326) with technological developments that might enable or restrict the scope and practice of our undertakings. Web images offer an exciting and challenging opportunity for business and management research. It is important that we discuss and debate the methodological challenges such research entails, but we should not be afraid to experiment and apply the lessons learned by researchers in other fields.

A particular area we are keen to explore is the circulation of web images (and indeed web texts). Hare et al. (2014) suggest that rather than seeing data on the internet as 'there' for collection, rather we should think of it as dipping into a constant stream of changing images, texts, sounds, etc. This has significant implications for research practice. First, it impacts the way in which we understand the temporal aspects of research; highlighting the potential for shortitudinal (Sniehotta, 2009) as well as more traditional longitudinal approaches. Second, it highlights the need for flexible and engaged research processes that might enable us to, for example, follow images across the web rather than simply extracting them at one point in time.

A further challenge for qualitative researchers is the way in which notions of big data are becoming increasingly synonymous with internet research (Dutton, 2013). On the one hand, this highlights the prominence of quantitative methods within internet research. These can produce topographical maps of internet phenomenon, illuminating the overall shape and form of the issues under consideration (Murthy, 2008). Yet such representations also set the scene and create interest in more in-depth understandings of human/digital interactions as we navigate these maps, examining experiences shaped through and by the internet. Qualitative approaches, including the visual analysis of web images, have much to offer in here. However, we have much more methodological work to do to secure a voice for such 'small data' qualitative approaches in a rapidly evolving 'big data' world.

Notes

- 1 Whereas handheld devices are discrete objects, in wearable technology the device is integrated within an item of clothing or accessory such as a watch or pair of glasses (Tehrani & Michael, 2014).
- 2 In this case, based on the purchase of rights to use the image in a single journal article and associated educational use associated with the research, we paid £40 per image. However, when requesting one of the same images for use within this chapter, Sage were quoted £130, which was deemed too expensive. Therefore, researchers need to bear in mind that costs will vary depending on the stock photograph itself, the agency involved and the proposed use of the image.

Making Meaning from Multimodality: Embodied Communication in a Business Pitch Setting

Rowena Viney, Jean Clarke and Joep Cornelissen

INTRODUCTION

A multimodal research agenda is gaining traction in organisational research; multimodality is the theory and understanding that multiple modes of communication outside of speech and text have the potential to convey meaning (Iedema, 2007; Jones & LeBaron, 2002; Kress & van Leeuwen, 2001; Streeck et al., 2011). There is an increasing realisation that the visual, material and embodied modes of meaning-making pervade organisations and understanding these non-verbal modes of meaning creation could provide opportunities for new and interesting theoretical, empirical and methodological insights (Bell & Davison, 2013; Jancsary et al., 2015). Multimodality emphasises that ‘language’ is just one of many resources for making meaning and that:

all such resources available in one social group and its cultures at a particular moment ought to be considered as constituting one coherent domain,

an integral field of nevertheless distinct resources for *making* meaning; all equal, potentially, in their capacity to contribute meaning to a complex semiotic entity, a text or text-like entity. (Kress, 2011, p. 242).

Within a multimodal perspective speech and text are not necessarily seen as the dominant mode of communication and are ideally not examined in isolation but as one mode of communication among many others (visual, spoken, gestural, written, three-dimensional, etc.) that also potentially interact and align to generate meaning (Philips et al., 2004).

Despite this increasing interest in multimodality and its relationships to organisations and management, there remains a lack of work which empirically investigates multimodality in the context of organisations. This may be due to the significant challenges presented to researchers interested in investigating multimodality, namely the lack of multimodal ‘literacy’ among organisational researchers (Jancsary et al., 2015). We remain unskilled in terms of ‘reading’, understanding

and analysing multimodal data. In particular, it is often necessary to transform multimodal data into easily accessible, text-based material so that it can be coded and reported on, which often leads to a loss of some of its original multimodal richness (Plowman & Stephen, 2008). It is often not fully possible to articulate through language a complete sense of the bodily and interactional richness and complexity of multimodal data and all that we find interesting about this data. Without proper multimodal analytical protocols these preverbal, visceral hunches can often ‘remain at the level of vague suspicion and intuitive response’ (Iedema, 2001, p. 201). There is, in other words, a need to develop the multimodal ‘literacy’ of researchers to ensure that multimodal data is represented and analysed in such a way that their contextual richness is being maintained whilst at the same time allowing for systematic analyses and theory development.

Our aim in this chapter is to give an empirical example of how multimodality can be examined in the context of entrepreneurship. Within the domain of entrepreneurship, an emerging line of inquiry focuses on how through both verbal and non-verbal communication and behavioural displays entrepreneurs may be able to convince investors to provide resources and investment (Baron & Markman, 2003; Chen et al., 2009; Clarke, 2011; Cornelissen & Clarke, 2010). In this chapter we focus specifically on entrepreneurs’ use of gesture when pitching for investment at organised pitch events. We focus on gesture as an element of multimodal meaning-making which forms a central mode of human communication alongside speech. As Kendon (1983, p. 27) for example suggests, ‘*gesticulation arises as an integral part of an individual’s communicative effort and ... has a direct role to play in this process*’ (italics in the original). Gesticulations (spontaneous movements of hands and arms that co-occur with speech), are one type of body movement that are thought to play an integral role

in the process of communication (Alibali et al., 2001). Gestures convey information complementary to speech as the mimetic and analogue format of gestures (in the form of shapes, sizes, spatial relationships) can lead to different representations of ideas compared to the more discrete and categorical format underlying grammar and speech (cf. Cornelissen et al., 2012). Thus, when gestures accompany speech, they may enable speakers to express thoughts that may otherwise not easily fit into the categorical system that their language offers (Goldin-Meadow & McNeill, 1999).

In demonstrating one way of examining multimodality in an entrepreneurship context, this chapter considers the utility of paying attention to non-verbal data by unpacking some of the embodied practices of competent entrepreneurs. The remainder of the chapter is structured as follows. We first introduce the setting of entrepreneurship. We then describe the role of gesture as part of multimodal analysis. We then discuss specific empirical work that features in our analysis. We conclude the chapter by discussing the insights afforded by gesture analysis and the contributions that this type of multimodal analysis makes to our understanding of entrepreneurship and more widely organisational and management research. We argue that directing attention to multimodal meaning-making complements and extends research that focuses on language alone and that the potential contribution of multimodal research in organisation and management research is substantial.

THE MULTIMODAL MEANING-MAKING OF ENTREPRENEURS

The acquisition of resources and capital is a critical step for many entrepreneurs, which triggers the question: How do entrepreneurs persuade potential investors to support their venture? Entrepreneurs, generally speaking,

face significant problems in convincing investors of their ventures due to the 'liability of newness' (Stinchcombe, 1965) associated with their ideas, with often little in the way of a track record, obvious asset value or profitability in sight (Brush et al., 2001; Cassar, 2004; Mason & Harrison, 2000). In this context, how entrepreneurs communicate about their ventures may be crucial to secure investment that allows them to further develop their ventures and potentially bring the business to a stable level of growth (Bird & Schjoedt, 2009). Investment pitching events offer an opportunity for entrepreneurs to communicate their ideas and are generally seen as critical in that a successful 'performance' is essential in order to gain support and resources from investors (Cornelissen & Clarke, 2010).

There have been increasing suggestions in the recent entrepreneurship literature that the non-verbal devices used by entrepreneurs are very important for entrepreneurial performances. Clarke (2011) demonstrates the importance of visual symbols (setting, props, dress and emotional expressiveness), illustrating how entrepreneurs use a range of visual symbols during interactions with stakeholders in order to increase low levels of legitimacy. Baron and Markman (2003) highlight the importance of what they refer to as 'social competence' in engaging others in the entrepreneurial venture. The idea of social competence goes beyond ideas of persuasion through linguistic domains, as it 'encompass[es] the ability to correctly gauge the current moods or emotions of others, proficiency in inducing positive reactions in others by enhancing one's own appearance and image effectiveness in persuasion' (Vecchio, 2003, p. 318). Mason and Harrison (2000) similarly found that if entrepreneurs did not 'sell' or persuade Business Angels of the utility of their product through effective use of language, display and artefacts, they were unlikely to secure the investment. Chen et al. (2009) also examined the importance of entrepreneurs expressing passion during

interactions with investors, potential employees and major customers. They define passion as energetic body movements, rich body language and animated facial expression.

Building on this stream of research, we aim to examine the role embodied communication plays in the context of entrepreneurship. In multimodal communication the underlying assumption is that multiple modes of meaning-making (gestures, gaze, bodily position, facial expressions) are used outside and alongside language in interpersonal communication (Kress & van Leeuwen, 2006). Drawing on this perspective, we start from the position that when communicating individuals naturally move their bodies when they speak and these movements are not accidental, but are often tightly coupled to the communicative messages speakers wish to convey (Kaschak et al., 2005). As Goodwin (1981, p. 125) noted, 'emergent displays ... integrate the bodies of the participants into the production of talk, and are important constitutive features of the conversation'. Listeners take notice of these movements and infer different things about speakers and their messages as a result of what they see (Clark, 1996; Glenberg & Kaschak, 2002).

The development of understanding between individuals is then fundamentally connected with the actions that their bodies perform (Richardson et al., 2003; Semin & Cacioppo, 2008). The literature suggests that hand gestures (naturally occurring gesticulations that tend to co-occur with speech), are centrally involved in language processing and communication as they convey substantive information (Goldin-Meadow, 1999; Leander, 2002; Loring et al., 2000). Gestures complement speech, as the mimetic and analogue format of gestures (in the form of shapes, sizes, spatial relationships) may lead to different representations of ideas compared to the more discrete and categorical format underlying grammar and speech (cf. Cornelissen et al., 2012). Thus, when gestures accompany speech, they may enable speakers to express thoughts that may otherwise not

easily fit into the categorical system that their language offers (Goldin-Meadow & McNeill, 1999) and allow listeners to infer speaker intentions and to form understanding.

Whilst there has been little work examining the importance of gesture in organisational contexts, in other domains the importance of gesture in terms of aiding communication has been well established. For example, in the context of politics, studies of politicians demonstrate that they use gestures frequently and in strategic and pragmatic ways to persuade listeners of a point that they are trying to make (Kendon, 2004; Streeck, 2008). Argentin et al. (1990), for example, asked university students to assess the persuasiveness of a politician depending on whether he delivered the same message with (or without) hand gestures. The politician was perceived as more persuasive when he used many ideational or metaphoric gestures and a reasonable amount of speech marking or rhythmic gestures. More recently, Maricchiolo et al. (2009) established in an experiment with students that a speaker trying to persuade students of the proposal to increase university fees was judged as generally more competent, composed and effective in her communication style when she used gestures (as opposed to no gestures) and ideational gestures in particular. Building on the importance that gesture-related information has been shown to have in these disparate contexts, we examine the role gesture plays in communication in the context of entrepreneurship. Below we describe our research context and data in more detail.

COLLECTING MULTIMODAL DATA

In order to examine the multimodality in the context of entrepreneurship we employed a video-based method that allowed us to gather both linguistic and non-verbal communication. Video recording is one of the primary media that allow researchers to capture such

multimodality in action. Through video, researchers can for example track facial expressions and gestures, the bodily use of artefacts, or how individual actors interact with their environment, making it an ideal method for a range of research objectives related to multimodal understanding. As Kress (2011, p. 253) argues ‘the use of the video-recorder brought with it a vivid realization of the limits of speech as either a sufficient or a central “means of record” of meaning made’. Video-analysis allows us to examine ‘starkly visible “extra-linguistic” features’ and opens up new possibilities for researchers by facilitating ‘multimodal’ analysis through the repeated scrutiny and frame by frame examination of the same motion/speech event in micro-level detail (Luff & Heath, 2012). We video-recorded 54 pitches of varying length that took place at Business Angel pitching events around the UK in 2013 and 2014. Following Collier and Collier’s (1986, p. 149) advice that ‘good video and film records for research are ultimately the product of observation that is organized and consistent’, we explored a range of issues prior to capturing the videotaped data including the optimum distance for researchers to videotape participants and the type of camera angle and view which is least distracting to participants (e.g. Collier & Collier, 1986; Prosser, 1998). These types of pitching events are routinely video-recorded so the entrepreneurs involved were quite used to the experience.

The videos were transcribed using a variant of transcription conventions developed by Jefferson (2004). These conventions capture the details of how talk is produced, for example stress, lengthened sounds, silences and audible in- and out-breaths (please see the Appendix for the transcription key). This transcription system is designed not only to capture *what* was said, but also the *way* in which it was said, which is important in this case given the focus on persuasion. The analytic approach to the data was informed by conversation analysis, a method that looks at

the minute detail of naturally occurring interactions to describe the structures of social interaction (Stivers & Sidnell, 2013). A key principle of conversation analysis is that when we talk we do particular actions, and there is a wealth of research on how certain types of action are accomplished by speakers, for example complaining (Drew & Holt, 1988), assessing (Pomerantz, 1984) and requesting (Curl & Drew, 2008); non-verbal means of communication are also incorporated into analysis, for example gaze (Goodwin, 1981), hand movements (Schegloff, 1984), and laughter (Jefferson et al., 1987). A second principle is that speakers orient their talk or actions to the rules and structures by which interaction is organised; certain types of action relate to particular other types and in particular ways, for example an offer will be followed by an acceptance or a rejection, and always in this order – ordinarily a rejection would not come before the offer (see Schegloff (2007) for an in-depth look at how interaction is organised). A further principle holds that through talk we maintain intersubjectivity, which means that as analysts we can see how utterances are interpreted by speakers by looking at how they are treated by the speakers themselves; such detail as silences or corrections of something in the talk (technically described as *repair* in the conversation analysis literature) can convey to both interactants and the analyst how an utterance has been understood (see Peräkylä (2004) for more on the principles of conversation analysis). The analysis below draws on these principles and the detailed interactional findings reported in the field of conversational analysis.

For the coding of the gestures, we drew on an established protocol from cognitive science (as in Cienki, 2005, adapted from Müller, 1998). The focus was on individual gesture strokes, the phase of gestural movement which displays the most distinct exertion of effort (as opposed to the preparation leading up to it or the retraction of the hand after it) (Kendon, 1980, 2004). The stroke

phase also provides the most information for determining a gesture's likely primary function (its 'meaning') (McNeill, 1992, pp. 375–6). First the shape, motion, placement and orientation of the entrepreneur's hands in each gesture was transcribed, without sound to ensure the initial gesture coding was not influenced by the speech. Following this initial coding, this initial annotation was revisited whilst listening to the speech, which allowed us to sharpen our interpretations and highlight instances where speech and gesture synchronise and align. The gestures were then categorised into *ideational* gestures which depict semantic information or *beat* gestures which mark points of emphasis in speech but 'do not present a discernible meaning' (McNeill, 1992, p. 80). Ideational gestures were further subdivided into gestures which refer to a physical, concrete referent based on the content of the speech or gestures which are used in an ideational *metaphoric* way to refer to an abstract notion in terms of a physical form or movement (Cienki, 1998; Kendon, 2004).

Unlike other types of interaction such as everyday conversations or interviews, business pitches generally do not allow for audience members to respond for the duration of the pitch, meaning that as analysts we do not have access to individual audience members' interpretations of and reactions to the talk and gesture being produced. However, business pitches, like presentations in general, are still produced for an audience and are therefore interactive. For example, Rendle-Short's (2006) analysis of academic presentations, during which audience members are usually silent and still, shows that speakers use their talk and their physical actions such as gaze and gesture to show engagement with their audience. This approach may be viewed as somewhat positivist, as the audience members' responses are not there to guide the analysis. Moreover, as conversation analysts systematically observe people's interactional behaviour in naturally occurring situations in an attempt to understand social organisation,

this could also be viewed as tending towards positivism (Peräkylä, 2004); however, the robust manner of examining interactional data and the comprehensive set of findings about interaction documented so far ensure that analysts do not simply impose their own interpretations onto the data.

A variety of interesting phenomena were observed in the recordings made of the pitches, one of which was the use of contrasts by entrepreneurs both verbally and in their gestures. Stills from the video recording are provided in the section below to show the arm and hand gestures used in the pitches, with descriptions of the speakers' movements included by each set of images. Key parts of the talk in relation to this analysis are shown in bold.

MULTIMODALITY AND ENTREPRENEURIAL COMMUNICATION

In all of the pitches in the data set the presenters describe an existing problem that their product or service will solve. They might not explicitly use the terms 'problem' and 'solution' or 'solve', but the implication that their product or service will solve a particular problem in their particular industry is still made at some point in their pitch. This tends to be set up as a contrast,

with a description of the problem being followed by the entrepreneur's solution. There can be several of these problem–solution contrasts within one pitch, which the entrepreneur can use to illustrate the various advantages of their product or service in relation to various aspects of the overarching problem. Contrasts and puzzle–solution pairs were identified as rhetorical devices used in political speeches by Heritage and Greatbatch (1986), which can be used to generate responsive applause from the audience. In the context of business pitches applause only comes at the end of the pitch, but the use of these rhetorical devices can still serve to gain the interest of the audience and to convince them of the point that the entrepreneurs are making.

The examples below illustrate the use of contrasts by entrepreneurs when trying to persuade potential investors to support their ventures. They present these problem–solution contrasts both verbally and physically, in order to make the concept they describe as understandable as possible (see also Appendix 1).

Example 1

In this extract the speaker describes a common misconception about paying for telephone calls, followed by how his product provides a solution to this apparent problem:

Event 6 – Pitch 2

- 01 E: .hh Lots of people say I don't pay for my ca:lls, (0.2) well
 02 -> you do. =You just actually **bundle them all up** so you still
 03 actually pay for your calls.
 04 (0.7)
 05 So: (0.2) ↑however it's dressed up you still pay for them (.)
 06 -> whereas what we can provi::de (.) is you u:se just a **thi:ny bit**
 07 -> **of your data °package°** (0.4) and all your calls are fre. And
 08 it doesn't matter where you are in the world.

Hands reach open point on 'bundle' and move together, ending movement on 'up'

Figure 18.1 Metaphorical gesture on 'bundle'

Right hand held with fingertips together, does series of beats beginning on 'tiny' and increasing in speed until ending after 'package'

Figure 18.2 Metaphorical gesture on 'tiny'

The entrepreneur begins with the statement 'Lots of people say I don't pay for my ca:lls', but then switches from the descriptor 'lots of people' to the generic pronoun 'you', with 'well you do:', thus aggregating the group that says that they do not pay for their calls with people in general, which also includes his audience (Lerner & Kitzinger, 2007). Shifting to this reference form means that the problem he describes is now not limited to people working in his industry but to people in general, the audience members included. He then describes how it is that people do actually pay for their calls: 'You just actually bundle them all up so you still actually pay for your calls'. The term 'bundle' is used by some mobile network providers as part of the deals they advertise, so it might be recognised by the audience as an industry-related term. However, the actual meaning – to gather closely together (e.g. a bundle of hay) – suggests something more physical. As phone calls cannot be physically manipulated or bundled, this use of the word bundle is metaphoric. The presenter's gesture at this point also highlights the physical nature of the term bundle, as he acts out 'bundling up' with his hands. The speaker's hands start held out to either side of his body on 'bundle'; the speaker brings them towards each other, reaching the peak position on 'up' where his hands are now in front of his body. At no point do his hands touch – at the peak of his gesture his hands are still held apart. However, throughout the movement his palms are facing each other and his hands are slightly curled inwards, which adds to the notion of 'bundling' things together. As his hands are still kept apart the impression

given is of a largish 'bundle' being depicted; this seems to be reflected in his talk with 'them all' being 'bundled up'. He completes his turn with the upshot of bundling calls in this way – 'you still actually pay for your calls', with the two occurrences of 'actually' serving to contrast with the initial reported assertion that people don't think that they pay for their calls.

After a 0.7 second silence the presenter reformulates this upshot as '↑however it's dressed up you still pay for them', with a further use of metaphoric language with 'dressed up'. However, as he continues his talk some more metaphoric gesture can be seen. This part of his talk is immediately set up as a contrast from the content of his just prior talk, as he begins with 'whereas'. He then frames what is to come as an advantage of his company's service: 'what we can provi::de', with stress on 'we', provides the added implication of the advantage being specific to his company and not any competitor. In his description of what his business provides he explains (still using the pronoun 'you', in contrast to the 'we' of his company) that 'you u:se just a ^{thi}:ny bit of your data °package° (0.4) and all your calls are free'. On '^{thi}:ny' the presenter raises his right hand to shoulder height and brings his fingertips together. He does a small beat on '^{thi}:ny' and does a series of beats of increasing speed which end just after he produces '°package°'. Although the content of his talk does not appear to contain any metaphorical language, this gesture does. Just as calls are not physically manipulatable, neither are internet or mobile data. Yet his hand position appears to show a physical size of

data that they use to provide this service, enacting ‘tiny’.

So in this extract we have three sets of contrasts being implied:

- 1 The first part of his talk sets out the problem: people think that they don’t pay for their calls but it turns out that they do, so they are paying for things that they think they are not. The second part contains the solution: the service that they provide uses a small bit of data and then calls are genuinely free.
- 2 In his talk he contrasts what customers pay for – a ‘bundle’ of calls versus a ‘tiny bit of data’.
- 3 In his gesture, by enacting the act of ‘bundling’ and ‘a tiny bit’, he reiterates what is in his talk but also adds a further physical element – the ‘bundle’ he appears to be holding is large, as can be seen by the distance between his hands, whereas the ‘tiny bit of data’ can be held

between his closed fingers in his next gesture; this pairing of gestures shows how size is an important concept in this context – a bundle of calls (big) is bad (expensive) but a tiny bit of data (small) is good (cheap).

His choice of language together with his use of gesture serve to highlight the contrast between the problem he describes and the solution his business can provide.

Example 2

Just before the start of this extract the presenter had said that he will list three advantages of the service that his business provides. This example describes the first of these advantages, to do with ‘turnaround times’:

Event 6 – Pitch 8

- 01 E: The first (.) is turnaround times.
 02 (0.4)
 03 Instead of: background checks being processed by a human data
 04 processor .hhh and **>processed< in batches**, (0.3) our:: candidate
 05 driven (.) online software is able to process checks (.) **as and**
 06 **when** they come in (.) and produce live results.

The presenter’s first utterance describes the first advantage of the service that his business provides, to do with ‘turnaround times’. He indicates that there will be a contrast set out in his talk by beginning with ‘Instead of:’. The first part of the contrast sets out two elements of

how current companies provide their service: first, they use ‘a human data processor’ to process background checks, and second, they are ‘>processed< in batches’. The second part of the contrast sets out what the presenter’s company does differently: they use ‘our:: candidate

Figure 18.3 Metaphorical gesture on ‘processed in batches’ and ‘as and when’

driven (.) online software', and process checks 'as and when they come in'; he also emphasises the 'us and them' contrast by placing stress on and lengthening 'our:'. So using 'human data processors' and processing checks in 'batches' is set up as the problem, the undesirable way of working and getting results. This is contrasted with using software and processing checks 'as and when', which is more desirable and the solution to the problem.

The specific contrast between how background checks are processed – '>processed<' in *batches*' versus 'process checks (.) *as* and when' – is reflected in the presenter's gesture. At '>processed<' his left hand is held at chest height close to his body. This hand remains roughly in this position. His right hand, however, beats near his left hand and then moves to the right, beating again at the right side of his body, and doing a final beat out to his right side. This bouncing movement appears to illustrate working in batches, with someone physically doing one batch, and then another, and then another. When describing processing checks '*as* and when they come in', the presenter holds his left hand slightly out to his left and moves his right hand from its start position slightly to the right of his left hand on 'checks'

in a smooth line during '*as* and when', finishing with his right hand far out to his right. The two movements – the 'bouncing' and the smooth – follow the same trajectory and end with the speaker's right hand in a very similar position. This same trajectory highlights the difference between the movements: one is halting whereas the other is smooth.

So again there are a set of contrasts in this one utterance:

- 1 The problem of a more time-consuming way to process checks using humans working in batches, contrasted with the solution of using software to process checks as and when with the implication that this is quicker.
- 2 A bumpy hand movement versus a smooth hand movement, which not only illustrates the idea of there being several batches but also implies the idea of a rough or bumpy path versus a smooth and efficient one.

Example 3

In this last extract the entrepreneur explicitly indicates that his company addresses a problem and has a solution: 'So: (.) the ↑*problem* we solv:e for *big* <agencies> ↓*is* ...':

Event 6 – Pitch 11

01 E: So: (.) the ↑*problem* we solv:e for *big* <agencies> ↓*is* when they
 02 have m:ajor clients the (bit-) (0.2) m:ed:ia agencies I mean (0.3)
 03 when they hav:e #a a a# *big* client ↓*in* the <like of> .hhhh
 04 ((company)) or:: er:: (0.3) ye::s (0.5) or: er ((company)) (.)
 05 -> <they want to> (0.2) run: campaigns *acr:o::ss* the board. bu:t
 06 -> they need to use (0.6) a *platform for web* a *platform for mobile*
 07 -> a *platfor:m for digital out of home*.
 08 (0.2)
 09 -> *U::s what we did* (0.2) *is: centralise* (0.2) *every* inventory: (0.3)
 10 *in:side* one single platform.

The entrepreneur begins by saying that the problem he is describing affects 'big agencies', which he then specifies as media agencies by repairing his talk (Schegloff et al., 1977), and he goes on to describe that the problem is specific to a particular need that these 'big agencies' have: having big clients

who want to run campaigns 'across the board', but in order to do so 'they need to use (0.6) a *platform for web* a *platform for mobile* a *platfor:m for digital out of home*'. The implication is that the problem is not that agencies want to go 'across the board' but that in doing so they have to do three separate

Figure 18.4 Metaphorical gesture on 'across' and 'platform'

Figure 18.5 Metaphorical gesture on 'centralise'

things by using three different platforms. After a 0.2 second gap, he contrasts this in the next part of his talk: rather than going 'across the board' using three platforms that each address a different area, his company has 'centralised' everything within just one platform. He also emphasises the contrast between the existing problem and his company's solution by starting his utterance with 'U::s' which is both stretched and stressed, and then following with what they did to solve the problem.

The language that he uses to describe the problem and solution is metaphoric. So although 'platform' is a technical term used in the realms of software/technology, and

platforms in this context are not things that are physically manipulatable, the term still has implications of the physical. Both 'across the board' and 'platform' conjure up images of physical objects: platforms can be physical levels/areas where you can walk or put things on, and running something across a board suggests moving something physically over a flat space with a specific determined area. The gesture that he uses in conjunction with his talk contributes to this sense of the physical. At the start of 'across' his hands are held together at neck level with his elbows out to the sides but as he produces this word he opens both his arms out wide to his sides. This also suggests a wide breadth of area to

cover when running campaigns. This breadth is further suggested in his gesture when listing the three platforms that need to be used; his right hand moves from right to left in three stages, with a beat on the production of each instance of 'platform'.

During the contrast part of his talk, in which he provides the solution to the problem, he begins his utterance with his arms wide open on 'U::s', and brings them towards each other by the time he completes 'did'. This movement together appears to visually depict 'centralise', and the similar arm shape to his prior utterance continues the theme of breadth and reducing this breadth.

So the entrepreneur's utterance again encompasses a set of contrasts:

- 1 He describes the problem, that there is a wide breadth of different platforms to run across, followed by the solution, that his company's service means that customers only need to use one platform, which is therefore simpler and quicker.
- 2 The verbs that he uses are contrastive: 'run across the board' versus 'centralise every inventory'.
- 3 He contrasts amounts, with the problem involving using three platforms and the solution using only one platform.
- 4 The presenter's gesture shape is similar throughout; however, his initial movement of his arms opening out contrasts with his arms then closing in.
- 5 The first part of the contrast includes three movements: three beats on three repetitions of 'platform'; however, the second part has just one movement, which occurs just before he produces 'centralise'.

These individual elements all serve to highlight the differences between the two parts of the contrast.

Setting up a problem–solution contrast serves two purposes in the pitches here. First, by describing an existing problem the entrepreneur shows that there is a space in their particular market for them to operate in, thereby justifying their existence in the market. By providing the solution to this problem, in the form of what their business

offers, they also (or so they hope) show that their product or service is appropriate to fill the gap in the market that they identified as the problem, thereby justifying their product or service as well. Second, in describing their solution to the problem they are also explaining to their audience something about their product by providing information about the service that they offer. So the whole problem–solution contrast provides the entrepreneurs' audience with both information about their product or service, and a justification for having developed the product or service in the first place.

CONCLUSION

This chapter aims to illustrate an approach that places multimodality at the heart of our analyses of organisational conduct; we give one example of the importance of non-verbal resources in the context of entrepreneurship where entrepreneurs seek to persuade investors to fund their venture. The chapter centres on the data from a video-based study of entrepreneur's pitches for investment at an organised pitch event in the UK. In particular it considers how entrepreneurs employ gestures alongside speech to communicate their venture most effectively. Drawing on data collected as part of a larger study on entrepreneurship, we highlight the role of gesture in entrepreneurship, and multimodal research more generally. In doing so, we show some of the informal and tacit practices that underpin the production of a persuasive message. One notable practice is the use of metaphor in both the entrepreneur's talk and their gesture is also a way to explain something quite abstract that the audience might not have much knowledge about. By using metaphor both verbally and in their arm and hand movements, the entrepreneurs in the examples given here 'give sense' about their products and services to the potential investors in the

audience, by adding commonly known attributes to the more abstract details of their products: a bundle of calls is visually represented as something being physically bundled together, work done in batches is visually depicted as a bumpy process compared to work done ‘as and when’ which is visually depicted as smooth, and using three platforms for a campaign is visually depicted as wide compared to using a centralised platform which is depicted as small. The analyses here show how those creating new ventures have to rely upon their own speech and visual presentation (Baron & Brush, 1999), including their gestures, to naturalise their venture and to provide a compelling and convincing rationale that accounts for its existence and appeals to others for their support. Speakers have a range of resources to use in their interactions: the words they use, the gestures they make, and the metaphor that can be in both the verbal and the physical. Using a multimodal lens, we can look beyond just the spoken element of this kind of data to see how visual elements contribute to what speakers are communicating to their audiences.

Collage Visual Data: Pathways to Data Analysis

Emmanuella Plakoyiannaki and Georgia Stavraki

INTRODUCTION

Collage (*papiers collés*) constitutes an artistic technique and an art genre (Butler-Kisber & Poldma, 2010). Its origins can be traced in the works of Picasso and Braque in the beginning of the twentieth century (Vaughan, 2005) particularly during their artistic experimentations in the period of synthetic cubism (Taylor, 2004). Its name comes from the French word *coller* (that is pasting, sticking or gluing) (Butler-Kisber & Poldma, 2010; Hoffman, 1989), and denotes a ‘glued work’ generated by the usage of fragments of images that are juxtaposed on a flat surface (for example on a paper or canvas) (Hoffman, 1989). The artistic technique of collage has been conceptualized as an abstract, revolutionary and relativistic form of art (Kjellman-Chapin, 2006; Kuspit, 1989; Rosenberg, 1989). Particularly, collage art is conceived as a type of abstraction, since its composition lies in the aggregation of visual representations of identifiable objects, which when they

are placed next to each other result in an incongruous effect. Collage is characterized as a revolutionary art form, because it bridges the (aesthetic) gap between art and life by mixing formal (for instance artistic techniques) and material realities (for example the incorporation of pieces of everyday life such as images from magazines, bus tickets) (Rosenberg, 1989). By so doing, collage can reflect the way individuals experience the world (Butler-Kisber & Poldma, 2010; Liao, 2013) by unravelling ‘multiple layers and signposts pointing to a variety of forms and realities, and to the possibility or suggestion of countless new realities’ (Kjellman-Chapin, 2006, p. 95).

Through its arts-based origin, the technique of collage has entered the world of research and forms an approach of qualitative inquiry (Butler-Kisber, 2010; Vaughan, 2005). Indeed, a great number of qualitative researchers argue that collages represent a visual interpretive tool, which elicits information that lies in the black box of

individuals (for example introspection, inner conflicts, etc.) (Belk et al., 2003; Koll et al., 2010). This potential of collages to enter the private worlds of subjects and to uncover inner thoughts, feelings and perspectives, contributed to the conception of collage more as a projective technique rather than as an arts-informed mode of inquiry (Boddy, 2005). This is evident in consumer and management studies, in which the aesthetic nature of collages appears to be undermined by their methodological categorization as a projective technique that aims at disclosing individuals' desires, feelings and wishes (Boddy, 2005; Donoghue, 2000). The employment of collage as a projective technique lies in the theoretical foundations of psychology rather than in the artistic origins of collage. For instance, various consumer researchers have employed the projective technique of collage in order to unveil the emotional aspects of consumption (Costa et al., 2003), the consumption imagery and its meaning (Havlena & Holak, 1996), the richness and complexities of consumers' lived experiences (Hogg et al., 1999; cf. Koll et al., 2010) and the unconscious desires and feelings of consumers (Belk et al., 2003). Similarly, different management studies have used arts-based methods as projective techniques to reveal managers' unconscious thoughts and feelings as well as to foster managers' reflections upon tacit knowledge and experiences (Taylor & Ladkin, 2009).

Despite this prevailing view of collage as a projective technique, its aesthetic nature has been recently highlighted by qualitative researchers (Butler-Kisber, 2010; Davis & Butler-Kisber, 1999; Vaughan, 2005). Indeed, collages are intrusive art entities with a hybrid ontology (Taylor, 2004) that can either manifest the imagined or real with the sensation, the surfaces and textures that make up their world. Arts-informed inquiry is rooted in qualitative research (Rolling, 2010) as it employs artistic methods within a research process and acknowledges the unique characteristics of these artistic methods (Eisner, 2008). As Eisner puts it 'any talk about arts-informed

research must take into account the characteristics of the particular art form or art forms that are being employed' (2008, p. 8). Moreover, the 'interdisciplinary' nature of collages (i.e. operating both as an aesthetic technique and as a form of visual data) manifests their value as a heuristic for gaining in-depth and new understandings of key perceptual notions; for disclosing conceptual connections that lead to novel and even to paradoxical insights/meanings (cf. Deleuze, 2000); for eliciting multiple narratives that represent individuals' inner worlds (Van Schalkwyk, 2010) and for providing a decentring technique (for instance collage representations unsettle expected views of understanding) for understanding the ways in which individuals experience the world (Butler-Kisber & Poldma, 2010; Poldma & Stewart, 2004).

Viewed in this light, collage is an artistic structure of heterogeneous elements that can capture the contradictions of modern life (Butler-Kisber, 2010; Vaughan, 2005). This postmodern epistemology of collage is manifested in its associative and paratactical structure, through which multiple realities and ways of perceiving and understanding these realities can be revealed (Kjellman-Chapin, 2006). Collage is a representational arts-informed form of qualitative inquiry that involves abstract, metaphorical and imaginative representations, which disrupt the normative ways of depicting and making sense. Collage as a representational arts-informed form of inquiry can be conceived as a living inquiry, which indicates 'an embodied encounter constituted through visual and textual understandings and experiences rather than mere visual and textual representations' (Springgay et al., 2005, p. 902). This conception parallels the more-than-representation mode of thinking (e.g. emphasis on actions and practices, Lorimer, 2005; Lorimer, 2010), since collages by weaving together the practices of knowing (theoria), doing (praxis) and poesis (making) can carve out novel and multiple orders in experience (Butler-Kisber & Poldma, 2010; cf. Vannini, 2015).

Based on the above, the purpose of this chapter is threefold. First, it attempts to illustrate the discrete creative strategies of collages that have not been exploited in qualitative research. The identification of these creative strategies is crucial since they generate the heuristic quality of collages for revealing unexpected conceptual associations, tacit understandings and new narratives. Second, it aims to provide a review of the existing methodologies for analysing visual data in order to argue that there is still a lack of a process of analysis which can capture and interpret the 'interdisciplinary' nature of collages and surface their heuristic quality. Third, it aims at proposing a process for analysing collages, which embraces their unique idiosyncrasy. It unfolds the methodological and interpretive potential of collage visual data that has been under-exploited in qualitative research (Butler-Kisber, 2002; Davis & Butler-Kisber, 1999; Vaughan, 2005). This potential emerges from its arts-based origin, which calls and challenges researchers not only to engage differently with this form of visual data (Cambre, 2013; Simons & McCormack, 2007) but also to 'move beyond the more traditional, categorizing analytic approaches' in order to analyse them (Butler-Kisber et al., 2003, p. 133). This chapter addresses the challenges relating to collage analysis by proposing the process of heuristic analysis that relies on collage creative strategies and produces 'a more embodied, intuitive and dynamic interpretation' (Butler-Kisber et al., 2003, p. 133) of this form of visual data.

THE CREATIVE STRATEGIES OF COLLAGES: JUXTAPOSITIONS AND METAPHORS

Collage as a composition of an imagery created by a combination of materials (such as, for example, printed images, three dimensional objects, glued paper) is a practice that is founded on a paradox, i.e. each disparate image of a collage acquires a new life and meaning through its relation to other images

posted on the collage surface (Kilgard, 2009; Vaughan, 2005). This interplay of multiple images on a collage surface manifests collage's paratactical structure (Kjellman-Chapin, 2006) that emerges from the juxtaposition of asyndetic materials, which in turn create a representation of 'a heterogeneous field of coexisting and contesting images and ideas' (Garoiian & Gaudelius, 2008, p. 64). Thus, the act of placing one image in the context of another as well as connecting one idea to another stress that the collage technique promotes both physical and conceptual juxtapositions (Kilgard, 2009), which reveal the visceral, associative and nonlinear meaning structure of collage. In this way, juxtapositions by having both aesthetic and epistemological dimension 'form the basis for discussion and learning' (Kilgard, 2009, p. 15).

As such, juxtapositions are not only part of a collage's syntax (namely they represent a discrete creative strategy in which every collage work is built on) but also generate its heuristic quality for revealing new conceptual connections, illuminating previously unconceivable insights and offering decentring approaches for representing and understanding the ways in which individuals experience the world (Butler-Kisber, 2007, 2008; Butler-Kisber & Poldma, 2010; cf. Cornelissen, 2005; Norris, 2008). More specifically, juxtapositions construct (new) relationships between the disparate elements that are put together and by doing so, they create and reveal the meaning(s) of a collage. Therefore, juxtapositions manifest the embeddedness of images in a shared world and thus, the implicit connection between these disparate images which unveils the life that exists in a collage. Kilgard (2009) calls this life 'the body of collage' in order to describe the intentional repetition of form, colour, texture or theme that characterizes (and connects) the disparate images of a collage. The body of collage by further emphasizing the associative structure of collages can reveal the metaphorical interconnection between the disparate image fragments in the bounded

space of the collage (cf. Cornelissen, 2005; Marshall, 2005).

Accordingly, metaphors are another discrete creative strategy of collage (Davis & Butler-Kisber, 1999; Norris, 2008), through which the conceptual processes that underpin collage making and the generative impact of collages (i.e. collages potential to open up new and multiple ways of seeing, conceptualizing and understanding) are illuminated (Boxenbaum & Rouleau, 2011; Butler-Kisber & Poldma, 2010; Cornelissen, 2005; Marshall, 2005). Metaphors in collage art emerge from juxtapositions that (de)construct the disparate images of a collage (Khatena & Khatena, 1990; Marshall, 2008) and communicate the collagist's attempts to express an idea, to evoke imagery and to connect (Clements, 1982). Viewed in this light, metaphors in collage art are conceived as visual compositions of dissimilar elements that propose anomalous relationships evolving from the juxtaposition of physically noncompossible elements (Butler-Kisber & Poldma, 2010; Carroll, 2003; Pachler, 2010). In other words, the anomalous relationships in a collage surface by transforming the original content of each image in the collage and thus, by evoking figural transformations, result in the creation of visual metaphors.

Visual metaphors in collage art constitute visual expressions of metaphorical thoughts (Butler-Kisber & Poldma, 2010; cf. ElRefaie, 2003), which imply a comparison process between the irrelevant images that create the visual metaphor. According to Carroll (2003), through this comparison both the metaphorical insight and the metaphorical intention can be grasped and as such, lead to the creation of new conceptual understanding(s) for both the collagist and the viewer. In this respect, the creative and imaginative dimensions of visual metaphors (for example the creation of relationships between noncompossible elements) reflect the transformative powers of metaphor whose source lies in the acts of discovery and invention (Khatena & Khatena, 1990). Thus, metaphors can not only act as interpretive frameworks for revealing unconscious connections and new understandings of collage representations (Davis, 2008) but can also enhance the interpretive viability of collages (that is the plurality and openness of a collage's meaning) which invites both viewers and collage creators to look beyond the literal and to uncover the variety of realities that can be found in a collage surface (cf. Cornelissen, 2005).

As such, the heuristic quality of collages (i.e. quality in opening up new and multiple

Figure 19.1 Collage 1: The creative strategies of collage

ways of seeing, conceptualizing and understanding, Cornelissen, 2005) evolves from the creative strategies of juxtapositions and visual metaphors (see Figure 19.1: Collage 1). Specifically, the juxtapositions on a collage representation by disrupting the linear process of thinking (Butler-Kisber, 2007) produce a variety of metaphors where the power of visual conceptualization lies (Feinstein, 1982; Jeffers, 1996; Lakoff & Johnson, 1980). Thus, it is through these creative strategies that collages can exhibit their unique idiosyncrasy and as such, act as a methodological technique that can provide new ways of understanding and reveal unexpected associations (Davis & Butler-Kisber, 1999).

CURRENT APPROACHES FOR COLLAGE ANALYSIS

The majority of qualitative studies employing collage as a method of data collection have interpreted it by using the method of content analysis (Hamrouni & Touzi, 2011; Havlena & Holak, 1996; Hogg et al., 1999). In these studies, the employment of content analysis focuses mainly on collagists' interpretations of the meaning of the images that compose their collages (Costa et al., 2003; Koll et al., 2010; Mannay, 2010). This practice of inviting collagists to express the meanings that they assign to their collages is referred to as *auteur theory* (Rose, 2001), through which researchers are able to reveal and understand the internal narrative of the collage (that is what collagists intend to show through their collages). Content analysis is a very popular method in social sciences research for analysing visual material, since it can minimize the ambiguity of non-verbal expressions by offering 'objective, systematic and quantitative analysis' of the visual content (Ball & Smith, 1992, p. 21). Content analysis concentrates on identifying and quantifying the different images embedded

in a collage; it does not, however, scrutinize the interconnectedness of image fragments, which essentially creates the composition of a collage (cf. Berelson, 1952; Butler-Kisber & Poldma, 2010). Thus, through the employment of content analysis the researcher overlooks the associative and paratactical structure of collages and thus he/she is not able to tap deeper layers of meaning which lie in the juxtapositions and visual metaphors of the collage.

Other qualitative researchers have interpreted collages by employing semiotic approaches to collage analysis (du Preez & Roos, 2008; MacKenzie & Wolf, 2012). Despite the fact that semiotic analysis allows researchers to interpret the literal meaning of the images that compose a collage (du Preez & Roos, 2008) and to disclose the plurality of meanings that an image holds (MacKenzie & Wolf, 2012), the employment of semiotic analysis may impede researchers in examining the interconnectedness of the image fragments of collages. Moreover, while semiotic analysis is a well-established approach for investigating how images communicate a message, it is mainly concerned with how individuals perceive the meaning of an image and as such, it does not reflect how individuals produce interpretations of an image that they construct (Bal & Bryson, 1991). Further, while semiotics attempt to analyse visual patterns of communication through the use of metaphors (Labbo, 1996), this method may mask the metaphorical thought that underlines the subjective process of collage construction, since it focuses on the compositional structures of signs, which generate the meaning of visual representation. Also, semiotic analysis is a method that can grasp the visual imagery of collages (cf. Foss, 1994; Jewitt & Oyama, 2001), yet this method is not concerned with the aesthetic dimensions of the collage technique, such as its juxtapositions, through which the collagist can 'challenge the way that we see everyday objects' (Brockelman, 2001, p. 118).

In addition to the aforementioned frameworks for analysing visual images, Rose (2001) proposes other methodologies for interpreting visual images, such as compositional analysis, psychoanalysis and discourse analysis. Compositional analysis is based on art history approaches and focuses on analysing the compositional elements of a visual image (see also Kress & van Leeuwen, 1996). These compositional elements refer to the content of an image (i.e. the representation), its colours (i.e. description of colours and how they are used in order to stress specific elements), its spatial organization (i.e. how creators manipulate the perspective so as to create specific visual effects), the light (i.e. what type of light is represented in the image) and its expressive content (i.e. viewers' responses to an image). This method, by concentrating on the investigation of the artistic techniques used in the construction of an image and by interpreting the visual effects that an image produces, is considered to be more applicable for analysing drawings rather than collages (Rose, 2001). This is due to the fact that the compositional elements that are analysed and interpreted by this method do not describe the aesthetic nature of collage making (cf. Kjellman-Chapin, 2006). For example, collage making by integrating multiple and heterogeneous fragments disrupts conventional sequencing and results in the creation of a randomized rather than a concrete composition (Davis, 2008; Kilgard, 2009; Kjellman-Chapin, 2006). Moreover, the compositional element of spatial organization refers to strict geometry and the position of angles, which are relevant to paintings rather than collage representations where oblique and overlapping shapes exist. Indeed, the specific focal points that are proposed by spatial organization cannot be applied to collages, since a collage creator may juxtapose images that convey the metaphorical meaning of collage in oblique angles and not in the frontal angles (Vaughan, 2005).

Psychoanalysis constitutes another potential method for analysing collage representations. Despite the fact that from a historical point of view this method is closely related with collage art (for instance the influence of psychoanalysis science in the creation of collages (Foster, 2004)), from a methodological viewpoint psychoanalysis is considered as being more appropriate for deciphering the meaning of film images and investigating the influence of film images on spectators (Rose, 2001). More specifically, psychoanalysis by examining the image itself and its influence on its audiences concentrates on the interaction that takes place between an image and its viewer. As such, this method conceives collage representations as a projective technique, which allows researchers to access individuals' inner worlds as well as their unconscious thoughts through the use of visual stimuli, rather than as an arts-informed technique that unfolds the creative strategies that individuals use in order to develop the internal narrative of the image (i.e. the meaning that the creator intends to give to his/her collage) (Rose, 2001). Moreover, the method of psychoanalysis takes into consideration the repetition of form, colour, texture or theme (i.e. body of collage) in a collage surface, yet it mainly concentrates on the interpretation of such patterns of repetition in light of psychoanalytic concepts (Rose, 2001; Stokes, 1982). Thus, psychoanalysis is not concerned with the analysis of the creative techniques of collages (namely juxtapositions and visual metaphors) that lie beyond the creation of such patterns of repetition and which enhance the plurality and openness of a collage's meaning (i.e. collage's interpretive viability, Cornelissen, 2005).

Finally, Rose (2001) also considers discourse analysis as a means for investigating the social meanings of images, that is, how images create particular visions of the social world. This method of analysis conceives visuality as a form of discourse and concentrates on the images as well as

on the intertextuality of the meanings that each image holds, namely on the meanings of other images and texts, which inform a specific image. This method of analysing visual data mainly focuses on the visual context of an image (i.e. interpreting one image in relation to the meaning of another image) in order to make sense of its (social) meaning (Mitchell et al., 2011). As a result, discourse analysis does not pay attention to the metaphorical seeing of an image as well as to the subjective meaning with which the creator intends to imbue an image. In this way, this method by being mainly concerned with ‘the social modality of the image site’ as well as by paying ‘careful attention to the image itself’ (Rose, 2001, p. 140), overlooks collagists’ interpretations of the meaning of the images that compose their collages as well as the metaphorical content of collages (Raaberg, 1998). Table 19.1 summarizes the aforementioned discussion.

AN ALTERNATIVE APPROACH FOR COLLAGE ANALYSIS: AN ILLUSTRATION

In order to overcome the limitations of the aforementioned methodological approaches to collage analysis and thus, to capture the rich interpretive potential of collage visual data generated by its aesthetic qualities (Kilgard, 2009), the authors propose and discuss a process of analysing collage data, namely heuristic analysis. Heuristic analysis denotes an abductive inferential process of analysis (Cornelissen et al., 2005; cf. Eco, 1995; Kilgard, 2009), which identifies and exploits the paratactical and associative structure of collage manifested in the creative strategies of juxtapositions and visual metaphors. These creative strategies of collage are at the heart of collage making and as such, they disclose collage’s creative potential of seeing and understanding the world

Table 19.1 Current methodologies for analysing collage visual data

<i>Methods</i>	<i>Content analysis</i>	<i>Semiotics</i>	<i>Compositional analysis</i>	<i>Psychoanalysis</i>	<i>Discourse analysis</i>
<i>Main purpose of analysis</i>	To capture (numerically) the meanings that a creator assigns to an image	To analyse how images communicate a message and how individuals perceive an image	To investigate the compositional elements of a visual image	To analyse the interaction that takes place between an image and its viewer	To investigate the social meanings of images
<i>Advantages</i>	Minimizes the ambiguity of non-verbal expressions	Investigates patterns of communication through the use of metaphors	Focuses on artistic techniques and interprets the visual effects that an image produces	Reveals individuals’ inner worlds and unconscious thoughts	Focuses on the intertextuality of the meanings that each image holds
<i>Limitations for collage analysis</i>	Overlooks the associative and paratactical structure of collages	Does not consider the aesthetic dimensions of collages	The compositional elements that are analysed by this method do not describe the aesthetic nature of collage making	Is not concerned with the analysis of the creative techniques of collages	Overlooks what collagists intent to show through the metaphorical content of collages

from multiple and new perspectives (e.g. perception of new and unexpected relations and connections).

This process of analysis (i.e. heuristic analysis) is based on the aforementioned synthesis of literatures concerning the discrete creative strategies of collages and illustrates the stages that we followed in order to identify and interpret these creative strategies, which have been neglected in the analysis of collages in qualitative research. Prior to the discussion of this analysis, a brief presentation of the research, within which collages were constructed, is presented.

The Research Context of the Collection of Collage Visual Data

The proposed method of collage analysis discussed in this chapter was emerged from an interpretive case study research (Stake, 2005), which aimed at providing an in-depth understanding on the creation of identity narratives that arise from the simultaneous interplay of consumers' multiple and competing identity positions in the context of contemporary art. The concept of multiple identity positions in the aforementioned research demonstrated the dynamic, multiple and dialogical nature of the self, which has been acknowledged and investigated by different disciplines, such as psychology (Hermans et al., 1992), consumer research (Ahuvia, 2005; Bahl & Milne, 2010) and management research (Belova, 2010; Pratt & Foreman, 2000). In this case study the Biennale of Contemporary Art Exhibition that was held in Greece in 2011 served as the research context, and the case study evidence emerged from various data sources including visitors' reflective diaries, interviews and collages.

The technique of collage as a method of data collection was chosen in the aforementioned case study research because of its power to elicit and produce rich representations of the various inner states that compose a multiple identity repertoire (Bahl & Milne,

2010; Van Schalkwyk, 2010). As such, the method of collage not only facilitated the informants (i.e. Biennale visitors) of the aforementioned case study to meet their multiple identity positions but also elicited more vivid and rich descriptions of their multiple identity positions that surfaced during their Biennale experiences. Furthermore, through collages our informants would be able to reveal the relationships and possible dialogues between their multiple identity positions which despite the fact that they occur below the level of awareness, participate in the creation of an identity narrative (Van Schalkwyk, 2010).

Each Biennale visitor who participated in the case study research, was invited to participate in a process of collage making that would depict his/her multiple self-states connected with the Biennale exhibition (Bahl & Milne, 2010; Van Schalkwyk, 2010). Each informant created the collage individually and was provided with the necessary materials (namely scissors, paper, paste and magazines) in order to complete the task. When participants completed their collages, they were invited by the researchers to compose a written narrative, in which they were asked to elaborate both on the associations and on the themes, ideas and texts that were presented in their collages (Koll et al., 2010).

Heuristic Analysis: An Analysis of Collages' Creative Strategies

The heuristic analysis of collages, which emerged from the case study research of the Biennale exhibition, was conducted in the following three intertwined stages:

Stage 1: Deconstruction of collages. In order for the authors to investigate the compositional elements of each collage as well as the themes, ideas and texts that were presented in collages, they deconstructed each collage and documented the meaning(s) of each image fragment (Van Schalkwyk, 2010). Specifically, in this first stage of

analysis we follow Van Schalkwyk's (2010) process of collage deconstruction, within which the literal and latent/metaphorical meanings of each image of a collage is identified and documented first on a clean sheet of paper and next in a story grid. The recording of the literal meaning of the collage consists of documenting the fragments of images posted on a collage, whereas the cataloguing of the latent meanings of the images glued on a collage surface involves the interpretation of the metaphorical meanings of a collage. Collage 2a in Figure 19.2 depicts this first step of the process of collage deconstruction, namely the recording of the literal and symbolic meanings of the images that compose a collage on a clean sheet of paper.

Next, the creation of story grids for each collage representation follows (Table 19.2). Story grids are 'a unique protocol for each participant' (Van Schalkwyk, 2010, p. 684) and involve the documentation of the literal and symbolic meanings of the disparate images of a collage, as well as the collagist's story behind each image. As such, story grids not only record the metaphorical meaning that the collagist assigns to the images that are glued on his/her collage surface but also reveal the implicit connection that exists

between the heterogeneous image fragments, namely they reveal the body of a collage. In our research the identification of the body of each collage was based on the intentional repetition of theme, which implicitly connected the heterogeneous images posted on each Biennale visitor's collage representation. Our choice to identify the body of each collage according to the intentional repetition of theme was determined by the fact that the reappearance of a specific theme could generate more illuminating insights about the conceptual ideas that underpinned collage creation in the context of our study about the creation of polyphonic identity narratives (Van Schalkwyk, 2010).

As Table 19.2 depicts, the recognition as well as the interpretation of the repetitive theme that connects the image fragments evolves from collagists' stories regarding the essence of their collages (Markham, 2005; Vaughan, 2005). Particularly in Collage 2a, the theme that connects the image fragments (i.e. the body of collage) was interpreted by the authors as *parallaxes*. The concept of *parallaxes* is defined by the *Oxford Dictionary* as the 'effect whereby the position or direction of an object appears to differ when viewed from different positions, e.g. through the

Figure 19.2 Collage 2a: Transcription of the literal and symbolic meanings of the images posted on a collage surface

Table 19.2 Example of Collage 2a's story grid

<i>Denotative meaning</i>	<i>Metaphoric meaning</i>	<i>Collagist's story</i>	Body of collage: Parallaxes
Man	Emptiness Informality Simplicity Passiveness	Before my visit to the Biennale I was like this man in the picture, namely like a simple man, who does not hold this kind of experience.	
Eye glasses	Vision Examination Performance Seeing differently	The eye glasses symbolize my Biennale experience. <i>During my visit I examined closely the different Biennale exhibits, such as the video art exhibits and the various paintings, and by doing so, I felt that I could view myself from a different perspective.</i>	
TV/ paintings	Artworks Transformation Extraordinariness	These two images that depict the same image, <i>which can be seen through different mediums, show my transformation.</i> I entered the exhibition as a simple man, and through this experience <i>I can see myself through another angle</i> , namely I as more cultured.	
Man with baggage	Knowledge Alteration Culture Holding Motion	This image <i>symbolizes another version of myself</i> , a version that was unknown to me. This man, contrary to the man depicted in the first picture, is in motion and more cultured. I see myself like being this man. A man who leaves the exhibition and holds in his hands this kind of experience.	

viewfinder and the lens of a camera'. We used this term in order to define the body of Collage 2a, since this term is in accordance with the collagist's story about the essence of his collage (Table 19.2) and manifests the implicit connection that this collagist assigned to his collage. Specifically, the parallaxes theme signals this informant's shifting identity perspectives and is manifested in the employment of image fragments that according to the creator/collagist portray the same images that are viewed by different angles (that is a man as passive and a man as active, the same artwork exhibited by different artistic mediums).

Stage 2: Identification and interpretation of juxtapositions. After the discovery of the body of each collage, the identification of each collage's physical and conceptual juxtapositions follows. In other words, this stage of the heuristic analysis involves the detection of the strategy (that is juxtapositions) through which a collagist deconstructs and reconstructs the meaning of the images

that compose his/her collage. The identification of juxtapositions entails the investigation of visual relationships depicted in a collage surface and through which concrete images lose their authentic meaning and represent abstract ideas. The detection and interpretation of these relationships begin from examining a collage as a whole (that is as one image) and are based both on the interpretation of the body of each collage and on the story that the collagist assigns to each image that is posted on his/her collage.

As such, in this stage of the heuristic analysis, the researcher unearths and interprets the meaning of juxtapositions by paying attention to the relationships that a collagist creates between the different images that compose his/her collage and to the implicit meaning that the collagist intends to suggest through these relationships. For example, in Collage 2a, the collagist by juxtaposing the images of eye glasses, the two artworks and the man in the train station, constructs a relationship between these images, which in turn provides

a new way of seeing and understanding this collagist's experience in the Biennale exhibition. The collagist manifests the relationship between these elements not only visually (see the arrows that connect these images and the positioning of these images side by side) but also verbally through his story (see in Table 19.2 how the collagist connects the stories of these images and in accordance with the body of his collage). The authors interpreted these juxtapositions depicted in Collage 2a as representing the collagist's performance of himself over the experience (that is he abandons his passive self and performs over the experience through his active self) and the outcome of his experience (that is the transformation of himself). Also, through these juxtapositions, the collagist creates a contextually anomalous relationship between these elements. This anomalous relationship is manifested in the unexpected position of the eye glasses above the head of a man (i.e. normally one does not expect to see eye glasses above the head of one person) and the painting as an uncommon extension of the coach's window. Through this anomalous relationship the collagist creates a visual metaphor, which is the second creative strategy used in collage creation and constitutes the third stage of collage analysis.

Stage 3: Analysis of metaphorical relationships. This final stage of the heuristic analysis entails the identification and interpretation of the visual metaphorical relationships that appear on a collage surface. The identification of the visual metaphorical relationships of a collage is based on the recognition of the anomalous relationships generated by the juxtapositions (see also stage 2) that create presentational and conceptual transformations of the collage image (cf. Phillips & McQuarrie, 2004). The interpretation of the visual metaphorical relationships that are created and suggested by collagists emerges from a comparison process between the juxtaposed images (Carroll, 2003; cf. Feinstein, 1982). In other words, the visual metaphorical relationship that a collage suggests is seen as a comparison in

which one image transfers its properties, relations and/or metaphorical meanings to another image (Cornelissen, 2004), and by so doing this process evokes a presentational alteration. As such, in a metaphorical relationship depicted in a collage, one image fragment acts as the topic (i.e. image A) and another image fragment as the vehicle (i.e. image B) (Cornelissen, 2004). Within this metaphorical relationship, the vehicle (B) transfers its properties, relations and/or metaphorical meanings to the topic (A) and by doing so, the vehicle not only changes the normal form of the topic but also invites the topic to be seen in terms of the vehicle (A is B) (Kaplan, 1990). The specification of the topic and the vehicle is based on the collagist's elaborations regarding the associations, themes, ideas and texts that are presented in his/her collage work, and on the interpretations of the juxtapositions and the body of a collage (see stages 1 and 2) (Vaughan, 2005; cf. Lynn & Lea, 2005).

After the specification of the parts of metaphor (that is the topic and the vehicle of a collage's visual metaphorical relationship), the interpretation of the meaning of the visual metaphor follows. The meaning of a collage's visual metaphor can be comprehended in light of the constitutive principles of metaphor as proposed and described by Cornelissen (2004). According to Cornelissen (2004), the meaning of a metaphor arises in the development and elaboration of the blending that takes place between the information that the topic and the vehicle import into the blend. As such, the meaning of the visual metaphor is emergent and constitutes a 'composition of a new meaning' (Cornelissen, 2004, p. 712) that can be found only in the interaction that takes place between the topic and the vehicle (that is the interactive process of seeing-as). Therefore, through this process the metaphorical inferences become insightful, which in turn assist researchers to generate associations as well as to synthesize the disparate meanings of the images posted on a collage surface (Feinstein, 1982). In Collage 2b (Figure 19.3) this process of analysing a collage's metaphorical relationship is depicted.

Figure 19.3 Collage 2b: Analysis of a collage's metaphorical relationship

Particularly, in Collage 2b the collagist juxtaposed the images of eye glasses, the two artworks and the man in the train station in order for these images to gain a shared meaning and as such, to inform each other. Within this relationship, the images of eye glasses and the two artworks around the image of the man in the train station are employed by the collagist as the vehicles (B) and the image of the man in the train station as the topic (A). In this proposed visual metaphor, the vehicles (i.e. eye glasses and art paintings) transfer to the topic (i.e. the man in motion) the metaphorical meaning of 'looking at things from different perspectives'. As such, the image of the man in motion is conceived by its collagist as representing another aspect of himself, an aspect through which the collagist sees himself as having a vision and as being cultured and unique. The metaphorical meaning structure that emerged from Collage 2a was interpreted by the authors as the visual metaphor of stereoscope, which conceptualized the Biennale experience as a process of confronting oneself from different viewpoints. Through the analysis of this metaphorical relationship the authors were able to provide a more vivid and insightful description of how this collagist lived his Biennale experience through the lenses of his multiple identity positions.

CONCLUSION

This chapter had three objectives. The first objective was to illustrate the discrete creative strategies of collages, namely juxtapositions and visual metaphors, through which the methodological and interpretive potential of collage visual data comes into existence. While it has been argued that the heuristic quality of collage visual data stems from these creative strategies (Butler-Kisber & Poldma, 2010; Davis & Butler-Kisber, 1999; Vaughan, 2005), they have been absent from the process of collage analysis in qualitative research. As such, within this first objective of the chapter we demonstrate why juxtapositions and visual metaphors constitute the discrete creative strategies of collages as well as how these creative strategies enhance the heuristic quality of collage as a representational arts-informed inquiry (Davis & Butler-Kisber, 1999).

The second objective of this chapter was to review existing methodologies for analysing visual data in order to argue that there is still a lack of a process of analysis which can capture and interpret the 'interdisciplinary' nature of collages and surface their heuristic quality. Particularly, we consider

Table 19.3 The insights of the different processes in the analysis of collages

<i>Methods</i>						
<i>Collage Ontology</i>	<i>Content analysis</i>	<i>Semiotics</i>	<i>Compositional analysis</i>	<i>Psychoanalysis</i>	<i>Discourse analysis</i>	<i>Heuristic analysis (authors' approach)</i>

<i>Composition</i>		✓	✓		✓	
<i>Metaphors</i>						✓
<i>Juxtapositions</i>					✓	✓
<i>Body of collage</i>	✓			✓		✓

five proposed methodologies for analysing collage visual data, namely content analysis, semiotics, compositional analysis, psychoanalysis and discourse analysis. We illustrate constraints of each methodology and present an alternative approach of collage analysis that captures the idiosyncrasies of such visual representations (Davis & Butler-Kisber, 1999). Table 19.3 summarizes the key insights generated from different methods of collage analysis.

As such, in this chapter, by conceiving the methodological technique of collage as a representational art form of inquiry, we suggest that the analysis of collage representations should also involve the identification and investigation of the body of a collage, its juxtapositions and its visual metaphors. The explicit process of collage analysis presented in this chapter can not only aid theorists and researchers in their use and analysis of collage data but can also complement other methodologies that have been proposed in the literature for analysing collages (for example semiotic analysis). Moreover, the presented process of collage analysis by providing a detailed explication and analysis of collage visual data demonstrates how juxtapositions and visual metaphors work on a collage surface. It has been shown that the metaphorical associations evolving from a collage's juxtapositions can be operationalized as parts of metaphor, and this operationalization can be based on informants' interpretation of their collages and in relation to the identification of the juxtapositions and the body that

characterize each collage (cf. Lynn & Lea, 2005). Heuristic analysis embraces the idiosyncrasies of collage visual data and offers insights into the (imaginative) processes behind the creation of collages. It opens up the reading of collage 'to a more embodied, intuitive and dynamic interpretation' (Butler-Kisber et al., 2003, p. 133), which can enhance its potential for providing different ways of knowing and understanding in management research.

As discussed above, collage arts-informed inquiry creates new forms of understanding and elicits multiple narratives that capture individuals' inner worlds. Viewed in this light, it can be employed by management and organizational studies that aim at extending the epistemological foundations of management and organizational knowledge (Bell & Davidson, 2013) and offer insights into organizational processes and practices through the exploration of the spatially and temporally (dis)organized nature of identity (Bell & Davidson, 2013; Belova, 2010; cf. Obodaru, 2012). Hence, collages may serve as a methodological tool into the epistemological research stream of narrative temporality (Cunliffe et al., 2004). Further, collages could be employed in organizational identity studies as well as in leadership studies, in order to provide rich insights into the multi-vocal and multifaceted organizational sense-making processes (Latham, 2014; Maitlis & Christianson, 2014) and 'mark a greater intimacy with daily truths' (Hoffman, 1989, p. 13) of organizational life.

Qualitative Research through Documentary Filmmaking: Questions and Possibilities

Rachel Morgan, Annilee M. Game and
Natasha Slutskeya

INTRODUCTION

The aspiration to capture, revisit and review reality has always been a driving force for both science and art (Gaines & Renov, 1999). The search for visible evidence and attempts to document the world also underpin the origins of the documentary tradition. Documentary has a direct, multi-sensory impact (Spencer, 2011) and this has led to a dual quest to develop documentary as a way of taking hold of reality and as a new form of social persuasion (Nichols, 2016). Recently, rapidly emerging new media technologies have triggered increased interest and a reworking of the documentary field (Hight & Harindranath, 2014; Nash et al., 2014).

The growing impact and importance of documentaries have been recognized in the academic sphere. Indeed, academics increasingly use filmmaking to generate and disseminate knowledge (Rakić & Chambers, 2010). While the use of documentaries as a resource for research remains a subject of debate – with concerns related to the potential for political

bias, possible lack of academic rigour and likely difficulties in combining documentaries with other forms of academic evidence (Belk, 2011) – there is some consensus that documentaries are a valuable and extremely under-utilized source of material for researchers (Belk, 2011).

In this chapter we explore the practical potentialities and challenges of using documentary films to enrich the academic research process. The discussion begins with a brief overview of ‘documentary’ as a broad genre, considering the reasons for its growing popularity. Next, we reflect upon the use of documentary for research. We then present strengths and limitations of different approaches to filmmaking and consider how they might be applied in management and organizational research. This is followed by a discussion of how film can be used and analysed as data in the field of management. At the end of the chapter we provide some practical recommendations for researchers

to consider before setting out to incorporate documentaries into their projects.

DOCUMENTARIES: DEFINITIONS AND CONTEXT

The genre of documentary film has developed and expanded during the last 100 years, and advances have recently been accelerated by the development of inexpensive video capturing and editing technology (Belk, 2011). While it is beyond the scope of this chapter to review in detail, scholars have discussed different stages in the history of the development of documentary from the earliest cinema documentaries, to observational documentaries initiated by new television opportunities and demands, and now digital documentary driven by emerging technologies and the need for new documentary forms (Ellis, 2012; Nash et al., 2014).

Documentary, however loose and inexact a category, broadly involves an attempt to represent reality rather than to imagine its possible alternatives (Nichols, 2016), or to translate realities of the world onto the screen (Ellis, 2012). Documentary films are often perceived as ‘a creative treatment of actuality’ as they are expected to reflect something factual or specific, depicting people, places and events. Documentary styles range from more traditional formats that capture histories and biographies, peculiarities and particularities of human behaviour and emotional dimensions of individual experiences, to what is described by scholars as docudrama (dramatic enactment or re-enactment of a historic event) and reality videos (Corner, 1996; Hampe, 1997). Documentary films can be produced with different goals in mind including providing information and increased understanding; interest and sympathy for the subjects; challenging dominant social systems; and putting across oppositional views (Corner, 1996; Hampe, 1997). For its advocates, not only can documentary function as a

colossal collection of faces, places and events but it also possesses huge technical power to achieve persuasive rhetorical engagement (Nichols, 2016).

Although filmmakers differ significantly in their approaches to the making of documentaries and in their beliefs of how to represent reality – with some permitting events to unfold in front of their cameras while others choose to reconstruct events and to guide their participants – what makes documentary films fascinating is their provocative nature in relation to truth and realism (Ellis, 2012; Gaines & Renov, 1999). Scholars in the field of film studies have reflected on different modes of documentary representation, given that the reality exposed in films is observed yet also constructed. Researchers have raised concerns regarding whether the resemblance of reality can produce legitimate forms of knowledge and whether it could be read as a form of evidence of the real (Nichols, 2016). They have also drawn attention to the fact that documentary reality is multidimensional; it allows different contributions and forms of collaboration and participation (e.g. between filmmakers and government agencies and/or between filmmakers and their subjects), therefore, reality never lies within the image alone but always in the discursive field around it (Ellis, 2012; Nichols, 2016). Finally, scholars in the field of documentary are increasingly occupied with the potential of documentary to replace representation with evocation. Scholars have begun to interrogate whether documentary films are equipped to afford a new form of truth – a truth which is not unshakeable but instead more undecided, less fixed (Ellis, 2012).

RESEARCH WITH A FILM CAMERA

The twentieth century witnessed deepening unease with means of knowledge production which persist in reinforcing a subject and object dichotomization. This prompted

exploration of the use of more experimental research tools in social sciences (Corner, 1996). There have been repeated calls from within social scientific communities to challenge the position of the researcher as a disinterested outside observer; to create more equal relationships between researchers and participants; to empower marginalized and vulnerable groups through research; and to consider the 'justice' of research by questioning who benefits from the outcomes of research projects (de Lange et al., 2008). The urgent need to respond to these calls has drawn scholars' attention to such qualities of documentary as its capacity to witness social events, to present society to itself, to incite a conversation among different spheres of a society, and to reveal and alter existing discourses and understandings – all qualities which are seen as enabling delivery of new forms of truth. Hence, scholars' consideration of documentaries might arguably indicate a critical response to the growing scepticism directed at more traditional forms of knowledge generation (Corner, 1996).

Researchers in different disciplines have explored the possibilities of incorporating filmmaking in research design (Rakić & Chambers, 2010). For example, filmmaking has been widely used by anthropologists, visual sociologists and geographers, as well as in educational, tourism and health research, to name but a few. The use of documentaries in academic research has been both praised and criticized. Advocates commend documentary for its humanism, for the collaborative nature of the relationships between researcher and subject and its commitment to long-term immersion in the project as the precondition of its representation (Grimshaw, 2002). Critics of documentary condemn it for oversimplification and manipulation of data (Grimshaw, 2002). Indeed, the use of filmmaking in research projects has provoked a wide range of debate with some qualitative researchers believing that objectifying the realism of documentary might undermine efforts to represent the multiplicity (and often

incommensurability) of different realities (Rakić & Chambers, 2010).

Scholars are still working out how these two categories (research and documentary) can intersect in order for them to deliver mutual benefits. To facilitate the integration of the two categories, researchers have discussed the commonalities and differences between the research process and the process of filmmaking (Goodman, 2004). For example, Goodman (2004) has summarized his personal experiences of being both a researcher and a filmmaker and has identified a number of similar steps integral to both processes. Similarities include: stating the question such that it provides focus and creates excitement and interest in the given area; planning the design; using similar techniques for data collection (for example, participant observation and interviews); and engaging with data analysis and interpretation. Additionally, both researchers and filmmakers rely on individuals' perspectives to gather data or to tell a story. As such, all the strengths and weaknesses of relying on narratives as a source of data affect both the research and filming processes (Goodman, 2004).

The methods of obtaining rich insights from interviews are similar in qualitative research and filmmaking. In both research and filmmaking, it is essential to encourage participants to tell their stories, to avoid leading questions and – while there is always a checklist of questions to refer to – it is especially important to follow up on unanticipated, surprising or contradictory comments made by participants (Hampe, 1997). Goodman (2004) further highlights that, unsurprisingly, data analysis in research projects is not far removed from film editing – the process which entails both systematic assessment and creative interpretation. Although Goodman (2004) also remarks on crucial dissimilarities between documentary and research (comprising different goals and different forms of documenting events and recording data), he concludes that researchers and filmmakers

have a lot to learn from each other and could unquestionably deliver mutual benefits. In the next section we present some current examples of how the documentary format is used in business- and management-related disciplines in order to illustrate how documentary has been applied by the field so far.

DOCUMENTARIES IN MANAGEMENT AND ORGANIZATIONAL RESEARCH

The use of the documentary format in management research remains limited. However, the growing reliance of the field on a wider range of methodological tools to capture multiple dimensions of social phenomena (e.g. interest in the affective aspects of interactions at work and in the materiality of work practices), and increased attention to the development of sensitive and participative methodologies (e.g. participatory research and action research), means that organizational and management researchers are well-placed to incorporate documentaries into their research designs.

Existing uses of documentaries in management and organizational research can be divided into three broad areas: 1) using pre-existing documentaries for investigative purposes; 2) new documentary-making that is used as a research tool to facilitate data elicitation and/or dissemination; and 3) producing documentaries for educational purposes. There are also limited examples of exploring the potential of documentaries to offer a critical re-imagining of problematic institutions, and an emergent interest in ethnographic video and filmmaking (see Smets et al., 2014).

Scholars, especially in the fields of labour history, industrial relations and studies of work, have relied on existing documentaries to gain insights into daily practices and rhythms of work and life from the past (Brigden, 2005). Documentary film analysis has been used by researchers to advance their understanding of labour processes,

industrial disputes and the working lives of those involved in changing industries or occupations (Brigden, 2005). Documentaries have also been incorporated in scholarly research in order to demonstrate that wider audiences should be involved in tackling industrial concerns, and that responses to moral issues are needed at individual, company and public policy levels. For example, by comparing Kopple's (1990) documentary *American Dream* to Moore's (1989) *Roger & Me*, Orvell (1995) drew attention to the predicament of workers whose jobs were outsourced to cheaper overseas labour.

The use of pre-existing visual documentaries as a resource for research, both contemporary and historic, is also pertinent to consumption studies, macromarketing studies (Belk, 2011), and to critical marketing and transformative consumer research (Tadajewski & Hamilton, 2014). So far researchers have relied on both dramatized films and documentaries in their analyses of the marketplace. For example, Holbrook (2006) studied trade-offs between art and commercialization using dramatized films about jazz musicians. In a similar vein, Tadajewski and Hamilton (2014) highlighted the importance of transformative consumer research by linking two documentaries about the hazards stemming from various waste disposal practices. In their article, Tadajewski and Hamilton (2014) demonstrate the documentaries' potential to invite consumers to reflect upon the moral and ethical implications of their buying decisions, to revisit their consumption patterns and to 'self-correct' their consumption behaviour. More importantly, documentary films are valuable in reducing what Bauman (1991) describes as 'moral distance' between us and the consequences of what we do as it offers us convincing visual evidence of our misdoings (Tadajewski & Hamilton, 2014). Finally, McDonagh and Brereton (2010) demonstrated the importance of considering representations of the marketplace in films for macromarketing scholarship.

When filming was first incorporated in management research, it was often in the service of documenting common organizational routines and practices. For example, workplace studies have engaged with such organizational settings as surgical operations, control centres, surveillance rooms, medical consultations and financial trading rooms (Heath et al., 2010). Recently organizational scholars have commented on the increasing number of ethnographic films used in research projects. Filming is used when researchers need to attend to multiple discrete sites (Smets et al., 2014). Ethnographers advocate a 'technically mediated presence' through filming for studies which involve online worlds, electronic trading or remote working (Smets et al., 2014). It has been accepted among management scholars that the use of filming enhances researchers' presence in the field (Clarke, 2011; Heath & Hindmarsh, 2002; LeBaron, 2008). Fewer studies have used ethnographic documentaries, however. Those studies that do exist use documentaries to enhance trust and improve communication between researchers and participants, triggering a richer exploration of participants' experiences, in turn strengthening theoretical insights and the practical impact of the research (e.g. Slutskaya et al., in press).

There has been an increasing interest in exploring the potential of documentaries in business and management education. Previous studies have demonstrated effectively how management educators can include discussions and examples from films and documentaries to illustrate such concepts as work-life balance (Cebula and Comer, 2007), organizational culture and diversity (Buchanan & Huczynski, 2004; Holbrook, 2009; Huczynski & Buchanan, 2004; Smith, 2009), and also to stimulate students' interest in issues surrounding ethical decision making and sustainability (Comer & Holbrook, 2011). Researchers have noted that video cases work especially

well to document interpersonal behaviour by emphasizing a more realistic complexity than traditional written cases. For example, Comer and Holbrook (2011) turned to documentaries on the making of music albums for teaching key management concepts comprising intragroup conflict, group cohesiveness, task and maintenance roles, norms and group effectiveness. The film was used to demonstrate the complex dynamics of group interactions in the process of product development. Comer and Holbrook (2011) argue that management students are likely to respond favourably to the use of documentaries as they often contain real life examples and insights into individual experiences. In another example, visual footage of actual, in situ practices in complex environments was used to explore ways of engendering practitioner reflexivity (see Carroll et al., 2008). This approach endorses the use of films for educational purposes as it helps overcome the simplifications characteristic of simulation exercises and exposes learner-practitioners to the complexity of real interactions, in ways that suit and benefit their own learning focus, style and pace (Boud & Miller, 1996).

In sum, the interest in documentaries in the field of management is present and increasing in response to the need for richer data which adds new multi-sensory dimensions to knowledge. There is also a long-standing invitation to management scholars to share their insights with wider audiences. Documentary offers great potential to reach non-traditional audiences, beyond the confines of academia (Slutskaya et al., in press). However, there is still limited discussion of how documentaries can be included in management research, and which approaches to filmmaking could be considered as the most useful or appropriate. Below, to assist researchers in selecting the most appropriate approach, we outline alternative documentary approaches and discuss how other scholars have used these forms to date.

KEY APPROACHES TO DOCUMENTARY-MAKING

From the above discussion it is clear that depending on the nature, goals and findings of a research project researchers may sometimes choose different approaches to producing or incorporating a documentary as part of their research design. In this section we therefore look in more depth at five distinct documentary-making methods which might be adopted by management scholars seeking to make a documentary. The main approaches include the expository approach, the observational approach, the participatory approach, the reflexive approach and the performative approach. Below we examine the forms and conventions of each approach, reflecting upon their respective strengths, limitations and utility for the field of management. Table 20.1 summarizes the discussion.

Expository Approach

Documentary filmmakers adopting the expository approach focus on ideas which underpin the message of the film (Nichols, 2010). Filmmakers grounded in this approach tend to convey the message in an instructive form (Nichols, 2010), often excluding the audience from participating in the production of meaning – the message is communicated to the audience rather than being co-produced intentionally. In other words, filmmakers set out to convey already existing information in a new way, emphasizing the message of their choice (DeGaudio, 1997). As a result, filmmakers are in control and a voiceover is often the main form of sound present. Additionally, images are carefully manipulated and ordered to further support delivery of the message. For example, within *Eyes on the Prize* (a PBS documentary series about the American Civil Rights Movement), during a fight between teenagers, a voiceover is used (the word fear) in conjunction with an image of a frightened person's face (Cagle,

2012). *Eyes on the Prize* further demonstrates how within the expository approach the voice of a social actor could be used together with actuality footage, conditional on the narration taking a clear objectivist stance (Cagle, 2012).

The expository approach can also be combined with some poetic (emotional) elements. For example, specific images might be used to produce certain moods in the audience (Nichols, 2010). Thus in Gideon Koppels' *sleep furiously* (2008) (a documentary showing the lives of people in Trefeurig, Wales), the filmmaker focuses on incorporating images of peaceful country roads to evade a direct portrayal of the hardship felt by the individuals (Waldron, 2014). Furthermore, expressive techniques such as music and flashbacks could be used as poetic elements in order to strengthen the impact of the message being delivered by the documentary maker (Nichols, 2010). Referring to the previous example, in *sleep furiously*, the filmmaker also uses a soundtrack, combined with panning of the landscape to direct the audience's attention towards the importance of the main character's personal relationship with the village (Waldron, 2014).

The overall aim of this approach tends to be prescriptive so it could be usefully applied as a communicative tool. Within organizational research, it could be used to portray to audiences, including employees, the nature of changes to organizational policies (for example, new procedures for monitoring and reporting ethical breaches). However, a number of concerns have been raised over this approach, including limits to the accuracy of the message and the fairness of representation that may arise from lack of collaboration in the production stages. Due to the authoritative position of the filmmaker, historical and contextual accuracy also may be questioned (Nichols, 2010). This approach might also result in lack of trust between the audience and the filmmaker as the filmmaker claims instructive dominance over the viewer (Nichols, 2010).

Table 20.1 Comparison of approaches to documentary-making

	<i>Expository</i>	<i>Observational</i>	<i>Participatory</i>	<i>Reflexive</i>	<i>Performative</i>
Aim	To inform and move audiences	To present untampered footage of people's everyday lives	To inform through interactions and engagement	To show how knowledge is socially and formally constructed	To show knowledge as embodied by focusing on subjective and affective dimensions
Sound	Voiceover, expressive	Generated through voice and movement of participants	Dialogue between the participant and filmmaker (often in the form of interviews)	Voiceover explaining the self-reflexive nature of the footage	Filmmaker's voice prevalent, music, sound and interviews are commonly used
Image	Manipulated to support delivery of message	Pure images, filmed as they really are	Can be a combination of manipulated and pure images	Can be a combination of manipulated and pure images	Strong performances from actors, manipulated images
Strengths	Easy to follow, message is clearly conveyed, filmmaker has full control so less time and costs involved	Increases transparency, audience can construct their own meanings	Both filmmakers and participants have partial control, can challenge historical footage	Challenges notions of reality, allows audience to make informed assumptions about the message	Acknowledges the complexity of knowledge, focuses on personal experience and emotions, audience can feel what it is like to be in a certain social position
Limitations	Unfair representation, full control of the filmmaker questioning accuracy of the message, ethical concern of viewers' trust	Omits historical context, ethical concern presents itself if through their non-existent role, the filmmaker disregards harm to participants	Loss of independent judgement on behalf of the filmmaker, pressure or manipulation from filmmaker towards participant, subjectivity often goes unquestioned	Pressure from filmmaker towards participant to represent their point of view, focus is drawn away from social issues towards construction of knowledge	The filmmaker's point of view may be far from societal norms, people or issues may be misrepresented, possibility of exaggeration
Examples of potential use in management research	Research to inform audiences of management policy changes in organizations	Research to reveal the everyday experiences of an 'unseen' occupation, for example hotel cleaners	Research to enhance understanding of motivation in organizations, through a collaboration between filmmaker and managers	Research on social inequalities in organizations. Researchers can include their own reflexive narrative to contextualize the film	Research to convey the emotive experiences of employees who are a minority within a particular industry

Observational Approach

Contrasting with the expository approach, an observational approach understands knowledge as created through watching, listening to and observing others. This documentary approach aims at democratizing and humanizing the filmmaking process (Grimshaw, 2002); it also challenges a number of academic and filmmaking conventions and traditional power relations. Observational film is argued to increase transparency by 'capturing untampered events in the everyday lives of popular people' (Nichols, 1988, p. 48). The filmmaker has much less control in this approach and sound is generated from the voices and movements of participants (Nichols, 2010). The subjects being filmed interact with one another, with the intention that they are unaffected by the filmmaker's presence (Nichols, 2010). Alpert (2013) discusses some examples of the observational approach adopted by Sergei Loznitsa, a Russian filmmaker aiming to 'show problems in the Soviet Union' (Alpert, 2013, p. 135). To deliver his message Loznitsa focuses on the image. His documentaries are free from sound and characters do not make any political claims. They endeavour to provide a candid representation of marginalized groups without openly articulated political concerns contaminating the visual images. In this way, he attempts to reduce his influence on the production of meanings. Such an approach invites the audience to construct their own perspectives on what is shown in the film.

In such an approach, potential hierarchies are removed. That is to say, there is no designated director, the key themes are decided by participants, and there is an alignment between the interests of a filmmaker and participants (Grimshaw, 2002). The approach does not rely on voiceover or interviews (Lashua, 2010). No music or sound effects are used nor 'historical reenactments' (Nichols, 2010, p. 172). Often, extra steps are taken to enhance the authenticity of experiences captured by the films. For example, use of the minimum necessary

recording equipment with very few people involved in shooting reduces the influence of the camera on behaviour; this, along with editing undertaken only by those who were present at the film shooting, means misrepresentations of captured phenomena can be avoided (Grimshaw, 2002). An observational approach could be used within management research to explore the experiences of employees in 'unseen' occupations, such as hotel cleaners, and to help illuminate employee concerns.

Some scholars remain doubtful about observational cinema, however, highlighting that such films isolate discrete events and deprive viewers of a broader historical context that might shape them (Nichols, 2010). According to these scholars, the focus on realistic representation might stall further scrutiny of social phenomena. Additionally, allowing subjects to revisit and relive their painful and dramatic experiences might result in their physical and emotional distress or harm (Nichols, 2010). The descriptor 'observational' is sometimes mistakenly interpreted by scholars as an attempt at 'objectification' which is seen as inconsistent with the original phenomenological stance of this approach (Grimshaw, 2002). The supposed realism of the observational approach has been queried by more sceptical scholars and filmmakers due to the strong influence of the camera on human behaviour (McCarty, 1995).

There are further practical challenges associated with this approach. For example, in order for the approach to achieve its goals, a close relationship between filmmaker and participant must be formed (Young, 1995); yet this may be difficult to achieve in practice, especially when perceived status differences between researchers and participants are large. Moreover, concerns have been raised regarding the complexity of managing the relationship between reflecting upon experiences from within and efforts to represent them.

Participatory Approach

The participatory approach shows knowledge as learnt from interactions, generally in the form of interviews (Nichols, 2010). This approach was generated to counteract a key criticism of observational film – that is, the neutrality of the message presented (McDonald, 2007). The overall focus of the participatory approach is engagement and participation; hence, it is characterized by dialogue between the participant and researcher/filmmaker (Nichols, 2010). Sound exchange takes place between a subject and the filmmaker in the form of conversation, reinforcing the participatory nature of the approach (Nichols, 2010). As such, the representative voice of the film is less distinguishable (Nichols, 1988). Nichols (2010) highlights that filmmakers using interviews often discuss content before it is filmed. In this respect, the filmmaker only has partial control over the content (Nichols, 2010). Nonetheless, filmmakers are still able to influence the perspective shown on camera. This approach allows a contemporary critique of historical footage, ‘without challenging assumptions of the footage as a voice-over might’ (Nichols, 1988, p. 54).

An example of the participatory approach is Parr’s (2007) production of an ethnographic film named *Recovering Lives*, aimed at revealing experiences felt by those with mental health problems. In order to adopt a collaborative approach to the filmmaking process, a monthly working group was established whereby joint meanings and understandings were produced between researchers and participants. Parr (2007) found that communicating in formal, structured ways did not suit her project and therefore she had to adapt her understandings and expectations to meet the needs of others involved in the project. All parts of the film, from designing questions to editing and finalizing the film production were completed in collaboration. Participants’ sense of ownership and authorship of the film became crucial for the

success of the project. This approach could be used in management research to further explore and analyse motivational or leadership practices within organizations. Here, a filmmaker and managers and/or employees could collaborate in order to explore the nature and effects of motivational techniques, or leadership styles, as they are perceived and experienced by staff.

The participatory approach has limitations which include loss of independent judgement on behalf of the filmmaker (Nichols, 2010), a lengthier and more time-consuming process and a more uncertain outcome. Additionally, a major concern with a participatory approach is potential pressure or manipulation that participants might experience from the researcher/filmmaker (Nichols, 2010). Furthermore, although interviewees are telling their own stories (Nichols, 1988), interviewers may be tempted to choose participants who agree with their point of view; therefore, the potential for subjective bias in this approach remains a concern (Nichols, 1988). In line with this view, Mathew (2014) argues that using the participatory approach fails to encompass the difficulties involved in portraying complex realities of everyday life.

Reflective Approach

A reflective approach defines knowledge as contextual, ‘always framed by institutional constraints and personal assumptions’ (Nichols, 2010, p. 210). Underpinning the reflective documentary approach is the ‘epistemological assumption that knowledge and the position of self in relation to the mediator of knowledge are socially and formally constructed and should be shown to be so’ (Nichols, 1988, p. 60). Supporting this, DelGaudio (1997, p. 193) states ‘the reflexive mode emphasizes the epistemological doubt inherent in the presentation of scientific theory through the medium of film, directly questioning knowledge’. Lashua (2010) stresses that this approach contests previous

notions of stable, graspable and representable reality. Unlike the previous approaches, the reflective approach reveals details of the filming process to the audience, thus demonstrating how being filmed interferes with the construction and representation of reality. Relevant details which inform constructed meanings are unravelled (Mondada, 2006). Furthermore, this approach queries the notion of realism. For example, *Surname Viet Given Name Nam* (dir. Trinh T. Min-ha, 1989) portrays the oppression of women in Vietnam through interviews; however, within the film it is revealed that interviews were performed by actors and the actors followed a pre-written script (Nichols, 2010).

Reflective documentaries mix observational and interview techniques (Nichols, 1988). A voiceover is often used which clearly shows how the footage is a self-reflective reality, not undeniable truth (Nichols, 1988). In other words, this approach presents two frames of reference: evidential (through observation) and instructive (through the viewpoint of the narrator/filmmaker) (Nichols, 1988). Within management research, this approach could be used to develop insights regarding social inequality issues such as class discrimination, ageism and racism within organizations. A researcher can express the reasons behind their interest in social inequality, as well as how they recruited actors, thus providing a contextualized account of the message being conveyed.

A major concern with this approach is that pressure may be imposed on participants to represent the view of the filmmaker (Nichols, 2010). Furthermore, focus is moved away from social issues themselves due to its emphasis on the constructed view of reality (Nichols, 2010). Nevertheless, such an approach reveals how societal norms and conventions might arguably fashion our understandings of reality (Nichols, 2010). Additionally, showing the audience the process of filmmaking, for example, the staged interviews in *Surname Viet Given Name Nam*, gives viewers an opportunity to reflect upon the validity of the message (Nichols, 2010).

Performative Approach

The performative documentary approach provides an alternative to empirical, factual or abstract forms of knowledge (Nichols, 2010). Here, knowledge is defined as what we learn from experience and is therefore embodied (Nichols, 2010). This approach acknowledges the complexity of knowledge by stressing 'its subjective and affective dimensions' (Nichols, 2010, p. 202). In other words, the performative approach focuses on the emotional dimension of the audience (Swinnen, 2013). The filmmaker's voice is highly prevalent and music, sound and interview dialogue are often used in sync (Nichols, 2010). For example, *Tongues Untied* (dir. Marlon Riggs, 1989), a film aimed at investigating black gay identities, combines an emotive voiceover with strong performances to allow the audience to inhabit the social position of a black, gay male (Nichols, 2010). The core difference between the performative approach and the others is the focus on personal experience and emotions. A performative documentary therefore could be suitable for management research to express emotive experiences felt by a minority group of employees within a particular industry (for example, women in engineering). This approach may help to capture the personal experiences and emotions felt by marginal groups within the workplace, therefore providing valuable insights regarding organizational behaviour.

Typical concerns about the performative approach include the possibility of misrepresentation of people or situations, and the possibility of eccentricity (on the part of the filmmaker) strongly influencing the message conveyed (Nichols, 2010). This approach is personally orientated, in that the filmmaker aims to convey the 'truth of what it feels like to experience the world in a particular way' (Nichols, 2010, p. 211). As a result, it provides an opportunity for less exposed and less visible groups to be seen in unconventional ways (Swinnen, 2013), in turn encouraging audiences to challenge stereotypically

negative connotations (Swinnen, 2013). A central critique of this approach stems from the inclusion of dramatic elements, with some scholars suggesting this potentially undermines the validity of the message (Bruzzi, 2000).

It is important to note that the five approaches outlined above need not be used exclusively – as with traditional ethnographic research it is possible to combine techniques (Henley, 1998). Referring to a previous example, *Eyes on the Prize*, the filmmaker combined a voiceover with interviews, thus mixing the expository approach and participatory approach respectively. Cagle (2012) suggests that by combining approaches, the filmmaker increases the transparency and coherency of the documentary. Indeed, hybrid approaches to filmmaking are common forms of contemporary documentary (Cagle, 2012).

APPROACHES TO DATA ANALYSIS

One of the most significant advantages of using filming as part of the research process is the richness of data collected. Documentary-making generates large volumes of visual and verbal data. The extra richness of data brings both benefits and challenges related to data management and analysis. A clear plan for managing multimedia data sources and the adoption of a systematic approach using CAQDAS (Computer Aided Qualitative Data Analysis Software) can help prevent data from being ‘lost’ in the analysis process (Slutskaya et al., in press). Unlike analysis of other forms of social scientific data, film data provides researchers with unique opportunities for ‘time out’ – to play back, to re-frame, to re-focus and re-evaluate. Researchers also acquire extra flexibility because the documentary format, similar to video methods, allows for multiple takes on the data – facilitating exploration of different issues on different occasions, or consideration of the same issue from multiple standpoints

(Heath et al., 2010). Video data, including documentary, offers an opportunity to return to the original material in order to verify, clarify or develop findings further (Pink, 2007). Documentary can be treated as the principal form of data on which insights and findings are based or it can work as an illustration, revealing and enhancing observations largely generated through fieldwork.

As yet, there is no single acknowledged ‘video analysis technique’ (Spencer, 2011). As with the analysis of conventional, text-based qualitative data, the researcher’s choice of a video data analysis method should be driven by research questions and the researcher’s theoretical and epistemological perspective. Hence, to date, video-based scholars have borrowed from various disciplines to analyse video data or films. Banks (2012) provides useful examples of how some researchers have applied content analysis in order to identify a number of patterns, themes or latent meanings (i.e. repeated sequences of shots with similar content) that function as a means of delivering particular messages to the audience (see, for example, Iedema’s (2001) study of failings in the Australian hospital system). Scholars like Iedema (2001) compile detailed descriptive shot lists in order to build a convincing weight of evidence. Clarke (2011), in her researcher-led, video-ethnographic study of entrepreneurs’ impression management, iteratively examined video footage of entrepreneurs’ interactions, alongside interview transcripts, to develop detailed descriptive case studies. Similarities and differences within and between cases were then analysed in order to develop theory.

In contrast, drawing on more constructivist traditions, Hindmarsh and Tutt (2012) advocate applying the guiding principles of conversation analysis to examining and understanding video data, including documentary films. According to these scholars, each action is shaped by its immediate context which, in turn, shapes the setting in which subsequent actions emerge (Heritage, 1984). This principle leads to a particular

treatment of evidence in which researchers are expected to attend to the ways in which participants themselves treat conduct in situ, rather than trying to abstract actions from their immediate sequential context. This approach endorses the meticulous transcription and analysis of microcomponents of social action within the documentary data (Banks, 2012). Whichever analytical approach a researcher selects, it is important to recognize that analysis of video data requires significant time for repeated iterations of watching, and reflecting on the data – until meaning gradually reveals itself (Spencer, 2011). Banks (2012) aptly refers to this process as allowing the images to ‘breathe’.

PRACTICAL CONSIDERATIONS IN FILMMAKING

There are a number of additional practical issues that researchers should take into account before adopting the documentary filmmaking approaches outlined in this chapter. Table 20.2 summarizes questions researchers can ask themselves in order to address these issues.

A fundamental practical consideration for researchers in selecting the documentary filmmaking route is to ensure that adequate funding is available. It is important to fully assess the costs of production, editing and dissemination against the amount of funding available (Parr, 2007). A shortfall in funding could limit the amount of viable options regarding film approaches. In particular, some approaches will need more expertise to execute than others, which will increase costs. For example, the performative approach requires increased sensitivity and careful editing as it deals with emotional expression. Furthermore, this approach includes a voiceover, music and interviews, thus production, editing and labour costs will increase. Similarly, the participatory approach involves collaboration between the

Table 20.2 Practical considerations in documentary filmmaking

<i>Issue</i>	<i>Examples</i>
Funding	• Financial constraints • Production costs • Editing costs • Dissemination costs
Cultural bias and personal factors	• Age • Gender • Political interests • Researcher – subject relationship
Location	• Where? • When? • Consent?
Camera positioning	• What is the message? • Which camera angles best convey this message?
Duration of film footage	• How many hours are allocated to shooting? • What is the duration of the final film?

filmmaker and subject which will increase production time and labour costs. Ideally, researchers should ensure that they use the initial research development (and funding application) phase to develop clear, fully costed plans commensurate with the type of documentary approach that will be of greatest benefit to the project.

Cultural bias and personal factors such as: age, gender, political interests and the relationship between the researcher and the subject can also affect practical decisions regarding the production and composition of ethnographic filmmaking (Henley, 1998). For example, a management researcher specializing in gender inequality among managerial positions may favour a participatory approach or a performative approach to enable subjects to convey their own experiences. However, a market analyst specializing in quantitative research may favour an expository approach, allowing them to inform audiences with analytic facts. Researchers need to be self-aware and practise reflexivity in their choice and justification of type of documentary approach.

The filmmaker must consider very carefully the location of filming, as well as when the filming should take place (Henley, 1998). The film setting must suit the purpose of the film without distracting from the key message. For example, filming an interview based on someone's personal experiences at work should not be set in a busy coffee shop. Doing so would be insensitive towards the subject expressing their personal experiences, and on a practical level, the external noise of a busy coffee shop may detract from the key message being conveyed. Researchers should be aware of the need to obtain permission to film in particular locations. For example, before conducting an observational approach to unveil the experiences of an unseen occupation, the filmmaker must obtain consent from the organization. Additionally, financial constraints will affect decisions regarding location.

Furthermore, one should consider carefully where cameras will be placed (Henley, 1998). Camera position, and the resulting shot framing and camera angles, influences the message conveyed to the audience. For example, in Loznitsa's films, long shots are used to set the scene (Alpert, 2013), rather than low angle shots which portray a character as frightened or endangered (Millerson & Owens, 2012). In management research, a documentary aimed at informing an audience of changes to management policy would require long and medium shots, whereas a documentary conveying the emotional experience of a marginalized group of employees may require a mixture of long shots, close up shots and low angle shots to express various emotions. Finally, the filmmaker needs to consider how many hours of film footage to shoot, which may also be impacted by financial constraints, as well as the full duration of the final production (Henley, 1998).

CONCLUSION

In the last 20 years, the use of video-based methods in academic research has yielded a

wide range of novel observations and findings. Video-based studies have contributed to different areas in the field ranging from organizational analysis and technology studies to more general studies exploring the communicative and linguistic aspects of work interactions (Heath et al., 2010). Despite growing interest in video-based methods in organizational research, the use of documentaries remains rare. Against this background, the aim of this chapter was to give a brief overview of available approaches to documentary-making and the potential for organizational scholars to consider them as a methodological tool. Our discussion raised questions concerning the relationships between documentary filmmaking and research while outlining both commonalities and differences. We evaluated the strengths and limitations of existing approaches to making documentaries, identifying the unique features of each approach, their technical dimensions (for example, the use of a narrator's voice) and possible applications. Throughout this chapter we have invited researchers to reflect upon how the inclusion of documentaries in research may have the power to extend the reach of traditional research tools and techniques – by foregrounding participants' accounts, capturing less recognized aspects of experience, and in turn triggering a fuller, yet more focused exploration of participants' working lives (Slutskaya et al., in press). We have also argued that filmmaking can open researchers' minds to different ways in which knowledge can be obtained/constructed (Rakić & Chambers, 2010).

Based on the examples and literature reviewed, it can be concluded that documentaries offer researchers an important investigative tool through the power and agency inherent in film (Pink, 2003), as well as a potential participatory tool that gives voice to participants to express their concerns. By incorporating documentaries in academic research projects, it may be possible to generate a more polyphonic account in which different voices are represented, and where the social distance between researchers and participants may

be reduced, especially through collaborative projects (Parr, 2007). The more collaborative approaches to documentary-making may also facilitate the development of greater participant trust. Hence, participatory or collaborative documentaries might be a particularly valuable resource for any research that requires rapport in order to engage with sensitive topics, or aspects of work that are poorly understood because employees feel normatively bound not to speak out, (e.g. organizational politics, team dynamics or difficult customer interactions) (Slutskaya et al., in press).

The use of documentaries offers innovative opportunities for presenting management research findings in ways that reach not only traditional academic audiences but also practitioners and policy makers. The role of visual methods in disseminating academic research findings is acknowledged in organizational and management research yet, to date, little attention has been paid to developing their potential (Meyer et al., 2013). Until recently, conventional academic publishing constrained the use of film as a means to communicate and/or support research findings. However, some journal publishers are beginning to provide free access for authors to web-based dissemination toolkits. For example, authors of papers published by Wiley are offered access to 'Kudos' (www.growkudos.com), which enables researchers to create links between their traditional paper outputs and a range of associated resources, including video. Alternatively, authors of academic studies using documentaries could simply include web links in journal articles to their research project website, and/or upload the film to YouTube and Vimeo, so that readers can access the documentary. Finally, future researchers could consider one of several ethnographic film festivals for wider dissemination of their documentary to non-traditional audiences (for example, such festivals as www.withoutabox.com/ or <http://filmfreeway.com/>).

Aesthetics: Working With the Senses

Martyna Śliwa

INTRODUCTION

In the editorial introduction to the tenth anniversary issue of the journal *The Senses and Society*, Michael Bull and David Howes (2016, p. 2) have declared that ‘the sensual revolution in the humanities, social sciences and the arts is flourishing’. As a discipline belonging to the social sciences, management and organization studies (MOS) have not remained outside this general turn towards the sensual. Since the mid 1990s there has been an increasing recognition of the importance of aesthetic knowledge, i.e. knowledge acquired through the senses, for researching organizations. Crucially for this *Handbook* and especially in the context of the discussion presented in this chapter, efforts to incorporate aesthetics into organizational research have mainly been pursued by qualitative researchers.

Insights into the link between the ‘aesthetic’/ ‘sensual’ and the ‘qualitative’ can be found in the origins of this line of research

and the kind of research questions explored by those MOS scholars interested in aesthetics. Bringing aesthetics into MOS has been framed as an antidote to an excessive reliance on a paradigm of organization that emphasizes rationality and objectivism. This paradigm has traditionally been associated with a belief in the possibility of ‘discovering’ objective knowledge and establishing ‘truth’ about management and organizations through the application of quantitative data and methods of analysis. To counter this dominance of rationalist and objectivist epistemological assumptions, scholars have called for research that inquires into organizations as socially constructed and subjectively, bodily experienced; and in particular research that takes account of the art, sensuality and symbolism as immanent features of organizations, the processes of organizing and the experience of organizational life (e.g. Bell & Davison, 2013; Carr & Hancock, 2003; Gagliardi, 1990; Guillet de Monthoux, 2004; Strati, 1992; Taylor & Hansen, 2005; Taylor & Ladkin,

2009). It has also been argued that the rise of the ‘aesthetic economy’ (Böhme, 2003) triggers the need to explore how, and to what end, the aesthetic dimension of organization – manifested, for example, in the design and ‘landscaping’ (Gagliardi, 1990) of corporate buildings and offices or company logos – is deliberately managed (e.g. Dale & Burrell, 2008; Hancock, 2003; Warren, 2008) and how, and with what implications, workers are expected to engage in aesthetic labour (e.g. Butler & Harris, 2015; Warhurst et al., 2000; Warhurst & Nickson, 2007). Understandably, answering these kinds of questions, with their emphasis on the generation of rich insights into the subjective experiences of individuals, and a strong interest in the ‘how’ and ‘to what end’ of the organizing processes necessitates qualitative empirical approaches. In a similar vein, organizational leadership has been conceptualized as occurring and ‘constructed in and through the sensing and experiencing bodies’ (Ropo et al., 2013, p. 380) and as such, calling for investigation through an aesthetic lens (e.g. Bouilloud & Deslandes, 2015; Hansen et al., 2007; Koivunen & Wennes, 2011; Ropo & Sauer, 2007; Ropo et al., 2013; Sinclair, 2005). Viewed this way, leadership is a phenomenon that needs to be explored in detail at the level of the individual and relationships between individuals. Qualitative methods are better suited to carrying out such an investigation empirically than are quantitative methods that have typically been applied in mainstream leadership studies.

Against this background and in line with the *Handbook*’s emphasis on research methods, in the remainder of this chapter I first discuss the complexities involved in researching organizational aesthetics and give a general overview of various research process related issues for consideration by researchers wishing to empirically ‘work with the senses’. Subsequently, I examine a number of existing studies that have adopted the aesthetic lens, focusing on the methods of data collection, analysis and representation applied by their

authors. On this basis, I highlight what kinds of insights and knowledge have been generated through the use of these particular methods, and discuss possible future directions for the development of research methods exploring the aesthetic in organizational life. The chapter addresses developments in MOS in general, rather than in specialist areas such as accounting, advertising, consumer research, marketing, operations management, leadership and human resources management (see e.g. Amsteus et al., 2016; Davison, 2015; Davison & Warren, 2017; Homburg et al., 2015; Krishna, 2010; Patrick, 2016; Phillips, 2016; van Marrewijk & Broos, 2012). In its preoccupation with methods applied in studying the aesthetic aspects of organization empirically, it does not cover work that is primarily concerned with the philosophical and theoretical underpinnings of aesthetics in organizations.

The selection of examples through which I illustrate the current ‘state of the art’ with regard to the research methods applied in MOS studies investigating the aesthetic is, out of necessity, incomplete and arbitrary. Throughout the chapter, I have attempted to reconcile an ambition to represent the diversity of approaches that can be found in the field – on a spectrum of those adopting ‘intellectual’ or ‘artistic’ methods, and those whose content focuses on ‘instrumental’ or ‘aesthetic’ issues (Taylor & Hansen, 2005) – with a wish to offer a relatively detailed account of the research methods. In doing so, I have chosen to concentrate on a smaller number of studies that collectively build a picture of how the aesthetic dimension of organizational life has been researched and represented.

THE COMPLEXITIES OF ‘WORKING WITH THE SENSES’

Researching the aesthetic dimension of management and organization is complex. As Warren (2008, p. 560) explains, aesthetic

knowledge is derived from aesthetic experiences, i.e. 'subjective reactions to material things (real or imagined)' which are often 'involuntary, overwhelming and short-lived', and 'is acquired in the first instance by the continual stream of sense impressions that provide the backdrop of everyday life' (Warren, 2008, p. 561). A crucial implication stemming from the ephemeral and elusive nature of the aesthetic experience is that aesthetic knowledge cannot be easily represented and communicated through words and numbers. Rather, it calls for the usage of other 'languages ... from visual to gestural, and other knowledge-creating processes, from intuitive to evocative' (Strati, 2000, p. 14). What further complicates the process of constructing and conveying aesthetic knowledge is the 'double character' (Welsch, 1997) of the aesthetic, in that it consists of the sensory experience that is felt at an individual level, and of the judgements formed on its basis. These judgements, in turn, are constructed intersubjectively and impacted by the processes of socialization within a particular context (Warren, 2008).

This does not mean that sensory experiences and judgements have not been subject to quantification in the sphere of management and organization. Everyday life provides instances where, particularly as customers, we are asked to 'grade' our bodily experiences. The ratings we give are subsequently analysed through the application of quantitative methods and the results are used to supply managers with information in support of managerial decision-making. To illustrate this: a passenger arrives at Heathrow airport, disembarks from the aircraft, waits in a queue towards passport control and exchanges a few sentences with an immigration officer enquiring about the place of the passenger's departure and the purpose and intended duration of their visit to the United Kingdom. By the time s/he has passed through immigration control, the passenger's body will have acquired a range of aesthetic experiences. These would have been felt affectively, such as perhaps an

accelerated heart beat, sweating of palms and a feeling of 'butterflies' in the passenger's stomach. To an extent, these aesthetic experiences would have also manifested themselves through a verbalized stream of consciousness and more or less coherent stories made up from thoughts associated with, for example, anxiety, irritation, relief and excitement. Past immigration in the 'Arrivals' hall, the passenger encounters a machine with four coloured buttons – green, lime, pink and red – and a screen located above them. Each button is imprinted with an emoticon representing different levels of satisfaction: from a 'happy' (green) to an 'unhappy' (red) face. The question on the screen reads: 'How was your arrivals experience today?'

By pressing one of the buttons, the passenger provides the management of Heathrow airport with quantifiable and, possibly, managerially useful information about her/his judgement of the overall experience. To a researcher seeking to build aesthetic knowledge through generating insights into 'what it feels like' to arrive at Heathrow and go through passport and immigration control, however, the information about which button a given passenger pressed and about numerically expressed levels of passenger satisfaction on arrival at Heathrow is likely to seem insufficient for understanding the aesthetic judgement made by the passenger. Indeed, it might even seem irrelevant, if the researcher's primary interest is in capturing the complexity of the sensual experience, from understanding the stream of sense impressions that form it, to how these sense impressions are interconnected and interpreted. Addressing such research interest empirically calls for qualitative, rather than quantitative methods.

When studying the aesthetics of the organization, it is the researcher's task to present the audience with aesthetic knowledge in a way that is 'as loyal as possible to the context, the embodied, sensory and affective experiences, and the negotiations and intersubjectivities through which the knowledge was produced' (Pink, 2013, p. 35). At the same time, the

complexity of aesthetic knowledge presents researchers with multiple challenges in relation to answering the epistemological question of ‘how we might both acquire and communicate knowledge of sensuality’ (Hancock, 2011, p. 12) in MOS. These challenges notwithstanding, there has been a plethora of successful attempts by organizational researchers to create space for employing ‘aesthetic awareness as a legitimate form of understanding organizational life’ (Strati, 1992, p. 568). This has been done through paying attention to how different senses, often considered individually but sometimes in combination with other senses, allow us to gain insights into organizations and the processes of organizing. For anyone wishing to empirically engage in this kind of research using qualitative approaches, it is important to reflect on a number of issues associated with the whole process of construction and communication of aesthetic knowledge about organizations and management.

Focus and Objectives of the Research

To start with, it is crucial to consider what the focus of the research is going to be. Research that pays attention to the senses is likely to be interested not in the senses per se – for example, in what can be visually discerned in the office space or what can be smelled on the factory floor – but in the meanings sensory experiences have for the organizational members, or what insights they give us into the organizational culture, history, power relations, etc. It is possible that a precise definition of the research question is not going to be formed a priori, and therefore it is important to retain an openness to different possibilities in this regard upon entering the field. As the examples of Baxter and Ritchie’s (2013) and Shortt’s (2013) studies discussed later in this chapter demonstrate, the significance of a particular sense or multi-sensoriality within the field might occur to the researcher once s/he has immersed her/himself in the studied environment, and upon this

realization a previously unanticipated research question might be formulated.

When constructing knowledge about the aesthetic aspect of the organization, researchers might also choose to ask questions which do not call for a direct empirical investigation within a fieldwork site. Rather, addressing these questions might involve mobilizing the researcher’s senses, be it metaphorically, as with Rippin’s (2013a) piece, or literally as in the case of Rippin’s (2013b) and Sørensen’s (2014) research discussed below. Such analyses can have as their main objective promoting researcher reflexivity, arriving at new theoretical insights into organizational aesthetics, and drawing attention to important conceptual links, such as the connection between the aesthetic and the political dimension of organization (see Sørensen, 2010, 2014; also Beyes, 2016; Beyes & Steyaert, 2012).

Perspective from Which the Research is Conducted

Another question to answer when ‘working with the senses’ refers to whose perspective(s) the researcher seeks to capture. For example, is the research primarily interested in the aesthetic dimension of the organization from the perspective of the researcher or of the participants? It is possible to give priority to the researcher’s aesthetic experience (see examples of Strati’s (1992) and Baxter and Ritchie’s (2013) studies discussed below). Research based on auto-ethnographic sensory participation allows the researcher to build aesthetic knowledge about the studied organization based on her or his own embodied sensory experience of it (Pink, 2015). In such situations, it is important to reflect on how this experience can contribute to generating insights about the aesthetic dimension of the organization (as in Strati’s case), and how it can play a role in promoting researcher reflexivity, and as such offer insights into the changing relationship between the researcher and the participants/fieldwork site (as in the

case of Baxter and Ritchie's (2013) study). It is crucial to remember that the sensory experience of the organization will have different meanings for the researcher and for the organizational members. The example of Warren's (2008) study which I elaborate on below provides a vivid illustration of this broader point which relates to both the subjective nature of sensory perception and of individuals' interpretations of it.

Choice of Fieldwork Methods

Further, the choice of which methods to adopt when 'working with the senses' is key to the research design. Decisions about which methods are appropriate for a given piece of research will underpin its success potential. As Pink (2015, p. 57) highlights, through the use of different methods, *different* 'sorts of engagements are facilitated' and *different* 'types of knowledge' are produced. What adds complexity to the issue of how to access others' sensory experience is that in different cultures, different meanings are attached to the senses. Depending on their cultural backgrounds, the participants might not necessarily perceive the world according to the modern western sensorium of vision, hearing, touch, taste and smell (Howes & Classen, 1991, 2014). An awareness of the cultural groundedness of sensoria therefore becomes of particular relevance when exploring the aesthetic dimension of management and organization in multicultural contexts.

To qualitative researchers, the most familiar and frequently used fieldwork method is the interview. For this reason, it is also unsurprising that those 'working with the senses' – including the researchers behind the examples discussed in this chapter, such as Warren (2008), Riach and Warren (2015) and Shortt (2013) – have also tended to apply this method, either on its own or in combination with other ways of generating empirical material. Pink (2015) proposes reframing the ethnographic interview as a 'multisensory

event': an embodied encounter that is not only social, but also sensorial and affective, whereby the 'sensing bodies' of the researcher and the participant perceive each other as well as the total environment in which the interview is taking place. Interviews can be very effective in situations where it is possible for the interviewee to recall and elaborate on their sensory experiences and the meanings thereof. This, however, is not always the case. Therefore, research into the aesthetic dimension of management and organization often draws on aesthetic methods as a way of accessing sensory experience and learning about the aesthetic. For example, when conducting an interview, the researcher might use different elicitation techniques which consist of presenting the interviewee with a sensory object, for example a photograph, a video- or audio-recording, or a smell card. The sensory object can be provided either by the researcher or the participant. The examples of Warren's (2008), Riach and Warren's (2015) and Shortt's (2013) studies illustrate how sensory elicitation can be accomplished in practice, and how it can be conducive to constructing aesthetic knowledge. Here, it is important to remember that an approach to elicitation that draws on a particular sense, e.g. sight – as in the case of photo-elicitation – can be used to trigger articulation of an experience mediated through another sense, e.g. hearing, or indeed, it can evoke discussion of more than one sense. Through deliberately engaging the participants' senses during the interview, the researcher creates the opportunity to gain access to the interviewees' multi-sensory impressions and memories.

Approach to the Analysis of Empirical Material

When carrying out empirical qualitative research on the aesthetic dimension of the organization, another set of questions for the researcher's consideration refer to when and how to analyse the collected material. On the

one hand, the process of analysis takes place in parallel with fieldwork: it is part of the researcher's ongoing reflexivity, usually recorded through written and/or audio field-notes. As such, it is difficult and perhaps unnecessary to attempt to make a clear-cut distinction between data collection and analysis. On the other, the material gathered throughout the fieldwork will also be subjected to a systematic analytical process that involves the identification of patterns and themes, and a search for answers to specific research questions, typically in light of the earlier literature on the subject and against the theoretical and conceptual framework underpinning the research. As the examples discussed below (e.g. Riach & Warren, 2015; Shortt, 2013) demonstrate, this is usually done following transcription of the empirical material which is subsequently coded and analysed using established qualitative analysis techniques. The analysis itself is an embodied process, informed by the researcher's sensory memories of the fieldwork site. These are evoked, for example, when the researcher carries out transcription and coding of the data. In fact, sensory memories can inspire new engagements with the site and the research participants. In particular, where research is conducted by more than one researcher, sharing sensory memories and reflections upon them with the co-researcher(s) can enrich analysis and interpretation of the material. As in the case of Baxter and Ritchie's (2013) study, it can promote researcher reflexivity in a way that enables exploration of previously unanticipated research questions and generation of new insights.

Format and Medium of Representation

Regardless of the possible multisensoriality of both fieldwork methods and insights generated in the research process, the representation and communication of knowledge about the aesthetic aspect of organization faces

limitations posed by the conventions of academic publication in MOS. Typically, the research is communicated in the form of a text, sometimes accompanied by photographs. In addition, the final text is expected to have been composed according to the principles guiding a particular genre, such as a journal article, a chapter in an edited collection or a monograph, and is supposed to offer not only empirical but also conceptual and theoretical contributions. At the same time, a piece of qualitative research on the senses should 'engage readers ... in ways that are sensual, empathetic and reflexive' (Pink, 2015, p. 167). The examples discussed later in this chapter demonstrate how researchers have accomplished this when preparing journal articles. While more experimental approaches to representing research into organizational aesthetics, for example through film-making, have been attempted (e.g. Wood, 2011), the current technological limitations and disciplinary conventions of scholarly publication make it difficult for these to become mainstream.

In the remainder of this chapter, I discuss examples of research focusing on the senses of sight, smell and touch, as well as multisensory research that combines a focus on the visual with the audible, and research that draws on the visual and the haptic. While recognizing that 'the senses are interconnected and not always possible to understand as if separate categories' (Pink, 2015, p. xiii), for reasons of presentational clarity, most of the examples I discuss address different senses in separation. This is also a common practice in multidisciplinary publications on the senses (e.g. Bull & Back, 2003; Classen, 2003; Drobnick, 2006; Edwards & Bhaumik, 2008; Korsmeyer, 2005).

ATTENDING TO THE VISUAL

Drawing on the sense of sight has so far been the most widely adopted approach by MOS scholars interested in researching the

aesthetic. This is hardly surprising. It is commonly agreed that within the modern western sensorium, the ‘ocularcentric’ aspect of human sensual perception is given primacy (Corbett, 2003; Kavanagh, 2004). Moreover, the technologies conventionally used for the purposes of communicating research results are at present considerably more advanced and accommodating when it comes to reproducing visual material, such as photographs and videos, than they are with regard to conveying sound, let alone smell, taste and touch.

This is not to say that methodological challenges involved in working with visual material in MOS research have by now been resolved. As Bell and Davison (2013) observe, despite signs pointing to the emergence of the ‘visual turn’ in management studies, existing literature is yet to fully explore and theorize visibility and the visual. To date, scholars have been adopting two broad approaches to data collection, either relying on pre-existing material to carry out ‘visual content analysis’, or generating new empirical material for the purposes of ‘visual elicitation’. Bearing in mind the pre-eminence of visual research within the aesthetic approaches to studying management and organization and the diverse range of methods adopted, below I use as examples the methods applied in three pieces of research to elaborate on how a researcher might approach the subject of researching the aesthetic aspect of organization. Two of these represent what by now are seminal contributions to the sub-field of organizational aesthetics, and their authors strongly argue for the adoption of an aesthetic lens in empirical studies of organizations: Strati’s (1992) discussion of the aesthetic appearance of two office spaces in an Italian firm, and Warren’s (2008) study of a workplace aestheticization programme in the web-design department of a global IT company. The third piece, Sørensen’s (2014) analysis of the ‘Organizational aesthetics of the dark side’, mobilizes ‘aesthetic juxtaposition’ in a theoretical endeavour that

challenges the way in which the ‘dark side’ of organization tends to be normalized and collectively understood.

The Researcher’s Gaze

One area of interest to a qualitative researcher wishing to explore organization and management through a focus on the visual refers to exploring the aesthetics of organizational life and to interpreting their meaning. Here, the researcher might ask questions regarding those elements of aesthetics that she/he can easily observe using her/his own sense of sight, such as the external and/or internal architecture and layout of the organizational space, and the objects located within it. What does the space and the artefacts communicate to those who enter the organization? For example, what do they say about its culture, structure, values and power relations? Which behaviours are enabled, promoted or perhaps prohibited by the organizational space and artefacts? Guided by these kinds of questions, it is possible for the researcher to design an empirical study around: 1) an auto ethnographic encounter with the organizational space; and 2) interviews with organizational members whose insights into the meanings of the space and the artefacts will be used by the researcher in developing an understanding of organizational life. In this case, the researcher treats the sense impressions that are, first, afforded by her/his own sense of sight upon entering the organization and resulting from spending time on its premises, and second, written down in detail, as ‘data’. The extent to which the researcher is observant towards her/his surroundings will largely shape the amount and quality of the empirical material obtained. The interpretation, composed as a text written by the researcher, will communicate mainly the researcher’s ideas about the meanings of the space and artefacts in the organization, informed by the additional knowledge obtained from the interviews with organizational members.

Within such an approach to constructing and communicating aesthetic knowledge, the researcher's position is central. Through the text, she or he mediates for the reader – who has never visited the organization – the 'flavour' of the aesthetic experience of the organization. At the same time, however, employing this approach also involves drawing on other parties' aesthetic experiences. Specifically, if the research involves interviews with organizational members, it is necessary for the researcher to acknowledge that her/his experiences have been influenced by what s/he has found out about the aesthetic experiences of the interviewees, and that the aesthetic experiences of the interviewees have been influenced by the encounter with the researcher. Finally, the outcome of the research – such as the text produced by the researcher – becomes a source of aesthetic experience for the reader.

An example of an approach to studying organizational aesthetics that gives primary importance to the researcher's gaze is provided by Strati's (1992) widely known piece 'Aesthetic understanding of organizational life'. Strati (1992, p. 569) sensitizes us to the fact that 'aesthetics opens significant "windows in the walls of the organization", that is, windows that both interface with the organization's aesthetic materials and constitute a mirror of organizational facts'. He focuses on the example of organizational space as observed by himself in his capacity of researcher, offering a comparative analysis of the appearance of two offices located in the same organization: the Chairman's office and the office of the Chairman's secretary. Beginning with the Chairman's office, the author describes first of all the location of the office within the building, the pictures that hang on the office's walls, as well as the plants, furniture and equipment installed in the office. Strati advises researchers that when engaging in a description of this kind, it is important not to divide the encountered organizational artefacts into pieces of art and ordinary objects used in routine organizational

practice. The processes that construct organizational aesthetics are, Strati argues, complex and interwoven, and they unfold over time. They are not the outcome of one person's design, but rather they result from the ideas and actions of different individuals, driven by different logics and expressing their personal preferences. As such, they offer a glimpse into both the past and present of the organization. Within this approach, the researcher assumes the task of describing what can be visually observed within the organization and of interpreting its meaning.

In addition to describing the organizational space as observable by a visitor who knows little about the organization itself, Strati also elaborates on some of the artefacts through providing the reader with an account of reflections and actions of organizational members that could not have been constructed simply through looking around the offices. For example, he explains how certain paintings hanging on the walls in the Chairman's office were highly expensive, and how the presence of a particular graphic work 'generated a sense of uncertainty' among the employees, since 'no one was sure of its artistic or economic value, nor of its position in the organization' (Strati, 1992, p. 572). Strati also draws the reader's attention to how some of the aesthetic aspects of the organization would promote particular behaviours by those entering either of the two offices, such as informal conversations that would typically form part of whatever 'business' matter was being dealt with inside the secretary's office, inspired by the inevitable noticing of the photograph of the secretary's children.

In commenting on his methodological approach to 'reading' the aesthetic of the organization in which he conducted research, Strati (1992, p. 575) admits that the kind of discourse he has created in order to convey the sense of the office space and of the organization itself, 'is based on personal allusions, on private analogic processes, and on evocative dynamics that ascribe legitimacy of expression and the right to speak to participants'.

A particularly valuable feature of Strati's (1992) article is that it gives the reader a very good 'feel' for what research into organizational aesthetics might involve – and as such, it invites engagement in similar projects. For a researcher wishing to undertake a study of this kind, it is important to consider in advance various issues around the intended methods of data collection and analysis, for example: What and whom to observe? How to record the observations? How to analyse the observations? When to consider observation complete? Whom to interview? How to analyse the interview data? What is the relationship of the data coming from an auto ethnographic encounter with the organizational aesthetics and the material obtained through interviews? The answers to these questions will depend upon the objectives and circumstances of each study. Strati's (1992) guidance with respect to the analysis and outcome of the research is that those studying the aesthetics of organizational life should pay attention in the analysis to constructing their account in such a way that it becomes plausible to the reader; to conveying the sense of elusiveness of the object of knowledge; and to consciously evoking in readers that which they are going to see (and not to see) through engagement with the text.

Looking Through the Eyes of Organizational Actors

The example of Strati's (1992) research illustrates which methods could be applied when the researcher is interested in observing and interpreting 'the aesthetics of organizational life' by themselves. Researchers who wish to explore organizational aesthetics from the perspective of organizational actors, however, will employ a different research design. A helpful example of this is Warren's (2008) study of a global IT firm which subjected its office space to an 'aestheticization programme'. The programme's objective was to foster a 'fun' working environment. Warren (2008, p. 565) details various 'cosmetic

enhancements of the material office space' which were implemented to serve this purpose, such as 'funky and futuristic' effects achieved through a particular combination of paint and lighting; toys, games and sculptures placed in the office in order to create a sense of fun, to boost the employees' creativity and to shape clients' perception of the company as innovative and creative; the meeting room space furnished as if it were a children's soft play room, with foam blocks serving as seating; and a range of children's toys.

Warren (2008) wished to explore 'how it felt to be an employee who was "required" to play at work, executing her/his duties in an environment where fun was explicitly encouraged' (Warren, 2008, p. 567). However, her interest in the aesthetic was not limited to the research questions, but it also extended over the methods applied for the purposes of data collection. To capture the feelings about the workplace from the perspective of the employees, she recruited 31 of them as participants in her empirical study, and asked them to take photographs that would represent how it felt to work at their department, and in particular would show what the photographer 'liked, disliked, had particular meaning for them, or even [what] they considered bland, boring or meaningless' (Warren, 2008, p. 572). While the idea of conveying 'how it feels' brings to mind associations with all senses, Warren's research design explicitly engaged sight as a way of both representing and eliciting narratives about the embodied experience of working in the studied firm. The photographs taken by the research participants provided 'data' in their own right and served as a vehicle for generating more data, since they were subsequently discussed during semi-structured individual interviews with the participants. Being able to look at and talk about the photographs proved valuable in the interview process: the photographs allowed for the depicted places, people and objects to be more tangibly present in the participants' stories. They were also helpful in

re-creating the aesthetic experience. Finally, interpreting and discussing the photographs together with the participants made it possible for the researcher to explore the socially constructed nature of aesthetic judgements.

One of the reasons why a researcher studying the aesthetic dimension of the organization might want to try to capture the aesthetic experiences of organizational members from their perspective is because being an ‘outsider’ to the organization makes it very difficult for the researcher to empathize with the ‘insiders’. For example, how the researcher feels when spending a limited amount of time within an office space will differ from how those who work there every day feel about it. Strati’s (1992) study discussed above demonstrated how paying attention to organizational space can tell us a lot about the organizational history, values and routines. Warren’s (2008) methodological approach, on the other hand, sensitizes us to the importance of an awareness of the differences between the researcher’s and the organizational members’ aesthetic experiences and judgements. Wishing to develop an ‘empathetic framing’ (Warren, 2008, p. 569) for understanding others’ experiences, in addition to data collection that involved photographs taken by and interviews conducted with organizational members, the researcher undertook a ten-week period of what she refers to as ‘aesthetic ethnography’. Not only did this make it possible for her to experience the aesthetics of organizational life and to develop her own aesthetic judgements about it, but also to realize how much her aesthetic experiences and judgements differed from those of the participants. To her, the office space remained primarily an aesthetic object that she studied, albeit one she had become very familiar with. To the participants, however, the space had multiple connotations with their everyday work and its positive and negative aspects. Their perceptions and experiences of the space were charged with organizational politics, including internal conflicts between management and employees. Warren’s (2008, p. 569) finding that the insiders’ aesthetic judgements

were interwoven with ‘the political economy of the department and the wider organization’ point to the connection between the aesthetic and the political; a connection that, on its own, can be a rich field of investigation for a qualitative researcher.

Warren’s research shows particularly well how when studying the aesthetic dimension of an organization from the perspectives of those working there, a strong reliance on discursive knowledge construction and communication remains, even if the emphasis of the research might be on that which is *visible/visualized*, as meanings are negotiated and communicated between the researcher and the participants through language. The study also demonstrates how bringing together language-based methods such as interviews with visual data such as photographs can result in generating insights that are possibly richer than those gleaned from using either of these methods alone.

Aesthetic Juxtaposition

Strati’s (1992) and Warren’s (2008) studies of organizational aesthetics are examples of empirical investigations conducted within particular organizations. However, a qualitative researcher willing to explore what insights can be gained through an aesthetic experience might also choose to engage the senses in order to pursue a theoretical endeavour, and to create space for asking new questions about the broader ends that research into the aesthetic might serve, such as turning organizational issues into matters of ethical and political significance. Here, aesthetic methods can be mobilized to open up for the researcher and her/his audience creative ways of conceptualizing organization, which would not have been conceived otherwise. Sørensen’s (2014) piece illustrates how this can be accomplished. He applies the aesthetic lens – again, with an emphasis on the visual – through ‘the adaptation of the critical anthropological method of juxtaposition

(Marcus & Fischer, 1986), a *defamiliarizing strategy*' (Sørensen, 2014, p. 281, emphasis in original). The method involves locating two seemingly completely dissimilar visual artefacts next to one another with the objective being 'to let the collision of the two items make the reader/viewer stand back and think anew' (Sørensen, 2013, p. 48).

Any types of artefacts, be it two- or three-dimensional, and more or less obviously evoking associations with management and organization – such as when, for example, Sørensen (2010) puts side by side an image of Caravaggio's painting *Conversion of Saint Paul* with Mintzberg's chart of 'The Six Basic Parts of the Organization' – can be juxtaposed. In this sense, the method is characterized by a simplicity. Its unique ability to generate new insights rests in producing a new sensual experience that results from the colliding and conjoining of two habitually different approaches to perceiving and interpreting what we are presented with. To fully take advantage of the potential for new knowledge that juxtaposition offers, it is necessary, in Sørensen's (2013) view, to analyse, explore and research in depth both sides of juxtaposition, and to take note of all similarities and differences emerging from this process. MOS researchers who intend to apply the method of juxtaposition are urged to obey the following rules regarding 'how to' conduct this kind of research: 1) choosing a visual artefact on the basis 'of its quality of being remarkable, interesting, and even iconic' (Sørensen, 2013, p. 50); 2) experimentation, whereby the researcher should select images that although in a significant way are different, belong to the same 'archive'; and 3) carrying out the analysis in a thorough and detailed manner, on the assumption that 'everything is already there, although it may be enigmatic, veiled, not yet unfolded' (Sørensen, 2013, p. 51).

An exemplary illustration of the application of the method of juxtaposition is Sørensen's (2014, p. 281) analysis that draws on juxtaposition in order to unsettle 'sentimental readings of history', and in particular

of the Holocaust. As the author argues, these readings have roots in a specific convention of 'collective instruction' (Sontag, 2003, p. 73) that shapes memory so as to perceive organization in terms of an apparently clear-cut distinction between a 'dark' and 'light' side. The first of the two images juxtaposed by Sørensen (2014) is a photograph, exhibited in the Yad Vashem Holocaust History Museum in Jerusalem, which was taken in the Warsaw ghetto in 1943. It depicts a boy who is being forced out of the ghetto by SS guards. The second image is Paul Klee's 1920 painting *Angelus Novus*, displayed in the Israel Museum, also in Jerusalem. In Walter Benjamin's (1969, p. 249) influential interpretation, the image 'shows an angel looking as though he is about to move away from something he is fixedly contemplating. His eyes are staring, his mouth is open, his wings are spread. This is how one pictures the angel of history'. With the help of these two iconic images, Sørensen (2014, p. 283) argues that 'juxtaposition and its detailed interpretation may conjure up, paradoxically, an "unrepresentable" reality to witness, at a time when the social sciences have been viewed as suffering a crisis of representation'. In other words, while the two images may be familiar, juxtaposing them gives rise, in the first place, to new aesthetic judgements, and subsequently, to new conceptual connections, insights and knowledge within organization theory. To Sørensen (2013), the main value and ambition of this kind of aesthetic analysis is in making it possible for the researcher to turn organizational issues into matters of ethical and political significance. Despite its seeming simplicity, the method of juxtaposition is not, in Sørensen's (2013, p. 60) own admission, 'an easy one'. It requires creativity, an intimate reflexive engagement with the two juxtaposed artefacts, and rich background knowledge that would allow the researcher to move beyond obvious and superficial interpretations, and to arrive at new insights and perspectives on questions relating to organization and management.

THE SCENT OF AN ORGANIZATION

Thus far, the discussion of specific examples of research into organizational aesthetics has addressed engagement with the sense of sight, both in terms of analysing visual artefacts observed by the researcher to build knowledge about organizations and the processes of organizing, as in the case of Strati's (1992) and Sørensen's (2014) work, and in relation to producing visual data as part of the research process, as shown in the discussion of Warren's (2008) study. Overall, attending to the visual has by now resulted in a substantial body of work that has helped MOS scholars move away from the primacy of 'words and numbers'. At the same time, some authors, for example Corbett (2006, p. 226), argue for the need to develop broader 'sensuous scholarship', based on ethnographic studies, extending the focus on the aesthetic and the application of aesthetic methods beyond an interest in the visual. Although to date, this agenda is yet to become mainstream within MOS research, in recent years there has been a growing interest in generating knowledge about organizations through senses other than sight.

To date, a limited amount of scholarly attention in MOS has been directed towards investigation carried out in relation to smell (but see e.g. Drobnick & Fisher, 2008; Low, 2005; Manalansan IV, 2006) for examples of research on smell in related disciplines). Corbett (2006) highlights the importance of this sense and urges organizational researchers to take smell seriously, both as a way of conducting research into sensuous and invisible aspects of organizations, and in pursuit of reflexivity. To a qualitative MOS researcher, questions about how smell is experienced in workplace contexts, what meanings it has for organizational members and how it influences different aspects of organizational life are of particular interest. This is especially so because from a physiological perspective a unique feature of how smell stimuli are processed by the brain lies in its direct link with

emotions and memories. As Soars (2009, p. 284) explains:

Of all the five senses, smell is the closest linked to emotions because the brain's olfactory system detects odours, fast-tracks signals to the limbic system and links emotions with memories.

Being so powerful in triggering emotions and memories, smell is central to how the world is experienced, which, in turn, makes it an important focus of study for MOS scholars interested in the experiences of individuals in organizations. This refers to both organizational members who encounter the organizational 'smellscapes' on a regular basis but also to researchers who, through concentrating on smell, can use the olfactory aspect of their engagement with the research site as a vehicle for reflection on the research process. Smells, whether encountered in everyday life situations or in the workplace, invoke strong reactions in the body and affect the mind. Research in psychology has shown how a familiar smell can easily give rise to, for example, pleasant memories of childhood holidays, as a consequence of which the body can become filled with a sense of relaxation and joy. On the other hand, in those who suffer from post-traumatic stress disorder (PTSD), odours associated with traumatic experiences have the power to trigger trauma-related flashbacks, or be an important component of re-experiencing trauma (Vermetten & Bremner, 2003). Unsurprisingly, then, the occurrence of smells in organizational settings, the ways in which smells affect organizational members and others who encounter the olfactory dimension of the organization, as well as the meanings of smell in organizational contexts call for scholarly attention.

The task of exploring the importance of smell in organizational life, however, poses practical challenges regarding both the methods used in empirical research and ways of communicating research findings. How to collect empirical material addressing the experiences and meanings of smells?

How to re-create the experience of a particular smell in participants? How to analyse smell-related material and how to represent the research findings so that they are plausible and meaningful to the audience? How to turn the researcher's smell impressions into a tool encouraging greater reflexivity about the research process? These issues arise partly because of smell's intangible and ephemeral nature; and partly because it has been identified as the 'mute' sense (Ackerman, 1990), one that is difficult to define and one for which there is no precise language that could be easily shared by researchers and research participants in discussions about types and intensities of odours (Hurdley & Dicks, 2011). To demonstrate how existing research in MOS has dealt with the practicalities of empirical research on smell, below I discuss the research methods applied in two studies that investigate the olfactory dimension of organization. The first, by Riach and Warren (2015), focuses on smell as experienced by and meaningful to organizational members; the second, by Baxter and Ritchie (2013) offers up smell as an entry point into the researchers' sense-making about their ambivalent and evolving relationship to the fieldwork site and the research project they were involved in.

How Does It Smell to Work Here?

Riach and Warren (2015) were interested in organizational members' experiences of smell at work, and the meanings smells had to them. In collecting the empirical material, the authors drew on a combination of 'smell diaries' and interviews with 14 British-born office workers in the UK. Participants were encouraged to focus specifically on 'odours, aroma and smelling' (Riach & Warren, 2015, p. 795) in the context of their workplace. The design of the study consisted of three stages: videotaped 'smell interviews', 'audio smell diaries' and a second round of individual interviews. The objective of the smell

interviews was to enter into a dialogue with the participants about how they experience smell at work. During the discussion, participants were handed out paper strips infused with smells potentially likely to be associated with the office, such as coffee, furniture and sweat. The audio smell diaries contained recordings taken over a period of one week in which the participants commented on their encounters of odours – specific 'smell episodes' – in the workplace. The conversations that took place in the final interviews were audio-recorded and they elaborated on the content of the smell diaries and pictorial representations of the participants' workspaces.

Riach and Warren's (2015) study adopts an aesthetic approach both throughout the research process and in relation to the focus of the research content. It illustrates how a range of methods, engaging different senses, can be applied in collecting material that centres on a particular type of sensory experience. The video-recording of initial interviews allowed for capturing the participants' reactions to the smells they encountered through smell cards. The use of smell cards made it possible to elicit participants' immediate reactions to smell. Similarly, the audio-diaries enabled the participants to record their impressions of a given 'smell episode' sooner and possibly in a more spontaneous manner than if they had been writing down their reflections. All this contributed to the quantity and richness of the collected material, which – when transcribed – resulted in over 600 pages of text.

In the analysis, the authors followed the established conventions of analysing textual qualitative material. The text was coded using qualitative analysis software, and the codes that emerged from the initial analysis of the data were combined with concepts found in anthropological and ethnographic research addressing smell. In particular, wishing to explore the 'interplay between sense experience ... and its articulation' (Riach & Warren, 2015, p. 796), the authors applied Waskul and Vannini's (2008, p. 54, cited in Riach & Warren, 2015, p. 795) concept of 'somatic

work', focusing on 'the activities individuals [use to] produce, extinguish, manage, reproduce, negotiate, interrupt, and/or communicate somatic sensations in order to make them congruent with personal, interpersonal, and/or cultural notions of moral, aesthetic, and/or logical desirability'.

Applying this set of research methods allowed the authors to elicit impressions and reflections upon smells in the workplace, and to theorize about 'how micro-social processes of being together at work are enacted between bodies-who-organize and constitute the conditions of bodily integrity' (ibid.). More specifically, it enabled them to tease out the intercorporeal character of organizational life and its implications at a personal, organizational and social level in a workplace setting by illustrating how 'bodies at work' both absorb the smells produced by others and produce smells themselves. Altogether, the application of 'smell diary' recordings, designed to capture the experience of smell in the workplace in as immediate a way as possible, in combination with more reflexive interviews, made it possible for the authors to generate knowledge about the olfactory aspect of the aesthetic experience of the workplace that is both empirically insightful and theoretically novel.

The Deteriorating Odour of a Project Going Bad

As discussed above, Riach and Warren's (2015) methodological approach can be particularly inspiring to researchers interested in applying aesthetic methods drawing on smell, and in exploring the experiences and meanings of smell in organizational contexts from the perspective of the organizational members. On the other hand, focusing on the olfactory experiences of the researcher can also be a source of important insights, and an effective vehicle for promoting researcher reflexivity. An example of this way of drawing on smell in organizational research is

provided by Baxter and Ritchie's (2013) study.

Similarly to Riach and Warren (2015), Baxter and Ritchie (2013) argue for the need to take greater account of smell when studying organizations, and contend that a focus on smell enables insights into 'extra-discursive' aspects of organizations. In the context of their research, the authors consider smell as central to their reflexive analysis of the fieldwork site. The location of their investigation was a bakery – a research setting that was 'immediately rich in sensory material' (Baxter & Ritchie, 2013, p. 371), and specifically the smell of baking which typically tends to be associated with childhood and invokes pleasant memories. The researchers used their impressions of the smells encountered in the bakery as an inspiration for reflection upon their own 'somatic work' (Waskul & Vannini, 2008) during the time of their engagement in the research project.

The stated objectives of Baxter and Ritchie's (2013) core research project did not include an investigation of smell in the fieldwork organization. Rather, the official focus was on helping the company improve its operations and save costs, while at the same time giving rise to knowledge that would be useful for academic purposes. This 'technology transfer' initiative was publicly funded and was intended to benefit the company itself, the university it collaborated with, and more broadly the economic development at a local level. However, the objectives of the core research project were not fulfilled and eventually it became a case of a 'technology transfer initiative gone wrong'. Seeking to unpack their thoughts and feelings accompanying the gradual deterioration of the project's prospects and the relationship between the company management and the researchers, Baxter and Ritchie (2013) turn to an analysis of their smell impressions – and the emotional connotations thereof – encountered on the fieldwork site. Specifically, what intrigued the researchers was an observation that each of them had initially made

independently, namely that the associations in their minds of the smells of the company which they encountered during each of their visits had been changing: the odours of the bakery, initially considered pleasant and welcoming, over time became repulsive. To explore in more depth how their attitudes to the research setting and the overall project were evolving, Baxter and Ritchie carefully reflected on what their changing olfactory sensations had been suggesting to them.

The material used by Baxter and Ritchie in their reflexive analysis consisted of various types of texts: research notes, documents and emails exchanged with the management of the bakery, and discussions that took place between the researchers, surfacing both the problems encountered in the research process and observations regarding the increasingly difficult relationship to the research site. In the paper, the authors do not present specific quotations from documents or emails, but construct a retrospective narrative addressing the unfolding and a gradual breakdown of the project. In the narrative, Baxter and Ritchie place an emphasis on their own olfactory experiences of the research site and what these signified to them at different points in time. According to their account, at first, the baking smell invoked sensations of ‘hunger and security’, and was concomitant with the positivity of the researchers towards the organization, its management and the research project which was about to commence. On each of the subsequent visits to the company, however, the smell of the site – conceived in both a literal and metaphorical sense – denoted something less and less positive. Week by week, the researchers’ frustration was increasing and they were able to discern its extent by noting how the bakery smell started to invoke in them a sense ‘of dread and revulsion’ and came to be perceived as ‘obnoxious’ (Baxter & Ritchie, 2013, p. 378). In the end, reaching a point of mental fatigue with the project, the researchers admitted that they had had their ‘fill of the pervasive baking smells and wanted to escape’ (Baxter & Ritchie, 2013, p. 379).

In interpreting their relationship to the research site through an olfactory lens, Baxter and Ritchie were able to make connections between the smells they were confronted with and the positivity and negativity of their impressions of the site. Here, the observation about deteriorating smell impressions became a vehicle for promoting researcher reflexivity: smell opened up for them ‘new and multifaceted ways of thinking through both the research process and the phenomenon under study’ (Baxter & Ritchie, 2013, p. 381). At the same time, they were able to reflect on their experience of the research process as embodied, and of themselves as embodied researchers whose position is shaped multisensorily and whose interpretations are constructed through all the senses. Baxter and Ritchie’s (2013) discussion shows that even when, as far as research methods are concerned, the importance of smell in MOS is addressed using textual material as both the ‘data’ and mode of communication, thanks to focusing reflection on olfactory sensation, original insights and a rich understanding of the research site and process, along with the shifting relationship between the researcher and the researched organization can be generated.

THE TACTILE ANAESTHESIA OF ORGANIZATION

Despite the growing interest in ‘working with the senses’ on the part of MOS scholars, to date, little has been said about the role of touch in organizational lives (but see Hancock et al., 2015). This is a surprising omission, considering that the significance of touch has long been acknowledged in some areas of business and management practice, especially in relation to product design. It is, for example, common for product developers to spend a lot of energy making sure that the texture of the tapestry covering a sofa makes it pleasant to touch and inviting to sit on, or

that the tactile sensations we experience when typing on the keyboard of a computer are so attractive that we would choose to purchase a particular brand and model over another one.

If we accept the argument about the intercorporeal character of organizational lives, then what follows is a recognition that bodies in organizations touch and are touched by other bodies, as well as various objects that can be found within organizational space, such as floors, chairs, desks, door handles, machines and tools. Indeed, since touch is the most relational and the most intersubjective of all senses (Paterson & Dodge, 2012), it is central to how we relate to and feel about the workplace. In work organizations, however, argues Rippin (2013a) in her essay on 'The human touch versus silver-handedness: the importance of the haptic in organisational life', we are actively encouraged to distance ourselves from touch and therefore we lose the relational aspect of our work. Below I elaborate on the research methods used in Rippin's (2013a, p. 367) piece in which she calls on management and organizational scholars and practitioners to 'learn how to touch and feel again, and to reclaim the relational element of our work, to reappropriate the notion of touchy-feely-ness ... and to reengage with work and with people through our own sensing, haptic touch'. An important feature of Rippin's (2013a) approach is that rather than engaging empirically with touch, she draws on the haptic metaphorically, using the concept of touch to reflect on ethics, authenticity and humanness in contemporary organizational life.

Recovering the Lost Touch

In considering the role of touch in organizational life, Rippin's (2013a) method consists in drawing on the Grimm brothers' story *The Handless Maiden* and on the psychological interpretations of the story by Johnson (1993) and Estés (1995). Methodologically,

Rippin's piece is situated within the tradition of using literary fiction as a vehicle for organizational inquiry (e.g. Czarniawska-Joerges & Guillet de Monthoux, 1994/2004; Land & Śliwa, 2009). At the centre of Rippin's (2013a, p. 357) discussion is the notion of 'silver-handedness' which to her denotes the kind of 'work in organisations which replaces basic human touch and relatedness with a way of dealing with the world through sterile and sanitised rulebooks, logic, and algorithms'. The Grimms' tale about a maiden who was mutilated through having her hands chopped off and who then received a pair of artificial, silver-made hands serves the author as an inroad into a critical reflection on what happens when organizational practices literally and figuratively neglect the haptic. Rippin (2013a) uses the term 'silver-handedness' metaphorically to highlight how organizations require their managers and employees to give up on their ability to relate to the workplace and work in an embodied manner by expecting them, on entering the organization, to conform to rules and procedures and to leave behind what makes them human: feelings, but also ethics and values. This results in both organizations and their members becoming 'hard', distant from their true selves, other people and true emotions, and losing a reciprocal contact with the world. Rippin (2013a, p. 367) cautions against this loss of authenticity because of its negative ethical and moral consequences and asks that we reclaim our embodied knowledge and become able to 'preserve some form of authentic life, put a student before the regulations, stand up for a colleague, refuse to do a shady deal'.

The author makes a connection between her metaphorical treatment of touch and its literal meaning in the context of organizational life (see also De Vita & Case, 2016). She argues that the 'silver-handedness' of contemporary management has developed in parallel with devaluing those activities within the organization that involve tactile

contact with the material, such as production work in factories, cleaning and catering. While her methodological approach did not encompass an empirical investigation of the meaning of the tactile aesthetic experience in an organizational setting, Rippin's (2013a) piece constitutes an important starting point for engaging with the haptic aspect of the aesthetic experience of organizational life, and a compelling call for rethinking the ethics of our 'being' in organizations (see also Gadoua, 2014; Lammer, 2007).

THE VALUE OF MULTISENSORY RESEARCH FOR EXPLORING HOW ORGANIZATIONS ARE EXPERIENCED

The previous sections have discussed the methodological challenges and choices associated with MOS research that predominantly focuses on one sense. At present, research into organizational aesthetics that adopts the aesthetic lens through drawing explicitly on more than one sense, or through not separating out the different affective elements that together form the experience of organizations, is much less common than such 'one-sense-studies'. At the same time, multisensoryity is of crucial importance to organizational practice. It is manifested, for example, through the ubiquity of visually observable decorations combined with Christmas songs in retail stores throughout November and December, selected by 'sensory marketing executives' to encourage customers to enter the festive spirit and to promote spending on Christmas presents and accessories.

Studying multisensoriality of organizations and the ways individuals relate to them presents a key direction of future research on organizational aesthetics. It also adds to the methodological challenges researchers face in relation to the collection, analysis and presentation of empirical material. Below I discuss some of these, using two examples of

multisensorial research. The first is Shortt's (2013) photo-led study which highlights the importance of sounds in organizational contexts, thus bringing together an emphasis on the visual and the auditory aspects of organizational life. The second is Rippin's (2013b) application of arts-based methods – specifically, the production of textile maps – which serve the researcher to demonstrate how regardless of the geographical location of its physical premises, the studied organization can 'co-exist in the hearts and minds of long-time clients and customers' (Rippin, 2013b, p. 1553).

Building Organizational Sound Walls

In organizational settings, sound is key to communication between members of the organization. For example, the tone and pitch of a person's voice – 'how someone sounds' – will have an impact on whether they are listened to and how their message is going to be interpreted. Yet, the auditory environments of workplace organizations, be it those filled with 'managed' sounds, i.e. music, or 'unmanaged' sounds, i.e. noise, are yet to receive the attention they deserve from MOS scholars (but see Korczynski, 2003). In this context, Shortt's (2013) piece of research discussed below constitutes a notable exception and suggests that we could learn much more about organizational life if investigation of organizational 'soundscapes' in combination with an exploration of the physical environment became a more frequently undertaken endeavour (see also Adams & Bruce, 2008; Korczynski, 2007; Korczynski & Jones, 2006; Raimbault & Dubois, 2005).

Throughout a nine months' long study with a broader focus on organizational space, materiality and identity construction, Shortt (2013) analysed the 'auditory routines' in hairdressing salons. The participants included 42 hairdressers working in five salons, of differing sizes and catering

for different types of clientele, in the UK. The empirical approach relied on the use of visual methods, specifically participant-led photography, whereby the researcher handed out disposable cameras to the participants and asked them to take up to 12 photographs each that ‘said something about who you are at work’ (Shortt, 2013, p. 348). In addition, the researcher took fieldnotes throughout the data collection process. Participants were instructed to take the photographs over a period of three days. Subsequently, the photographs were developed and the resulting analogue images were used as a vehicle for ‘photo-elicitation’ during semi-structured individual interviews with the participants. During the interviews, the researcher encouraged the participants to elaborate on the photographs they had taken, and discussed with them why they had taken a particular photograph, what a given image represented, and what experiences, meanings, memories and stories the participant associated with it. The interviews as well as some of the fieldnotes were transcribed and coded. In the process of data analysis, sound emerged as a significant theme. The content of the empirical material made the researcher realize that sound was of great importance to those working in hairdresser salons, and prompted her to focus in the analysis on the auditory landscape of hairdressers’ work.

Shortt’s (2013) study demonstrates how sounds are subjectively experienced by individuals in organizations and how, regardless of whether specific aspects of the workplace soundscape – such as the sound of traffic in a busy street outside the salon or the sound of water running down a wash basin – would be commonly labelled as pleasant or unpleasant, fulfil a particular function and are attributed meanings by the workers. To a large extent, sounds were deployed by the participants in order to enable ‘tuning out’ of the workplace surroundings and ‘tuning into’ a space that became more personal and private. This process of ‘tuning out’ offered an escape from and constituted an antidote to the oftentimes

strenuous emotional labour hairdressers are required to engage in.

It is worth pointing out that Shortt’s (2013) exploration of the importance of the *auditory* experience of organizational life relied on the application of *visual* methods, although throughout the research process the researcher experienced and took notes addressing the multisensory dimensions of the hairdressers’ salons she studied: smells, sounds, tastes and the visual landscape – all of which encompassed the aesthetics of the participants’ working lives, and her own aesthetic experience of the fieldwork sites. In this way, among being exposed to a plethora of sensory stimuli in the salons, she had first-hand knowledge of the sounds accompanying hairdressers’ work. Sounds were also a recurring theme in the interviews. Shortt’s (2013) study draws attention to the importance of exploring organizational soundscapes and shows that there is ample scope for developing research methods that would be best suited for capturing the aesthetic experience of organizational life beyond the discursive and – to a lesser extent – the visual.

Representing Organization Through Art

Rippin’s (2013b) research discussed below is an example of a different – compared to Shortt (2013) – multisensory approach to investigating the aesthetic in MOS, and represents the use of arts-based methods in studying organizations. She adopts the aesthetic lens to explore two important questions. First, elegantly bringing together simplicity and complexity, she asks: ‘where are organizations?’ (Rippin, 2013b, p. 1551). Stating that ‘they exist in our experience of them’ (ibid.), she then poses her second question: ‘how can we represent that diffuse and fragmented experience so that the rest of the community of inquiry can understand and potentially work with it?’ (Rippin, 2013b, p. 1552). Rippin points to the rarely acknowledged

issue that locating an organization presents a difficulty, as organizations are encountered in manifold ways: through our experiences of their products, services, brands and logos, the buildings that accommodate their offices and the call centres they set up, their online presence, the people who work for them, and the various documents and marketing materials they produce. As a research method suitable for representing the experience of organization, Rippin (2013b) proposes an art- or studio-based approach. In developing the method, she draws on Dewey's ideas on the connection between experience, art and community, contained in his highly influential work on aesthetics *Art as Experience*, originally published in 1934, as well as Barrett and Bolt's (2010) theory about art as research.

Rippin uses the studio-based method to represent her nearly 40-year experience of one organization – The Body Shop – which she had encountered at three points in life: as an adolescent and customer/consumer growing up in Nottingham in the late 1970s, as a researcher on a three-year project within the organization in Littlehampton in the 1990s, and as an academic at Bristol University in the early 2010s, where she spent a considerable amount of time reflecting on the company, of which by then she was neither a customer nor internally employed researcher. The particular approach Rippin (2013b, p. 1553) designed to investigate her relationship with The Body Shop involved making a textile map, with the purpose of 'locating the experiences, physically and emotionally, which make up the organization for [her]'. A significant aspect of understanding the process of locating and reflecting on experiences of organization through quilt making, argues Rippin (2013b), rests in the realization that there exists an analogy between the dialogue the artist enters into with the object she makes, and the dialogue the stakeholder enters into with the organization she encounters. Since making art allows for registering that which had previously been overlooked, when the object of art refers to matters

related to organizations, such an approach makes it possible to arrive at insights valuable for organizational scholars. In Rippin's (2013b) case of quilt making, the crafting of art objects engages in particular the senses of sight and touch (for comparison, see Koelsch's (2012) discussion of (virtual) quilt making as a metaphor for qualitative research). Following Barrett and Bolt (2010), this process of research through art making involves two key elements. First, there is *revelation*, whereby insights are gained and new knowledge is produced. Revelation is succeeded by *exegesis*, whereby both the process of art making and the knowledge it has generated are given an analytical written account.

To produce the quilt representing Rippin's relationship with The Body Shop and its founder Anita Roddick, it took the artist-researcher nine months. The quilt consists of a number of panels, three of which correspond to the locations that the researcher associates with The Body Shop:

Nottingham has the excitement of being an adolescent girl caught up in 1970s feminism and women like Anita becoming the sisters who were doing it for themselves, iconic and inspirational to a generation of women entrepreneurs. Arundel and Littlehampton were replete with experiences of fieldwork encounters, including the time on the production line, and meeting Anita, and being part of a research team of very powerful women academics. Bristol has recently been the site of encounters of a much older and wiser self with a company which now has become an object of study rather than infatuation. From this, the quilt can be understood as a record of geographical locations, pinpointing where The Body Shop had a material presence, but also as a map of my experiences of that company, a significant part of which exists inside me as a series of stored experiences available to be instantiated into art for 'the enjoyed receptive perception' (Dewey, 2005 [1934], p. 49) of organization studies scholars. (Rippin, 2013b, p. 1561)

In inquiring into the possibility of conducting organizational research through art-based methods, Rippin (2013b) urges researchers to take up the challenge of not limiting their exercise in artistic expression to well-crafted

writing but also to attempt to *create* art objects. She argues for normalization of art as research, pointing out that this would be particularly beneficial within organization studies since making art ‘is a process of organized life when faced with something important, significant, meaningful, in order to communicate insights about these events to the community’ (Rippin, 2013b, p. 1555), including the community of organization studies scholars (see also Biehl-Missal, 2015).

CONCLUSION

As we encounter the world through the senses, our experience, including that of organizational life is of an aesthetic nature. Yet, representations of organizational world and life that take sensory knowledge into account are still somewhat on the margins of MOS research. While a lot has been accomplished since Corbett’s (2006) call for a ‘re-awakening’ of organizational researchers’ senses, there is still more to be done. As this chapter has demonstrated, existing research into the aesthetic aspects of organization has not proceeded according to one fixed model; the methodological repertoire for studying the aesthetic is dynamic, and new perspectives and orientations are constantly unfolding.

For this exploration to be productive, reflection is required on several important questions about the future of research on the aesthetic in management and organization. On a very basic level, we must ask which sensory realms we ought to investigate in our empirical efforts. So far, the only relatively mature area within studies of the aesthetic in organizational life has been research focusing on the visual. In the context of qualitative MOS research, the interest in the visual has helped us move away from the dominance of the semi-structured interview and an over-reliance on the discursive in charting and interpreting the experience of organizational

life. Research that engages senses other than sight, however, has been much less widespread and it is clear that we are yet to witness a move towards a greater ‘sensory equilibrium’ (Classen, 1993) in MOS. While it has been acknowledged that a competence in interpreting visual data, also referred to as ‘videocy’ (Bell & Davison, 2013; Denzin, 1991) has increased in importance for organizational researchers, a corresponding importance of such competence has not to date been extended over other senses.

At present, we are at a point where there is still scope for addressing organizational life as experienced through a singular sense in order to restore the imbalances between the primacy of that which is discernible through sight and that which is experienced through other senses. We need to be mindful, though, that – as senses are ‘entangled’ (Mason & Davies, 2009) – even if analytically useful, an approach addressing one particular sense in isolation from others is artificial. In this context, future studies should build on the existing developments in multisensory research, as represented by Rippin’s (2013b) and Shortt’s (2013) studies discussed earlier, and offer accounts of organizational life that take account of that which can be heard, seen, smelled, tasted and touched.

Another key question refers to how we can access the aesthetic experience of organizational life. Existing work shows that to an extent, the aesthetic aspects of organization can be experienced and reported by the researcher. There is, however, a limit to ‘imaginative participant observation’ (Strati, 1999, p. 14) in that the researcher’s ability to find out ‘what it’s like to work here’ is constrained by her or his outsider status and fragmentary knowledge of organizational politics and the meanings organizational members attribute to different facets of being part of the organization. Hence, a lot must be said for conducting studies – such as Shortt’s (2013) – that privilege the perspectives of organizational actors over that of the researcher. In carrying out such studies, the researchers need

to be careful to move beyond using the aesthetic, for example the visual, as a vehicle for accessing linguistic data – as tends to be the case with techniques relying on ‘visual elicitation’ (Bell & Davison, 2013) – and to seek a more comprehensive way of engaging with the embodied experience of organizational life, by drawing on methods that engage and generate knowledge about other senses.

An answer to the question about how to access the aesthetic experience thus also involves consideration of which methods are the most suitable for addressing the senses. As researchers strive to ‘switch on’ their senses and to encourage research participants to do the same, Mason and Davies (2009) caution against adopting a sensory methodology rooted in a doctrine of literally ‘matching methods’ whereby, for example, the visual is only investigated through visual methods. As there is no straightforward correspondence between the aesthetic experience and the research method employed to gain an insight into it, they call for the development of creative methods that acknowledge the entanglement of the senses and that show – as also demonstrated in Shortt’s (2013) piece discussed in this chapter – how empirical methods mobilizing a particular sense can afford us access to that which is experienced through other senses.

For moving forward with the current ‘state of art’ of research into the aesthetic of organizational life, it is also important to reflect on how we conduct the analysis of empirical material and how we represent the knowledge constructed on the basis of investigating the aesthetic. With regard to the former, taking a lead from sensory ethnography, it is necessary for organizational researchers reporting empirical findings to make it ‘explicit how fieldwork practices develop ... and how analytical techniques, processes and practices are developed and engaged to offer a new layer’ (Pink, 2013, p. 265) of reflexivity. With regard to the latter, at present, significant limitations are posed by academic publishing in that it remains biased towards conveying ‘words

and numbers’. It is high time for conventions of communication of academic knowledge to shift so that it becomes more multimodal and more closely engaged with the senses. There is a long way to go in this respect: after all, this very book chapter, addressing methods used in researching the aesthetic, is limited in its form to a set of black letters set against a white background – a far cry from a multimodal and multisensory approach to communication.

In order for aesthetic approaches to inject new life into business and management research, however, more is needed than the introduction of innovative methodologies for conducting research and communicating its findings. Crucial questions emerge revolving around issues such as: to what end should we conduct research into the aesthetic? What kind of organizations do we want to shape through this research? These beg reflection on how studies of the aesthetic can help us find new ways of conceptualizing organizations, organizing processes and organizational life. As the examples discussed in this chapter show, research into organizational aesthetics has moved away from considering aesthetics as limited to matters of art and beauty in an abstract sense, and has engaged with the embodied and emotional experience of organizational life and the social processes within the organization. However, the above questions highlight the need for critical studies that link the aesthetic to the political and the ethical, and for developing a ‘sensuous politics’ (Corbett, 2006) of organization that accounts for how bodies subordinated to organizational regimes also influence those regimes (Cutcher & Dale, 2012). In this context, it would be fruitful for future studies to connect to Rancière’s (2000/2006) project of challenging the politics of invisibility and voicelessness by critically exploring the ‘distribution of the sensible’ within the aesthetic regimes of organizations, and to extend it by making not only sight and hearing, but smell, touch and taste more present in analyses of the aesthetics of organizational life. Finally, there

is space and need for future sensory research in MOS to take up greater interest in sociological categories such as class, ethnicity and gender, in order to address issues of 'social justice' (Vannini et al., 2012) in the context of contemporary workplace organizations.

Sewing in Management and Organisation Research: The Subversive Stitch and the Politics of Cloth Revisited

Ann Rippin and Paula Hyde

INTRODUCTION

This chapter explores how sewing, as a method (creative medium) for and subject of management research, can be analysed as research data – as case studies in organisational research, as gendered labour, as a metaphor for perishable aspects of organisational life and as illustrative art forms – to inform our understanding of organisations and to develop theory. The art of sewing is interwoven with ideas of femininity and it is a complicated task to separate the threads of women's lived experience from the practice of sewing. We have not sought to separate the two. However, rather than being about feminism or gender per se, this chapter addresses sewing as a form of arts-based method in management research; specifically, as a medium to explore and critique management and organisations.

Production and work with cloth has been a powerful economic force and, beyond formal work, sewing continues as a partly hidden

community activity among women. Yet, sewing also offers the chance to present something powerful and oppositional – from the banners supporting female suffrage to radical feminist art pieces such as *The Dinner Party* (Chicago, 1979). As such, sewing is of considerable interest as a source of interpretation and illustration of organisational and social experience. Moreover, sewing has great potential as a source of ideas and evidence for theory development and testing. Finally, it enables us to remain open to many different interpretations reflecting the ambiguity of the social phenomena we study.

In exploring the potential for sewing in management and organisation research, we begin the chapter by considering the interwoven history of femininity and sewing. We examine sewing in art and community activity before examining the significance of sewing in our lives and our research. The varied examples we present illustrate a variety of means of engaging with management and organisations through sewing.

SEWING AND THE MAKING OF THE FEMININE

Production of and work with cloth has been an enormous economic force and its perishable nature has mirrored and exacerbated the hidden economic contributions of women throughout history. For example, published in 1984 and based on painstaking research, Elizabeth Wayland Barber's book *Women's Work: The First 20,000 Years*, challenged contemporary historians as it extended the history of woven cloth and women's economic involvement in sewing by a considerable period of time to some 20,000 years.

Sewing has become almost inseparable from associations with feminism or femininity, but this has not always been the case (Rippin, 2015, 2005). Rozsika Parker's critically acclaimed historical study, *The Subversive Stitch: Embroidery and the Making of the Feminine* (1984), (to which our title refers) traced the decline in the status of embroidery from a major art form practised by men and women in the Middle Ages to a lesser art form which was specifically feminine and domestic by the nineteenth century. Associated to this was her study of 'sweated labour'; the sewing done by working women. She detailed the historical 'hierarchical division of the arts into fine arts and craft as a major force in the marginalisation of women's work' (p. xii). Sewing as a form of women's work was not only marginalised but working with cloth also played a central role in managing women's lives, for example, in reinforcing Victorian ideals of femininity. And before the Victorian era, the church was implicated in corralling embroidery as a powerful force in the domestication of women. Not least in cementing the importance of female silence, chastity and purity in seeking to control women's reproduction. Sewing has been instrumental in reinforcing notions of femininity.

The work of second-wave feminism in the USA and Europe in the 1970s and early 1980s revealed and represented women's

contributions to history not only through sewing but also through literature. Many 'women writers, poets and artists whose work had been marginalized and forgotten by the canonical process' were rediscovered (Phillips & Rippin, 2010, p. 283). The social processes through which women are erased from history have been written about in engaging ways. For example, Joanna Russ's satirical account of the loss of women to literature, outlines the absurdist social process through which women disappear from the record:

In a nominally egalitarian society the ideal situation (socially speaking) is one in which the members of the 'wrong' groups have the freedom to engage in literature (or equally significant activities) and yet do not do so, thus proving that they can't. But, alas, give them the least real freedom and they *will* do it. The trick thus becomes to make the freedom as nominal as possible and then – since some of the so-and-so's will do it anyway – develop various strategies for ignoring, condemning or belittling the artistic work that result. If properly done, these strategies result in a social situation in which the 'wrong' people are (supposedly) free to commit literature, art or whatever, but very few do, and those who do (it seems) do it badly, so we can all go home to lunch. (Russ, 1983, pp. 4–5, emphasis original)

Recognising the marginalisation of women in history and following an extended search for forgotten but significant women in the arts, politics, religion, Judy Chicago conceived a collaborative art installation. It was produced by more than 400 women and men titled *The Dinner Party* (1979). This installation can be viewed as a case study of women's changing power in society over time. She described her excitement at discovering so many inspirational women, and her sense of obligation in representing them and their achievements to a wider audience:

I have brought these women together – invited them to dinner, so to speak, in order that we might hear what they have to say and see the range and beauty of our heritage, a heritage we have not yet had an opportunity to know. (Chicago, 1979, p. 52)

Each of the 39 place settings has a sewn component. They commemorate particular historically important women and the plates sit on embroidered runners stitched in the style and technique of each woman's time (Parker, 2010, p. 209). The purpose of the sewn runners was to reveal something about 'the quality of their lives and their relationship to needlework' (Chicago in Parker, 2010, p. 209). The relationship between plates and runners is symbolic. Taken in chronological order, the embroidery on the runners extends from the periphery (for women in antiquity) until it encroaches on the plates representing: 'a metaphor for the increasing restrictions on women's power that occurred in the development of Western history ... occasionally there is enormous visual tension between the plate and its runner as a symbol of the woman's rebellion against the constraints of the female role' (Chicago in Parker, 2010, p. 210).

Sewing as an art form, an occupation and a socially significant activity is, therefore, of considerable interest as a source of interpretation and as an illustration of organisational and social experience. As a source of ideas and evidence for theory development and testing, however, sewing has much greater potential.

SEWING AS A SOURCE FOR CREATIVE AND CRITICAL RESEARCH

In their book on organisational research methods, Alan Bryman and David Buchanan (2009) argue for the 'development of further fresh insights based on increasingly creative combinations of traditional and novel research methods' (p. 705). Sewing, we argue, offers a creative vehicle for management and organisation research.

[T]he distinctive character of creative research [is] to show how the process of material thinking enables us to think differently about our human situation, and by displaying in tangible but non-reductive form its inevitable complexity, to demonstrate the

great role works of art can play in the ethical project of becoming (collectively and individually) oneself in a particular place. Neither is this in the least a solipsistic benefit. To understand how identities form, how relationships with others are actively invented (and therefore susceptible to reinvention), is essential knowledge if societies are to sustain themselves. (Carter, 2004, p. xii)

By this reading, sewing presents a means of embodying ambiguity, for example, in relation to organisations. Sewn exhibits are able to illustrate, for example, 'the fragmented and often schizophrenic nature of organizations; the public-facing efficiency machine versus the internal shambles, or the values-driven public strategy versus the shareholder-values imperative' (Rippin, 2015, p. 114). Sewing offers a means of making visible the performative processes that create organisational experience and it enables us to take seriously the importance of material objects in our scholarship. Peter Reason and John Rowan (1981) describe this as an extended epistemology, where a variety of forms of knowing are valued. 'Propositional knowledge with which we are familiar is present and valued, but so too is presentational knowledge, subtle, embodied, often pre-linguistic knowledge that has to be expressed through gesture, sound, artefact' (Rippin, 2015, p. 113).

In relation to management research in particular, sewing can be used as a means of organisation examination and analysis. *Nike Quilt* is an example of the use of the quilted form to critique the arrogant masculinity of Nike (see Figure 22.1). The making of the piece was initially described as a tool for thinking before being exhibited in its own right.

Figure 22.2 shows one of several hangings from a quilted exploration of leadership at Marks and Spencer called *Waiting for the Warrior*.¹ The piece hinted at the potential for foundation myths to run to the core of organisational functioning (Rippin & Fleming, 2006). The quilt portrayed a critique of patriarchal lineage as a form of legitimate

Figure 22.1 *Nike Quilt*, Ann Rippin, 2002

leadership succession (after early versions of the folk story *Sleeping Beauty*). In reference to events at Marks and Spencer, Rippin (2005)

argues that 'violent, hyper-masculine behaviour creates and maintains a destructive cycle of leadership lionisation and failure at the company which precludes a more feminine and possible more effective construction of change management' (Rippin, 2005, p. 578).

In reflecting on the content of and reactions to the finished work Ann has written:

I use the medium probably most associated with the feminine, stitching, to critique the hyper-masculinity of leadership as domination. A leadership style which is achieved through being the last man [sic] standing in knock-down arguments about policy, direction, strategy. At the same time as the yearning for strong leadership, messianic dependency in Bion's terms (1961), there was a strong desire for protection from the prowling hostile bidder, Philip Green. Attack and defence were needed simultaneously in one individual, a set of requirements one person, man or woman, was unlikely to be able to fulfil well. The quilt with its long associations with protection and padding under armour, the protection in battle, is the perfect metaphor for this set of dual demands on leadership. The quilts are in places hard and shiny as well as soft and comforting. They mother and father at the same time. It might be pushing it a bit, but this monstrous hybridity of the maternal and the paternal, the feminine and the masculine

Figure 22.2 Part of the exhibit *Waiting for the Warrior*, Ann Rippin, 2004

in one object, along with the deliberately used haberdashery from women's underwear and the sexual connotations thereto, might account for the reaction the pieces got including trivialisation and confusion, and delight and desire. (2005, p. 578)

Studies using feminist research methods, collaborative and participatory research and the coproduced outcomes that arise (Burns et al., 2014; Coleman & Rippin, 2000) are all substantial parts of the organisation of sewing as a form of management research. The outputs portray ambiguity and remain open to further critical interpretations. Attention to the feminine activity of sewing indicates how stitching and cloth embody the political and can subvert or question conventional thinking. Thus, we argue, sewing offers a rich potential for insights into management and organisation.

HIDDEN IN PLAIN SIGHT: SEWING, WOMEN AND ORGANISATION HISTORY

One of the more controversial books on quilting is *Hidden in Plain View: A Secret Story of Quilts and the Underground Railroad* (Tobin & Dobard, 2000). Tobin and Dobard argued that quilts provided a handbook for escaping slaves in America in the nineteenth century. The named designs included coded information on safe houses, directions, what to wear, what to pack, when to be ready to depart and so on. Quilts, which were frequently aired on washing lines and which were, therefore, a common sight on plantations and around private houses, could be displayed to signal this information to illiterate slaves. The information was therefore hidden in plain view: the meaning only became apparent if you knew the code. This is a fascinating, contested and nonetheless, romantic story. The quilting community remains divided: some love the romance, others detest the conjecture. What the book does illustrate clearly though, is this association between needlework and the hidden.

In concert with the representation of women in history generally, women are equally hidden in management and organisation history (Phillips & Rippin, 2010). Rowlinson (2009) notes that in business history, other than brief references to the roles played by women in family business, gender is conspicuous by its absence. Indeed, many varieties of feminist theory from liberal to post-structural, articulate a range of critiques of formal organisations and their relative inaccessibility to women (Calás & Smircich, 1996). This element of the hidden is important in sewing, where there are many attempts at invisibility: invisible mending, darning and hemming. The process of what and how things are hidden is also important.

Relating to the notion of hidden actors in society, Gibson-Graham and colleagues (Gibson-Graham, 1996, Gibson-Graham et al., 2013) developed their concept of hidden economies; a set of alternative economies, commonly referred to as their iceberg model. They argue that only the paid, waged economy is of interest to conventional social scientists, primarily economists and that this economy forms the tip of the visible iceberg. Underneath the waterline is the massive bulk of economic (value-creating) economies such as the gift, illegal, co-operative, bartering and unpaid economies. This includes intra-family work such as child care and elder care, which enables others to join in above the waterline economy. Also below the waterline is charitable and voluntary work.

Sewing fits in perfectly with this underground or underwater work, which is invisible within GDP calculations. Women organise tirelessly to produce clothes for children in the developing world, items for raffle, knee quilts for military amputees, incubator covers for premature babies, quilts for refugees and so on. As women stitch, usually in groups for this kind of activity, they develop their political awareness and therefore begin to engage in a kind of resistance to the status quo. An example of this is the work done with a quilting group in Bristol to raise funds via a raffle

quilt for a sex workers' support group in the city. What mattered, as much as the funds raised, was the coming together of the two groups who would never normally mix and the enhanced understanding certainly on the side of the quilters. This is a theme picked up by Parker:

Embroidery is still identified with femininity, but the framework has changed. Women have challenged the constraints of femininity and entered previously masculine preserves. On the whole women no longer embroider as a gesture of wifely or domestic duty. But the aspect of embroidery as a bond between women has lived on. Books, exhibitions, magazines and societies devoted to embroidery and dominated by women constitute a curiously autonomous female area. (Parker, 2010, p. 215)

Sewing continues as an almost hidden community activity, albeit one that brings a curiously autonomous female experience. It is one that nevertheless, observes and critiques organisational activity. For example, Dorothy Russell, a quilt artist based on Anglesey, produced one example of this community-based critique recently called *We Stand Surrounded by the Work of Thieves* (see Figure 22.3). The quilt formed part of a travelling exhibition called 'Connection', and including quilts produced by Cwilt Cymru. She wrote of this piece:

I was naïve enough to be horrified by the greed and corruption exposed during the financial 'crash'

Figure 22.3 Close up showing part of *We Stand Surrounded by the Work of Thieves*, Dorothy Russell, 2014

within the banking sector. What makes it worse is that although massive sections of society have suffered because of the banking crisis, the people at the centre seem to be undisturbed as though at the 'eye of the storm', still wealthy, still greedy and still in control. Greed and corruption, of course, are not only evident in one sector of society, and stung by these thoughts and feeling impotent in the face of them, I set about responding through my work. The work is blue and understated, hiding its serpentine message in intertwining words which are subtle and need to be searched for in the same way that the manoeuvrings of the powerful are disguised and secretive. There are also words which appear in the background machine quilting, though many are difficult to decipher or simply illegible. Falling through the image are appliqué silver discs suggestive of coins. There are flashes of red in the painted/printed background and around the lettering. Red is used to symbolise danger or threat. The border is foundation pieced but with no apparent pattern or regimentation, and separating it from the centre is a confusion of couched threads, distracting the eye from the message within. (Russell, 2015)

In a different vein, Dorothy Russell's *Cross Purposes* (see Figure 22.4) was produced after listening to and reading news stories during the course of one day. She was frustrated by the oppositional and unspoken paradox of news programmes that presented, for example, a story about rising pollution followed by another concerning a new runway at Heathrow Airport and problems of obesity and food shortages. The quilt is roughly painted in sludgy colours in the horizontal and red threads are couched downwards surrounded by obscured or visible phrases from the news. The piece is decorated with sequins and beads to reflect a brighter light in association to the way news stories can be spun.

She said of the piece:

My response to hearing, via the news media, how much at cross-purposes are the actions of our various political and quasi-political bodies and how far we are from resolving most of the world's problems and inequities. Everything in the quilt is at cross-purposes. (Russell, 2015)

Rozsika Parker recognised a dual role for sewing, both as a weapon of resistance and a source of constraint for women. She also

Figure 22.4 *Cross Purposes*, Dorothy Russell, 2014

demonstrated how sewing simultaneously, ‘promoted submission to the norms of feminine obedience and offered both psychological and practical means to independence’ (Parker, 2010, p. xix). Parker’s book fed into second-wave feminist critiques with its focus on the use of embroidery as a medium for feminist consciousness-raising. It recognised the ambivalence experienced in relation to embroidery, ‘understanding the medium as both an instrument of oppression and an important source of creative satisfaction’ (p. xii).

This potential to say something powerful and oppositional in cloth, in secret and in plain view, makes it a perfect medium for critical management research. These kinds of work are ambivalent and open to many different interpretations as are the social phenomena we study. The viewer (or toucher) is therefore invited to develop their own critical insights into the phenomenon under review through engagement with the mind and the senses. Moreover, and, perhaps, counterintuitively then, the use of sewing, a traditionally feminine occupation, as a method of inquiry

may prove to be more significant and durable as a form of management research – one concerned with not only the lives of women, but with lives of men and the organisational arrangements that involve and affect us all. The politics of cloth, hidden economies and organisation of the feminine are themes central to sewing in contemporary management research to date.

THE SUBVERSIVE STITCH AND THE POLITICS OF CLOTH REVISITED: WHAT WE DO WHEN WE SEW

One of Rozsika Parker’s serious but playful observations in *The Subversive Stitch* is that sewing in the Victorian household was frequently done in a domestic setting by the Angel in the House, quietly, with a bent head, individually in silence. According to her analysis, this suited the gendered imagination of Victorian society: silent, domesticated women, taught compliance by following a pattern with head meekly inclined, the perfect domestic angel. As Parker says, however, you never know what these women are actually thinking, or even plotting.

The laughter provoked by embroidery practised ‘out of place’ illustrates the strength of sexual divisions in society ... women have nevertheless sewn a subversive stitch – managed to make meanings of their own in the very medium intended to inculcate self-effacement. (Parker, 2010, p. 215)

Rozsika Parker, also a practising psychotherapist, argued that psychoanalytic theory presents a means of understanding how creativity fosters thought. In examining what happens when we sew, and quoting Margot Waddell, she suggests that creative activity invokes the psychoanalytic phenomenon of ‘containment’, ‘The art object promotes and expands mental capacities by offering a shape and containing structure for the transformation of emotional experience into recognisable form’ (Waddell in Parker, 2010, pp. xix–xx).

Parker expanded on this to say that the embroiderer ‘sees a positive reflection of herself in her work and, importantly, in the reception of her work by others’ (p. xx).

In preparation for writing this chapter, and, not least because it was our first collaboration, we undertook to develop the chapter on sewing in management research through epistolary, sewn and more traditional methods. The process began with a meeting at the Whitworth Art Gallery, Manchester, superficially billed as an opportunity to map out the chapter, but stimulated by the opportunity to view Cornelia Parker’s *Magna Carta (An Embroidery)* (2015). While not chosen for this reason, the location resonated with our task as the Whitworth housed one of two (simultaneous) Subversive Stitch exhibitions in 1988 (the other was held at the Cornerhouse, Manchester).

Cornelia Parker’s community project was created by taking a print of the Wikipedia page for the Magna Carta on its 800-year anniversary. The words were stitched by over 200 people with the main body produced by prisoners and many famous and/or distinguished people; for example, prisoners embroidered the word *freedom* and Jarvis Cocker embroidered the words *common people*. Pictures and other details were produced by members of The Embroiderers’ Guild. It was an interesting piece as it represented a community project that ‘connects us by both a simple means (*sewing*) and a highly complex one (*the internet*) to our ancestors’ (Cooke, 2015, Emphasis original). The work of embroidering was imbued with meaning and purpose beyond that encapsulated in the words and images in the finished piece, just as the Magna Carta held social meaning beyond the written terms it contained in subjecting everyone, regardless of status, to the law.

In reflecting on this exhibit, and in our written exchanges we considered hidden economies (Gibson-Graham, 2006) of work that are uncounted or invisible on national and organisational balance sheets. Also, we

discussed how women’s work, and sewing in particular, is both a solitary domestic and a communal pursuit, often part of the hidden economy. We discussed what happens to the feminine in organisations (and management schools in particular), what happens when we sew and the potential of sewing in management research. In refining the focus for the chapter, we began with our own interest in, reasons for, and experiences of sewing. This part of the research formed an epistolary activity linked to sewn pieces that we produced in isolation and subsequently exchanged. See extracts below.

For one of us (AR), sewing and arts-based methods were at the heart of her management research; at times an intensely personal activity, it formed the basis of a research method from which her critical management theory took shape (see extract in Box 22.1). For the other (PH), sewing was a separate and private activity, an alternative to her management research, closely associated with family, home, local textiles industry and being with women (see extract in Box 22.2).

The few who have been able to combine radical thought and sewing have been remarkably successful in delivering a powerful message; from the banners supporting female suffrage and the trades union movement to radical feminist art pieces such as *The Dinner Party* (Chicago, 1979). However, the ability to combine a public, academic, intellectual life with sewing is relatively rare. Rozsika Parker suggests ‘The categorical separation of femininity/embroidery from masculinity/professionalism is the outcome of Victorian success in preserving embroidery as the demarcator of women’s sphere’ (Parker, 2010, pp. 214–15). Although, many women and men sew, Rozsika Parker’s interviewees explained how sewing was incompatible with university life as one sociologist tells her, ‘I soon learned never to tell people I embroider’ (2010, p. 214). This opening foray into collaborative writing and sewing has created this chapter, a piece in text and picture.

Box 22.1 Extract 1. Ann Rippin on 'Why I sew?'

Part of my identity is in what I stitch. I am what I sew. It is a very natural activity for me. And yet, we both know the perils of using words like 'natural'. Of course it is not natural. It is no more natural for me to sew than anyone else. I have been constructed in my own mind, and now in the minds of several others, as a sewing woman. The connections between sewing and femininity are well-established. I used to keep a collection of paintings of women sewing. They were always lovely pictures. The woman was always in a quiet room in a comfortable chair, usually in a golden light, bent over her work, silent, self-contained, diligent, alone. There were often flowers in the room. Sometimes there was an open French window, possibly with a gentle breeze. I don't remember seeing pictures of Victorian seamstresses bent over their industrialised work, going snow blind from stitching crystal beads on ivory evening dresses, or just plain blind stitching jet beads on mourning clothes, having their food cut up into small squares by the owner of the business so that they would not have to slow down to eat their lunch, putting whiskey into tired eyes to sharpen weary blurred vision. Nothing romantic or sentimental about the lives of those women, whose choice was the drudgery of working on clothes for the rich, or, quite simply, going on the game.

As Rozsika Parker told us, 'To know the history of embroidery is to know the history of women'. Embroidery for the wealthy was an accomplishment, something to speed you onto the marriage market. Look what a lovely pair of slippers she has made. Look how daintily she embroidered that coverlet. For poor women in service it was all about making samplers at school in order to get them their place marking linen in the Big House. All those samplers we love so much represent so much schooling of women in the feminine arts in preparation for a lifetime of drudgery.

I sew as part of my research as a political act. I do it to insist that I stand in a long line of my sisters who made their living by it, just, exploited and weakened by it, and with whom I want to stand in solidarity. I do it because it is so firmly associated with the feminine. It is so counter to the masculine hegemony which holds sway in so many of the institutions which constitute my world. If I am serious about having a career in the academy, sewing is the last thing I should be doing. It is risible. It harks back to a time when women were stitching pantaloons for pianos to preserve everyone's blushes, although there seems to be precious little evidence that this ever really happened, and it sounds like yet another move to trivialise and discount silly women doing silly things in frilly domestic interiors. Really, you can't take them seriously if all they do is embroider tea cosies and spectacle cases.

I want to meet that stereotype head on and be a sewing woman who uses the sharp point of her needle as her preferred analytical instrument. I want to ally myself with the women who embroidered all those beautiful Trades Union banners. I want to make sewing a conduit for the truth just like Philomela and Penelope. I want to join with the Craftivist movement and make sewing a means of lobbying for social change, a means of drawing attention to things which metaphorically need mending.

SEWING IN MANAGEMENT AND ORGANISATION RESEARCH

In November 2013, the Victoria and Albert Museum (V&A), London held an exhibition exploring the legacy of three landmark events: the publication of Rozsika Parker's ground-breaking book *The Subversive Stitch: Embroidery and the Making of the Feminine* (1984) and two Subversive Stitch exhibitions held at the Cornerhouse and Whitworth Art Gallery, Manchester (1988). The V&A exhibition explored the contemporary politics of cloth and focused on activities of men and women that address global, social and ethical issues. Our chapter title nods to the V&A exhibition entitled *The Subversive Stitch*

Revisited: The Politics of Cloth as the exhibition examined cloth as a subversive strategy and highlighted radical, interventionist projects that questioned and challenged structures of power.

Women's work consisted largely of making perishables – especially food and clothing. So if we are to retrieve significant amounts of women's history, or the history of any evanescent occupation ... We need the skill to glean all surviving evidence and to wring out of it every last drop of information and useful analysis. (Barber, 1994, p. 286)

On a similar theme, Elizabeth Wayland Barber's (1984) research on the economic and social history of ancient textiles over the last 20,000 years was, as a result, able to provide an account of 'early women, their lives,

Box 22.2 Extract 2. Paula Hyde on 'Sewing apart from work?'

I have sewn periodically since being very young, but there have been very long gaps where I haven't sewn at all. I started sewing with scraps of fabric my mum brought home from work. I made crude hand sewn stuffed toys usually from my own simple ideas but sometimes using patterns for dolls that my grandma cut out of magazines.

Mum worked in a textiles factory in Stockport and for a birthday when I was about seven years old or so, she and her workmates clubbed together and got me a sewing box and filled it with cottons, needles, pins, scissors, tailor's chalk and all sorts of sewing equipment. Although I had to replace the sewing box a few years ago, I still have many of those cottons and bits of equipment. Over time, I have gathered small sewing heirlooms from friends and family. My sewing box contains my Grandma's old Bakelite pin box and folding scissors and my friend's grandma's 'roller-skate' pincushions. Soon after I was given the sewing box, I was allowed to use mum's electric Singer sewing machine and I got more adventurous with the things I made. Most memorably copying David Cassidy's flared-sleeve, t-shirt. Mum's factory made poor-quality, synthetic fabric so I made the t-shirt in a black-flecked, gold lamé. I never used a pattern. I used to copy around other clothes or just draw lines on fabric and cut out shapes. There were many, many mistakes – I made a pair of drainpipe cords from some cheap flares and could only get them over my heel by tugging hard and inching them slowly upwards. They were even harder to get off. I made lots of punk t-shirts too, usually on the evening I was going out. I'd finish the item, put it on and go out to see a live band. Happy days!

Looking back, I see that the long periods of my life where I haven't sewn are associated with obligation, doing my duty, working, looking after my family and/or being a bit adrift in life. Not particularly unhappy times but uncreative times. I've never really associated the idea of work with something enjoyable like sewing. When I sew, I am totally absorbed and usually really happy – full of creative ideas and free. When I research I am serious, hard-working, determined and careful. I'd now like to bring the two together without losing anything of both and I don't know whether that is possible. This is why I approached you – first to be my mentor so I can explore how I might incorporate sewing into my work and second as a kind of joint-venture – a chance to examine the possibilities and potential for sewing in management research.

The women in my family, who weren't retired, all worked full-time industrial/factory jobs too, so these activities took place in the evenings, holidays and at weekends. I've started to read the research about community economics by Gibson-Graham, the two Australian economists Ann mentioned and I see how the economic well-being of my large and not very well-off extended family was completely dependent on the products of unaccounted women's work such as crocheted blankets, knitted jumpers and recycled clothes. Now I make bed quilts for my family and though I invest them with meaning and memories, those meanings are known, largely, only to me.

their work, and their values, chiefly from the technological record of one major produce of women ... textiles' (p. 13). She produced a convincing and critical account of the effects on the women who made the cloth and clothing. Although archeologists and historians had previously claimed weaving to be a relatively recent innovation, she found, on the contrary, that weaving dated back far earlier:

I kept running across wonderful bits of information about the women – virtually always women – who produced these textiles and about the values that different societies put on the products and their makers ... stories that told of women's lives thousands of years ago ... we know much more than has gotten into the general literature about women's history ... glimpses of real women of all sorts – peasants, entrepreneurs, queens, slaves, honest souls, and crooks – good, bad, high and low. For

all the strangeness of their cultures, they seem refreshingly like us. (Barber, 1994, p. 12)

In contrast, we have offered description and analysis of a range of methodologies incorporating sewing. In the main, these styles have followed other arts-based methods in management research in being varied and applied. We have not only seen how researching sewing as an activity can reveal hidden aspects of social and organisational life but also how sewing can be employed as a critique in itself. As we noted early in the chapter, it is almost impossible to separate the association of sewing with women and many of our examples relate to the experiences and lives of women. However, we argue that the basis for considering its potential use in

organisational research goes beyond gender. Sewing offers opportunities in organisation and management research as a subject of research, a method, a means of analysis and a means of exposition.

The chapter has addressed sewing in management research at two main levels, research methodology and sociological analysis. For the former sewn pieces may appear initially appealing to organisational research in that it appears to promise an opportunity to represent ambiguity in rich data that remains wide open to interpretation – sewing in action research. Also methodologically, sewing seems to offer an alternative; an addition to, yet different from, other arts-based methods. The suggestion is that a sewn piece can add to the diversity and richness of data collected on, for example, work, occupation and organisational life. As such, there appears potential for sewing to contribute not least by providing more expressive images than can be obtained through some other research methods.

Taking the use of sewing beyond a solitary, domestic, female activity, we have argued that sewing can be viewed as theoretical propositions, case studies, critical analysis and a source of primary data which can be useful with regard to theory development and testing. Sewing has three advantages in this respect. First it can portray lived experience. Second, by exploring a variety of interpretations, sewing can help us to develop process theories of organisational phenomena. Third, the products of and narratives associated with sewing provide us with secondary interpretive data, with alternatives which we can contrast to our own personal and organisational circumstances. They present the viewer and the makers with cultural images, questions and dilemmas. Sewn products can be analysed as research data, as novel sources of ideas, insight and inspiration, combined with the potential for theory development and testing.

In summary, the rich and varied examples above illustrate various means of engaging with management with and through

sewing. We have explored how sewing, as a method for and subject of management research, can be analysed as research data – as case studies in organisational research, as gendered labour, as a metaphor for perishable aspects of organisational life and as illustrative art forms. Rather than being about feminism or gender necessarily, sewing provides a medium to explore and critique management and organisations. Paradoxically, the use of sewing, a traditionally feminine occupation, as a method of inquiry may be more durable in certain instances than other forms of management research.

Netnography for Management and Business Research

Robert V. Kozinets

INTRODUCTION

Whether we are examining managers, employees, consumers, regulators, entrepreneurs, or any of the myriad of roles and players who populate business and management research, online interaction and experience is likely to play an important and increasing role in their daily experience of the world. Researchers interested in these areas may benefit from an understanding of netnography, a form of ethnographic research that has been adapted to the unique contingencies of technologically mediated social interaction.

Netnography is an approach to online research that was introduced to the fields of marketing and consumer research in 1996 (see Kozinets, 1997, 2012). The approach began to diffuse through marketing, business, and management fields about a decade later, as social media participation and platforms began to multiply. Although it originated in fields related to business and management, netnography is a broad-based study of online

social interaction and experience from a human perspective. It is founded in anthropology's epistemologies of participant-observation and that field's axiologies of cultural understanding, but, distinct from traditional varieties of ethnography, it relies heavily on technologically mediated and archived forms of communication and information.

The terms digital ethnography and online ethnography are general ones, nominally applied to reference a range of possible practices that engage with qualitative online data. Most often, but not always, these practices originate in a research position that combines participation with observation. Netnography is, like the term virtual ethnography (Hine, 2000), a more specific form of online ethnography. The use of such term connotes particular positions vis-à-vis the research enterprise and the practices used to realize its aims. Using the term netnography implies the use of a common understanding and a common set of standards for the conduct of online ethnography, as well as inclusion in a body

of multidisciplinary and interdisciplinary work. Employing the established standards of netnography confers upon future studies a consistency and dependability they might not otherwise hold.

The approach of netnography is both specific and dynamic. Because it deals with a set of social fields that are in flux, for example the emergence of popular new social media apps such as Snapchat or non-commercial social networking sites such as Ello, the particular approaches of netnography must be subject to frequent revision. Nonetheless, netnography has an unchanging relation to its ethnographic orientations and aims. The term refers to a particular adaptation that links ethnography to the needs of contemporary research practice. We can therefore consider netnography to be a specific term relating to the adoption of a specific set of related ethnographic, data analysis, ethical and representational practices. These practices are, as with general online ethnographies, conducted using communications and information found and created through the Internet, including its mobile manifestations. In management studies, netnography has been overwhelmingly employed to understand the conversations, languages, online behaviors, and symbolic repertoires of different groups of interest. In particular, netnography has often been employed to understand particular consumer groups to serve the needs of marketing and consumer research.

Despite the predominance of application in marketing and consumer research, netnography can also be used to understand infrastructures, networks, groups, and any relevant constituent's online behaviors, and potentially inform us about many elements of their overall lifeworld. So for example, Rhazzali (2015, p. 164) uses netnography's participant-observational perspective and particular research practices to study 'online conversions to Islam' and finds that 'the logic of the web has an essential role in the construction of the religious message' (p. 179). This message customization involves a certain

customer-centricity that results in the tailoring of the message to the convert, so that a variety of different people with differing subject positions can be led to Islam. It also involves a certain capitalist advertising style, in that the religious converters employ 'tricks typical of promotional campaigns, such as highlighting the individual benefits of choosing Islam, or using testimonials as examples' (ibid.).

In another example, Bakken (2015) follows netnography's ethical guidelines, among others, in a morally difficult study of 'crypto-markets' such as Silk Road that exist online to sell and educate about black market goods such as illegal drugs. Linking scientific data to personal experience and understanding, Wu (2014) uses netnography to theorize how the massive amounts of biological data in the Gene Ontology are developed, maintained, and used by a consortium of biological information communities, mostly consisting of model organism databases. Using the specified criteria for netnographic site selection, Hartmann (2015) provides a netnography of guitar player and gardening online sites to show how consumption and production are articulated within the practices of everyday living. Adapting the technique to business usages while still staying true to its anthropological origins, Brem and Bilgram (2015) show how netnography can be used to identify lead users for innovation partnerships and co-creation initiatives. As this short listing demonstrates, netnography's uses are wide and deep, ranging from examinations of the online spread of religion and illegal drugs, to the practices and infrastructure of complex database use, to the furtherance of business partnerships and innovation insights. In using this methodological approach, a variety of different investigators tie their research into the network of other published netnographies by employing a specific type of participant-observation and its associated practices.

The particular practices are well established. Compared to other approaches, netnography is digitally native. Its observational elements offer a less intrusive research experience than

ethnography because they use unprompted data. Netnography is more naturalistic than personal interviews, focus groups, surveys, and experiments. Questions of ethics and consent are salient to netnography because it uses information that may not have been provided for the purpose of research. Oftentimes, netnography is used to investigate sensitive topics, making a cautious stance towards human subject research ethics questions even more important. Netnography tends to be less costly and timelier than many other methods because it leverages online archives and existing technologies to rapidly and efficiently gather and sort relevant data. However, netnographers must also cope with the vagaries and mixed blessings of data abundance. Sorting, classifying, and making sense of vast amounts of information can prove challenging and must be dealt with in a rigorous manner. These are some of the key benefits and drawbacks of the method. The following sections will provide the reader with a general understanding of the method. First, they outline some of its key philosophical foundations, including the key differences between digital and embodied ethnographic approaches. Then, they overview netnography's key research practices. The next two sections focus on matters of special concern to netnographers: data collection and analysis, and research ethics. The final section points the way forward for netnography, as it charts the possible development of this method into the future.

FOUNDATIONS OF NETNOGRAPHY

Netnography imparts a range of perspectives to the study of Internet-based social interactions and experiences. These perspectives include those of ethnographic research practices, research ethics, as well as research ontology, epistemology, and axiology. Netnography takes the range of traditional ethnographic practices – such as *entrée*, keeping field-notes, conducting interviews, undertaking

interpretation, and ensuring consent and a fair cultural representation – and adapts them to new, Internet-mediated contingencies. To accommodate the differences between social contexts, new practices have been added. These include procedures for locating online fieldsites to pursue particular research questions and topics of interest, dealing with large digital datasets, navigating challenging online ethical areas, and dealing with the public intellectual aspects of netnographic participation. In an age of colonized digital media, researcher immersion becomes linked not only to participation in social media but also to personal academic branding. The scholar becomes a personal brand who competes for a certain type of online attention and must build legitimacy and trust through the construction of a precise and distinctive academic image (see Kozinets, 2015).

Netnography's core purpose lies in valuing a cultural approach to understanding the social interaction that transpires through interactive media. For the purpose of netnography, a cultural insight involves an understanding of cultural elements such as language use, rituals, roles, identities, values, stories, myths, and, centrally, meanings. For example, netnography is fascinated by commonalities in symbol use. Recently, more attention is being given to the use of visual images in social media, such as emojis and memes (Riera, 2015). Similarly, the value of shared stories and narratives in social media interactions cannot be overstated in netnographic research (see, for example, Muñiz and Schau, 2005). Netnography's epistemology values a human-level interpretation, a recognition of the humanity operating behind the technology, an understanding of the urge to be social (and anti-social) that drives online communication and interaction. When a netnographer is absorbed into a communication or set of communications, she can then relay the way that sense is made in this context, the manner in which meaning is conveyed, and the practices perpetrated and perpetuated in the digital world and beyond.

Online and embodied social interactions are often intermingled in practice. They are increasingly intermixed in contemporary realignments of technology and social being such as mobile phones, wearable technologies, and regimes of surveillance capitalism (Zuboff, 2015) and sousveillance (Mann et al., 2003). Yet there are still enough fundamental differences between life on and off screen to necessitate lucid adaptations of traditional ethnographic practices into those of netnography. As detailed and explained in *Netnography: Redefined* (Kozinets, 2015, pp. 72–5), there are six fundamental differences between online and face-to-face sociality that are salient to the practice of netnography and ethnography:

- 1 **Alteration.** Communication changes to suit the technological medium, whether it is a Twitter post's restrictive 280-character limit, YouTube's coded video language, the increasing use of emojis and memes, or the deliberative act of turning thoughts and utterances into visual text of one sort or another. Netnographers must become adept translators of an ever-evolving set of meanings and symbols.
- 2 **Access.** Technology provides radically different experiences of social access. Existing friends can communicate more intensely. Close family members who are not as technologically literate may be locked out of key communication channels. New relationships can happen with the press of an icon in Tinder. Strangers become friends; friends become strangers; relationships gain a new fluidity. Online interactions can gain prominence over physical ones. As well, people with particular needs or interests can find each other much more easily, regardless of physical or geographic barriers. Netnography transpires within this new spectrum of social connection and relation.
- 3 **Archiving.** All online social communications are automatically stored and archived in various ways and places. In-person interactions generally leave only wispy memories, evaporating as they occur. However, online social interactions do not. Online social interactions are automatically archived, easily shared, and create permanent records for netnography. Yet privacy concerns such as the 'right to be forgotten' (Rosen, 2012)
- also become increasingly salient matters for netnographers to consider.
- 4 **Analysis.** Because of technological developments, researchers have more ways to search for, code, and analyze digital social interaction information than ever before. Scraping, mining, capturing, and using ever-more-sophisticated software programs to automatically categorize and analyze the mass of textual, visual, audio, and audiovisual social content become highly relevant. Various new technologies provide multitudinous ways to analyze and visualize data. Netnographers face massive challenges as well as opportunities within this brave new world of analytic empowerment.
- 5 **Ethics.** These changes, and in particular the easy access to people's postings and personal information, raise a range of novel ethical, legal, and social questions relating to research in these online territories. When are social media conversations public and when are they private? Who owns this information? How is it to be used? As our legal and moral systems struggle to adapt to rapidly changing technologies and their impact on individuals, culture, and society, netnographers are among them.
- 6 **Colonization.** The final difference concerns the role of large corporate and organizational interests in online social spaces. Although one does not have to sit through advertising, surrender one's personal conversations over to a corporation, or implicitly agree to be spied upon by myriad government agencies to have an in-person conversation with family or friends, many actual and implicit terms of service do require such concessions. Companies and governments have intensely colonized technologically mediated interactions. This has important and unprecedented implications not only for the conduct of netnography, but also for the very nature of human social interaction and society.

NETNOGRAPHIC RESEARCH PRACTICES

Ethnography as an anthropological practice generally references in-person fieldwork that has been conducted by gaining membership into particular social groups and observing

and participating within them. Although in the past it was customary for a netnography to focus in on a particular site or location, this is no longer necessary (e.g. Kozinets, 2002a). Any topic, even a topic that does not exist discretely in the physical world – such as crowdfunding or fashion blogging – can be considered for netnographic investigation.

In netnography, the concept of field site liquefies. No longer is a particular location needed for a netnographic fieldsite. Particular topics can constitute sites. Individual people, or groups of individual names, can constitute sites as they move through multiple communication channels. The allegedly bounded physical fieldsite is no more, but some of the practices used to engage within it remain surprisingly salient. A particular online community can be the focus of a given netnography, such as a corporate LinkedIn group dedicated to workplace rumours and complaints. Or the topic could be more widely dispersed among different locations, such as using social media to cope with the challenges of being a new manager or female entrepreneur.

Topics can manifest through a range of sites accessed from multiple locations and through many different devices. In the most vital stage of netnography – search – researchers must invest the time to match their research questions and interests to appropriate online ‘locations’. The evolving set of research practices that netnography encompasses are centered upon the use of various types of search engines to locate particular sorts of interactional and social information, as well as the use of different types of communication channels to conduct research-related interactions with persons of interest. Search engines used in netnography can range from web applications that are widely available – Google is likely the most popular and familiar – to those which are highly customized and specialized, and may be programmed on request. In addition, websites are often deployed in order to create a controlled interactional space. These websites can be placed on the general Internet, may take the form of blogs,

or be centered in social networking sites such as Facebook. The goals of this information search and communication are to answer focused netnographic research questions about particular topics, sites, or people.

It is incumbent upon netnographers to examine the wide range of social media formats, including social networking sites such as LinkedIn and Facebook, microblogs such as Twitter, video sites such as YouTube and Vimeo, visual sites such as Instagram and Snapchat, blogs, the old standby of forums, apps such as Tinder and WhatsApp, and other communicative sites. This crucial stage of netnography requires the discovery of online social spaces to help refine specific research questions and to locate the type of social interactional information that will inform these questions and assist in answering them.

To choose netnographic sites as part of a formal study, researchers should look for particular loci of interaction or experience that: (1) are more rather than less directly relevant to the study’s research question, orientation, or its topic; (2) have a larger amount of seemingly relevant data, be it textual, visual, audiovisual, audio, graphical, or otherwise; (3) offer a larger rather than smaller number of discrete message posters; (4) provide the researcher with a sense of activity and liveliness, as a social place where something interesting is happening; (5) exhibit postings and other data that is time-stamped more recently (if currency is relevant; in historical investigations it may not be); (6) provide the researcher with interactions that are more detailed or descriptively rich; (7) offer a more welcoming atmosphere and one in which interpersonal contact might be pursued; and (8) exhibit interactions where one poster responds to another, and another responds to them, creating conversational threads that manifest a flow of conversation.

As with many qualitative techniques, netnographies are usefully subject to rules of saturation, such that the collection of netnographic data should stop once new insights on important topical areas related to the

research focus or question seem no longer to be generated by the engagement. Some netnographers will closely track the amount of text collected, sampled, analyzed, and read, reporting it quantitatively, as well as accounting for the number of distinct participants. This sort of accounting can satisfy some who wish to more objectively understand the composition or extent of the dataset.

The necessity for researcher participation in netnography has been a matter of some debate. As with an ethnographer, the goal of the netnographer is a deep understanding that reflects the lived experience and social world that is to be represented in the netnography. However, given the fluidity of notions such as culture, community, and membership within these categories in the online social context (see Kozinets, 2015, pp. 9–13), there is certainly some debate about what constitutes participation. In netnography, as in a physical ethnography, researchers must negotiate a spectrum of participation and observation. Yet netnography is also based upon an experience of embedded cultural understanding. Participation may not involve actively posting messages in this or that particular online group, but it does suggest an understanding that is built up over time from various interactions, be they with archived texts, informational web-pages, people met through interviews, or many other means. Without experience of the cultural context surrounding a particular site, topic, or person, the netnographic interpretation suffers, becoming more descriptive than explanatory. Immersion and engagement assure the reader that the netnography is based on a human understanding of meaning, of the relevant codes and languages represented, whether they belong to one group, to a set of groups, or to a multitude. The key to this understanding is cultural relation, representation, and translation based upon careful cultural curation of online and other relevant materials. This stance differentiates netnography from data mining.

In data mining, the qualitative data on the Internet is considered as a type of content

that must be decontextualized in order to reveal more general patterns. In netnography, researchers view qualitative online data from the perspective of cultural understanding and thus elevate context to the point of it being a source of many complex central constructs. Data mining tends to be a software-driven, heuristic exercise in word recognition and content coding that can have considerable value in answering particular sorts of questions. In fact, for handling large netnographic datasets, some kind of content analysis – whether automated or manual – is invaluable and nearly unavoidable. However, procedures must be careful to minimize the risk of missing some of the most interesting contextualized cultural components of online social phenomena. Netnography seeks cultural engagement on a human level, and its meaningful presence in the final research representation, by carefully tracking and pursuing these contextual connections.

Tom Phillips (2011) provides a useful example of an insightful netnographic study that transcends the limitation of mere data mining and content analysis. Phillips sought to investigate online fan communities. He began his research by participating in online fan communities devoted to the work of filmmaker Kevin Smith, whose activities cut across a number of social media channels. Initially interested in notions of social capital as they were expressed online, Phillips found his online interactions with fans deepening his experience of both fandom and online sociality in new and unexpected ways. As he began to meet other fans in person and extend his online connections into personal meetings and friendships, he was able to explore the complexity of contemporary fan relationships as phenomena that often express a distinctly human element of the hunger for personal contact. Reversing his earlier assumptions about online fan's social capital building from their cultural capital, he finds the most important elements to be social and connective, rather than knowledge-based. Data mining of extant discourses relating to

fandom would have revealed only the starting point of Phillips' research: the presence of many fan discussions apparently dominated by the knowledge structures of specialized cultural capital. It took netnography, with its participative stance and human sensibilities, to reveal the deeper strata of human connection and personal friendship networks that undergird these phenomenon-level cultural and communal formations.

DATA COLLECTION AND ANALYSIS IN NETNOGRAPHY

Like ethnographers, those who would perform netnographic research must constantly tack back and forth between two core experiential frames. First is the experience-close, 'emic', 'subjective' immersion in social media interactions and experiences. Second is the more 'etic', distanced, 'objective', abstract, and 'scientific' mode that objectifies, speaks in scientific tongues, and seeks to answer research questions. Data will inform the netnographer's understanding of the emic, the etic, and the translation between the two realms of understanding.

Data in netnography assumes three main forms: archival data, co-created data, and fieldnote data. Archival data in netnography can act as a historical record and a cultural baseline. It is comprised of any pre-existing data the researcher gathers that does not involve her involvement in co-creating or eliciting the data. The capture, saving, and storage of these pre-existing archives of data is very important. A variety of means and tools are available to help the netnographer capture, save, and organize archival data. Co-created data is interactional, the result of elicitation, interview, conversation, or other social interchange between the netnographic researcher and relevant persons or other actors in the social media scene (these could be textual, or even non-human actors like bots). Co-created data could result

from researcher participation in a Twitter discussion, or taking part in or initiating a conversation on a LinkedIn group. Scaraboto (2015), for example, uses a geocaching research web-page to elicit participation in netnographic discussions about geocaching and thus to co-create data. Fieldnote data is authored by the netnographer and constitutes firsthand observations about her participation in the netnography, her reflections on interactions and experiences. Keeping fieldnotes is recommended in netnography, and the reflection and human interaction that underpins it is considered to be a key sign of participation.

There are two basic ways to capture online data: saving and capturing. Saving involves storing a particular set of information as a computer-readable file which does not necessarily preserve its formatting. Capturing involves taking a snapshot-like visual image of information that appears on the computer screen, which may not be machine-readable but which preserves formatting. In data mining and content analysis contexts, files are often saved. In netnography, however, there are choices to be made. Capturing images is appropriate when context, visual elements, and perhaps other types of links, for example, video, may prove salient to answering the research question. In netnography, the default decision is generally to capture the image rather than to reduce it and lose context by saving the file. Various software programs that can capture the entire flow of images across the screen have been found useful in netnography. What are required are methods of data capture that can accommodate the naturalistic richness of people's multifaceted and multidimensional online representations.

Although there is now a range of content analysis approaches including the use of machine intelligence called 'natural language processing', even the best computer programs currently miss many more meanings than they are able to recognize. Machines are excellent at particular kinds of understanding, but understanding cultural behavior still requires human beings because human

associative nets are complex and incredibly vast. Netnography seeks to maintain the importance of human intelligence as the most reliable method for the translation and interpretation of social and cultural meanings, but to balance this against the enormous demands that come from finding and analyzing gigantic cultural datasets.

Netnography involves an expansive look at online information, then a focus onto its particulars, with a very fine-grained examination of some of those elements. To be useful during such a process, data capture must be flexible and reliable. For example, Brown et al. (2003) began by sampling a variety of different sites devoted to particular retro brand communities, but eventually narrowed their search down to particular threads of subsections of these communities that were theoretically informative. Netnographers often use automated data capture techniques. Many times these techniques are employed in coordination with some sort of qualitative data analysis software program for the large initial scans of online source material. Automated data capture and analysis can assist with data coding and organization in larger projects with greater amounts of data. When the topic of study is a large, active social media site, for instance, or when the work seeks to explore a major topic, the netnographer will often rely on automated methods to search, capture, scan, and then narrow down the large resulting amount of data. Usually this is the beginning stage of a netnography.

The next stage of the netnography will involve a more intensive focus on much smaller amounts of data. For this, capturing context is important. Manual data collection and analysis in netnography infer the capture of computer files on a hard drive or other memory device. Then, these files tend to be coded manually, on hardcopy printouts, or in document programs, such as Word, spreadsheets, or database programs. At this point in the netnography, these more labor-intensive methods of capture and analysis make sense because the data is selectively and

scientifically reduced to a smaller and much more manageable size, perhaps around 500 printed pages.

Just as it does in ethnography, data collection in netnography occurs simultaneously with some basic data analysis. Although the act of participating changes the nature of data collection and analysis, this act is what distinguishes netnography and makes human understanding of cultural contexts possible. Netnography uses content analysis in an interpretive manner, reflecting social interactions back to self, and self back into social interactions and experiences. In the final analysis of cultural content, the goal is cultural fluency: thus, a netnographer should be conversant with expert others about a topic, fluent in the symbolic languages of a site, or so knowledgeable about a key person that they have an almost biographical authority regarding them.

However, netnography is not necessarily founded on a repetitive and difficult manual process of interpretation. Instead, netnography as a set of practices holds human intelligence and understanding to be at the center of its repertoire of interpretive and analytic processes. Software solutions are often used to expedite data search, data narrowing, project organization, data storage, data coding, data display, and theory building. Indeed, netnographies could not exist without the content analysis software of search engines. The epistemological difference between netnography and processes which are more automated in terms of how data is treated and analyzed, however, is that in netnography, the determination of key research direction and data collection aspects of a research project unfold through time and with human reflection on the emergence of cultural understanding.

The act of analyzing cultural digital information is holistic: the social must be discerned within the data and linked to the various contexts in its network. The contexts to which it should be linked will include things such as sites, topics, message posters, archives, group

history, or conversations. Contextualizing online data is necessary to its analysis in netnography, and can prove challenging because digital social information comes to us altered and decontextualized (see Kozinets, 2006). The online landscape mediates social representation by making it more intentional and crafted. It can also render problematic the issue of informant identity. To deal with these issues, netnography assumes a symbolic interactionist and pragmatic stance that treats the social act as an important unit of analysis. The digital utterance, not the allegedly 'real' identity of an individual person, is what is of central interest.

People in contemporary society are constantly inventing and reinventing themselves through acts of display and mirroring. The online environment accelerates this tendency. As people display different aspects of themselves in different social contexts, such as multiple gender positions, they reveal more of their complex multidimensional inner truth, not less of it. The transformation of identity in different contexts is a natural consequence of our social life *in every context*. It is not simply an idiosyncratic tendency that manifests itself exclusively in the online environment. Netnography has long held that expression online may reveal at least as much as it obscures. In the right analytic hands, netnography can reveal the rich and multidimensional inner realities of social interaction in some cases in a far richer way than almost any other method.

Thus it would be fair to say that aspects of individuals that they might be unable or unwilling to express in physical interactions can become more apparent and accessible in their ostensibly anonymous, or pseudonymous, online expressions. As noted above, this makes netnography an ideal place to study topics that are sensitive or controversial. Excellent netnographies have been written about topics such as drug abuse, teen alcohol use, illegal websites, sexual fantasies, and other ostensibly hidden matters (see, for example, Orsolini et al., 2015).

RESEARCH ETHICS IN NETNOGRAPHY

The latest thinking in netnography considers online interactions to be similar to territories, and research to often be like an invasion or incursion of others' important communicative and interactional spaces. In this way, a netnography has some aspects in common with a physical or traditional ethnography. However, in other ways salient to the question of research ethics, there are stark contrasts when comparing netnographies to embodied ethnographies. For one, the presence of the researcher in netnography may not even be obvious – people being studied in a netnography may not even realize that they are being studied. In fact, unless they read academic journals and recognize their own postings, they may never realize that their freely shared conversations have become incorporated into business or management research. All of these thin boundaries between private and public spaces, rightful and illegitimate use, and sharing of social media data render ethics in netnography a matter both difficult and complex.

In most traditional methods, researchers collect information directly from people who consent to its use in research. In netnography, this is not always the case. Many researchers choose to perform observational netnographies where their participation is limited or not visible. In addition, because of the colonization of social media space, corporations and other organizations may own the data and not want it used in research. In some cases, they may have research businesses of their own. There are other possibilities as well. For example, the netnographer may be an active participant on a particular site that is of research interest. In this case, the researcher should honestly and completely disclose her presence, affiliations, and intentions. In other cases, where participation does not take the form of active posting in an online group, but involves the collection of interactional data, there may be no need for a potentially disruptive disclosure. For example, Smith

and Stewart (2012) observed a bodybuilding forum online for 36 months without making personal contact. In terms of using data, there are a number of guidelines governing its use in research publications and reports. Particular source materials, such as blogs, should usually be cited. Depending upon the likely amount of risk or harm to research participants, various degrees of cloaking, or even the rewriting of data (so it can not be traced through entry into a search engine) are recommended.

THE EVOLUTION OF NETNOGRAPHY

In the business and management field there can be a tension between the academic tendency to critique business, to cast a critical eye upon markets, organizations, and other institutional business structures, and a more pragmatic imperative. Indeed, management research tends to take place within the rubric of business schools and their training programs. Corporations and governments tend to expect business research to be applied or 'relevant' (Augier & March, 2007). It should help businesses do what businesses do best. This includes making profits, becoming more efficient, expanding globalization, and gaining legitimacy. The two elements, the critical and the pragmatic, coexist in some contemporary business and management scholarship but are always somewhat at odds.

When we add an interdisciplinary orientation into the mix, matters can become even more complicated. And when that orientation draws from anthropology, with all of its divergent discourses and disapproving subdisciplines, the orientation can become more difficult still. For anthropologists as scientists and anthropology as a field have observed and continue to observe firsthand the negative consequences of rampant colonialist capitalism. In countries around the world, anthropologists study and write about the dirty and hidden little secrets of

the contemporary capitalist system and its agents, the many tragic side effects, impoverished groups and peoples, devastated environments, extinct species, and decimated ways of life behind the first world business successes that business schools are expected to trumpet so loudly.

Because netnography aligns itself with anthropology, it cannot simply turn a blind eye. Indeed, the axiological orientation of netnography emphasizes examining the corporate colonization of online social interactions and experiences. Rhazzali (2015), mentioned above, finds that even the religious conversion of new acolytes to Islam follows a market-based logic of advertising and promotions. Certainly on the Internet and on our mobile phones and other devices, there seems to be increasingly little social space for us to relate to one another outside the sometimes-oppressive logic of the market (see Kozinets, 2002b).

Born of the business school, but built of the raw matter of critical cultural anthropology, netnography is an uneasy combination of two antithetical perspectives. On the one hand, netnography offers business and management scholars a powerful way to understand various constituencies. In the field of marketing research, netnography has a 20-year track record revealing consumer tastes, habits, meaning systems, social structures, hidden needs, creative potentialities, and much more. It has been applied to help businesses solve a variety of questions, from website design and consumer engagement to new product development and brand perceptions. On the other hand, netnography seeks to critically confront, challenge, and build solutions to address the problem of contemporary society and technology that are so readily revealed through its analysis of social media, for example the ineffective corporate governance of the interlinking of physical relations and virtual social connection noted by netnographers such as Muñiz and Schau (2005), Phillips (2011), and Scaraboto (2015).

Along with its scientific objective of understanding culture and society through

its social media manifestations, netnography questions the power of companies, individuals, and groups in today's technology-dominated social world. It asks that we interrogate how the transformation of political, corporate, and personal influence have been affected, coerced, and empowered by technological devices, networks, and practices. It suggests that we look for a clear and lucid rendering of the space beyond technophilia and technophobia, eschewing technological determinism for a type of co-evolution between people and our inventions. This inbuilt axiological emphasis of netnography asks if research can lead to better decisions. It investigates the boundaries of activism and social movement mobilization in the service of the public good. It wonders if technologies such as the Internet, which were heavily promoted as utopian, might still with important adjustments become tools of liberation and empowerment, or whether we must see them as elements of an inevitably insidious technologically based capitalism that has no end other than the furtherance of corporations and their owners' aims.

How does netnography hope to help researchers in business and management answer these important questions? Through the delineation and pursuit of four distinct types of netnography, which are described in more detail and illustrated with numerous detailed examples in Kozinets (2015). We can think of these four types of netnography arranged along two axes, in the familiar 2×2 business quadrant. The X-axis concerns the axiological representation orientation of the netnography, whether it will support and assist the existing status quo of business and management or whether it will challenge it. The two ends of this axis are labeled the complementary and the critical. The Y-axis concerns the analytic field focus, which is the particular orientation of the netnographic study, whether it will look at the larger and more general system, or whether it will examine particular instantiations of that system. The familiar labels global and local

Figure 23.1 The four types of netnography

anchor this axis. As Figure 23.1 represents, the intersection of the two axes draws out four different netnographies, which will each be briefly explained in turn.

Positioned in the bottom left quadrant is Auto-netnography. 'Auto-netnography' is an adaptation of auto-ethnography (Hayano, 1979). It is form of netnography where data collection is filtered through the self and thus concerns a particularly 'local' site: one's own identity and story. Auto-netnographies, like auto-ethnographies have autobiographical elements and contain personal reflections on social media participation (for examples of this type of work, see Baym 2000; Kozinets & Kedzior 2009; Markham 1998). However, the Auto-netnography is not merely a personal recounting but a situated understanding with a distinctly critical edge. By passing analysis of social media interaction through the filter of self-reflection, a reflexive and powerful statement about existence in a contemporary time of technologically mediated communications can be constructed.

In the bottom right quadrant is the Symbolic Netnography. The Symbolic Netnography grew out of the need of netnography to provide insights that are useful to managers, particularly managers in marketing. Symbolic Netnographies, like commercial ethnography itself, attempt to help managers and others decode the everyday worlds of people or consumers. Symbolic Netnographies are also useful for theory building and understanding.

They are the most common type of netnography by far. Social media information and interaction are used to build a portrait of particular people or sites that can inform decision-making. The Symbolic Netnography tends to stay local, focusing on a specific group or field site and attempting to discern and explain their practices, meanings, and values, painting a portrait that can further a more purposeful, empathic, and culturally fluent understanding of them.

Digital Netnographies occupy the intersection of a complementary axiology and a global focus. Digital Netnographies are a more recent development that bridge statistically based data analytic techniques with cultural understandings. Automated and human-centered methods of cultural content analysis are used to discern general patterns oriented towards general or global fields of research inquiry. Usually these global fields concern the infrastructural workings and influences upon particular sociotechnical networks. After this inquiry, and often during it, a narrowed focus into particular aspects of findings will be explored with a keen eye towards their sociocultural implications. Like Symbolic Netnographies, they tend to be used mainly to help reinforce or improve existing business, management, and social practices.

Using critical inquiry and critical theory, Humanist Netnographies use social media data to investigate questions of social importance and have an impact upon their discussion and solution. Among the more pressing questions with which Humanist Netnographies might grapple is the changing nature of human social existence in the face of widespread technological change. To answer this question requires a systemic view of social media. It becomes necessary to follow local patterns to their wider networks, to the places they connect with global support structures in institutional, ideological, regulative, and market-based systems. Some possible questions follow: How does the nature of our social being change when our communications change? How do smart phones and

other technological agents change markets and politics? What should be done about all of this? Not only do Humanist Netnographies attempt to provide answers, they also encourage authors to help spread their findings. Humanist netnographies formalize the relationship of the netnographer to a social media audience, casting the researcher in the role of advocate and even activist.

Therefore, what began with the tension between anthropology and business and management studies results in four different types of netnography and two fundamental axiological orientations. One is pragmatic and easily applied to the needs of business and managers, in essence separating out research method from the resulting uses of the research to reinforce the current market system, as is so often the case in contemporary science. The other assumes a moral stance, building on the traditional placement of the academy in a gift economy that stands at a critical distance from other institutions such as government or business. As a critical form of research, netnography deploys understandings of wider technological, institutional, and ideological systems to chart possible paths for positive change and the pursuit of social betterment.

Netnography partakes in both of these streams, although thus far in its development it has been used mainly to prop up 'business as usual', particular in marketing. Yet netnography as recently redefined clarifies its anthropological basis and rediscovers its roots. As it does so, spreading to disciplines such as education, geography, tourism, technology studies, cultural studies, addiction research, sexuality, psychology, education, library sciences, sociology, theology, political science, and anthropology, it grows to both include and expand the research view of the topics and methods of management and business studies (see Bengry-Howell et al., 2011; Kozinets, 2012; Wiles et al., 2013). With technology changing so much of the world of business and management, there will be many opportunities for

researchers to provide rich, contextualized, pragmatic, and critical understandings by using netnography.

Ethnomusicology

Nic Beech and Stephen Broad

INTRODUCTION

Music is a central part of a culture both in general and as it relates to work. There are many cultures in which people have sung in order to help them with alienating work, to establish connections or simply to have some fun while working. At the same time, music and associated styles and fashions are used as ways of claiming and expressing identities and establishing group boundaries. In some cases, music is used to give a rhythm to repetitive work or to attract customers. In its many uses and expressions, music is part of the fabric of life at work and in addition to understanding other cultural specifics such as dress, linguistic patterns and ritualistic forms of behaviour, understanding the role that music plays in work cultures has the potential to develop insights about work cultures which would not otherwise be recognized, or at least not understood in the same way. Sound has meaning in cultures. It can variously signal alarm or joy, be an identifying emblem for a

culture or community (for example, a national anthem or 'our song'), and often things that are most important are expressed through musical sound in rituals and ceremonies (for example, at weddings or at significant sports events) as well as in everyday life. Ethnomusicology, as it applies to studies of work and organization, seeks to understand how music is produced, used and consumed in the symbolic practices of a culture. There is an interest in the music industry, but beyond that there is a focus on the part that music plays in everyday cultures of work.

In this chapter we will introduce the main methodologies of ethnographic fieldwork, participatory and practice-based approaches and autoethnography. We will outline some illustrative examples from areas as diverse as traditional factory work and contemporary community music and will conclude with some of the key questions and insights that ethnomusicology can offer to business, organizational and management research.

DEFINITIONS

Ethnomusicology has a rich and varied history which includes prolonged debate over how to define it. In a synthesis of the variety of approaches, Nettl (2005) identifies four definitive features. Ethnomusicology is the study of music in culture and resists any attempt to abstract music from the social setting in which it is created, performed and heard. For Nettl, it is a form of relativistic study, seeking to understand a music as its society understands it. Ethnomusicology studies all musical manifestations including the excellent, the ordinary and the 'barely acceptable' (2005, p. 13). The principal mode of research is fieldwork, direct observation and engagement with people who conceive, produce and consume music. Increasingly, there has been a focus on bi-musicality in which the researcher learns about the culture by participating in the music of the culture, typically by learning to play an instrument and taking part in music which is central to the culture. Following the initial bi-musicality approach, it is now more common to adopt an inter-musicality stance. This differs in not assuming that the researcher will start with a primary training in the norm of western music and add on a subsidiary knowledge of another culture, but rather will start from a more equal perspective in which neither tradition is presumed to have primacy over the other. Hence, ethnomusicology differs from other areas of music research by seeking a holistic and cultural understanding, having a concern with the meaning of sound and music for communities, and it differs from organizational ethnography in having a particular focus on what is heard, the meaning of sound and how such meanings are put to use in the culture.

An initial question is: what counts as 'music'? The enquiry into how it is defined (or disputed) within societies is part of ethnomusicology. Hargreaves et al. (2005) adopt an inclusive definition in which music is understood principally as sound (although it

incorporates silence and written forms), produced with intention as a mode of expression. In some settings, tonal or harmonic structures are emphasized, sometimes there is an expectation of some degree of sophistication and skill on the part of performers, but generally the meaning and purposes surrounding music are seen to differentiate it from mere noise or sound. For Hargreaves et al. (2005) music is inherently ambiguous and has what they refer to as a 'floating intentionality'. Quoting Cross (2005), they say: 'it [music] can be thought of as gathering meaning from the contexts within which it happens and in turn contributing meaning to those contexts' (p. 2), and hence music can take on meaningful significance for individuals, couples, groups, nations and signal messages that are interpersonal, commercial and ceremonial. In some settings music can enable, or be used as a proxy for, communication that would not otherwise happen, for example, the expression of emotion, joy, mourning, altered consciousness, social solidarity and isolation. Ethnomusicology is concerned with the connections between music, its meanings and significances, reflecting and contributing to the construction of a culture or community. Thus there is an aim to understand music and its associated practices in their social context.

UNDERSTANDING THE CONTEXT

Higgins (2012) suggests three strategies of research which can provide a framework for an enquiry. These are: historical (re)construction, action exemplars and interrogation through a theoretical framework. Historical reconstruction draws upon published texts and academic analysis, but in addition, Higgins advises referring to popular magazines, websites and other less formal sources: a more pluralistic sense of 'primary sources' than old-school musicology allows. These can provide some insight into how historical moves have entered the popular imagination

and may have influenced the thinking of practitioners. Trends and fashions in music are significant in the influence they have in commercial markets (Frith et al., 2009), the interests of young and aspiring musicians, and in how sub-cultures develop forms of expression including music, language, dance, food and dress (Hargreaves et al., 2005). Such trends, however, may or may not produce musical outcomes which are genuinely innovative in a technical sense as, for example, well-worn patterns of song structure, musical texture and melody are reproduced in popular songs across apparently diverse sub-cultures. Analysed purely musicologically, such music might only be interesting from the perspective of how patterns are reproduced, perhaps with different musical textures. From an ethnomusicological perspective, it is the relationship between the music and social context which is particularly important and, for example, the production or adoption of relatively similar forms of music in different social settings is itself a matter of interest. Hence, a historical perspective is important for incorporating an understanding of the relationship between the socio-economic backdrop, shifts in markets, changes in clothing, literature and other aspects of the cultural economy (Pratt & Jeffcutt, 2009) which enable certain forms of musical expression to emerge and constrain the success of other musical modes of being.

An alternative strategy is the use of 'action exemplars' which are accounts of practice which aid the process of theoretical construction (Higgins, 2012). Higgins advocates for the use of exemplars rather than seeking to produce a holistic explanation of a culture because of the danger of 'drowning' in data. This approach is contestable, and approaches which draw on Grounded Theory (Glaser & Strauss, 1967), for example, would celebrate an open form of data gathering followed by iterative cycles of selection of data to form categories which then form the basis for engagement with theory. Whether working in a tradition that does some initial selection

of what it is important to pay attention to (as Higgins does) or in an approach which overtly selects where to pay attention after initial engagement with the empirical site of enquiry (as Grounded Theory does), methods which tend to be most frequently used are ethnographic fieldwork and autoethnography (Higgins, 2012). We will now explore these methods in a little more depth and discuss examples relating to the field of organization research.

ETHNOGRAPHIC FIELDWORK

Fieldwork entails the researcher becoming embedded in the culture, observing, often participating and learning from members of the culture. Bendrups (2006) highlights what he refers to as the 'myth of fieldwork' (2006, p. 24). (The myth is that ethnomusicologists arrive in societies to conduct objective research based on observation, recording and collation of musical performances.) Normally, an interpretivist stance to research is adopted which seeks to understand local meanings, how they relate to societal norms and mores, and produce accounts which explore diversity of interpretation. Thus, different groups might react quite differently to the same piece of music, for example, some seeing it as part of their community identity and as highly attractive while others see it as alienating. These reactions say something about the social differences within the culture. Understanding this can involve analysis of the music, but is a starting point, rather than a culmination of the work (as it might be in analytical musicology): fieldwork provides the route through which the researcher becomes immersed in the music and meaning of a culture.

Baily (2001) has argued that in order to understand music it is very helpful, if not necessary, to learn to play music and an instrument of that culture. Playing an instrument of the culture means that interaction with other

musicians occurs in a particularly engaged way – helping to gain insight into a shared psychological and embodied experience. The emphasis on learning is significant as going through the musical training process of a culture not only delivers technical ability but also insight into the norms and expectations of being in a teacher-learner relationship and the context of collaborative music-making. Training the ears and hands enhances theoretical understanding, sometimes in unpredictable ways. For example, Baily reviews the literature on African rhythms which sounded extremely complex to western ears, and yet could be understood by taking the role of participant since each individual contribution to the sound was relatively simple and the complexity lay in the combination of the whole. Baily develops the ideas of Hood (1960) on bi-musicality. Like being bilingual, insights into a culture can be gained from being able to communicate musically. However, unlike someone who is fully bilingual, it may not be necessary for ethnomusicologists to be able to play at concert level but to learn a second music as a beginner. In fact, there are potential advantages to learning as long as there is sufficient proficiency to be able to join in with music-making. Being a high level performer would give access to some parts of the culture, but, in Baily's view, discovering how the average performer learns, uses his or her skills and collaborates with others may be more revelatory about the culture in general. In his words, the job is to be an ethnomusicologist first and a player second, or third. The learning process reveals what is regarded as important and enables the ethnomusicologist to engage with other learners and group activities (rather than intensive solo study supported by one-to-one coaching from a master). Mistake-making is a crucial part of learning and being able to identify mistakes reveals the rules of operation and the systems of value that characterize the community in question. For example, the right notes might be played but at the wrong tempo for dancing, and this becomes clear when the dancers

complain. Similarly, this type of engagement with players and performing encompasses other aspects of insight which would be much more difficult to appreciate from a purely theoretical perspective. Examples would include how bodily movement in relation to the instrument is conducted. Differing stances, grips, positions and so on can impact not only on the sound that is produced but also show cultural differences. Compare, for example, the relatively static, seated classical orchestral violinist to the standing folk fiddle player whose movements express a different form of bodily engagement with the music. These stances have musical function, in the traditional folk player having a more 'relaxed' stance which is compatible with playing in lower positions on the finger board, while orchestral musicians hold the instrument erect and hence can more easily play in higher registers.

Gabor (2013) studied the embodied process of learning to be a classical musician, focusing on children and professionals. She emphasized socialization before and during learning as people see and hear what it is to perform, and come to regard the self as having a vocation for music. In addition to a social and psychological orientation, physical bodily changes are necessary. For example, string players need to develop calluses on their fingers where they press the strings down. Perhaps ironically, the calluses, which are less sensitive than normal skin, enable greater sensitivity in playing (for example by being able to sustain longer notes and play with vibrato) and there can be enhanced feeling around the calluses. The physical change of growing calluses can be observed to interact with psychological change as learners gain confidence and hence play with greater expression or vigour, and consequently continue to build their calluses and muscular control. Embodiment also relates to emotions of playing. For example, Gabor (2013) discusses a pianist who, not untypically, put herself into a particular, contemplative frame of mind in order to play a piece and this helped

with the subtle weighting of arms and wrists in generating expression. Some aspects of embodiment relate to preparation through restraint. For example, singers may choose not to drink milk or carbonated drinks prior to a performance because of the impact on the voice and the production of sound. Paying attention to the embodiment of learning, rehearsing and performing is significant in understanding what the ‘lived experience’ of being a musician is like, what pain, joy, physical development and restraint are involved in inhabiting the identity and practice.

Studies of musical communication have also drawn on psycho-social theories and emphasized the interplay between talk, communal sense-making and music-making. An example of this is ‘interthinking’: the interactive process through which people not only share knowledge but are able to be creative together, producing joint outputs (Littleton & Mercer, 2013). Although in some cultures creative achievements are often attributed to individuals, research indicates that creativity is commonly a collaborative enterprise and even where aspects of it are attributed to individuals (e.g. in composition), those individuals are normally part of a community in which thoughts and practices are shared, discussed and reviewed. Miell and Littleton’s (2008) study of bands in rehearsal show how interactions, both verbal and non-verbal, led to shared interpretations of the music, how parts fitted together in pieces and how pieces fitted together in performance. These interactions were not always harmonious and included evaluation and critique – often impassioned on points of difference, but there was a shared striving to achieve a good performance. Littleton and Mercer (2013) expand this understanding and identify three modes of communication between musicians: instruction, cooperation and collaboration. Each mode has verbal and non-verbal aspects. Hence, instruction can be in the form of telling or coaching or non-verbally learning by ear or sight. Cooperation can be based on overt discussion or non-verbally worked

out in rehearsal through eye contact, gestures and playing in such a way as to demonstrate a point (for example, about volume or tempo). Collaboration can be based on discussion and evaluation of performance or, for example in improvisation, non-verbally through the spontaneous creation of ‘musical utterances’ (2013, p. 44) which are picked up and elaborated by others.

These forms of interthinking, showing how groups form and operate and how creativity is achieved, can be studied through observation or participation. Following Littleton and Mercer (2013), we can note that perceived similarities and differences between researchers and participants can influence which is the most effective approach to observation. For example, where skill levels are compatible and the context is fairly informal, participant observation can be highly effective. However, where the context is more formal or pressured, for example in preparation for an imminent performance, participation could be less welcome. Last, where there are strong perceived differences between academic researchers and musicians (e.g. as Miell & Littleton (2008) experienced with a young indie band) observation can be most effective when the band members are given video cameras to self-record without the researchers being physically present. Littleton and Mercer (2013) observe interthinking arising through disputational interaction (where disagreements are surfaced), exploratory interaction (where questions are asked and proposals are tried out) and cumulative interaction (where there is little critique but musical ideas are added to by others). From an ethnomusicological perspective, such observations can produce insights into how musicians are able to develop a way of performing together, how their social rules and roles enable disputation, creation and accommodation of a group product, and how music itself is produced.

We will now explore two examples, one from a traditional work setting and another

from a setting which blends paid and voluntary work, professional and amateur musicians.

FACTORY WORK

Music can be put to a variety of uses as a cultural resource in the workplace. In industrial settings music can operate as a way of coping with alienation by workers, for example as a way of coping with boredom, but it can also be used by companies as a way of separating workers, for example by making conversation difficult or by highlighting social differences. For example, Jones and Schumacher (1992) explore how pop songs used in the workplace bring the personal into the 'impersonal' workspace. Romantic conventions and images and stories of love and loss relate to how people in the workspace identify themselves and others as being in 'conventional', 'successful' relationships, or not. Music can be used by companies as a way of increasing performance (DeNora, 2000), for example through applying the findings of experiments on types and tempos of music which are correlated with increased work activity. Equally, workers can use music as a form of resistance (Korczynski, 2007). Although the workers are positioned as an audience, they can be an active audience (Negus, 1996) by exercising choice in what songs are played or by appropriating the meanings of songs, for example, singing along with irony or changing words to emphasize otherness from management. Similarly, music can be used by workers as a community-building resource which helps them survive challenging and unpleasant circumstances.

Korczynski (2011) provides an example of an ethnomusicological study of a factory which manufactures window blinds. There were two main rooms in the factory: the 'rollers room' in which roller blinds were made and the 'verticals room' in which vertical blinds were made. The work was Taylorized

and accomplished through eleven job types. There was a workforce turnover in the region of 35–40 per cent and management had introduced some policies to seek to increase commitment, including a works' council. In the rollers room, music was played on worker-owned radios which were placed around the workspace and were controlled by the workers. In the verticals room, a centralized system played radio through loudspeakers. The workers had a choice in which radio station was played.

The majority of the workers created a 'stayin' alive culture' (2011, p. 93) in which they coped with boredom and feelings of alienation and being unimportant by creating a 'bright mood'. They talked of needing the radio just to get through the working day, as one worker put it: 'Oh, you need the radio. Oh it's deathly, it's deathly without it' (2011, p. 94). The degree of participation varied through the week, with the same song (an example being *Angels* by Robbie Williams, 1997) eliciting no reaction on a Monday but having a 'normal pattern' of singing the 'key bits' on a Friday. Workers also talked about songs that expressed how they felt about work, such as *I don't like Mondays* (Boomtown Rats, 1979), but the meanings associated with this were about the difficulty of getting back to work on a Monday rather than the actual narrative of the song with its story of nihilistic violence. Similarly, the words 'we don't need no thought control' from Pink Floyd's *Another Brick in the Wall* (1979) was sung with some passion by a worker who had just been 'called in' by the supervisor. Korczynski asked 89 workers if they had a song that spoke to them about their working lives, and 79 had swift and clear responses, almost all expressing ways of coping with negative experience (e.g. *I Will Survive*, Gloria Gaynor, 1978). On Korczynski's analysis, the workers are (amongst other things) using the music to stick together. There are patterns of interaction, times for singing along and times for silence, different individuals have their 'party pieces' which

everyone expects them to do and the ‘stayin’ alive’ culture is one of collective response to an alienating work experience. These forms of producing music in an informal way both rely upon and exhibit cultural knowledge. Knowing the melody, enough of the words or just a hook line is required before community members can join in and/or use the song to subvert a corporate message. For us to understand Korczynski’s analysis we need to know enough of the song and its place in the culture. However, this does not necessarily mean that an ‘accurate’ (or true to the composer’s intention) understanding is necessary. For example, the Police song *Every Breath You Take* (1983) is about an obsession with a ‘target’ person, a story of stalking, and yet it was used at many weddings as a romantic song (Gabriel et al., 2000) presumably because a superficial awareness of the lyrics makes it sound like a shared attraction. However, this ‘mistake’ is, from an ethnomusicological perspective, an interesting interpretation, perhaps indicating something about the cultural power of romantic narrative to lead to selective perception on the part of listeners rather than simply being an error.

COMMUNITY MUSIC

Community music provides a potentially fruitful field in which to explore the relationship between ethnomusicology and organizational and management research. It is an area in which change and development are central, it typically entails complex organizational practices as professionals, amateurs and learners collaborate to achieve particular outcomes, and it articulates with boundary-crossing in identity work. Higgins (2012) suggests three perspectives on community music: the ‘music of a community; communal music making and an active intervention between a music leader or facilitator and participants’ (2012, p. 3). The music of a community may symbolize a culture, for

example, traditional Celtic music may symbolize a particular view of communities in some parts of Ireland and Scotland, or a samba-reggae hybrid may symbolize particular Afro-Brazilian communities. Communal music-making emphasizes the activity, for example, in the form of ‘sessions’ or *ceilidhs*. The third perspective entails musicians in teaching and enabling others, for example, by teaching a particular instrument in group sessions, by enabling community members to play together or by using music to fulfil some broader purpose which could relate to, for example, health, well-being, youth development or criminal-justice. In each perspective, the focus is normally outside formal institutions and although education may be part of the purpose, the activities are not normally restricted to schools, universities or conservatoires. Community music can be a way that a community expresses identities and traditions at the same time as emphasizing the role of interaction in community building. Players and other participants may have a strong sense of place and the people for whom, and with whom, they perform. Value is often placed on involvement and participation and while facilitators may be highly qualified experts, many participants may practice at levels closer to a beginner or intermediate player. Community music is often associated with resistance to established institutionalized structures and promoting ‘folk’ or ‘working class’ vernaculars rather than ‘high art’ (Higgins, 2012), though there are also other models. Last, the community musician identity has been categorized as a ‘boundary-walker’ (Kushner et al., 2001). They operate between established (establishment) identities as performing musicians and music educators and other professions such as therapists, community workers, teachers and probation officers. Community musicians often work alongside these other professionals and, in music circles, may experience negative images of amateurism. On the other hand, as Higgins (2012) argues, the boundary-walking image

can be construed very positively, reflecting someone who goes beyond normal restrictions and transcends cultural limitations. Hence, their practice can incorporate activism, facilitating community change and personal development as well as musical outcomes. As Deane and Mullen (2013) argue, many who are taking part in the revivals of Gaelic music are expressing their views and feelings on social change and development. As Pete Moser of 'More Music' put it: 'Almost all the work I do has a dual purpose. Community music, for me, has always been a mixture of being a social worker and a composer and finding ways of bridging that ... I passionately believe that music has the ability to make communities pull together' (cited in Deane & Mullen, 2013, p. 29). Similarly, Lombos (1998) describes the blurred boundary between the music industry, commerciality and community music. He cites the example of Asian Dub Foundation, a commercially successful band which formed through a community music project. Referring to this work, Dean and Mullen quote the Asian Dub Foundation guitarist saying 'if you give opportunities to people who don't have a chance, you'll not only get an increase in self-esteem, but new music: new sounds, new combinations, that will guarantee music's longevity' (cited in Deane & Mullen, 2013, p. 30).

Many forms of community music relate to social positioning and often resistance to prevailing powers – be it traditional music as part of a resistance to colonizing powers or youth music of rebellion which is expressing distance from established societal hierarchies (Cloonan, 2015). Beyond merely being a form of expression, music plays an intertwined role with actual rebellion and resistance through, for example, songs of rebellion and 'marching' songs or by providing an alternative socio-economic setting for people to develop and produce music which gives meaning to their community and provides a source of income (Beech et al., 2015).

AUTOETHNOGRAPHY

Autoethnography entails the researcher researching and writing his or her own culture and practice (Kempster & Stewart, 2010). An advantage of traditional ethnography is that the researcher is from outside the culture and so may notice aspects of cultural forms and practices which are simply taken for granted by those within the culture. Conversely, for the autoethnographer, becoming sufficiently detached to be able to recognize the significance of 'normality' can be a challenge. Equally, a difficulty in traditional ethnography is for the researcher to be accepted, speak the language and undertake the cultural practices sufficiently well to have an 'insider experience', while for the autoethnographer these matters are more straightforward. In autoethnography, therefore, reflexivity is the foundational requirement. For Parry and Boyle (2009) this entails two forms of reflection: *outward*, in which the symbols and practices of the culture are observed and analysed; and *inward*, in which personal reactions, meanings and emotions are recognized and expressed.

This blend of the inwardly focused and the outwardly focused is explored by Humphreys et al. (2003) in their consideration of jazz. They are mainly concerned with small sized bands which emphasize soloing and improvisation. They argue that there is an analogy between ethnography and performing jazz. For Humphreys:

Playing jazz is not just a means of self-expression, but of self-discovery and self-development as well. This insight has, of course, to be balanced with an awareness that jazz is a social art that builds on collective memory learned through a process of socialization into a community of practice. (Humphreys et al., 2003, p. 7)

Autoethnographic approaches often entail playing with others, and for Humphreys et al. this can reveal to the musician/autoethnographer what kind of musical identity they have, how it relates to musical capabilities and limitations, and what possibilities it affords.

For Barrett (1998), who also draws upon autoethnographic work, the key to successful jazz performance is what he calls 'dynamic synchronization', which is the rapport between individual (often the soloist) and the group who develop a collective musical understanding. Because of the improvisational nature of much jazz, this means that not only is the soloist improvising, the rest of the band is also needed to extemporize in order to make the piece 'work'. Sometimes this can mean a repetitive accompaniment, but it can also entail considerable, if less prominent, composing-in-the-moment to provide suitable harmonic and textural support as the solo progresses and changes. Hence, there is often a great deal of tacit knowledge and understanding amongst the group such that they can react with great speed, but without knowing in advance exactly what notes will be played. Gaining membership of such a group entails not only musical skill but also the development of this group-based tacit knowledge that underpins the community of practice. Hence, autoethnography may be particularly suited to such studies.

Zack (2000) provides insight into how different communities of practice have structured improvisation. He regards this as a form of conversation, not only between the players on stage, but between successive generations of players. For example, Postbop can be regarded as a reaction to Bebop which itself was a reaction to swing. In swing improvisation practices involved embellishing and elaborating tunes over a structured chord or harmonic sequence. Hence, there were 'good' and 'bad' notes (Barrett, 1998) as some fitted with established harmonies and rhythmic patterns and others would break those conventions. Bebop made more use of chromatic 'passing notes' between the degrees of the scale or mode in use, and thereby created more complex tonal and rhythmic sequences. Later Bebop also introduced new chord alteration and additional spontaneity to the accompaniment. Postbop and Free Jazz seek to challenge how

improvisation itself is understood by, for example, abandoning the norm of melody and taking a few notes around which a band will create responses live. Hence, the notion of 'good' and 'bad' notes (amongst other musical matters) are increasingly questioned as the values of practitioners develop. For the jazz player, 'playing outside' is breaking the current rules, or playing outside the norm. Not delivering what is expected. For Zack (2000), these practices are revealing because they show not only what it means to produce music in a particular jazz genre but also what the social rules are which contextualize the performance. Decisions on when and where to modulate (that is, change from one key to another), and whether or not to do it in a conventional way, reveal much about the players' musical group norms and their musical identity.

Storytelling is another means by which players reveal inheritances from their culture and forebears. Humphreys et al. (2011) discuss how the stories that jazz musicians tell each other, often of iconic figures, has an impact on how they work together, what they expect of band leaders and what sort of performances they aspire to. They see storytelling as a mode of sense-giving and sense-making. In a similar way, Currie and Brown (2003) argue that stories are not only descriptive (and may not be that) but can be normative, carrying legitimacy for particular practices and identities. In their fieldwork, Humphreys and his co-researchers (2011) found repeated tellings of the same stories. For example, Duke Ellington was known for 'moulding the music around the man'. This meant that when he hired a new musician he would try to find the best 'fit' in the sound for that player. Ellington was also known as a great composer, but a repeated story was that he just wrote 'triggers' for the musicians so that they could express themselves, but he did this in such a way as to produce not just excellent individual performances but to enable the orchestra to play as 'one instrument'. There was a high level of stability in

the make up of Ellington's orchestra and this engendered trust and was part of what enabled them to play as a unit very effectively. Conversely, stories about Miles Davies tend to emphasize a very different approach and style of leadership. Davies would seek to hire the best musicians no matter where they came from or whether or not they would fit with the band. Indeed, some of his notable innovations as he went through different phases of musical style resulted from wholesale changes in his band to bring a completely new sound and approach. Unlike Ellington, Davies thought that improvisation was hampered, not helped, by musicians knowing each other and being comfortable together. Humphreys et al. (2011) found stories along these lines being used in the way that contemporary jazz band leaders practised their leadership. One band leader put it like this:

Miles hired such different musicians because he was always looking for a sound that was never created before. This is something I will be doing with my band too; I have a guy that is from Jamaica, another from Connecticut, Jersey. They never met each other before until they got into my band. (Sean Jones, cited in Humphreys et al., 2011, p. 49)

Autoethnography, and perhaps ethnography more generally, might be seen as a means of self-discovery in which the researcher is the research 'instrument' which becomes attuned over time through increasing knowledge of a culture and its (musical) practices. This is also informed by theoretical understanding which can direct attention for observation towards particular topics which may be nuanced in various ways. For example, playing jazz might be investigated through the lens of power as it relates to race, gender or forms of resistance. As a representation of a community of practice (or several communities of practice) the rules of 'the game' can be revealed concerning what is judged to be high quality musicianship, a truly novel improvisation, turn-taking during band playing, or the role of band leader, and these can be interrogated from perspectives such as

feminism which might produce particular critical interpretations of, for example, leadership. Thus, the identity of the autoethnographer will impact on what they observe/participate in and how they interpret the rules of the community.

ETHNOMUSICOLOGY, PRACTICE AND PARTICIPATION

The examples above have served, we hope, to illustrate briefly the sorts of insights that ethnomusicological studies might have to offer the worlds of business, management and organization research. Investigation into the structures of what Christopher Small (Small, 1998) called 'musicking' reveals how individuals in a community draw on and use music to shape, reshape, affirm and reaffirm the individual relationships that draw them together as a community. In pointing out these relationships, and the role that music can take even in the potentially depersonalized context of the workplace, ethnomusicology clearly offers direct insights into the way that communities are constituted. For the ethnomusicologist, music both reflects and is an agent of human relationships in a culture. Having touched on the methods of ethnomusicology above, we now revisit these to consider what insights these methods might have for qualitative research in business and management.

The first methodological cornerstone of the cases we have explored above is one that is shared by the vast majority of ethnomusicological studies: fieldwork. Throughout the ethnomusicological literature, the central importance of 'being there' (or having 'been there') is constantly underlined. We have already considered the problematic image of the heroic researcher stepping out into a (preferably) remote and 'primitive' culture to penetrate its secrets with a supposedly 'objective' study of its quaint musical rituals; in practice, and after a fairly shaky

start, ethnomusicology has become perhaps a model of respectful engagement with ‘other’ cultures, wherever these are found. Perhaps because of the difficulties that music can present to an outsider of any kind, ethnomusicological studies are notable for their patient, even dogged, approach: participant observation, interspersed with ethnographic interviews and the careful documentation of musical practices. This latter element of fieldwork has historically involved both recording and transcription (that is, the setting down of music in notation) and is a key point of distinction between ethnomusicology and more general ethnography. Approaches to documentation have evolved dramatically in response to the musics encountered: the self-evident problems with notating the musics of other cultures in the inflexible notation of European art music led, in the nineteenth century, to the development of the now conventional unit for pitch, the cent, which permits (say) the pitches of differently tuned scales to be compared systematically and with a (slightly) less obvious bias towards the supposed ‘norm’ of European music.

One result of ethnomusicology’s resolute focus on fieldwork is that studies tend to be localized – reflecting, perhaps, the capacity of a single researcher to immerse himself or herself successfully in a community or culture. And this tendency to focus on the particular means that ethnomusicological studies have, in general, avoided grand totalizing narratives, as ethnomusicologists endeavour to do justice both to the communities within which they have been embedded, and to an academic discipline that seeks high standards of reasoned argument based on high quality data.

A second result, a corollary of the first, is that ethnomusicologists tend to develop their insights from the data itself, rather than from overarching theories or hypotheses. A good deal of ethnomusicology from the mid-twentieth century is, in this sense, rooted in Grounded Theory *avant la lettre*. The Grounded Theory dictum ‘all is data’ resonates strongly for the ethnomusicologist.

What distinguishes ethnomusicology is the nature of the data that it draws upon – in addition to the interviews and observations of the ethnographer, the ethnomusicologist usually seeks to document and understand *as a musical human* the musical phenomena under consideration. She or he does this using a range of methods, but chief amongst them is learning to play or sing the music in question – by becoming, at some level, a music maker in the community or culture under study, by participating in the communal musical practices and understandings that are the focus of interest. This is the second methodological cornerstone of ethnomusicology.

The notion of ‘bi-musicality’ (or more recently ‘inter-musicality’) reflects the idea that significant insights are gained by taking part in the music-making itself, that the data is incomplete without the embodied experience of being a part of the community or culture – however provisionally and temporarily. Whereas ‘bi-musicality’ was conceived at a time when all ethnomusicologists were trained in the European tradition and therefore became ‘dual’ musicians as they were immersed in an ‘other’ culture, ‘inter-musicality’ more meaningfully attempts to reflect the myriad micro-cultures that are present within even a single individual’s musical identity, and the effect of adding to these the new musical culture under study.

This attention to, and participation in, the musicking itself is not restricted to learning instruments or songs: in Korczynski’s work on the use of music in a factory, we can only understand the relationships and strategies that are being enacted by the workers because we share with them an understanding of the music being used. Korczynski’s account would lose much of its meaning for a reader who could not hear – in her inner ear – Gloria Gaynor singing *I will survive*: although the title in this case directly reflects the theme of the song, it is the reader’s own direct musical experience of the song that allows her to understand the way the music is being co-opted as a means of resistance. The reader

takes a part in the communal musical experience shared with the workers in the study, the author and other readers who share the same cultural references.

The notion that significant insights may come from taking part in the musical activity itself might seem obvious – a given even – but this feature of ethnomusicological method marks something of a contrast with approaches in other disciplines. The notion here is that, commonly, the researcher might, as a basic requirement, have to *take a part* in the culture or community he or she studies, a part-taking that goes beyond observation (recognizing, of course, that observation will also, in reality, reshape the phenomena under investigation).

It might be tempting to see musicking as a special case of communal human activity that, perhaps uniquely, requires the researcher to engage at length in the actual practices under investigation, rather than moving quickly to the way they are organized, the patterns of production or the observable social phenomenon that they reflect or create. Certainly, music seems so full of meaning as to demand special attention in itself; but perhaps this is really just an intensification of a wider phenomenon related to the lived quality of human experience in a particular community. Other embodied experiences, such as the physicality of work, could equally fall into this category; however, a differentiating factor of music is the cultural aesthetic judgements attached to its production and consumption. These judgements and practices can influence the degree to which a person is experienced as a member of the culture.

The two cornerstones of ethnomusicological method – fieldwork and participation in the practices of a community or culture have significant resonance in business and management more generally. Practice-based studies and activity theory (Nicolini, 2012) have particular relevance in this regard. Engeström's (1990) activity theory has been applied and elaborated by Blackler et al. (2000) who focus on the connection between

individuals, communities and their objects of activity.

Activities imply the motives and goals of participants ... activities provide the link between the individual and society ... societies can be conceptualized as an interlacing pattern of different activities. (Blackler et al., 2000, p. 296).

According to this theory, as individuals operate in communities they operate around objects of activity which provide a focus and vehicle not only for the activities but also for people to develop and express their identities as individuals and community members. Although the term 'object' sounds physical, in fact an object can be entirely ephemeral and the production of sound could easily constitute such an object. Typically, communities develop tools and technologies to work on and produce the objects of activity, and in the case of music this could clearly include musical instruments, but equally it could include improvised and found objects used as instruments. Activity systems incorporate rules and procedures and, for example, a division of labour. Essentially, activity systems entail knowledge and learning. In some cases, this learning is codified in roles and rules, but in many cases, it is learned through socialization and is somewhat tacit, at least amongst the initiated. The musicking of one of the Jazz bands referred to above, for example, would be amenable to such an analysis. If the object of activity were to play a gig, there are particular roles and a division of labour, for example between band leader and other players, a distribution of playing roles according to skill and expertise and so on. Musical instruments are used, but there is also an important context – that of the venue, the arrangement of the players on a stage which physically and symbolically places the players together and apart from the audience. Some bands use the tool of music stands and read the music rather than memorizing it. Others play from memory or improvise, and so relatively simple tools, such as a music stand, by its presence or absence can

symbolically and practically permit one form of the practice and disallow another. The rules of the activity include how and when players will improvise, for how long and how turn-taking is managed. In addition, however, the rules also apply to non-musical parts of the activity, for example, who introduces songs and the sorts of phrases they use.

Meaningful activities are never absolutely individual as even a composer apparently acting alone is doing so in a social, cultural and historical context which provides the language and symbolism with which to accomplish meaning. This would explicitly be the case in the stories of Duke Ellington referred to above in which he composed with particular players in mind in order to get the best out of them. The social context is that it provides tools and structures of meaning which lay the basis for the actors to be able to act with intention.

Activities interact in a conceptual system and can be complementary, or there can be tensions between differing purposes and objects (Orlikowski, 2002). For example, the purpose of putting on a concert for some may be to produce wonderful music, whereas for others it may be to make a financial return or indeed to make productive use of a venue. In producing community music there may be several objects of activity at play, including, for example, providing entertainment for an audience, giving participants something pleasurable to do, building up the self-esteem of participants and producing music of a particular sort. The community is particularly important in negotiating priorities and symbolic meaning, allocating resources and enabling learning often based on informal cultural learning. However, it would often be a mistake to think of the community as a homogenous culture. Rather, plural cultures encompass people with different priorities and understandings of the situation such that the same object of activity, such as community musicking, could simultaneously have different meanings for several different sub-groups. In addition, given that individuals are complex in themselves, there could be a confluence of meanings for one person.

Hence, it is relevant for the ethnomusicologist to pose questions drawn from activity theory to explore what the (multiple) objects of activity are in musicking, who people are being, both individually and in their community, when they engage in this activity, how they produce and use tools for direct and indirect use, and what meanings for players, audiences and others are produced through the activity.

The significance of taking a part in the community or culture under investigation – of drawing data from the lived experience of being a part of the community – might have some significant ethical consequences. It will, for example, modify the power relationship between the researcher and the participants in the research: at a simple level, the researcher has to give up any semblance of superiority if she is to participate – as an outsider, as a guest, possibly as a beginner and certainly as someone with less experience – in the practices of a group under study. The power relationship tilts towards the participant, who becomes a true participant (as opposed to a ‘subject’). At a deeper level, the researcher is confronted with practical minutiae that may not be easily accounted for (or swept away by) existing theoretical approaches: the work of understanding meaning-making in a particular context becomes at once more difficult but also less vulnerable to theoretical ‘bad faith’. Finally, the researcher might better empathize with the people whose lives unfold within the structures he or she purports to understand – through taking part rather than a traditional analytical stance of ‘taking apart’.

CONCLUSION

Ethnomusicology is concerned with understanding the place of music in a culture and the role of culture in music. It normally adopts an ethnographic approach in which, in addition to observation, participation is increasingly emphasized. Along with the focus on participation, autoethnography,

especially when the researcher is working in his or her own culture, is often used as a method, as learning through undertaking a musical practice and reflecting both 'inwards' and 'outwards' provides a basis for rich insight and understanding. Ethnomusicology is broader in subject than musicology in that it is interested in diverse sources of data (including, for example, documentary sources such as magazines, websites, fan literature and so on, ethnographic interviews and cultural observation) in order to understand the meaning(s) of music within and for a community or culture. It has a tighter focus than general ethnography in that it always has music as a central cultural feature that is being examined, but this still leaves a broad field of interest across the full range of musics and cultures. In this chapter we have drawn examples from factory work and the use of pop songs, jazz and community music-making, but equally there is considerable interest in orchestral music, music as part of resisting the power of capital, small scale 'DIY' and punk music, to name just a few. Ethnomusicology normally adopts an interpretivist, relativist epistemology, rather than seeking to make any predictive generalizations, and is not uncommonly associated with a radical or critical epistemology in which arguing for change or against prevalent forms of power is part of the research. We have suggested above that ethnomusicology fits well with a practice theory or activity theory approach, which would indicate a complementary form of research to that in the organizational literature which focuses on communities, their ways of knowing and practising (e.g. Nicolini, 2012). Ethnomusicology brings a particular emphasis on embodied practice and aesthetics (e.g. Strati, 1999) to such research approaches. Therefore, we would see ethnomusicology as a well-established form of research which is increasingly being applied in the field of business and management. It fits with major paradigms of critical and interpretivist research and with movements towards practice-based theorizing. Applying the concept of

inter-musicality does, however, provide a challenge in that it requires the researcher to have sufficient musical ability in order to participate. However, given that participation through learning can be a particularly insightful way of gaining understanding of a community, and that the use of music in amateur ways (for example in the factory research) does not require high levels of musical accomplishment, this may be less of a barrier than has been assumed to date.

Business and management research has now broadened into interests not only with commercial companies and public sector organizations but also to seeking a contextualized understanding of organizing as part of society. Music is a fundamental part of cultures and communities and seeking to gain insight into music beyond its commercial production is entirely appropriate as part of the business and management research agenda. Ethnomusicology provides a method (or set of methods) which have been used in interesting ways in business and management, often in understanding how music is organized (Beech et al., 2015) or as a way of elaborating organizing more generally (e.g. Humphreys et al., 2003). We would suggest that there is considerably greater potential for the use of ethnomusicology in business and management research, particularly in addressing questions of knowledge, power and resistance, embodied practice and aesthetics in many forms of organizing in which music (literally) plays a part.

Application Questions

We would suggest that ethnomusicology can contribute to business and management research by posing questions that relate to and complement research questions posed in other methodologies. A non-exhaustive list is:

- 1 ***Production and consumption*** – how are musical products and events conceived, supported, produced and consumed? What do

these processes say about the cultures of which they are part and how do the cultures enable and come into being through music?

- 2 **Identity and diversity** – how is music used as a mode of producing and performing personal and social identities? What meanings are shared, and what are not? How is identity in music performed both as active and re-active concept (for example, as a form of resistance)?
- 3 **Change and tradition** – how does music represent continuity and extension of symbolic significances from the past to the future and how does it adapt incrementally or through disjunctures?
- 4 **Technique and technology** – how do modes of producing music impact on the nature of the music and its social position for example as an expensive and elite skill or a democratic and participatory activity? How do the tools available for use influence practices, and how are tools and technologies created and improvised in musicking?
- 5 **Value and purpose** – how does music connect to, and inform, social structures, judgements, status and mediated uses (e.g. producing commercial outcomes)? What role does aesthetics and aesthetic judgement play in music-making? What embedded/implicit structures of community are revealed in or through the music?
- 6 **Practising and knowing** – how are skills and knowledge in music acquired, and how do they relate to sub-cultures and communities of practice? Beyond highly technical performance, how are listening, joining in and subverting performed as musical practices?

Advances in Qualitative Comparative Analysis (QCA): Application of Fuzzy Set in Business and Management Research

Ursula F. Ott, Rudolf R. Sinkovics and
Samia Ferdous Hoque

INTRODUCTION

Following on from the seminal book of Charles Ragin in 1987, qualitative comparative analysis (QCA) has gained increasing acceptance in social science research for systematic comparative case analysis (Rihoux, 2006). The QCA approach is built upon the set-theoretic comparative technique, primarily Boolean algebra, and has been introduced as a 'synthetic strategy' for integrating the strengths of qualitative and quantitative methods while overcoming the key concerns inherent in both the approaches (Ragin 1987, p. 84). Berg-Schlosser and De Meur (2009, p. 17) define it as 'a nonlinear, non-additive, non-probabilistic conception that rejects any form of permanent causality and that stresses equifinality (different paths can lead to the same outcome), complex combinations of conditions, and diversity'. The Boolean or crisp set technique is the first

QCA version, while fuzzy set technique is a more recent extension (Ragin, 2000, 2008a). Unlike crisp sets that assign dichotomous membership, fuzzy sets permit partial membership in a category, meaning both causal and outcome variables can be multichotomous (Stokke, 2007).

Although social science research has a long-lasting tradition of prioritising variable-oriented quantitative methods, the popularity of case-oriented qualitative techniques has also been developing at a steady pace (Ragin, 1994; Ragin & Becker 1992). Nevertheless, case-oriented qualitative research is often criticised to be weak in terms of external validity for placing an overly emphasis on the specifics of an individual case. The internal validity is also in question considering the method's inability to choose between various possible or plausible explanations of a phenomenon. This problem, regarded as degrees-of-freedom or 'small-N problem', means that

‘there are too few observations relative to the set of variables under consideration to determine the relative significance of the causal factors’ (Stokke, 2007, p. 501). Qualitative researchers tend to compensate for this issue by paying attention to complexity and depth in a given case (Ragin & Becker, 1992). In this respect, Ragin (1987, p. 51) argues that the term ‘small-N problem’ misrepresents the challenge confronting case-oriented research, since ‘it is not the number of relevant cases that limits the selection of method ... but the nature of the method that limits the number of cases and the number of different causal conditions that the investigator is able to consider’. The QCA technique is designed to overcome this small-N problem and is equipped to handle only a limited number of cases. The approach will not only increase the number of cases but also will find similarities and differences across cases on a configuration of causal conditions in order to identify patterns with possibilities for modest level generalisation (Rihoux & Ragin, 2009).

Although initially applied in political and historical sciences, QCA offers particular promise to organisational researchers (Rihoux & Ragin, 2009). Fiss (2007, p. 1180) argues that ‘organisations are best understood as clusters or interconnected structures and practices, rather than as modular or loosely coupled entities whose components can be understood in isolation’. The QCA approach is fundamentally based on the idea that the patterns and attributes will exhibit different features and lead to different outcomes depending on how they are arranged. Therefore, the approach stresses nonlinearity and synergy of depth and breadth within and across cases (Ragin, 2014), which is typical of real-world qualitative research (cf. Sinkovics & Alfoldi, 2012). However, this contrasts with a long tradition of organisational research in the application of econometric or statistical tools which imply linearity.

Against this context, the use of QCA in the field of management is beneficial for the understanding of complex management

phenomena. It combines qualitative investigation with quantitative analysis. A recent *Journal of Business Research* special issue (Roig-Tierno et al., 2016) published 46 articles on QCA and illustrates the potential for management research. In their lucid overview article, Seny Kan et al. (2016) show that 95 articles use QCA in management research. Their classification highlights its use in general management, marketing, innovation, strategy, human resources, organisation studies and operational research. The result of their article suggests that researchers apply QCA to four management situations: the internal environment, the external environment, links within and between these environments, and the optimal way to question management phenomena. The use of QCA in the special issue extends the application to entrepreneurial activity, organisational strategy and management performance (Roig-Tierno et al., 2016).

To this end, the purpose of this chapter involves presenting, discussing and explaining the QCA method and highlighting the application of the method in business and management research. The chapter is, therefore, organised in the following way: first, we present the QCA approach discussing its history, epistemology and key methodological features; second, we shed light on the progress in the application of the QCA approach by highlighting the patterns thus far; and finally, we detail the method for its application and exemplify the conceptual considerations presented earlier. The chapter concludes with a summary and suggestions regarding future avenues for using QCA approach in the field of management research.

BACKGROUND ON QCA AND fsQCA

QCA is the umbrella name for two main types of techniques: crisp set qualitative comparative analysis (csQCA) and fuzzy set qualitative comparative analysis (fsQCA)

(Rihoux, 2006). Both methods are designed to transfer subjective data into numeric ones by assigning values of either 0 and 1 (crisp) or in between 0 and 1 (fuzzy). csQCA was the original version of QCA and is built upon the binary language that George Boole developed in the mid-1800s. The Boolean algebra is also the mathematical basis of computer technology. Boolean algebra does not manipulate numbers but rather systematises logical expressions in order to sort data and create a list of the configurations of circumstances associated with a given outcome (Stokke, 2007). The application of crisp logic for systematic comparative procedures dates back to the eighteenth and early nineteenth centuries, primarily in natural sciences (Rihoux & Ragin, 2009).

fsQCA is a much later extension to QCA and is built upon the fuzzy set theory (Ragin, 2008a). The introduction of fuzzy set theory dates back to the 1960s with the publication of seminal articles by Zadeh (1965) and Goguen (1969). Zimmermann (2010) highlighted that the development of fuzzy set has mainly been in two key areas: first, as a formal theory with increasing sophistication and specification being added to the original ideas and concepts of Zadeh (1965); and second, as fuzzy-oriented application in problem solving and research. The acceptance of fuzzy set gained momentum between the 1960s and 1970s with its first application in controlling technological processes. The successful use of a fuzzy rule-based system, namely fuzzy control, in the manufacturing of washing machines, video cameras, subway trains and heavy machineries by Japanese technology firms triggered the interest in further application of the method in scientific research during the 1980s.

The application of classical set theory in social science research followed from a seminal volume by Charles Ragin (1987). In a series of publications (e.g. Ragin, 1987, 1994), Ragin introduced the use of csQCA in social science research. During the 1980s and 1990s, csQCA was mostly applied in political

science (comparative politics) and historical sociology (welfare state studies) research. As a result, csQCA was initially adopted in the social sciences as a tool for macro-level studies involving entire societies, economies, states or other complex social and cultural formations. The organisational researchers have applied the method in meso-level (i.e. firm-level) studies in recent years (Rihoux & Ragin, 2009).

Zadeh (1965) argues that fuzziness is contained in human language, including human judgement, evaluation and decisions. Drawing upon this argument, Ragin (2000) contends that fuzzy set theory can be a powerful tool to capture the fuzzy nature of human language that has remained difficult thus far through the application of dichotomising techniques of csQCA. Therefore, built on crisp sets' csQCA, the key strength of fsQCA lies in providing the variance of the observations.

Developed around the Boolean binary logic (scores of 0 and 1), csQCA assigns membership to cases across a configuration of condition, in which a score of '1' reflects 'full membership' and '0' reflects 'no membership' in a specific set of conditions. While csQCA assigns dichotomous membership ('yes=1' or 'no=0') to the cases across a set of conditions, fsQCA addresses degree of membership in sets by assigning intermediary numbers between 0 and 1 (Rihoux & Ragin, 2009). Ragin (2008a, p. 30) claims 'fuzzy sets have many of the virtues of conventional interval and ratio-scale variables, but at the same time they permit qualitative assessment'. For instance, in the fsQCA approach, a membership score of 1.0 indicates full membership in a set; scores close to 1.0 (e.g. 0.8 or 0.9) indicate strong but not quite full membership in a set; scores less than 0.5 but greater than 0.0 (e.g. 0.2 or 0.3) indicate that objects are more 'out' of than 'in' a set, but still weak members of the set; a score of 0.0 indicates full non-membership in a set. The score 0.5 reflects maximum ambiguity or fuzziness in the assessment of whether a case is more in

or out of a set. Thus the variables (condition and outcome) can be calibrated aiding the construction of the truth table through use of substantial theoretical knowledge and evidences from cases (Rihoux & Ragin, 2009). As pointed by Ragin and Amoroso (2011), fuzzy sets are simultaneously quantitative and qualitative: full membership and full non-membership are qualitative states, while varying degrees of membership are quantitative measurements ranging from more out (closer to value 0) to more in (closer to value 1).

Epistemologically, the QCA approach (both csQCA and fsQCA) is a middle way between the case-oriented qualitative research and variable-oriented quantitative research (Rihoux, 2006). On the one hand, the qualitative approach emphasises the complexity of a social phenomenon and offers in-depth detail about a small number of cases/instances. On the other, the quantitative approach is interested in generalisation and finding patterns that are evident in a large number of cases/instances. One of the key criticisms of the quantitative approach relates to its difficulty in addressing actors' underlying motives to certain responses, observing the subjectivities and sequences of the events, and deriving the causal connections. Qualitative methods, by contrast, excel in these areas. However, with a qualitative approach, it is difficult to claim that the findings are generalisable due to its reliance on a small number of cases. Despite this methodological divide, qualitative and quantitative approaches could be complementary and mutually dependent. For instance, qualitative researchers often cite general patterns that they have learned from previous quantitative studies in order to explain case-specific phenomena. On the other hand, quantitative researchers also cite unobserved case-level mechanisms to explain the cross-case patterns they document. This complementarity and mutual dependence underpins the idea of building a bridge and finding a middle ground where concerns of both worlds can be met (Ragin, 2000). The QCA approach offers this middle ground

between the issue of generality as portrayed in quantitative study and complexity in qualitative study.

Ragin (1987) contends that the QCA approach resolves some of the methodological issues inherent in qualitative and quantitative approaches and strengthens the connection between the two approaches. The QCA (and fsQCA) approach has its fundamental tie with case-oriented research, which has the unique strengths of understanding the cases within their context, the causations in conjunction and outcome as results of combinations of conditions. While clutching these unique strengths of case-oriented approach, QCA is developed to formalise those by using Boolean algebra. Nevertheless, case-oriented researchers often claim that their findings are specific to individual cases and, thus, faced with a large number of cases, they find it difficult to sustain their attention to complexity and also to address the similarities and differences across many cases. By contrast, a variable-oriented approach is more interested in variables across a large number of cases to find correlation between those, and in the process, the cases lose their identity and the context gets overlooked. While holding its case-oriented tradition, QCA is designed to handle a larger number of cases at the same time, examining the causal complexity in those cases by avoiding the simplifying principles of variable-oriented research. It is, therefore, a 'synthetic strategy' that is interested in both within-case and cross-case analysis (Ragin, 2014, p. 84). On the one hand, the emphasis on breadth as in the variable-oriented approach is retained through analysis of more than just a handful of cases, which is seldom done in case-oriented research; on the other hand, the attention to depth is given by focusing exclusively on the specificity of individual cases and maintaining intimacy with the context (Rihoux & Ragin, 2009).

Rihoux and Ragin (2009) had listed four key features of QCA: i) causality, complexity and parsimony; ii) modest generalisation; iii) ideas and theory; and iv) data, replicability

and transparency. First, in QCA, approach causation is typically understood conjuncturally, as combinations of conditions. It is interested in causal complexity, which Ragin (2008a, p. 23) defines as 'a situation in which an outcome may follow from several different combinations of causal conditions, that is, from different recipes'. These configurations of causally relevant conditions are compared across cases to link those to outcomes (Ragin, 2008a, 2014). The key tool for analysing causal complexity in QCA is the truth table, a tool that allows structure-focused comparisons (the process of constructing a truth table is detailed in the methodology section). In comparative analysis, causal conditions do not compete with each other, as they do in variable-oriented analysis while deriving correlations; they rather act in combination to generate a specific outcome. Again, different combination of conditions may also lead to the same outcome, for example, different social forces leading to the emergence of welfare states in Western Europe (e.g. Alber, 1995). Thus Rihoux and Ragin (2009, p. 8) refer to this characteristic as 'multiple conjunctural causation' in which, the word 'multiple' refers to the different paths to produce the same outcome, and 'conjunctural' conveys that each path is a combination of conditions.

Second, the QCA approach allows comparing small to intermediate numbers of cases (referred to as 'small-N' or 'intermediate-N' (Ragin, 1987)) as a configuration to identify similarities and differences across cases. The cases are compared in a truth table to identify the ones displaying identical configurations of causal conditions and the ones differing on one or more causally relevant conditions (Ragin, 2014). This process allows the finding of patterns among a low number of cases, such as 2, to an intermediate number of cases, say 50 to 100. Therefore, QCA is equipped to support 'modest generalisation' in a small-N or intermediate-N situation (Ragin, 1987, p. 31). This systematic comparative analysis facilitates formulating propositions which can then be applied to other similar cases

(of course, with caution). However, the robustness of generalisation is greater in variable-oriented research, allowing very broad generalisation (Rihoux & Ragin, 2009).

Third, the QCA approach facilitates a dialogue between theory and cases. The cases are considered as a specific combination of properties within a specific context – a 'whole entity', while in variable-oriented research, the cases and context are lost in the course of variable search and analysis (Ragin, 2014). Therefore, the research needs to have in-depth understanding of the cases, which aids the identification and development of the configuration of the conditions. The cases are not randomly selected from a population, but rather are carefully selected in consultation with historians, country experts and others, and each case is well known having an identity rather than being anonymous. Therefore, the processes of selecting the understanding of the cases are holistic and inductive. The choice of conditions also needs to be theoretically informed, which adds a deductive dimension to the QCA approach. The theoretical knowledge also contributes to the selection of the cases, including the exceptions and outliers and also treatment of the contradictory configurations, i.e. the cases that display the same values on the condition variables but which lead to different outcomes (Rihoux & Ragin, 2009). The interpretation of the findings should also have to be derived from theoretical knowledge. With having both deductive and inductive aspects embedded in the process, QCA is equipped to generate mid-range theories (Rihoux, 2006).

Finally, with the use of Boolean algebra, the QCA offers tools that are both formalised and replicable. The QCA allows assigning numbers to data that are originally subjective in nature and thus making the study replicable. The process of selection of variables, processing them and intervening during the analysis are transparent. The researcher has to constantly refer to the case and go back-and-forth, which requires a rich data and theoretical knowledge. Thus the approach is not a

mere mechanical and ‘push-button’ oriented one, but rather requires researchers’ constant engagement, which makes the process more transparent (Rihoux & Ragin, 2009).

QCA IN BUSINESS AND MANAGEMENT RESEARCH

The rationale for why researchers use QCA in management is that the complexity of the management phenomena and the understanding the management practices asks for more refined modes of investigation: an in-depth knowledge of the cases and a robust manner to analyse them. QCA has three variants – crisp set, multi-value and fuzzy set. Seny Kan et al. (2016) investigated the use of QCA in management research and found that in most articles it serves the renewal of the understanding of management situations. QCA can be positioned between exploration and hypothesis testing, and it has an original role in strengthening knowledge generation through a dialogue between case studies and theory. Finally, QCA is helpful in limiting the recurrence of mismatches between theory and methods in management research. The authors emphasise that the QCA has two forms of explanatory paths: 1) a specific management reality could have a multiplicity of causal paths – equifinality; and 2) an asymmetric nature of management phenomena. Overall, QCA offers the depth of qualitative research and a coherence for understanding the configurations of the antecedents leading to the outcome of a phenomenon. Many paths can lead to an outcome in managerial research. Seny Kan et al. (2016) show that fuzzy set is the most common of the three variants of QCA and the studies were empirical, theoretical and methodological. Important for the use of cases is that the unit of analysis can be organisation, individual, country or state. This chapter highlights the recent developments in QCA in management research and positions it in this respect.

The scope of small-N to full-N enables fsQCA to be used in qualitative and quantitative investigations. FsQCA in the latter is mostly used to complement quantitative findings in providing asymmetric relationships of the analysis. The fsQCA approach in qualitative research gives the robustness of the results and the generalisability of the findings. The critiques of qualitative research can be circumvented in this case, since validity, reliability and authenticity of the results are positioned in a more convincing way with fsQCA. With fsQCA, the researcher can distinguish between necessary and sufficient conditions for the occurrence of managerial phenomena and by being able to do this, a central criticism of management research – the lack of actionability (Seny Kan et al., 2016) can be addressed.

The use of fsQCA in business research can be considered in a more structured way after the publication of more than 100 articles. Seny Kan et al. (2016) and Roig-Tierno et al. (2016) provide classifications of the articles using fsQCA in management research. Figure 25.1 shows the frequency of fsQCA use in the respective functional areas of management.

Interviewing actors on different organisational levels helps to find out about organisational and managerial phenomena which need an exploratory approach for knowledge generation. Seny Kan et al. (2016) moved away from a functional perspective and focused on the four configurations discussed below.

Internal Environment

Mostly organisational structure and strategy papers use fsQCA for their investigation into procedures, strategies and performance.

External Environment

The relationship of the actors with customers, suppliers, HQ and governmental bodies

Figure 25.1 The use of fsQCA in management research (Seny Kan et al. 2016)

benefits from an in-depth analysis of the cases for managerial research.

Entrepreneurship Activities

As a new approach towards understanding small enterprises, interviewing entrepreneurs shows a valid empirical and theoretical unit of analysis by focusing on the individual and the decision-making of business leaders.

Innovation and Performance

This stream of research in fsQCA is important and transferred to many different levels

from individual to country and shows the reliability of the findings in terms of necessary and sufficient conditions for the outcome.

The recent Special Issue of set theory (fsQCA) in the *Journal of Business Research* (69: 4) can be seen in structuring fsQCA in management according to entrepreneurial, organisational and performance configurations in management. Table 25.1 summarises the extensive use of fsQCA in this respect.

The applications for fsQCA are manifold and offer a research agenda for many years to come. The next section offers an example fsQCA application.

fsQCA APPLICATION EXAMPLE

This example uses Ragin's (2008b) manual for fsQCA software as a guide on how to work with the collected data and transfer it into fsQCA results. The example below goes back to Ragin (2008a) and Rihoux and Ragin (2009). This is especially beneficial, since the country comparisons chosen are an important approach to provide a classification and calibration for an introduction into fsQCA. The data is in general collected with an Excel spreadsheet and then saved with comma separated (.csv) format, which will lead to the screenshot shown in Figure 25.2 when starting the fsQCA programme.

From interviewing to calibration, the data collection with interviews benefits from the in-depth knowledge of the researcher. As Ragin (2008a) points out, the researcher needs to know the subject, interviews, theory and method well to be able to generate new insights with fsQCA. The number of interviews or cases can be from small N to medium N. Large N are only used to compare quantitative studies (regression models of

symmetric relationships) with fsQCA (asymmetric relationships). The interview data can then be structured into themes which make up the conditions (antecedent, concurrent and consequential). The example below uses gross domestic product, manufacturing sector, strong unions, etc. (macroeconomic conditions for country perspectives). The next step is the generation of a calibration table in which the qualitative results are translated into memberships of sets. Full membership in a set is considered at 1 and an empty set is 0. All the grey levels in between will be positioned between break points (0.5, 0.33 and 0.67, 0.2, 0.4, 0.6 and 0.8). This is the important part for the transfer from qualitative to quantitative analysis. Figure 25.2 shows therefore values between 0 and 1.

The screenshot in Figure 25.3 shows the cases in the first column and the conditions generated from the calibration table. In this case *gdpf* stands for affluent, *inqf* is substantial income inequality, *manf* is strong manufacturing sector, *unf* is strong unions and *weakcv* stands for weak class voting (Ragin, 2008b, 75). To generate a truth table analysis,

Case	name	gdpf	inqf	manf	unf	weakcv
1	AUS	0.9	0.7	0.3	0.7	0.7
2	BEL	0.7	0.1	0.1	0.9	0.7
3	DEN	0.7	0.3	0.1	0.9	0.1
4	FRA	0.7	0.9	0.1	0.1	0.9
5	GER	0.7	0.9	0.3	0.3	0.7
6	IRE	0.1	0.7	0.9	0.7	0.9
7	ITA	0.3	0.9	0.1	0.7	0.7
8	NET	0.7	0.3	0.1	0.3	0.9
9	NOR	0.7	0.3	0.7	0.9	0.1
10	SWE	0.9	0.3	0.9	1	0
11	UKN	0.7	0.7	0.9	0.7	0.3
12	USA	1	0.9	0.3	0.1	1

File: CV1379.CSV

Figure 25.2 FsQCA Data sheet after Calibration in .csv

Figure 25.3 Selection of conditions

the user will need to go to 'Analyze' and then to 'Fuzzy Sets' and 'Truth Table Algorithm'. The screenshot in Figure 25.3 should guide the reader towards creating the truth table, which follows in two easy steps. The outcome condition will be chosen first and then the conditions leading to the outcome are then clicked into the causal condition section. Clicking on the run button will bring up the truth table.

The truth table shown in Figure 25.4 shows the causal conditions, the number of the cases with the combination, and the outcome condition as well as consistency values. For example, let's take the first row with 3 cases or 25 per cent covered by the joint set of *gdpf* and *inqf* and the empty cell for outcome and 0.95 for consistency. The truth table represents 2^k rows (where k represents

gdpf	inqf	manf	unf	number	weakcv	consist	pre	product
1	1	0	0	3 (25%)		0.950000	0.909091	0.863636
1	0	0	1	2 (41%)		0.736842	0.523810	0.385965
1	0	1	1	2 (58%)		0.666667	0.333333	0.222222
0	1	0	1	1 (66%)		0.764706	0.529412	0.404844
0	1	1	1	1 (75%)		0.812500	0.571429	0.464286
1	0	0	0	1 (83%)		0.928571	0.833333	0.773809
1	1	0	1	1 (91%)		0.789474	0.600000	0.473684
1	1	1	1	1 (100%)		0.722222	0.411765	0.297396
0	0	0	0	0 (100%)		0.909091	0.714286	0.649351
0	0	0	1	0 (100%)		0.733333	0.428571	0.314286
0	0	1	0	0 (100%)		0.916667	0.714286	0.654762
0	0	1	1	0 (100%)		0.785714	0.454546	0.357143
n	1	n	n	n (100%)		0.928571	0.818182	0.759740

Figure 25.4 Truth table

the number of causal conditions), which is a reflection of all possible combinations of causal conditions.

The outcome condition *weakcv* is blank and it is up to the researcher to determine the outcome for each configuration. Consistency values are shown in column *consist* and show the degree to which membership in that corner of the vector space is a consistent subset of the membership in the outcome (Ragin, 2008b, p. 77) after applying the frequency threshold of 1 to the data and reducing the table by the configuration that does not have any observations. The consistency threshold of 0.9 is selected and 1 is placed in the *weakcv* (outcome) column for configurations with 0.95 consistency and greater and 0 for cases with lower consistency (see Figure 25.5).

After constructing the truth table the researcher can then select 'Standard Analyses' and this leads to the provision of the complex, intermediate and parsimonious solutions. These are the logical remainders of the solution. Using the Specify analysis will lead to different outputs. The standard analysis is preferred however. Figure 25.6 shows the output for the standard analyses.

According to Ragin (2008b), the solution is here that weak class voting is a product

of the high membership in the set of affluent countries and weak membership in strong unions.

FsQCA offers as well the possibility to show descriptive statistics, frequency analysis and cross-tab results. Figure 25.7 shows the result for the fsQCA outcome of weak class voting shown as descriptive stats.

CONCLUSION

The explanation, presentation and discussion of fsQCA for management and business research offers a tool which benefits this field of research to generate qualitative results and transfer these into rigorous quantitative findings. This chapter emphasises the relevance of this methodology and shows its applicability to real-life problems in a complex field such as business and management. The chapter review therefore provides an insightful overview regarding the use of fsQCA. We hope that business and management scholars will follow up on the opportunities offered by this methodology. A good starting point is the literature offered by Ragin and colleagues in terms of empirical application, and the software offered as a

gdpf	incf	manf	unif	number	weakcv	consist	pre	product
1	1	0	0	3	1	0.950000	0.909091	0.863636
1	0	0	0	1	1	0.928571	0.833333	0.773809
0	1	1	1	1	0	0.812500	0.571429	0.464286

Figure 25.5 Truth table

Figure 25.6 Truth table analysis

free download at the University of Arizona, will prove invaluable.

This chapter highlights the possibility for researchers to see their qualitative results transferred into a quantitative framework. This allows the findings to be communicated differently, which will be appealing to quantitatively trained audiences. Organisational business questions are looking into asymmetrical relationships which coincide with real-life applications and the strength of fsQCA to provide answers in that respect. Regression analysis results, which have been used so far in management research and provide a symmetric solution to asymmetrical problems, can now be complemented with fsQCA findings.

The practical example in this chapter follows a step-by-step approach from data collection, calibration, truth table analysis to the necessary and sufficient conditions of the outcome. The researcher can also add descriptive statistics, which enable qualitative data to be shown in an equivalent manner to quantitative results.

This chapter argues that fsQCA offers qualitative research a tool which gives rigorous insights into problems, which considers the classification and analysis of actions and behaviour as well as the provision of equifinal solutions where many paths can lead to an outcome. The in-depth analysis of case-oriented research combined with rigour benefits the research questions of managerial phenomena.

The screenshot shows a software window titled 'fs/QCA' with a menu bar containing 'File', 'Analyze', 'Graphs', 'Window', and 'Help'. The main content area displays 'weak-class-vot.dat: Descriptive Statistics' with a table of statistical data for five variables: gdpf, incf, manf, unf, and weakcv. The table includes columns for Variable, Mean, Std. Dev., Minimum, Maximum, N, and Cases Missing.

Variable	Mean	Std. Dev.	Minimum	Maximum	N	Cases Missing
gdpf	0.675	0.2384848	0.1	1	12	0
incf	0.5833333	0.2881936	0.1	0.9	12	0
manf	0.4	0.3316625	0.1	0.9	12	0
unf	0.6083333	0.3094574	0.1	1	12	0
weakcv	0.5666667	0.3399346	0	1	12	0

ANTI-History: An Alternative Approach to History

Gabrielle Durepos and Albert J. Mills

INTRODUCTION

This chapter offers a theoretical description of six facets of ANTi-History. Each is illustrated by empirical examples of published work where ANTi-History is in use. ANTi-History is an alternative *critical* historiography that was initially developed by Gabrielle Durepos and Albert Mills in 2008 (Durepos, 2009; Durepos & Mills, 2012a, 2012b; Mills & Durepos, 2010). ANTi-History is a multifaceted approach to the study of history. Its critical potential lies in its focus on destabilizing the very notion of history as a dominant account of the past: to that extent ANTi-History is *anti* history. However, this does not mean a rejection of history as accounts of the past, but rather a rejection of the idea of the past as knowable through history (Munslow, 2010). Instead, ANTi-History is interested in how history as *knowledge of the past* is produced; it is interested in how human and non-human actors come to perform, and in the process,

produce histories. In this vein, ANTi-History speaks to the time before a given history is produced (in that sense it is *ante* history). Drawing on Actor-Network Theory, or ANT (Latour, 2005), it seeks to understand the relationships through which histories are produced – thus ANTi-History.

ANTi-History was developed against a growing discontentment with positivism in management and organization studies and its ahistorical character (Burrell & Morgan, 1979); disenchantment with capitalism and Soviet communism and their respective grand narratives of American exceptionalism and dialectical materialism; a developing interest in poststructuralism (including Foucauldian new historicism), cultural theory and sociology of knowledge accounts of *knowledge* (including ANT); the development and fusion of a number of critical communities (including feminists, Marxists, poststructuralists, etc.) that manifest itself as Critical Management Studies in Management and Organization Studies (MOS); and

a burgeoning call for more history in MOS (Booth & Rowlinson, 2006). While ANTi-History was developed in large part to answer that call in MOS, its multidisciplinary roots in for example, the sociology of knowledge (Mannheim, 1985); postmodern historiography/cultural theory (Foucault, 1982) and ANT (Latour, 1999a) means that it has applicability for historical work in any academic field.

As noted, ANTi-History is *ANTI*-History in that it draws on ANT to inform the method for doing history. But ANTi-History goes beyond ANT in that ANTi-History critiques ANT's lack of explicit attention to history (Durepos & Mills, 2012a). To make ANTi-History, we explicitly drew out of ANT its potential to address history. This has consequences for the style of writing history when using ANTi-History, examples of which are discussed below. The alternative style of writing is evident in ANTi-History in that it is an approach to undertaking organizational histories, and it is also a contribution to our understanding of how history is written or performed by actors. It suggests a hyper reflexive, and hyper transparent approach to history. What this means is that it encourages writing in, as part of the narrative itself, the social and political tactics of respective actors to describe not only *what* is the narrative but also *how* that narrative came to be. Seamless narratives written from a third-person voice that hide their politics of construction are discouraged. Instead, the actors' and writers' social and political tactics, which eventually lead to a particular narrative composition, are written in the narrative. With ANTi-History, the *what* and *how* of history are important but even more so is their *relationship*. A central focus of ANTi-History is the relationship between the social and political tactics of actors (the *how*) as well as the specific process through which this translates into a particular history (the *what*). The intent is to trace this process.

To date, ANTi-History has been used to do empirical work in a number of MOS

contexts, including analyses of the development of a history of Pan American Airways (Durepos & Mills, 2012a); debates around the representation of Weber's ideas (Durepos et al., 2012; Mills et al., 2014); the making of the history of the Academy of Management (Myrick et al., 2013); the development of critical management studies in Atlantic Canada (Bettin et al., 2016); multiple histories of a CEO succession in Air Canada (Hart et al., 2014) and analysis of the way municipal budgeting literally acts to perform a community as history (Corrigan, 2016). Attempts to theorize ANTi-History include Durepos and Mills, 2012b; Bryman et al., 2011 and Durepos, 2015. These theorizations and applications offer various insights and challenges for ANTi-History.

The chapter layout and our explanation of ANTi-History proceed in six parts. First, we theorize the meaning of the past-as-history. Second, we illustrate how to view the past-as-history through actor-networks. Third, we outline the notion of relational histories. Fourth, we probe the ontological potential of history by theorizing history as performance. Fifth, the concept of multiple histories is unpacked and finally, we explore the idea of ontological politics. Each part features a theoretical description of the ANTi-History facet followed by examples of empirical work where ANTi-History is in use. A summary of how ANTi-History is invoked in each empirical example is provided in Table 26.1.

THEORIZING THE PAST-AS-HISTORY

ANTI-History draws on postmodern historiography as a point of departure in theorizing notions of the past and history. Postmodern historians have made a significant effort to both define the past and history but also emphasize the need for their distinctiveness (Jenkins, 1991). A fundamental assumption of both postmodernism and ANTi-History is that the past is ontologically absent (Jenkins, 1991)

Table 26.1 Summary of empirical examples that use ANTI-History

<i>Example</i>	<i>Method</i>	<i>Data</i>	<i>Analysis</i>
Studies that use ANTI-History	The methods used	Types of data generated / analysed	How the data was analysed What the data reveals about the respective ANTI-History facet
Foster et al., 2014	Textual analysis	Select US textbooks published between 1933 and 1949 Formative management journals including <i>Administrative Science Quarterly</i> and the <i>Academy of Management Journal</i>	<i>ANTI-History facet demonstrated: the past-as-history as History</i> The authors demonstrate that in the inevitable process of selecting aspects of the past (e.g. The Human Relations School) to the exclusion of other aspects (e.g. The New Deal) there is a tendency to (i) conflate the past and history, e.g. what happened in the past <i>is</i> history; (ii) rely history as History, e.g. an account of the past (history) is legitimized through an almost metaphysical association with History as a means of determining the past; and (iii) blackbox the account as <i>the</i> history of the past, e.g. serving to marginalize or ignore other accounts (e.g. the importance of the New Deal for Management and Organization Studies). The textbooks are read to determine what version of the past of MOS is celebrated. The early publications in formative journals are analysed to show the emergence of the field and how it was being shaped. By placing the narrative of the textbooks and formative management journals in their socio-political context of creation, the authors are able to surface a competing narrative and how certain actors (New Deal) were marginalized through silencing. The authors show that what happened in the past is different from the history written about the past. They demonstrate that histories are written outcomes of their social and political contexts but conceal those, as they become uncontested histories.
Durepos et al., 2008	Archival research at the Otto Richter Library, University of Miami Textual analysis of published histories of Pan American Airways (PAA)	Letters and correspondence between actors Internal company newsletters Company memos Published histories of PAA Book reviews of published histories of PAA	<i>ANTI-History facet demonstrated: the past-as-history</i> A detailed archival review of documents at the University of Miami's 'Pan American World Airways collection' revealed that several traces of the company's history were actively suppressed by those, including the CEO Juan Trippe, who wanted to tell a heroic story centred on the leadership of Trippe. It was found that the airline's senior management set out to commission a particular history of the airline and in the process dissuaded a number of credible historians. They did manage to hire an aviation writer to undertake a number of interviews and gather relevant materials for a specific history of Juan Trippe's leadership, but it was left to fiction writer Robert Daley (1980) to write the particular narrative account of the company's past.

(Continued)

Table 26.1 Summary of empirical examples that use ANTi-History (Continued)

Example	Method	Data	Analysis
Myrick et al., 2013	Archival research at the Martin P. Catherwood Library at Cornell University Textual analysis of existing histories of AOM	Early AOM conference proceedings AOM organizational planning documents AOM meeting minutes AOM conference day programme AOM member roster Letters and correspondence between actors Documented memories of early AOM actors Existing official histories of AOM	<i>ANTi-History facet demonstrated: the past-as-history as actor-networks</i> The documents were analysed to assess <i>how</i> each important claim from the past (actor) came to take part in legitimating an official AOM historical (network) account. For example, the claim of AOM of having an unbroken 'history' going back to 1936 was examined by assessing the interests and actions of the actors involved in constructing the past as an official history (punctuated network). The process entailed looking for claims that supported an unbroken history, factors that raised doubts about such an account, and explanations of why the unbroken accounts were accepted over other accounts. Where possible, the authors tried 'to follow the actors in the production of the AOM but also in the production of histories of the AOM and the relationship between the two'. The process was iterative as the authors tried to both 'unravel the actors from their embedded histories while treating history itself as a key actor in the process. (Myrick et al., 2013, p. 349)
Durepos et al., 2012	Relational textual analysis which focuses on: 1) The politics of actors that influenced the construction of a text; 2) The relationship between texts; 3) The relationship between authors of texts; 4) How widely various texts disperse and forge relations with other authors or texts.	Various English translations of Max Weber's work between 1927 and 1968 Popular MOS texts where Weber's work is explored MOS articles that claim Weber's work has been misunderstood	<i>ANTi-History facet demonstrated: relationalism</i> The authors looked at the (politics of actors involved in the) construction and dispersion of Weber's work as it was linguistically translated to English. The focus was on tracing the various relations that bound the actors involved in translating Weber's work to assess, as much as possible, the types of influence they had on the outcome of the work. Different versions of Weber's work were surfaced and each were described as relational outcomes (thus, tied to) their socio-politics of construction. The authors suggest that various versions of Weber's scholarship are 'produced through series of relations or translations' where translations refer to actors capturing the interest of others and 'translating' their will to match that of their own (Durepos et al., 2012, p. 271)
Corrigan, 2016	Archival research at the Nova Scotia Archives Observation at Africville Museum Textual analysis Semiotic analysis	Formal agendas from Halifax Council meetings Official archived minutes from the Clerk's Office Halifax Budget documents Historical information about Africville Exhibit materials from the Africville Museum Media reports	<i>ANTi-History facet demonstrated: ontological potential of history & ontological politics</i> Corrigan shows that budget making is about the interpretation of accounting reports and numbers. He demonstrates the storytelling capacity of budget making. Three competing (but nested) (hi)stories emerge from the various budgets. These include: historical neglect, historical aggression and historical romance. Reading the Municipality budgets and surfacing three histories with respective to rationalities offers three competing ways of seeing Africville. They are not simply three different stories (plural types of knowledge) of the past. Instead, these are <i>multiple</i> versions of the past <i>performed</i> as history through the budget. The budgets perform three different versions of the past-as-history. In so far as the three histories compete with one another, we can see them as subject to <i>politics</i> . The three stories offer an example of <i>ontological politics</i> because they offer multiple and competing ways of seeing the past as history.

Hartt et al., 2014	Archival research at the Aviation and Space Museum and the Library and Archives of Canada Thematic analysis of text	Published histories of Air Canada Over 20,000 pages of Air Canada airline records from the archives including: - Memos for airline management - News clippings from national, regional and local press - Government memos and letters - Meeting minutes of senior management and the Board of the Airline - Reports to the Minister of Transport - Correspondence to and from the Minister of Transport and members of the Liberal Party Federation - Board of Governor reports - Internal memos - House of Assembly papers - Annual reports - Site maintenance reports - Correspondence between actors - Internal and external newsletters - Personal diaries - Provincial Museum Acts - Photos - Official opening programs - Curatorial reports - Museum attendance reports - Applications for labour union certification - Vandalism reports - Files on historic houses	<i>ANTI-History facet demonstrated: multiplicity</i> By analysing the archival materials and the various published histories of Air Canada, the authors reassemble three narrative histories of a key event at Air Canada in 1968, the controversial appointment of Yves Pratte as CEO. A close thematic analysis of the archival materials allows the researchers to surface 'how different networks operating within the airline contributed to how certain events in that time frame came to be understood and influenced', the construction of particular versions of the past-as-history (Hartt, et al., 2014, p. 289). As an outcome, we are left with three different versions of the past constructed as histories. Far from being independent of each other, the histories are related in that they compete but also support one another.
Durepos (in progress)	Archival research at the Nova Scotia Archive and the Nova Scotia Museum Web and media searches Interviews Non-participant observation	Board of Governor reports Internal memos House of Assembly papers Annual reports Site maintenance reports Correspondence between actors Internal and external newsletters Personal diaries Provincial Museum Acts Photos Official opening programs Curatorial reports Museum attendance reports Applications for labour union certification Vandalism reports Files on historic houses	<i>ANTI-History facet demonstrated: multiplicity</i> The goal of this research is to construct a(n) (organizational) history of the Nova Scotia Museum that features how the Museum has, over time, performed the past of the province (of Nova Scotia) as history. The various performances of the past of the province lead to <i>different</i> versions of the past-as-history, thus multiple histories (not different independent histories). To show how the museum has performed multiple versions of the past of the province, the researcher followed actors around, in and out of the archive, through various interviews, in media reports and also through days of non-participant observation.

but traces (actors) of the past are continuously *related* to other traces to form history (networks made of related actors).

The past is often described as all that has happened before now (Jenkins, 1991). It exists as a ‘permanent dimension of the human consciousness’ (Hobsbawm, 1997, p. 10). Postmodern historians do not contest that the past happened but do contest that the sum of its moments amounts to history itself (Jenkins, 1991). ANTi-History is mostly aligned with postmodern notions of the past. Both view the past as an absent present. But ANTi-History moves beyond a cognitive level of analysis where the past is assumed to exist as a dimension of human consciousness, and as a craft strictly reserved for historians (to one that is *relational* as explained below).

Postmodern scholars are united in their claim that history does not exist in an ontological realist mode, but is instead *knowledge of the past* (Jenkins, 1991). This stands in contrast to realist historians who, in general, believe in the existence of the past and history independent of our mental appreciation of them (Durepos, 2015). Based on this assumption, realist historians have sought to create histories that mirror the past as it happened. Realist historians aspire to singular and truthful histories, where history is an exact and real(ist) replica of the past. For postmodern and ANTi-History scholars, the past and history are necessarily dissonant. This is because the emancipatory potential of history lies in the many ways we can assemble traces of the past-as-history. Though postmodern historians have emphasized divorcing the past and history, historians like Munslow (2010) argue that the craft of history involves a moment where the past *becomes related* as history. As a result, though the past and history might be dissimilar, they can never be separated as one invokes the other. Munslow (2010) emphasizes this idea textually in the *past-as-history* to remind us of their distinctiveness (history does not represent the past) but also that one will necessarily and always invoke the other. This textual depiction reminds us

to emphasize their continual relation, and it is the *composition of this relation* with which ANTi-History is concerned.

Let’s take the example of the importance of the Human Relations School in the development of MOS. It is commonly held that while Taylorism and the Scientific Management School were the forbearers of MOS and the relationship between task design and efficiency, the Human Relations School introduced the ‘human factor’ into the developing field (Wren, 1972). So pervasive is this idea that even feminist accounts of the role of Mary Parker Follett have referred to her as an early adherent of Human Relations (Graham, 1996). Yet, this oft-repeated history of the field relies on a number of subjective choices. By starting with Taylor, the field is defined as focused on for-profit organizations and the drive for efficiency. It may have been a different matter if histories of the field had started with the work of Robert Owen and the notion of cooperative production. The idea of ‘schools’ of management thought is another imposition on the narrative of field development (Koontz, 1962). A third imposition is the choice of Human Relations as succeeding Scientific Management practice. This is a curious choice that ignores the role of President Roosevelt’s New Deal policies that put millions of workers to work in a relatively short period of time compared with the Human Relations experiments at the Hawthorne works, with its 30,000 employees – many of whom were laid off during the New Deal era. Indeed, arguably the idea of Human Relations as a coherent school of thought did not develop until well after the World War II and was retrospectively imposed on events in the 1930s (Foster et al., 2014; Mills et al., 2015a). Finally, the choice of these, and subsequent schools of MOS, was premised on a USA-centric account of the field that largely ignored events and scholarship in other parts of the globe (Witzel, 2012). The question from an ANTi-History perspective would not be whether these accounts were accurate and true, but rather who is telling the story

and what are the resulting implications for the field.

As shown, ANTi-History draws on post-modern historiography but it also departs from it in a number of ways. First, ANTi-History moves away from conceptualizing the past and history as a cognitive product. For example, Jenkins (1991) describes history as an interpretation of the past made present in and by the contemporary *mind*. Thus, the history is an outcome of an historian and his/her cognitive labour in collecting and interpreting documents, followed by writing up the analysis. For ANTi-History, however, history is an outcome of the socio-politics of different conglomerations of actors (human, non-human and non-corporeal) as they transform *a sense* of the past. An example of this approach is the study of the socio-politics of Robert Daley's (1980) history of Pan American Airways, which arose out of the concerns of the airline's senior management to commission a (specific) history of the company that would focus on the leaders' exploits (Durepos et al., 2008). Second, ANTi-History moves beyond the postmodern epistemological description of history as *knowledge of the past*, to probe the ontological potential of history (as discussed below). Third, ANTi-History not only features what happened in the past but also includes the *process* and *practices* in which the past was transformed as history as part of the narrative. ANT helps us fulfil these three distinguishing points about ANTi-History (Law & Hassard, 1999).

THE PAST-AS-HISTORY AS ACTOR-NETWORKS

The second facet of ANTi-History entails defining the past-as-history through interlaced actor-networks. The past-as-history is both constructed and enacted through the practice of actors that form networks and networks that oscillate as actors (Durepos,

2015). Actor-networks are not a metaphor to understand the past-as-history, but are what comes to constitute the past-as-history, itself. We unpack this by drawing on ANT.

With ANT, actors and networks are not essentialist entities that exist out there, that a researcher simply collects and documents. Rather, the actor-network itself is the 'frame' (Calás & Smircich, 1999, p. 663). As with ANT, actors in ANTi-History are theorized as heterogeneous. *Actors* are human, including oral history interviewees, research assistants and heritage interpreters. Actors are also non-human such as archival documents, diaries and board of governor reports (Law & Mol, 1995). *Networks* (of the actor-network) are past traces ordered into a coherent narrative. Actor-networks are the *means* through which the social world is built. Actor-networks are also the building blocks of the past-as-history. ANTi-History uses actor-networks as the conceptual *frame* for reassembling the past-as-history.

The notions of the actor, the network and the hyphen that connects them are central to ANT and also ANTi-History. We focus on the actor and network for now. Callon (1986) explains that to realize their goals, actors capture the interests of others, translate their will and enrol them into their cause. In doing this, actors form networks. Sometimes, the interests of actors in the network become so aligned that actors can be understood to act as one. For example, the actions and message actors convey to realize an objective is so uniform that it conceals the 'collective' on which it stands (Latour, 1999b, p. 310). In this sense, a network can be understood to have oscillated as an actor, one that has become blackboxed (Law & Hassard, 1999). A detailed focus on any actor reveals the composition of a network on which it has come to stand. Thus, actors (*en masse*) not only form networks but also are understood as networks themselves. The task of ANT is to *trace the topography*, thus how actors assume an order into a network and how networks become actors that are eventually nested into other networks.

Seeing the past and history as actor-networks allows us to trace actor politics and composition. With ANTi-History, actor-networks (with the hyphen) and their topographies are the building blocks of the past-as-history. A study of the history of the Academy of Management (AOM) provides an example. The AOM has far-reaching influence within academia. For many scholars worldwide, a paper accepted for presentation at the AOM is likely to be seen as prestigious by one's peers and, importantly, one's Dean. While there is no doubting the *current* influence of the association, an interesting ANTi-History question is how the influence is/was achieved? Two factors stand out from the AOM's own sensemaking of its importance – size and history: 'Founded in 1936, our global community today is nearly 20,000 strong, spanning 120 countries' (aom.org/about/). The AOM website goes on to make much of its history, including its archives, fellows and presidents. In recent years, the AOM has made much of the length of time it has been in existence. Proclaiming an unbroken existence going back to 1936, the 2011 Presidential address celebrated the AOM's 75th year and a 2015 commemorative pin was minted to celebrate the '75th Annual Meeting'.

An ANTi-History study of the AOM by Myrick et al. (2013) set out to understand what is its claimed history, how the history was produced and whether there were alternative readings of events. Myrick et al. (2013) found a number of factors that had to be negotiated to arrive at an unbroken history of the AOM from 1936 onwards. These included debates around what constituted a 'founder', the purpose of the association and an interpretation of a period of inactivity from 1941 to 1947. In 1936 Charles Jamison and William Mitchell held a dinner meeting to discuss the establishment of an 'association of management teachers' (Myrick et al., 2013, p. 7). They managed to enrol (for example, recruit actors to a unifying viewpoint) eight other business scholars that year, fifteen

others in 1937 and nineteen to the 1938 dinner meeting. Apart from Jamison, only two others attended all three meetings. The 1938 dinner meeting was designated as the 'Third Annual Conference of the Academy of Management', but it wasn't until 1940 that the meeting adopted a formal constitution and name, with a new purpose developed by Ralph Davis – to foster 'a philosophy of management' to aid the socio-economic aims of industrial society (Myrick et al., 2013, p. 11). In other words, while Jamison and Mitchell did much to enrol members to their idea of an association of management teachers, Davis translated the purpose into a supportive ideological philosophy for capitalism. In 1941 Robert Brecht took the leadership role in the AOM, but with the USA entry into World War II, the association became totally inactive, with no apparent effort to keep it going even in name. In 1947 Ralph Davis and others made an attempt to, what they called, revive the association and a conference was held later that year. In the ensuing debate about the character of the association there was conflicting opinion as to whether it was being restarted, resurrected or reinvented. In the end, Ralph Davis prevailed in translating the event into the 'Renaissance' conference. In subsequent years the idea of an association that was continuously in operation since 1936 was developed through, among other things, a retrospective assignment of names and terms of office to selected individuals, including Jamison (1936–40), Brecht (1941–7) and Davis (1948), etc. Through this process the idea of an unbroken association dating back to 1936 was blackboxed (for example, fixed as true or real), with all the gaps and the socio-political processes involved hidden from view. This long 'history' may not be of any consequence now, with AOM having such a large membership and prestige. But it may have been an important enrolment process for much of the early years post 1947 when the AOM had little more than 100 members until the 1960s. Myrick et al. (2013, p. 345) show that history

'is an important part of the legitimization process whereby an organization comes to be seen as important and its activities validated by the sheer passage of time'.

TOWARDS RELATIONAL HISTORIES

How do we map actor-networks? To do so, we need to unpack the third facet of ANTi-History, namely *relationalism*. Relationalism in ANTi-History means placing emphasis on the *relations* that bound traces of the past. It implies tracing the associations or connections that come to form a particular history as opposed to taking for granted actor-networks or histories as pre-given and stable. ANTi-History calls for disturbing taken for granted and thus, established history. Unlike modernist approaches to history (Mills & Helms Mills, this Handbook), ANTi-Historians do not view history as stable, fixed, assembled and complete. Instead, they ask how histories are produced and performed through a series of relations over time. With ANTi-History, we foreground actor' trails, thus how they are associated (Latour, 1986). We suggest tracing the link between actors in a way that reveals their trajectory through time. Through mapping, ANTi-History emphasizes how actors are altered at each point in the trajectory. To do ANTi-History, we suggest tracing chains of actor associations (Latour, 1986). Tracing relations is not simply a method of studying actor-network movement across time. It is a way of telling stories of how the past becomes history (Law & Mol, 1995).

Central to the focus on actor-networks is the hyphen (Latour, 2005), which stresses the notion of *oscillation* and *becoming*. For Latour (2005), the social is made of actors that *become* networks and networks that *become* actors. Like ANT, of importance in doing ANTi-History is what happens at the site of the *hyphen*. ANTi-History shifts the researcher's gaze from stable states (the past or history) to the site where traces of the past

(actors) *become* history (a network whose topography engenders a version of the past). The focus is also on how the history/network takes its place as part of the past and becomes an actor. This process is one of *becoming* and *ordering* (Law, 1994). Past actors *become* ordered in a network and networks (made from traces from the past) *become* actors.

Tracing associations involves looking at actors, but specifically their *encounters*. The encounter is where relations are either forged or missed. Forged relations bind actors and, collections of actors form networks. In ANT, networks assume their status as such once they are able to hold particular actor formations intact, either temporarily or long lasting (Latour, 1999b). Of interest is how these actors/traces of the past formulate a version of the past-as-history and do so by virtue of their placement in the network, the relations they forge and the meaning assumed through these relations. Mapping the placement of past actors by outlining their relation to one another assumes importance because after all, actors or past traces have no essential meaning in and of themselves. Instead, they assume their meaning in relation to other actors (Law & Mol, 1995). It is through these very *relations*, thus the position of an actor (a trace of the past) as one link in a network, that actor significance is established (Law, 1999). Though the past is viewed as absent, its traces assume individuated meanings through their location in a network. Of interest for Latour (1999b, p. 303) is the 'complex and controversial nature of what it is for an actor to come into existence'. Actors are defined by their trials (Latour, 1999b). Each encounter, whether it leads to a permanent or long-lasting relation, alters actor composition. Each connection makes a difference to both the shape of the actor and by virtue of this, the shape of the network in which the actor is involved (Latour, 1996). Tracing these differences and the resultant *composition* of actor-networks is the process through which the past becomes history.

The importance of German sociologist Max Weber's work for MOS provides an interesting example of relationalism. There is little doubt that Weber has an influence on MOS, but there is debate around what is that influence. Much of the debate takes Weber's importance as a given. It rarely challenges the oft-repeated characterization of him as 'the father of Organization Theory'. Apart from some issues of language translation, much discussion circulates around what Weber 'really' said and what he really meant – as if the issues can be resolved through reference to some underlying truth. Drawing on ANTi-History, Durepos et al. (2012) examine a series of relationships around the translation work (for example, both the interpretation of a foreign language and the imposition of meaning) of Talcott Parsons as he introduced Weber's work to US scholars. The resulting and subsequent texts produced a dominant view of Weber as a scholar in the structural-functionalist tradition that remained untested for several decades. Tracing the actors involved in this outcome, Durepos et al. (2012) trace Parsons through a series of relational points. These include being taught by R.H. Tawney at the London School of Economics and then by Karl Mannheim at the University of Heidelberg. The interactions with Mannheim led to an interest in Weber and connections to Marianne Weber, Max's widow, and agreement to allow the young and inexperienced Parsons to translate Weber's work. Tawney's initial connection with Parsons became more significant later when the publisher Allen & Unwin insisted on hiring a senior scholar to write the introduction and oversee the writing of Parsons' translation of a book on Weber. This latter process led to extensive edits by Tawney that influenced the meanings of the Weber text and helped to construct the particular structural-functionalist account for which Weber's work became known. Durepos et al. (2012) also went on to trace how the Parsons-Tawney account came to have a retrospective influence of MOS in the late 1940s/early 1950s

as new generations conflated the period when Weber was writing (late 1800s/early 1900s) with his influence on the emerging field of management theory in the USA at a much later point in time.

In tracing the relations that allowed for Weber's work to be translated as history, we gain an insight into this actor-network composition. Doing ANTi-History means tracing relations that bound actors into a network formation. These relations crystallize and eventually become taken for granted. In short, doing ANTi-History means revealing the topography of actors and their relations. But these straightforward instructions have complex philosophical consequences in the realms of epistemology and ontology.

HISTORIES AS PERFORMANCE: PROBING THE ONTOLOGICAL POTENTIAL OF ANTI-HISTORY

Similar to postmodern historiography, doing ANTi-History means producing knowledge of the past by documenting past traces; this is an epistemological comment. But the move of ANTi-History away from the postmodern emphasis on text, knowledge and the realm of epistemology become most evident in its insistence on the ontological potential of history. With ANTi-History, history is not only *knowledge of the past* as assumed by postmodern historians (Jenkins, 1991). Instead, we propose in our explanation of the fourth facet of ANTi-History that history is what actors *perform* through their very acts to define it. The (absent) past is transformed into history in conventional actor *practices*. It is in these very practices that worldviews are built and shaped. In discussing history as performance, we enter the realm of ontology. ANTi-History meddles with the ontological potential of history.

To explore the ontological realm of history, we must continue our focus on relations. The relation that bounds actors and networks

is one of activity, movement and fluidity (Law, 2008). It is characterized by latency and potential (Latour, 1999a). At this site, the conditions of possibility for what an actor *can become* are open (Ermarth, 2007). There is potential for translation and transformation (Latour, 1999a). Most importantly, it is at this site that we are privy to actor activity and practice. To explore the ontological potential of history, we must focus on these practices and the ways of being that are enacted by virtue of them. Following Mol (2002, p. 152), we suggest a move away from 'understanding objects as the focus point of various perspectives to following them as they are enacted in a variety of practices'. The ontological realm of history exposes it as the outcome of practices as opposed to knowledge of the past. After all, even knowledge is produced in practice (Mol, 2002). The shift of focus from knowledge to practice will have consequences for how we approach history. To do history, we no longer first select a perspective and use it as the lens from which to view an object of interest. In the new course of action, we follow 'objects while they are being enacted in practice' (Mol, 2002, p. 152). To do history, we must foreground practice and the relations whereby traces of the past are bound.

But questions might arise as to what can be gained by following actors in practice. Again, why is tracing relations necessary to do history? To start, the past is performed or enacted as history in practice. It is in practice that relations are forged which bound actors into a particular network formation. It is through that network formation, through its very composition that the object of study (for example, the AOM) comes into being and its meaning established. In short, practice is the site of performance or enactment. Calás and Smircich (1999, p. 663) offer that practice 'constitutes and describes its object of interest'. Representations are not static but are articulations that help to make and remake the object they describe (Law, 2008). Representations of the past

articulate a version of history; they are cogent participants in its making (Law & Urry, 2004). Historical articulations produce the version of the past they describe. This is the ontological potential of history. As Law and Urry (2004, p. 397) note, we are no longer talking about 'different perspectives on a single reality', instead we are talking about 'the enactment of different realities'. Africville, an area of Halifax, the Nova Scotia capital, provides a uniquely interesting example:

After the American Revolution of 1775 and the War of 1812, Black Loyalists, who were escaped slaves, and free Blacks came to Nova Scotia to settle land. An oral history account by the Africville Heritage Trust (2014) suggests that some of these people settled in the north end of Halifax to be close to fishing opportunities in Halifax Harbour and to have a chance to find paid work. The area developed into a community, which eventually became known as Africville. (Corrigan, 2016, pp. 80–1)

Focusing on the budget making process of the Halifax Regional Municipality (Municipality) over time, Corrigan (2016) shows how budget making is not simply a matter of numbers and rational calculation but dramatic performances with history making propensities. He explores how various budgetary *performances* served to create different histories of Africville over time, including historical neglect, aggression and romance. To focus on the first of the three, one dominant history was performed through the Municipality's 'systematic neglect' of Africville in the allocation of resources. Such 'performances often call for responses to criticism and in the process stories are developed and histories enacted'. In this case the 'all-white administration declined to see budget discrimination as racism, preferring instead to see the overall "problem of Africville" ... [specifically] the problem of the colored people in Halifax' (p. 87). This history was reinforced when a subsequent council voted to tear down Africville as an eyesore and to relocate the inhabitants to

other areas of the region. This latter performance, through a focus of paternalist concern, nonetheless served to reinforce the idea of Africville as a problem of the ‘colored residents’.

In pursuing this type of reasoning, the question of whether you can ever *know* the past of a phenomenon loses reverence. What assumes relevance in the new line of reasoning becomes *identifying the practices where different versions of one past are enacted* (Mol, 2002). The exercise of mapping actor-networks now entails following them in practice. It entails tracing actors across their various practices to see which version of the past they perform as history and, why. What becomes crucial is mapping the way a version of history performs the past of an object. In following the practice of budget making over time, Corrigan (2016) traces different enactments of the past of Africville.

The focus on practice is noteworthy. If ‘practice becomes our entrance into the world, ontology is no longer a monist whole’ (Mol, 2002, p. 157). Instead, ontology has multiplied (Mol, 1999, 2002). If history is performed differently depending on the *set of practice* in which it is found, then (and as shown in the next section) history is not plural knowledge of the past but *multiple* enactments of it. To summarize, the past-as-history is performative. The performance varies based on the set of practice in which it is found. This means the past-as-history is necessarily multiple.

MULTIPLICITY IN HISTORY

Our aim with this fifth facet of ANTi-History is to show that history is not single or plural, but instead multiple (Mol, 1999).

With ANTi-History, we problematize historical accounts that are either described truthfully, written in an authoritative style or adopt a tone of certainty. These narratives lack reflexivity: no effort is made to

acknowledge how the historian has shaped the narrative. No consideration of alternative ways the past could be narrated as history is included in the narrative. Singular stories are, by virtue of their emplotment, absolute, thus deemed truth. Postmodern historians have critiqued history as truth by showing how different perspectives lead to plural histories. Though we are sympathetic to these critiques, we are also cognizant of the problem caused by plural history, which Mol (1999) calls *perspectivalism*.

Perspectivalism in history suggests that many historians focused on one phenomenon will construct different independent histories. Each historian is informed by his or her respective standpoint, professional and social background. The result is *mutually exclusive* histories, each an outcome of the perspective adopted by respective historians (Durepos, 2015). In viewing history from different standpoints, though on their own terms, each version is assumed equally plausible. None is contestable. Each is deemed *true* from its respective perspective. In existing alongside one another, though without interfering with one another, each may be considered *singularly* (Mol, 1999). Though perspectivalism fosters a break from singularity, it presents another type of *singular* truth which perhaps fosters more trouble than relief. For what it brings is not single truths but instead (and ironically), *plural-singular truths*.

This leads to another problem: because perspectivalism implies the production of different histories where each version is unrelated, no effort is made to trace the connections or *relations* between the different histories. The need to trace politics between different versions remains irrelevant. Questions such as *does one representation weaken or strengthen the other by contradicting or supporting it* are not asked or answered. But, without acknowledging the relationship between different versions of history, we have no grounds to assess their plausibility, thus the plural versions become relative. In

short, plural histories fall prey to relativism (Law, 2008).

In light of these problems, we suggest moving away from perspective and plurality, in favour of performance and multiplicity. Tracing multiplicity begins with foregrounding practice and documenting how the past of a phenomenon is performed as history in practice (Law, 2008). To trace multiplicity, we must search for the different *sets of practices* where the past of a phenomenon might be performed as history. Here is an example: one of the authors of this chapter (Durepos) is currently studying how a museum constructs and delivers history (she is also writing their organizational history). Her research has consisted of following actors such as heritage interpreters and museum administration. Specifically, she has looked at how the heritage interpreters perform the past of Canadian inshore fishing for elderly couples and children. She also viewed how the museum administration initially performed the past of inshore fishing as part of an application for museum funding. In each situation or set of practices (history of inshore fishing for an elderly couple, children and museum funding application), a different *version* of the past of inshore fishing was performed as history. In following the performance of inshore fishing across the three sets of practice, the result is not three different histories or three mutually exclusive, independent phenomena (plural histories), but *different versions of the same thing*. As Mol (1999) and others (Law, 1999) have noted, multiplicity is more than one but less than many. It is *more than one*, there are three different performances. The *version* of the past performed as history of inshore fishing changes based on the audience. For example, the (one) past of inshore fishing performed as history for the elderly couple, children and funding application *are different*. But it is *less than many*: there is only *one* past of the inshore fishing industry being performed. The heritage interpreters and museum administrators are each involved in performing the same past. It is

more than one version performed (as history) of the same past.

Our point in providing this example is that the past performed as history does not lead to different, independent histories. With this example, we show how history can *perform different versions of the past*. The past performed as history across practice (interpreting heritage for children, the elderly or the government) multiplies. With ANTi-History, history is the outcome of the *performance* of actor-networks in practice and following the actor-networks across their practices leads to *multiplicity*. We have moved away from the postmodern emphasis on perspective, epistemology and plurality. ANTi-History moves us towards performance, ontology and multiplicity.

Hartt et al. (2014) demonstrate multiplicity in a key event in the history of Air Canada. In 1968 Air Canada controversially appointed a new CEO, Yves Pratte. Pratte, a Montreal lawyer, was the first 'outsider' to head up the airline – the previous CEOs had all been recruited from among the company's pilots. A particular starting point for the controversy was that senior management had expected insider Herb Seagrim, Vice President of the company and the outgoing CEO's (Gordon McGregor) handpicked successor, to become the new CEO. The largely unionized membership had also expected that an insider, especially one that had worked their way up through the ranks, would be chosen. The Canadian Government of the day, however, had other ideas. The government was taking steps to enact a process of bilingualism throughout the public service and saw the retirement of McGregor as an ideal opportunity to appoint a Francophone to the position. These different sensemaking positions arguably served in the eventual construction of three histories of the event – one by senior management, one from a union perspective and other from the government (Hartt et al., 2014). All three histories are agreed about the event – the year (1968); who was in place at the time (McGregor), the possible successor (Seagrim) and the actual

appointee (Pratte). The histories differ, however, on what led up to the appointment; the context in which it occurred; the reasons for the selection of Pratte and/or rejection of Seagrim; and the eventual outcome (for example, improvements or otherwise in the airline's operation). In other words, there are multiple accounts of a single past.

ANTI-History sets out to *read* histories and accounts of those histories with an eye to the multiple telling of one event, person or phenomenon to understand how the past gets performed based on varying practices. This can include looking for the existence of varying, conflicting and/or silenced accounts (Decker, 2013). In examining the histories of Pan American Airways, for example, Durepos et al. (2008) found that major accounts were similar in their approach and at best appeared to offer different parts of the same overall narrative. This raised questions about how it was that at least three histories followed roughly the same major narratives, and what may have been left out of the accounts. A detailed archival review of documents at the University of Miami's 'Pan American World Airways collection' revealed that several traces of the company's history were actively suppressed by those, including the CEO himself (Juan Trippe), who wanted to tell a heroic story centred on the leadership of Trippe. Less suppressed than just plain ignored was the role of women in a narrative focused on men and machines. Archival research also surfaced the potential for other, postcolonial, tales, traces of which had been collected and documented from a colonial perspective (Hartt et al., 2012).

HISTORY AS MULTIPLE PERFORMANCES: ONTOLOGICAL POLITICS

The previous two facets of ANTi-History have focused on the ontological potential of history and multiplicity. Those discussions

have prompted us to ask the following: if there are different versions of the past performed as history, and these are different versions of reality, then the question becomes which version to perform? As Law (2008, p. 13) notes, how do the versions 'relate? How do we choose between them? How should we choose between them?' Furthermore, is the decision concerning which version to perform infused with politics? For example, are there 'additional political reasons for preferring and enacting one kind of reality rather than another' (Law, 2008, p. 13)? This leads to the sixth facet of ANTi-History. It combines the ideas of ontology with multiplicity into the notion of ontological politics (Mol, 1999, 2002). Ontological politics surfaces the politics in which actors engage to make decisions about *how* to perform the past-as-history or *which* version of the past should be performed as history. This is achieved by foregrounding the relations that exist between actors as they form networks. As noted above, an analytic focus on the hyphen linking actor-networks allows us to ask questions like: what happens in between, and how does the actor become a network? We offered that the site where actors of the past oscillate as history (network) is one where politics are enacted. Ontological politics concerns actor uses of small and large power tactics in making decisions about what might be 'made in the relations of investigation, what might be brought into being' (Law & Urry, 2004, p. 396). Thus with ontological politics, we ask what realities does history help to enact or erode? What realities of the past might history 'help to bring into being or strengthen' (Law & Urry, 2004, p. 396)? The critical potential of ANTi-History resides in its focus on tracing the politics of actors involved in the doing of history to surface the multiple versions of the past-as-history as well as those privileged and marginalized by them. ANTi-History traces actor struggles *over how to see* the past-as-history.

To return to the Africville example, Corrigan (2016) points to three prominent

histories, including, more recently, a romanticized story. In this ‘romance’ history attempts are made to move from the demeaning view of Africville to one that presents the community as idyllic – ‘not a slum at all, but instead an idyllic seaside community worth preserving’ (Corrigan, 2016, p. 91). A group seeking to preserve the history of the community developed this romanticized history through the use of exhibits and texts at the Africville museum. They also resorted to a legal case against the Municipality to compensate the former residents of Africville for having their idyllic community denigrated and destroyed.

SUMMARY AND NEW DIRECTIONS

ANTI-History was initially developed between 2005 and 2009 from a fusion of Gabrielle Durepos’ interest in the sociology of knowledge and actor-network theory, and Albert Mills’ interest in critical historiography. This fusion eventually became the focus of Durepos’ doctoral thesis (2009), and a subsequent co-authored book (Durepos & Mills, 2012b).

Descriptive accounts include Bryman, et al. (2011, chapter 21), who provide a detailed discussion of ANTi-History’s approach to ‘Historiography and the Past in Business Studies’; and Mills and Durepos’ (2010) encyclopedia overview. Recent theorizations include Durepos and Mills’ (2012a) comparative analysis of actor-network theory and ANTi-History in the development of critical historiography; and, more recently, Durepos’ (2015) theorization of amodern thinking in historical analyses. Reflective pieces include Mills et al.’s (2015b) analysis of how their collaboration creates specific knowledge and what we can learn from this; Weatherbee’s (2016) critical assessment of ANTi-History’s contribution to management and organizational history; and Suddaby’s (2016) review of ANTi-History as an emerging construct that offers potential to bridge

the gap between business history and management theory.

Several applied studies have appeared over the past few years, including examination of the production of a corporate history of Pan American Airways (Durepos et al., 2008); an analysis of the history of the AOM (Myrick et al., 2013); analysis of a key event in leadership succession at Air Canada (Hartt et al., 2014); a study of the reproduction of a scholarly conference association (MacNeil & Mills, 2015); analysis of debate around the writing and interpretation of Max Weber (Durepos et al., 2012; Mills et al., 2014); and exploration of the local development of Critical Management Studies in Eastern Canada (Bettin et al., 2016).

Certain developments in the application of ANTi-History are noteworthy, such as the use of archival research. In contrast to actor-network theory that has primarily used ethnographic methods for following actors, ANTi-History has involved archival research as well as textual searches. Table 26.2 lists the benefits and limitations of using respective methods with ANTi-History. Ethnography and archival research are not incompatible and, although time excessive, could provide a wealth of analysis if used in conjunction. There are recent studies that combine multiple methods to do ANTi-History. The first, as discussed above, is currently underway by Durepos and involves extensive collection and analysis of archived materials in the Nova Scotia Museum alongside a series of interviews with museum staff. The second is a recent study by Coller et al. (2016) who, in their study of the history of British Airways Archives, analyse archival materials to establish some of the names and stories around the development of the archives, undertake an analysis of the archives’ uses and operation (for example, sitting in staff training sessions on the airline’s history) and then undertake follow-up interviews with many of the people identified in the texts. A third study is by Hartt (2013) who has introduced the notion of the non-corporeal actant into ANTi-History

Table 26.2 Benefits and limitations of the methods used with ANTi-History

<i>Method</i>	<i>Benefits</i>	<i>Limitations</i>
Archival research Media and web searches	• Data generated is from the past, thus from the very context that it is intended to represent • Reveals a vast array of respective actors • Allows for following the actors across various documents to map how they are related into a network formation • Allows for following a large number of actors over a considerable period of time (e.g. PAA's archives cover the period 1927 to 1991; AOM's archives cover the period 1936 to the present)	• Documents can be difficult to interpret because they are removed from their temporal context of creation • Archive can have limited documents • Researchers can only follow the traces that have already been collected, selected and catalogued by the archive's administrators • Archive can conceal certain narratives and/or actors' documents which may have been deemed not important enough to include in the archive • Cannot access the motivations of actors who produced the document found in the archive • Time and effort intensive • Travel and accommodation can be costly if archive is not local
Textual / thematic analysis	• Allows for a close reading and contextualization of documents (from the archive or published histories) • Allows mapping of actors across various documents, books and published histories to assess dispersion • Texts analysed can cover a wide time span	• Can get access to actor motivations • Limited amount of text or information found might lead to an inadequate answer to a researcher's question
Interviews	• Gives the researcher access to actors' actions and motivations • Allows for discovery of new research leads and allows the researcher to probe	• Interviewees are subject to their memory, which can lead to forgetting dates or details of the event • Important actors can die before interview • Data generated is a <i>present centred</i> perception <i>about</i> the past but not necessarily from the past thus may not be deemed historical
Observation Non-participant observation	• Allows for following actors in practice and context • Allows for asking actors questions as they arise	• Potentially difficult to document actor motivations as the data generated is observed from the researchers' lens and not the actors' lens • Limited in the number of actors that can be followed • Limited time period over which actors can be followed

studies. Hartt argues that apart from human (for example, Charles Jamison) and non-human actors (for example, AOM conference meetings) we need to take into account non-corporeal actants (ideas, non-embodied and non-material influences) that are not directly related to any one person or thing. This notion has drawn attention to those intangible things that influence people and events in enrolling them in a particular actor-network. Fourth, the work of MacNeil and Mills (2015) has experimented with fusing archival research with qualitative social network analysis.

While the archival research was undertaken to identify a number of actors, the intent of the social network analysis was to map the large number of data points of the network under analysis viz. the Atlantic Schools of Business (a scholarly association).

We end on both a reflective and an ironic note. The future development of ANTi-History, although initially produced by Durepos and Mills, will depend on the processes of enrolment, translation and, yes, blackboxing by themselves *and* others. We already note some accounts of ANTi-History

that vary from what we intended. That is, after all, how research traditions proceed. Nonetheless, in keeping with the guidelines of the SAGE *Handbook* series, this chapter sought to provide a *clear* and *focused* articulation of what is ANTi-History (as we know and practise it today). We recognize the irony of the goal. This is due to the realist assumption that underlies it which is antithetical to ANTi-History. For example, underlying the goal of trying to clearly capture what is ANTi-History is an assumption that it exists outside our mental appreciation of it, and in a stable, capture-able format. It does not. We close by modifying this goal: in this chapter we aimed to provide a clear articulation of what is ANTi-History as a critical historiography that shifts and translates each time it is invoked.

'Use Your Feelings': Emotion as a Tool for Qualitative Research

Kendra Dyanne Rivera

You must unlearn what you have learned ... Try not. Do. Or do not. There is no try. Yoda. (Lucas & Kershner, 1980)

Throughout the *Star Wars* saga (1977–2015), various characters are consistently being told to 'search your feelings' and 'use the force' to help them understand relationships, make decisions, and gain wisdom. In the scene wherein Yoda instructs a young Luke Skywalker to 'unlearn what you have learned', he is trying to teach the Padawan student how to let go of his inhibitions, fear, and desire for control. Instead, Yoda wants Luke to focus his energies (the force) with positive mindfulness. Yoda explains, in only a way that Yoda can, that to 'try' is pointless – rather the Jedi in training must simply 'do' the work. Indeed, this advice is counter-intuitive to many, who would understand wisdom and decision-making as cognitive and rational endeavors, not guided by intuition or emotion. In order to follow this advice, one would have to 'unlearn what you

have learned', particularly for those of us raised in a Western tradition that places the ultimate value on rationality, and in academe, where the 'scientific method' requires linear procedures, systematic reasoning, and stoic objectivity.

As I thought about how to write about emotion in qualitative research, a voice from early in my own research training echoed in my head, saying, '*Use the Force*'. I might also have been influenced by a recent marathon of *Star Wars* movies with my son, but no matter the reason, I decided to utilize the wisdom of Yoda to guide this chapter. Of course, I realize that no self-respecting SAGE *Handbook* chapter should begin with quotes from Yoda or a discussion of what is arguably one of the most quintessential popular culture icons: *Star Wars*. However, I don't know any better way to *show*, as well as *teach*, emotion in our research. Whether you are actually studying emotion as a topic of your research, or whether you simply want to be more emotionally engaged in the research process,

this chapter is geared toward exploring the strengths that emotion presents to the qualitative research process. *Star Wars*' (Kazanjian & Marquand, 1983; Lucas & Kershner, 1980; McCallum & Lucas, 2005) frequent advice to 'use your feelings' can be a guide in qualitative research, and I believe it is very sage advice indeed.

AN INTRODUCTION TO EMOTION IN QUALITATIVE RESEARCH

Many of the truths that we cling to depend on our point of view. Yoda. (McCallum & Lucas, 2005)

Qualitative researchers have often championed the value of emotion in the research process. Although emotion has been portrayed as 'the enemy' of rational thought in many traditional social science fields (Fineman, 2005; Li et al., 2014), the use of personal reflection, which is replete with emotion, is a trademark in many areas of study, including feminist theory, queer theory, and critical ethnography (Conquer-good, 1991; Denzin, 2005; Haynes, 2006; Rambo Ronai, 1992). Yet even while many scholars have encouraged reflexivity and subjectivity in qualitative research (i.e. the 'Reflexive Turn,' Van Maanen, 1988), the existence of emotion explicitly within the research process is often invisible and is rarely mentioned in published qualitative studies or methodological text books (Haynes, 2006). However, because emotion is an integral part of all human activity, organizing practices, and communication, it is necessarily an important aspect of the research process as well (Kara, 2013; Rivera & Tracy, 2014).

'Emotion' is a challenging concept to define or describe. Although many scholars agree that emotion includes a 'subjective experience, expressive reactions, physiological reactions, different kinds of behavior and certain types of cognition' (Munkejord, 2009,

p. 152), there are disagreements about which of these elements is the most important. Often described as 'response tendencies' that influence actions (Gross, 2002, p. 282), emotions are 'relatively brief sensations that take place in response to specific incidents or experiences' yet they are also 'essentially social and have social consequences' (Scarduzio & Malvini-Redden, 2015).

Emotions may be seen as beneficial for research because they help us form relationships with participants and can provide intuitive insights in the field. However, emotion may also be seen as disruptive for good research because it is subjective, changing, and may 'cloud' rational thought. Indeed, as Cunningham and Kirkland (2012) note, 'definitions of "emotion" often include an implicit (or even explicit) contrast with "cognition"' (p. 369) and therefore create a false dichotomy that pits emotion as the opposite (and less favorable) process than rational cognition. Indeed, many scholars contend that emotion is part of the cognitive system (Cunningham & Kirkland, 2012) or is part of a complex system of rationality (Li et al., 2014). Yet this perspective subsumes emotion as part of the greater system of cognition or reason. In another view, Matsumoto and Hwang (2012) offer a bio-cultural model, arguing 'different domains of emotion are more relatively influenced by biology or culture' and propose various delineations or categories for specific emotions or affective states (p. 91). However, Matsumoto and Hwang's position shifts the dichotomy from rational/emotional to biological/cultural.

In contrast, Sinclair's (2011) work resisting 'traditional' leadership models advocates for mindfulness in management studies, arguing, 'bodies activate unconscious processes and gendered societal archetypes that reinforce or undermine authority, power and socially-constructed credibility' (p. 118). Sinclair's standpoint provides an opportunity to explore the ways in which emotion is experienced in our everyday lives – as embodied and necessary for building relationships, understanding

our worlds, and making decisions on a daily basis. Indeed, emotion and cognition need not be at odds with each other. In the past, qualitative researchers have suggested that we ‘blur the boundaries between categories’ because dichotomous thinking may hinder how we perform our intellectual and empirical work (Southgate & Shying, 2014). Although some qualitative scholars have begun to explore the role of emotion in their research, it is rare to write about emotion in the (re)presentation of our work. This chapter therefore echoes calls from previous researchers to bridge the gap between the actual lived experiences of the research process and the more abstract methodological discussions that appear in our scholarly publications (Cunningham & Kirkland, 2012; Haynes, 2006; Rivera & Tracy, 2014).

In this chapter, I begin by discussing emotion as an integral part of sense-making in qualitative research. Next, I explore the role of emotion in specific research contexts providing an example from my own research notes. Third, I explore emotion as a tool in research, beginning with the importance of reflexivity, moving to the use of emotion throughout the methodological process, and concluding with emotion as a tool for representing research findings. This chapter is meant not only for those who study emotion, it is also written for those who want to more actively engage emotion into their *research process*. Woven throughout the chapter is the assumption that emotions are already present in our research. We must learn how to acknowledge, value, and use them to benefit our participants, our analysis, and our representation.

EMOTION: AN INTEGRAL PART OF SENSE-MAKING WITHIN RESEARCH

*Already know you that which you need. Yoda.
(Kazanjan & Marquand, 1983)*

Emotion is an integral part of the sense-making process. And the good news is, we

use sense-making every day! Rather than accessing a new skill, sense-making is about harnessing a process we already use in daily life, and learning to articulate the role that emotion plays in that process. Through sense-making, we understand our worlds and build knowledge about the people and phenomena around us. According to Weick (1995), who originated the concept, sense-making is the process by which ‘people generate what they interpret’ (p. 13). Consensus amongst scholars is that sense-making refers to the processes by which people attempt to explain or understand ambiguous/novel, unexpected, or confusing issues or events (Brown et al., 2015; Maitlis & Christianson, 2014). Sense-making is therefore about *invention*, because it requires both micro and macro levels of knowledge creation (Colville et al., 2012; Weick, 1995). As such, we draw on a variety of sources – past, present, and future – in order to make sense of our experiences.

Research on sense-making has been prevalent within organizational, management, and business research (Brown, Colville, & Pye, 2014), and has been used in a variety of management studies, such as network theories (e.g. Henneberg et al., 2010; Öberg et al., 2008); inter-organizational studies (Ford & Håkansson, 2006); executive leadership and management (Ping Li, 2015; Thiel et al., 2012); decision-making or change (Balogun & Johnson, 2005); and studies about identity formation and socialization (Cunliffe & Coupland, 2012; Humphreys & Brown, 2002; Rivera, 2015; Sluss et al., 2012; Tracy, 2004; Tracy et al., 2006). Weick (2001) sums up sense-making by asking, ‘How can I know what I think until I see what I say?’ (p. 189). Recent scholars have tried to expand this focus on ‘thinking’ by exploring embodied ways of knowing, such as Rivera and Tracy (2014), who ask, ‘How can I know what I feel until I see what I do?’ (p. 215). To this list of sense-making inquiries, I now add, ‘How do I know what I think, until I see what I feel?’

Within sense-making, emotion is one tool (alongside cognition and embodiment) that

helps us in the process of knowledge creation. A long history of feminist scholarship considers emotions as 'rich epistemic resources that provoke rather than prescribe our understandings of the social world' (Southgate & Shying, 2014, p. 233). Although emotion has not been extensively studied in the sense-making literature, this is not particularly surprising given how little attention emotion receives in organizational and management literature more broadly. It is important to note that scholars who have explored emotion within sense-making see it as 'an important factor in shaping the kind of sensemaking process that occurs' (Maitlis et al., 2013, p. 223). Indeed, in contrast to research that proposes that emotion has a negative role in sense-making (Weick et al., 2005), some research proposes that emotion is actually a trigger that begins the sense-making process and that the valence of emotions (positive or negative feelings) may have a significant impact on sense-making processes (Bartunek, Balgun, & Do, 2011; Godbold, 2013; Greene et al., 2001; Maitlis et al., 2013). In particular, many scholars argue that emotions are '*essential* to decision-making' (emphasis in original, Li et al., 2014, p. 295), and increasingly call for emotion to be an openly explored part of the research process (Rivera & Tracy, 2014). As Kara (2013) inquires, 'are there, perhaps, ways in which we could *use our emotions* to benefit our research?' (p. 71).

Sense-making is therefore concerned with the everyday experiences and activities of people, and is integral for the qualitative research processes. In order to design, implement, interpret, analyze, and (re)present our findings, qualitative scholars engage in sense-making processes, wherein we seek to understand and explain novel, unexpected, or confusing issues or events. In addition, sense-making's emphasis on communication, language, and storytelling (Weick, 1995) is particularly relevant for qualitative research, given the need to collect data via ethnographic methods, interviews, and focus groups – all of which are communicative in their origins, and most often are then

translated into written field notes or transcriptions. In particular, emotion is a useful tool for accessing tacit knowledge in our research – the wisdom we hold inside is often challenging to articulate without the help of our emotions and embodied experiences.

EMOTION: A TOOL FOR THE HUMAN INSTRUMENT IN QUALITATIVE RESEARCH

Control, control. You must learn control! Yoda.
(Lucas & Kershner, 1980)

In qualitative scholarship, the researcher is 'the human instrument' (Guba & Lincoln, 2005) through which we gather data and gain understandings about the phenomena we study. As noted, emotion is a key part of the sense-making process by which we gain these understandings, but as researchers we must also learn to access and control the wisdom carried within our emotion. Emotion allows the researcher to be fully present and engaged with their participants and data, as they take part in gaining understanding about the phenomena under study (Haynes, 2006). Emotion is a type of tacit knowledge that can be used as a tool for assisting in the sense-making processes that lead us through our research.

As a way to illustrate emotion as 'tacit knowledge' which leads to sense-making, I offer the following example, drawn from my field notes at the start of my research with the U.S. Border Patrol. As a scholar-in-training (a Padawan, if you will!), I offer a glimpse into a short fieldwork experience in which emotion is felt, encouraged, and useful all at the same time.

'Use the Force' Field Notes/ Interview Notes Written 9/21/07; Edited 12/30/15 and 11/20/16

I sat in the dimly lit coffee shop drinking in the earthy smell of coffee and old books. I would have preferred to meet the Public Relations Officer from

the Border Patrol at the sector office, but he suggested a neutral location. It was my first official interview with an agent, and I tapped my nails nervously on the table. A lot was riding on this interview. This agent held the key to accessing other agents, and the Patrol sector in general.

I could tell by the look on a student's face – eye-brows furrowed deep, mouth dropped open – that Agent Ramirez had arrived. Another student's lips mouthed a silent, 'what the fuck?' I turned to meet my new 'gatekeeper'.

'Agent Ramirez!' I said, not really asking, since it was clear who he was. I tried not to notice that the students were now eyeing me with suspicion too.

'Hi, Kendra' he responded, taking hold of my extended hand.

I sat at the table where I had already situated my notebook and pen. Agent Ramirez paused, motionless amidst the bustle of the mid-day coffee run. Then, he quickly pulled out a chair and looked over his shoulder at the door before sitting down.

'Would you like to sit here?' I suddenly remembered that most law enforcement want to see the entrance, so they can keep track of people in the room.

'Yes, that would be great,' he sighed, taking what was once my seat. 'I really hate to sit with my back to the door'.

'I understand', I said. I kicked myself internally for not considering where this agent would like to sit.

He began telling me about his role at the Border Patrol. He told me how he's a lieutenant, but he volunteered for the position as Public Affairs Officer. After a couple of years, he'll go back to the field. He pointed to the various parts of his uniform, explaining what each section meant.

'I noticed that your badge is covered...' I let my voice trail off.

'Yes,' he said, placing his hand over the badge. 'One of our agents was killed in a head-on collision last week. He was young too, and had a young family'.

'I'm so sorry', I said, hoping he could see that I was genuine. 'That must be really hard'.

'We cover our badges from the time of death until after the funeral service, and the service is tomorrow'.

'I've been surprised to learn how many Border Patrol agents die on duty'.

'Yes, we lose too many agents', he shook his head. 'You know, we're the only sector in the U.S. without a permanent checkpoint?'

'No, I didn't know that'. I felt jolted by the sudden change of topic. Perhaps this was his way of telling me he didn't want to discuss agents' death. We continued talking, me taking notes about checkpoints and daily routines, and statistics about the number of undocumented immigrants or pounds of narcotics apprehended by the Patrol in this area. Toward the end of our conversation, after I had talked about my son and we had laughed about south-west Texas, I asked, 'So how did you come to be at the Border Patrol?'

He smiled thinly, and relaxed back into his chair. 'I went to college. I was the first in my family to go to college. And one day, I met a recruiter. So I took the test. I didn't know what else I would do with my life. But it was a hard decision'. He leaned forward, then sat back again. He looked over my shoulder. I wondered if I should fill the silence with another question, but his movement seemed to hint that he had more to say. I closed my notebook. He leaned back in his chair, and locked me in an intense gaze.

'My dad worked in a restaurant when I was a kid. He was a hard worker. He had come up to the U.S. illegally. Sometimes, the Border Patrol would come into the restaurant for lunch and one day, there was a mess in the dining room, so my dad went out to clean it. Two Border Patrol agents were sitting there eating, and they could tell my dad was nervous by the way he looked at them. When he was done, he walked straight through the kitchen, took off his apron, and headed to the back door. He thought, "well that's it. I gotta get outa here"'.

'But when my dad opened the door, there was one of the agents. He pulled my father to the side and said, "Are you illegal?" and my dad said, "yes". The agent gave my dad a card and told him to call this number. So my father called the place and it was a service to help you become a citizen. So both my parents went through the program. And on the day my father became a citizen, he looked to the back of the room, and there was the agent'.

Folding his hands together, Agent Ramirez leaned even over the small table between our chairs, closing the distance separating us. 'So when the lady called me and told me I had passed the Border Patrol test, I asked my parents what they thought.

My dad said, "you gotta do what you gotta do. Just don't forget who you are". And so that's the advice he gave me'.

He sat back in his chair again. 'I decided at that point how it would be. I decided to treat people as they treat you'. He paused. Meeting my smile with a nod, he continued, 'Respect equals respect. Disrespect equals disrespect'.

'Agent Ramirez', I decided to risk one last question.

'Please', he said laughing and shaking his head, 'Call me Javi!'

'Okay, Javi', I started again, 'Before you leave, do you have any tips for me as I try to meet with other agents? I had a full protocol and interview guide my teacher made me design, but the Customs agent I met with literally took a pen and crossed that out, so...' my voice staggered off.

'Well, that was probably good advice!' Javi laughed. 'You did just fine with this interview. Just "use the force"'. He nodded knowingly as he stood up.

I laughed out loud and closed my notebook. 'Use the force, huh?' I'd been a Star Wars fan since I was born (in 1977, the same year the first Star Wars movie was released). So I knew exactly what he was talking about, but I still felt confused. 'That's your advice?' I sat stunned looking up at him.

'Yeah', he kept laughing. 'You know, "use your feelings". Cause nothing else can prepare you for our special kind of shit'.

I stood up and extended my hand.

'Okay, then. I'll channel my inner Jedi, and listen for Yoda's voice'.

'You'll do fine, kid', he told me shaking my hand. 'I enjoyed meeting with you. Let me know how I can help'. He turned and left as abruptly as he had come, seemingly oblivious to the stir his presence caused in others.

Within this short story about Agent Ramirez and myself, we can see several emotional 'leakages' in the supposed 'rational research process'. In addition, we can also see that my emotions led to decisions that in turn led to additional knowledge. Take for example, my

embarrassment and frustration at not giving Agent Ramirez the seat with the view of the door automatically, since I knew law enforcement officers usually preferred to sit where they can see (and be prepared for) others who might be approaching them. Upon deeper reflection, my emotion 'triggered' a thought process about the interaction that might otherwise have gone unnoticed – this interaction actually allowed me to know Agent Ramirez a little better, and showed me a vulnerability of his. This momentary sharing of emotion was rare in my interactions with agents, and I believe it likely also helped lead to Agent Ramirez discussing his father with me.

As a key to our sense-making processes, emotions are a valuable tool for accessing understandings about context and participants in our research (Woodthorpe, 2007), in ways that our cognitive or rational sense-making processes may not be able to achieve. We do not base our actions or decisions on reasoning alone – we also do what feels right, based on our experiences and who we are as individuals. Similarly, we make sense of events after the fact by utilizing emotion as well as reason. As we note in my research with Border Patrol agents, our emotions 'fundamentally construct and refract meaning' (Rivera & Tracy, 2014, p. 215). Indeed, it is precisely because our emotions impact decision-making (Stocco & Fum, 2007), that they should be fully recognized and embraced as part of the research process (Munkejord, 2009).

'USE YOUR FEELINGS:' EMOTION WITHIN THE METHOD

Okay, if you've made it this far, then you may be asking, 'What does emotion look like in our research?' 'How might we more strategically utilize emotion in our qualitative studies?' As Yoda would say, we need to unlearn what we have learned with regard to 'good' research as being exclusively rational, linear, and objective. Instead, we need to 'use

our feelings' as a guide toward the knowledge and skills that are so vital for doing our work. It's not that we should throw out the practices in which many of us were trained. Even Master Obi-Wan in Star Wars encourages his student to 'Be mindful of your thoughts' as well as his feelings. Instead, I propose opening ourselves to the insights that emotion brings, and to acknowledging the ways in which emotion has always helped to shape our research. Therefore, in the remainder of the chapter, I focus on emotion within our research process and the ways in which we may utilize specific strategies to harness our emotions, tacit knowledge, and sense-making in order to expand our understanding of the phenomena we explore.

KEY ONE: REFLEXIVITY AND SUBJECTIVITY

You will find only what you bring in. Yoda. (Lucas & Kershner, 1980)

In order to utilize our emotions effectively, researchers need to become acutely aware of what we bring into our research. We need to know what our emotions are, why we are feeling them, and how they might help us (or hinder us) in our research. Reflexivity allows researchers to identify, name, and analyze our emotions so that they may be utilized in our research (Kara, 2013). As such, reflexivity is a key first step in accessing emotional tacit knowledge and making sense of our research through a lens of emotion.

Reflexivity has long been a central tenet of critical research traditions. At its essence, reflexivity can be defined as a form of critical self-questioning that enables deeper exploration of actions and practice (Kara, 2013). Brannick and Coghlan (2007) articulate reflexivity as a process that can unlock our deeply rooted tacit knowledge, in order to repurpose that knowledge as theoretical knowledge. Similarly, Hughes (1999)

explains that reflexive practice has an empowering impact on the researcher because it 'enables learning from experience' (p. 282). Thus, it is the purposeful act of reflexivity that provides an avenue for naming, reflecting upon, and gaining understanding from our emotional experiences.

In an example of the importance of reflexivity (without studying emotion specifically as a research topic), Carolyn Ellis has written about her ethnographic research with the 'Fisher Folk' (1986), and how her lack of reflexivity led to ethical miscalculations in the presentation of her research (2007). She reveals that a lack of critical self-evaluation camouflaged her own desire for a good story, at the cost of the privacy of some of her participants, who had become 'intimate others'. Ellis (2007) encourages long-term reflection as she notes, 'by repeatedly questioning and reflecting on my ethical decisions, I have gained a greater understanding of the range of my choices and the kind of researcher I want to be' (p. 5). In this case, reflexivity – even after a long period of time – can lead to greater knowledge and wisdom about our craft as researchers.

Reflexivity acknowledges that the ways we experience emotion and ourselves will change depending on our situation and the contexts in which we do research. It also embraces the awareness that the researcher and the participants continually affect each other through the research process. Both of these aspects of reflexivity may also be known as 'subjectivity', wherein the researcher acknowledges and interrogates their subject position in relation to their research and participants (Ellis & Flaherty, 1992). As such, reflexivity and emotion are not in a static state, but rather must be continually employed and explored in order to make sense of the research process, the participants, the data, and the analysis (Munkejord, 2009). I will never know how my relationship with Agent Ramirez might have developed if I had responded with different emotions when I saw him making the emotional decision about whether to tell me

about his father, but the decision led to new insight regardless of what might have been.

Reflexivity is therefore a space 'in between' our 'otherness' and 'insiderness' as a researcher, as well as a position 'in between' our rational cognition and our emotional tacit knowledge (Cunliffe, 2003). According to Munkejord (2009), the 'betweenness' of reflexivity 'implies that social realities are constructed between the researcher and the participants in dialogue' (p. 155). Reflexivity therefore serves as a bridge between seemingly dichotomous ways of processing our research, connecting the rational to the emotional and embodied through purposeful exploration of both. And I believe that acknowledging the role that emotion plays in our research is essential for developing ethical and effective research processes.

KEY TWO: DESIGNING RESEARCH WITH EMOTION IN MIND

Train yourself to let go of everything you fear to lose. Yoda. (McCallum & Lucas, 2005)

Emotion plays a role in the research process from the moment we begin to formulate questions in our minds about what topics to explore or what participants to study. Many scholars chose to research topics or populations based on prior experiences or passions. Yet whether we explicitly acknowledge (or even know ourselves) an emotional reason for our topics of research, we bring previous knowledge, insights, experiences, and understandings into our research programs as they develop (Haynes, 2006). Emotion impacts the research process in terms of 'what is studied or not studied, by whom and in what way', in addition to 'influencing researchers' interpretations of a situation' (Widdowfield, 2000, p. 199). Therefore, it's important to acknowledge, name, and explore what our emotions may reveal to us about our research from the very start of the research process: design.

Asking Questions Reflexively

As discussed, the design process should begin with reflexivity – we question ourselves to explicate the nuanced details of how our research progresses, and acknowledge why certain decisions are being made. Of course, I've never actually sat in some mythical and magical research lab and just dreamed up a research protocol from scratch. Generally, my research process starts from an experience I've had, a conversation that intrigued me, or a problem I wanted to solve. From there it morphs into a vague idea, followed by many more conversations, articles read, and connections made. But regardless of the lack of linear process – whenever you figure out that you *are* indeed designing a research study (at least by the time you decide about applying for ethics approval), you should begin to reflexively consider your positionality in the research, and how your experiences may color your research design.

By acknowledging the emotional contributions to our study up front and explicitly, we expand our abilities to make sense of the phenomena we are studying, and our theorizing can be fuller and more effective (Kara, 2013). Writing reflexively is therefore a method of inquiry into our research (Richardson, 2000). Through writing, we come to understand more than we previously did about our research, the people, and phenomena we study, and ourselves as living and breathing contributors to our research endeavors (Richardson, 1994, 2000; Richardson & Adams St. Pierre, 2005). As Richardson (2000) states, 'by writing in different ways, we discover new aspects of our topic and our relationship to it. Form and content are inseparable' (p. 923). Thus, the process of interpretation is powerfully located with the practice of writing.

Gaining Access and Keeping 'Score'

Another key step to exploring emotion in our research design is the process of gaining

access to a population or a site to study. Anyone who has ever attempted to gain access to a ‘private’ organization or ‘at risk’ population knows the integral role that emotion (and often emotional labor) plays in the research process (Rivera & Tracy, 2014). Because we utilize emotion as a key part of relationship building, it is important to interrogate these emotions for meanings, particularly to responses we have to specific organizational members or participants. Many of us keep a record of all participants we encounter, marking down key demographic information such as age, income, race, and education – such as how Tracy (2012) describes cataloguing her research of correctional officers. In addition to this type of data, I recommend that researchers wishing to engage emotion in the research process (regardless of whether you are studying emotion as a topic) also keep a record of emotion. This is because emotion is often one of the most intimate ways to respond to others, particularly if you want to build relationships. Recognizing others’ emotions will allow you to build upon what you know cognitively, and create a more complete picture of participants. To do this, I recommend adding brief descriptions to the participant spreadsheet, noting how you felt, and why you think you felt that way. How might the participants’ emotions impact *your* emotional responses? Consider how this may relate to your research questions, particularly if you find patterns over time.

Designing Interview Protocol

Obviously, there are far too many aspects involved in research design to explore all of them in depth, but a third area of design I encourage you to explore emotion in is the design of your interview protocol. Regardless of the type of interview – from narrative to oral history to confrontational – emotion plays an important role in how people answer questions, and therefore, it should be explicit

in the design. The entire interview process – from preparation to contact and follow up (MacDougall & Fudge, 2001) – is heavily influenced by the management of emotions through the research process. However, in designing the interview protocol, an emotionally informed researcher can consider a variety of strategies to be both ethical and build good rapport.

Rapport refers to the relationship and trust developed by a researcher and participant, usually within the first few minutes of an encounter. Many scholars have consistently noted that rapport is more likely to be developed through non-verbal communication strategies and responses to emotion than in any other part of the research. In her research about emotional geographies, Bondi (2014) notes that focused listening – including responses to emotion – provided a venue through which her participant ‘sensed’ that the researcher is ‘hearing’ her. This technique can be used to develop rapport, regardless of the topic of the interview, and points to how important planning for an interview can be.

The order in which you ask questions may also elicit an emotional reaction, and many researchers chose to put more emotional or challenging questions at the end of an interview. However, if the participant is aware of the research topic, moving the emotional questions earlier in the interview may provide the research with a depth they had not anticipated. For example, when I was interviewing a Border Patrol agent who was displaying negative emotions toward the interview process (folded arms, refusal to sit down, frowning face), I decided to skip to my final question and asked, ‘What advice do you have for new agents?’ To my surprise, this question elicited a highly emotional response (weeping over the loss of a child while on the job), and the interview then continued successfully for over an hour. Thus changing the order of questions can sometimes have a positive impact on the interview experience.

KEY THREE: EMOTION AND ANALYSIS DURING THE RESEARCH PROCESS

You will know ... when you are calm, at peace, passive. A Jedi uses the Force for knowledge and defense, NEVER for attack. Yoda. (Lucas & Kershner, 1980)

During our research, emotion can play a key role in alerting us to meanings that may allow us to probe further in a certain direction, or help us build relationships with participants. In addition, emotion can provide insights into areas for analysis. Even if emotion is not the central focus of study, remaining attuned to the wisdom of our emotional reactions and our participants' emotions can lead to new insights and knowledge in a variety of research situations.

Cultivating Empathy

Qualitative research is focused on people and the individual insights that, put together, can provide new understandings of important phenomena. As such, a key to remember during our research, particularly during ethnographic field research, is the importance of remaining thoughtfully engaged in emotion. For example, the development of empathy is important for our social experiences working with participants. Empathy is the emotional response that stems from the comprehension of what another person feels, and then the ability to re-experience those feelings oneself. Empathy is identified with knowing what another person feels (role taking), feeling what another person feels (emotional congruence), and caring or responding to what the other person feels (sympathetic concern) (Vreeke & Van Der Mark, 2003). Empathy is a therefore highly emotional process that includes both emotional reactions as well as emotional sense-making. In her empirical research with 'transformational elite interviews', Kezar (2003) notes that empathy involves listening and responding in such a way that it places the interviewer into

the position of the interview participant as much as possible. This process relies keenly on the ability to generate and then respond to emotion in the participant. Indeed, as I discovered in my research with Border Patrol agents (Rivera & Tracy, 2015), understanding how another person is feeling can lead directly to questions and responses that can help the researcher not only gain better understandings of the phenomena and population under study, but also of their own emotional research journey.

Emotional Diversity

Another important key to exploring emotion during the research process is that not everyone experiences emotion the way that you experience it. Different cultures may experience and express emotion uniquely, and in ways that are new to the research (Ashkanasy et al., 2002). Often, researchers may approach phenomena such as emotion as 'universal', but research has consistently shown that emotion and emotional displays are culturally specific and therefore to view all participants' emotions, as well as all researchers' emotions as similar can be ethnocentric and damaging to research findings. For example, in their research about worry, Hinton et al. (2000) suggested that emotion played a role in researchers' ability to recruit participants from the Chinese and Chinese-American communities. Similarly, empirical research on non-verbal facial expressions discovered that individuals from the Himba in Namibia did not link facial expressions to specific emotions, whereas U.S. participants did link non-verbal expressions to presumed emotional categories (Gendron et al., 2014). This is significant because previous research (primarily conducted with Western participants) proposed that facial expressions were universally used to communicate universal emotions (such as anger, fear, or joy) (Jack et al., 2012). Therefore, it is important to continuously evaluate our own interpretations of

emotion and communication, while also asking our participants to openly discuss their emotions so as not to reify stereotypes or misinterpret potential findings.

In addition to being aware of cultural diversity, researchers must be cautious in how they interpret and respond to stereotypically gendered emotions in their research. Management and organizational scholars have provided a depth of research demonstrating not only that emotions are socialized based on gender (Broadbridge & Simpson, 2011), but also the outcomes of gendering emotional management performances (eg. Lewis, 2008; Lewis & Simpson, 2007). The necessity of understanding gendered emotional performances is underscored in Jewkes' (2011) articles about 'doing prison research differently' to include emotional aspects in the research process and representation. However, in his response to her article, Crewe (2014) argues that masculine reporting of prison research has indeed been both emotional and gendered, while also noting the ways in which research can continue to be emotionally developed and explored. Similarly, I recall a class with one of my mentors, Dr. Sarah Amira de la Garza, who once asked me about a gendered emotional description in my field notes: 'Is the woman "angry"? If it were a male participant, would you describe him as "angry" or "assertive"?' she asked. These examples demonstrate the complexity of emotion in the research process, in research topics, and in representations of research, and suggest that as qualitative scholars, we must interrogate our own gendered emotional assumptions even as we move throughout the research process.

Emotion and Analysis

Emotion can also play a significant role in data analysis, as the researcher cycles between data collection and making sense of the data collected. Munkejord (2009) makes the case that emotions are essential for the

grounded theory process, because the researcher is 'cycling between data collection and making continuous analytical decisions on where next to collect data' (p. 153). In her research with international refugees, Gemignani (2011) takes a constructionist perspective to develop her analysis, noting that 'rather than being discovered in the Other, scientific knowledge emerges as an act of narration and participation' through reflexivity, empathy, and other emotional strategies (p. 706). In their empirical work on healthcare, Hsieh and Shannon (2005) discuss the importance of context for exploring emotion of participants, noting that the way in which analysis develops can have a significant impact on the type of 'findings' the data may yield. In particular, how the researcher herself responds in the setting may help alert them to specific contexts that impact participants as well. For example, writing out emotional stories helped me understand my data and create new categories for analysis (Rivera & Tracy, 2014). Thus a variety of emotional tools may be used in the development of codes for the analysis of data, as our emotion as well as participants' emotion may contribute wisdom toward the better understanding of a variety of experiences and phenomenon.

Coding, particularly qualitative coding that results from grounded research and/or individual reflexivity, can be enhanced through the attention to emotion. The researcher's awareness of the potential emotions involved in the topic – both for participants and for the researcher herself – can and should influence the ways in which the stories and experiences are interpreted and analyzed (Dickson-Swift et al., 2009). For example, Tracy and Rivera's (2010) research with male executives asked participants about work-life perspectives – not necessarily an emotional topic. However, the analysis coded not only verbal responses, but also non-verbal responses and dysfluencies, noting that respondents were more likely to exhibit non-verbal 'blunders' when they discussed gender roles and work-life

issues. The dysfluencies revealed an emotional discomfort with the subject matter, and disruptions to 'traditional' or 'normal' scripts about work and life and gender (Tracy & Rivera, 2010). Thus, attention to emotion, even in coding the data, can and does influence findings. If one researcher codes only for emotional word or terms, while another codes for the context surrounding emotional terms, and another codes for non-verbal emotional responses (such as laughter or tears), each may have unique findings with regard to describing a phenomena – regardless of whether the phenomena seemed 'emotional' or not (Hsieh & Shannon, 2005). For research that explicitly seeks to better understand emotion, the importance of coding with emotion in process is even more paramount.

KEY FOUR: EMOTION IN (RE)PRESENTATION

Always pass on what you have learned. Yoda. (McCallum & Lucas, 2005)

How do we 'show' our emotion in our research? The complex world around us inspires a wide spectrum of opportunities for how we can (re)present our research findings to one of many audiences. Although 'traditional' Western academic publication venues have privileged the rational, linear, and 'objective' view of knowledge, since the mid 1980s the range of possibilities for qualitative scholars utilizing 'alternative' representations has grown not only in quantity, but in the accessibility and acceptability within the broader academic community. The methodologies that we choose and subsequent ways that we represent our research do not occur in a vacuum, separate from the rest of our lives. As scholars, the choices we make have consequences for the dissemination of knowledge and for the very real, material impact our work can have on individuals' lives. As Dutton (2003) notes, 'the tools we use to

parse life in organizations are not neutral. They not only allow us to see and write about different things, they enact us differently as scholars and as people more generally' (p. 8). Therefore, I encourage qualitative scholars to include emotion in the (re)presentation of their research, regardless of the publication venue or audience you seek to reach.

'Traditional' Research

Although creative writing practices venues are more common now than in previous decades, most scholars – particularly those on an academic 'tenure track' trajectory – must still publish in 'traditional' research journals, as defined by Western academic standards. Most empirically-based 'top tier' scholarly journals still expect writers to conform to the 'four act play' writing of: I. Introduction/literature review; II. Methods; III. Findings; and IV. Conclusion (Tracy, 2012). However, even within these linear pieces, qualitative scholars can articulate the emotion involved in their research, particularly within the methods section, where we can explicitly acknowledge the role(s) that emotion plays in the research process. In addition, as we participate in the review process, we can encourage other scholars to discuss their positionality, and the role that emotion may have played in their research. If we collectively add this to our service to the field, we will begin to 'normalize' the value that emotion adds to our research.

Creative Writing

As discussed previously, creative writing provides an opportunity to explore data in new ways, and writing as a method of inquiry is particularly well-suited to engage emotion within our data. These texts are also well poised to represent our data to a variety of audiences. As we note in our 'messy text' about emotion at the U.S. Border Patrol,

qualitative researchers must ‘experiment with the format of our writing’ in order to engage our texts emotionally (Rivera & Tracy, 2014, p. 204). Kara (2013) encourages scholars to utilize ‘fiction-writing techniques’ in academic writing in order to ‘convey some of the “messier” aspects of research such as emotion’ (p. 71). Because how we write impacts what we write (Richardson, 2000), creative writing allows researchers to engage emotion and promote emotional actions, such as compassion (Rorty, 1989) or empathy (Rivera & Tracy, 2014).

Creative writing can take a variety of forms. For example, *Poetry* provides another mode of encoding and sharing of lived experiences, grounding both audience and author in the sensuality of our interactions (Brady, 2004). Indeed, writing ‘data’ as poetic text helps to question assumptions about social science by drawing into sharp comparison the ‘reality’ from the constructed writings of the author (Richardson, 2000). Similarly, *creative non-fiction* is yet another opportunity for writing to serve as heuristic and epistemological tool, attempting to translate ‘data’ or traditional information into more interesting reading to reach a broader audience (Caulley, 2008; Goodall, 2008). Lee Gutkind (2008), known as the ‘father of creative non-fiction’, describes the genre as ‘factually accurate prose about real people and events – in a compelling and vivid manner’ (p. 12). Each of these writing methods and genres (for a more exhaustive list, see Ellis & Bochner, 2000 and Richardson, 2000) overlap and blur the boundaries of creative practices and coming to knowledge through the practice of writing.

Applied Writing

Applied writing bridges the gap between academic scholarship and ‘real-world’ lived experiences within organizations. Within management and organizational studies,

some might consider all research to be ‘applied’ in some sense, because it all attempts to understand and improve organizational processes. However, some scholars have also critiqued applied research as biased because it is promoted by specific agendas within the public sector (Tracy, 2012). Regardless of where you fall in this debate, it is clear that writing in applied formats provides scholars with a broader audience. As Tracy (2007) notes, ‘to actually impact problems and promote change, we must not only publish in rigorous scholarly journals, but also present research to various stakeholders in a reader-friendly form’ (p. 109). Scholars who re-think their scholarship for an ‘applied’ audience may publish in practitioner venues, popular sources, or even on-line formats. Rush and Tracy (2010) even discuss the use of Wikipedia as a mode of public scholarship, arguing that scholars should update or create entries as a method for educating ‘those most needing our expertise’ (p. 313). Certainly, the ‘translation’ of our research into non-scholarly publication venues would expand the reach of our scholarship outside of the classroom and the walls of the Ivory Tower.

Performance & Audio/Visual Presentations

Performance can also function as a method of inquiry, and is particularly well-suited for exploring emotion within research. Similar to writing as a method of inquiry, performance studies scholars (who oftentimes are also writers) engage performance as method, analysis, and presentation of data. Similarly, audio and visual ethnographies offer alternative ways to both know a phenomenon, and (re)present research findings. Importantly, all of these formats de-center the written word as the primary focus of our research, data, and findings. Performance as a method of inquiry returns the body to the center of attaining insight, thus shifting the emphasis

'from space to time, from sight and vision to sound and voice, from text to performance, from authority to vulnerability' (Conquergood, 1991, p. 183). This can be done through *dramatic performances* of many types, ranging from monologues to full theater productions (Richardson, 2000). Visual representations draw attention to images as a focal point in evoking feelings, as Stanczak (2007) notes, 'images are not merely appendages to the research, but rather inseparable components to learning about our social worlds' (p. 3). Although researchers have begun to utilize a variety of audio and visual techniques in the gathering of data, (re)presenting that data remains a challenge that future scholars can work to expand.

CONCLUSION

Much to learn, you still have. Yoda. (McCallum & Lucas, 2002)

This chapter has explored emotion within the qualitative research process, provided an example of emotion within field notes, and has offered examples of emotion inclusion throughout the research process. Although it may seem that only those who study emotion as their primary topic of research might need to consider emotion in their research process, I argue that because emotion is integral to our lived experience, it necessarily is integral to our research, regardless of the topic. In fact, emotion is already woven into the fabric of our scholarship – the question is: Will you acknowledge that emotion, and harness the wisdom and strengths that it offers your research?

In his germinal work on the anxieties created by the process of conducting research and the subjectivity inherent in all observational sciences, Devereux (1967) contends that the study of humans, human interactions, and human processes requires the creative use of emotional tools. If we fail to acknowledge

and utilize emotion in our research, he notes that our research risks becoming 'less relevant, more and more segmented', and will 'shed almost no light on what is alive about ... man [sic]' (pp. xviii–xix). Indeed, while some may fear the integration of emotion into our scholarly endeavors, others note that inclusion of emotion is, at least, 'a threat with a corresponding gain' (Jewkes, 2011, p. 63). In other words, while we may give up our claim to rationality, research that requires emotional and social investment is likely to generate personal, social, and professional change in investigators and their participants (Gemignani, 2011).

At the very least, a more mindful inclusion of emotion into the research process will increase our capacity for empathy, and enrich the creativity and depth of our representation of participants' stories (Gair, 2012). There is little question that qualitative research has advanced our theoretical understandings of a variety of phenomena (Bluhm et al., 2010), and the strategic use of emotion as a tool in our research will help us to continue to develop novel methodological techniques. In particular, we as scholars, have an opportunity to continue to learn through our research. As Yoda notes to Luke, 'much to learn, you still have', and indeed we can all continue to learn through the dialogic process of emotional qualitative research. And may we all learn to 'use our feelings!'

Pattern Matching in Qualitative Analysis

Noemi Sinkovics

THE IMPORTANCE OF PATTERN MATCHING FOR BUSINESS AND MANAGEMENT STUDIES

Hodgkinson and Starkey (2011, p. 364) note that researchers in business and management studies (BMS) need to ‘re-evaluate their conceptual and methodological armoury in order to ensure the field continues to be both scholarly and relevant to a diverse array of constituents’. Although this statement is equally relevant for both quantitative and qualitative research, the latter is more prone to criticism due to its inherent messiness and complexity (cf. Sinkovics & Alfoldi, 2012). Furthermore, there are epistemological disputes about the extent to which it is possible for constituents (fellow researchers, practitioners, policy makers, etc.) to interpret the presented data in the same way and arrive at the same conclusions as the investigator(s) of the presented qualitative research. This makes the creation of guidelines/criteria for the design and evaluation of qualitative

studies challenging (cf. Hammersley, 2007; Johnson et al., 2007).

To this end, pattern matching can be tremendously helpful at various levels. First and foremost, it aims at externalising implicit mental models and assumptions as much as possible. This helps the readers of the qualitative piece of work to retrace the thought processes of the investigators and to better understand how and why they arrived at the presented conclusions. Second, pattern matching requires meticulous contextualisation, clear-cut theoretical formulation, as well as detailed and precise operationalisation. While it is not possible to identify and externalise every aspect of our mental models, the concious application of pattern matching will improve the way researchers go about the design, implementation and write-up of studies that satisfy the double hurdle of rigour and relevance (cf. Pettigrew, 2001).

Fundamentally, pattern matching involves the comparison of a predicted theoretical pattern with an observed empirical pattern. The underlying assumption is that human beings

make sense of the world by comparing what they observe externally with internal mental models (Hammond, 1966a). As a consequence, even in cases where the pattern match is not made explicit, it is still present to a certain degree. At the same time, the purposeful application of the pattern-matching logic will result in a more rigorous and structured research process and write-up as it requires systematic planning, including as much advance conceptualisation work as possible and detailed documentation throughout the entire project. While the idea of pattern matching originates from a quantitative tradition, the application of its principles does not necessarily require the use of statistics (cf. Ghauri, 2004). In this chapter, the focus is on the demonstration of how pattern-matching principles can be used in the design and implementation of qualitative research.

The intended contribution is twofold. First, the chapter aims at providing readers with an in-depth understanding of how this idea emerged and developed over time. In order to achieve this goal, a brief but detailed overview of the historical and philosophical roots of pattern matching will be given followed by an elaboration of the general logic of pattern matching. The latter is meant to offer the reader some guidance regarding what he/she should consider when consciously applying the principles of pattern matching in a study. Second, the chapter goes beyond the existing literature on the application of pattern matching in qualitative BMS. This is done by the classification of pattern-matching applications in three categories according to the degree of the pattern match. They are labelled 'full pattern matching', 'flexible pattern matching' and 'partial pattern matching'. For each category a detailed example from a published study will be provided.

THE HISTORICAL AND PHILOSOPHICAL ROOTS OF PATTERN MATCHING

The concept of pattern matching originates from the field of psychology. From a

meta-theoretical perspective (cf. Burrell & Morgan, 1979) it can be traced back to Egon Brunswik's probabilistic functionalism (cf. Hammond, 1966b). Brunswik was one of the influential yet controversial figures in what Koch (1959) calls the Age of Theory, or as postmodern researchers tend to refer to it, the age of modernity (cf. Kvale, 1992). The central theme of this period was the attempt to build a science of (hu)man and behaviour (cf. Wolfe, 1959). There are four key characteristics that need to be mentioned when explaining the background against which the idea of pattern matching emerged. In the Age of Theory, there was a pursuit of extrinsic legitimation and an attempt to emulate the natural sciences. This, at times, led to an emphasis of institutionalisation and method over the quality of the content and relevance of research problems (Koch, 1959). A quest for universality manifested itself in an attempt to create law-like generalisations. The dominant research design of the period was the laboratory experiment that involved hypothetical-deductive reasoning and the correlation of linear variables. The emphasis was on prediction and control. Last, in the Age of Theory there was a general belief in the commensurability of theories (cf. Koch, 1959; Kvale, 1992).

The controversy surrounding Brunswik was a response to his deviation from the functionalism of his time as sketched out above. While he still believed in the existence of a universal truth, he posited that human beings' comprehension of that universal truth is merely probabilistic in nature (Hammond, 1966a). This proposition is believed to have been influenced by his early experience of studying history in school. Egon Brunswik was born in the Austro-Hungarian Empire in 1903. As a bilingual child, he received his history education in both Hungarian and German. He very soon noticed inconsistencies in the way the same event was recounted in the respective languages. The deviation in the accounts triggered his initial insights into the probabilistic nature of a person's

knowledge of their environment. His psychological and scientific interests in later life were centred around perception, reasoning, probabilism, functionalism and the historical development of psychology (Tolman, 1966). Brunswik's psychology focuses on the adaptive interrelationships between organisms and their environment.

In his writings, Brunswik emphasises the equivocal nature of cues that results in an ambiguity in the relationship between cause and effect. He postulates that because of this ambiguity, the relationship between the observed cue and the real object should be described in terms that allow the quantitative measurement of the degree of the relationship. He calls this the ecological validity of the cue. In other words, he theorises that because the environment is only partially accessible to human beings, environmental cues can be interpreted in different ways. Put differently, when observers attempt to explain/interpret an observed event/object, they can merely collect sensory cues that are scattered in the environment. These sensory cues are then recombined by the observer and form a probabilistic explanation. Furthermore, the way the observer picks up sensory cues, and how he/she interprets them, is path-dependent; that is, it is influenced by past experience and the amount of available information. For example, the same managerial behaviour may be interpreted by different observing researchers in different ways, depending on their familiarity with particular bodies of literature, practical experience, methodological background, etc.

In his methodological system, Brunswik stresses the importance of studying the context/environment, and the use of statistics. He furthermore emphasises the representative design of experiments. The resulting probabilistic functionalism can be described as an attempt to describe behavioural phenomena in statistical terms in order to provide an adequate level of understanding with respect to variance and invariance (Hammond, 1966a). The coining of the

term 'pattern matching' itself is most commonly attributed to Donald T. Campbell (e.g. Chen, 2015; Trochim, 1985). By building on Brunswik's work, Campbell (1966) investigates the question of how knowledge of external objects and events is achieved if we accept that 'instances of valid knowing and of mistake both occur and are in some instance discriminable' (p. 81). He proposes that this happens through the process of pattern matching. To underpin this proposition, Campbell (1966) draws on examples from engineering, astronomy, and computer science, and on the work of scholars emphasising the importance of analogy in scientific thought (cf. Oppenheimer, 1956). He furthermore argues that because scientific theories aim at explaining objects that are external (distal) to the theorist, and because all knowledge is indirect, pattern matching happens at many stages and iteratively.

Moreover, there are two patterns to be compared, one of which is a pattern of theory and the other a pattern of data. It needs to be noted that while each pattern (i.e. theoretical and data patterns) is informed by the other, theory is not a summary of data. From this, it follows that in order for a theory to be testable, it needs to be separable from data (Campbell, 1966).

In the decades that followed the publication of Campbell's (1966) article, 'pattern matching', both as a logic and a technique, was picked up by other fields, such as computer science (e.g. Jackson, 1991), operational research (e.g. Amintoosi et al., 2007), urban planning (e.g. Zeiss & Lefsrud, 1995), and more. At the same time, it continued to retain its relevance in the field of psychology (e.g. Geisler & Super, 2000; Waters et al., 1997). For BMS (cf. Ghauri, 2004; Yin, 2009), the most relevant strand of pattern-matching-related literature comes from the applied field of programme evaluation (e.g. Marquart, 1989, 1990). The next section will briefly introduce the general principles of pattern matching, also known as the theory of pattern matching (Trochim, 1989).

THE GENERAL LOGIC OF PATTERN MATCHING

Trochim (1989, p. 356) defines a pattern as any arrangement of objects or entities. He uses the term arrangement to indicate that patterns are non-random and, to a certain extent, describable. He furthermore proposes that pattern-matching principles permeate all types and levels of research activities, even if they are not consciously recognised. At the same time, even though all theories imply some patterns, theories do not equal patterns. As theories generally propose predictions, pattern matching involves an attempt to link a predicted pattern that is derived from theory, with an observed pattern. As a consequence, the process of pattern matching can be divided into two realms, that is, a theoretical realm and an observational realm (Trochim, 1985, 1989). The left side of Figure 28.1 represents the general logic of pattern matching.

However, as outlined in the previous section, the underlying assumption is that we cannot fully equate what we observe with an

objective reality. For this reason, the pattern match is not simply performed between theories and facts, but between different levels of theories (cf. Lakatos, 1970; Wible & Sedgley, 1999). It needs to be noted that in this context, the term ‘theory’ is, mostly but not exclusively, employed in the broader sense of the word; namely, ‘an idea used to account for a situation or justify a course of action’ (*Oxford English Dictionary*). The left side of Figure 28.1 also provides an illustration of these different levels of theories. The theoretical realm contains an initial theorising process, and the definition and construction of an expected theoretical pattern. This initial theorising process may have many sources (Trochim, 1989). It may come from a formal process of theorising (e.g. Weick, 1989), it might be based on the ideas or hunches of the investigator (Trochim, 1989) and/or on the perspectives of stakeholders of the investigated phenomenon (Marquart, 1990), or it might be a combination of these. The general purpose of this stage is to make implicit mental models as explicit as possible.

Figure 28.1 Different degrees of pattern matching in qualitative (and mixed) research

Source: adapted from Trochim (1989) and Wible and Sedgley (1999)

The next step involves the translation of these initial theoretical ideas into specifiable theoretical patterns. There are many ways of conceptualising theoretical patterns. They can be presented in verbal, mathematical, pictorial or any other form. Notwithstanding, in BMS the verbal form is the most common presentation form. In Figure 28.1, this stage is referred to as explanatory theory construction. Depending on the context of application, the purpose of this phase is to supply a tentative explanation for expected observations. This explanation can take the form of alternative theories, propositions, hypotheses, etc. In this conceptualisation process, the researcher also needs to decide on the level of generalisation that should be achieved (Trochim, 1985, 1989; Trochim and Linton, 1986). Examples of different levels of generalisation include a specific case in a narrow context (e.g. managerial decisions in a specific firm), a specific case in a broader context (e.g. managerial decisions of a specific organisation in response to an industry event or government policy), or a phenomenon, behaviour, etc. in general (e.g. managerial decision-making in general) (cf. Trochim, 1989).

The empirical counterpart of the theoretical realm is the observational realm. In this part of the process, we can distinguish between two levels of theory. A theory of data construction should describe in detail the type of raw data that is relevant, how it should be collected and how it should subsequently be prepared/manipulated for analysis. The empirical data can come from many sources, such as observations, field notes, interviews, documents, surveys, etc. (Trochim, 1985, 1989). In addition, an observational theory should lay out how one would construct appropriate and believable inferences on the basis of the data. This includes the construction of an analytical framework and the specification of how this framework will make sense of the data (cf. Wible & Sedgley, 1999). These four levels of theory form the foundation on the basis of which the pattern match is performed. The observed pattern is compared to the predicted pattern in order for the relevance and

potential validity of the mental model/theory to be gauged (cf. Trochim, 1989). The next section is dedicated to the explication of the right side of Figure 28.1, with examples included.

PATTERN-MATCHING APPLICATIONS AND EXAMPLES

One can distinguish between three broad categories of pattern-matching applications in BMS. The right side of Figure 28.1 provides a graphical overview. The rest of this section will introduce each of the categories in more depth, including detailed examples.

Full Pattern Matching

Category (c) in Figure 28.1 is dubbed ‘full pattern matching’ and contains methods that embody all stages of the general pattern-matching process (represented by the bold arrows), namely, initial theorising, conceptualising, defining and specifying theoretical patterns, and the matching of expected patterns with the observed data patterns (cf. Trochim, 1989). This category is best suited to investigations whose goal is to examine causal relationships and build explanations. The emphasis is on a very rigorous research design, with as much conceptualisation and operationalisation prior to data collection as possible. In order to establish causality and the validity of that causality, researchers are required to construct alternative explanations before data collection is carried out. Category (c) in Figure 28.1 shows two application examples for this type of pattern matching. The first example is the original pattern-matching technique developed by Trochim (1989) for the purpose of programme evaluation.

This particular technique combines qualitative and quantitative methods to create concept maps based on multidimensional scaling. These maps are subsequently used to derive specific conceptualisations and

operationalisations for the evaluation of programmes and/or interventions/policies (Kane & Trochim, 2007; Trochim, 1985; Trochim & Linton, 1986). In its essence, this form of pattern matching does not differ from traditional hypothesis-testing and model building (Trochim, 1989). The main difference between Trochim's (1989) technique and more traditional hypothesis-testing methods, such as the t-test and ANOVA, is that the former can handle a larger degree of complexity and treats the observations from a multivariate perspective (Trochim & Donnelly, 2008). However, as the purpose of this chapter is to introduce how the pattern-matching logic can be used more broadly in qualitative analysis, this specific technique will not be considered in any more detail here. For a full description and practical demonstration of how concept mapping for planning and evaluation works, the reader is referred to Kane and Trochim's (2007) book on the subject, in the Applied Social Research Methods series. For more information about how the pattern-matching

logic is applied in quantitative research, for example, in the form of structural equation modelling, the reader is advised to refer to the book *Research Methods Knowledge Base* by Trochim and Donnelly (2008).

The second example of an application for this pattern-matching category is the multiple explanatory case study (cf. Yin, 2009). Figure 28.2 demonstrates the parallels between the general theory of pattern matching and the characteristics of Yin's (2009) explanatory case study design.

A very good published example of a piece of multiple explanatory case study research that applies the principles of pattern matching is that by Yin and Moore (1988). Their research focused on the explanation of what research-funding organisations and researchers can do in order to enhance the practical utilisation of research outputs. The context of the study was specified as the natural hazards field. The authors set out to answer the following two research questions: (1) 'What explains why the results of research have been utilised

Figure 28.2 The general logic of pattern matching and its application in explanatory case study design

Source: adapted from Trochim (1989)

in the past?’ and (2) ‘Do the explanations suggest how research utilisation might be effectively promoted in the future?’ (Yin & Moore, 1988, p. 26). Given that there were three alternative theories in existence that could have explained why practitioners used scientific research, there was no need for additional theorising. The theories in question were the knowledge-driven theory, the problem-solving theory and the social-interaction theory.

The authors specified critical conditions for determining the validity of these three theories. For example, the knowledge-driven theory stipulates that the diffusion of scientific knowledge is a linear process that starts with basic research, gradually develops into applied research, and eventually results in the design of commercial products and services. From this the following critical conditions can be derived: the project should be built on prior basic research; the research should be entirely defined by the researcher; the research results should represent a contribution to knowledge in the form of academic publications; and the research should result in a commercialisable product.

The unit of analysis was defined as the research project. The authors selected nine cases based on three criteria: (1) the utilisation outcome was known; (2) the research project was based in the physical or social sciences, or in architecture; (3) it was a high-quality project. There was a rigorous nomination process in which high-profile stakeholders nominated 66 projects in total. Based on a selection protocol, the authors narrowed the number of cases down to nine. The data collection was guided by a field protocol and comprised project site visits, interviews and project documents. The analytical framework consisted of five categories based on different utilisation outcomes: (1) practice, decision-making and enlightenment use; (2) decision-making and enlightenment use; (3) practice and decision-making use; (4) enlightenment use only; and (5) minimal or no use. The authors then provided a detailed description of the cases within each of these

five categories by drawing on the dimensions previously specified, to aid the judging of the validity of the three alternative theories.

The results of the analysis indicated that the best explanation for research use was provided by the social-interaction theory. Furthermore, a number of recommendations were derived from the case studies for improving practitioners’ utilisation of research.

Flexible Pattern Matching

Category (b) in Figure 28.1 is labelled ‘flexible pattern matching’. It includes techniques that provide greater flexibility for the matching of theoretical and observational patterns. Flexible pattern matching is most suited for exploratory research designs. While there is an initial definition of research questions, and preferably an a priori specification of a tentative analytical framework or initial template (cf. King, 2014; Yin, 2009), this translates into more basic theoretical patterns than in the case of an explanatory case study design. The emphasis is on exploration and theory building based on the patterns that emerge from the collected data (cf. Eisenhardt, 1989). The constructs/dimensions/patterns specified a priori mostly constitute an initial tentative analytical framework aimed at providing guidance and some focus for the explorations. It is important to keep in mind that both the research question(s) and the constructs/dimensions could shift by the end of the study. Propositions and hypotheses emerge from the analysis of the cases, and their validity is ascertained through replication logic. Subsequently, the emerging constructs, concepts and theories are compared with the existing literature. A further test of the theory’s internal validity consists of identifying conflicting and corroborating findings from the existing literature (cf. Eisenhardt, 1989). A further example of a category (b) type of pattern-matching logic is template analysis (King, 2014). Template analysis can be used

on its own for the analysis of qualitative data, or nested into an exploratory case study design. In the latter instance, it is a very useful tool for providing an initial set of *a priori* constructs. The nodes for the initial template are most commonly derived from the existing literature.

A published example of flexible pattern matching that uses nested template analysis within an exploratory multiple case study design is provided by Sinkovics et al. (2014). The authors set out to investigate the relationship between bottom-of-the-pyramid (BOP) business models and social value creation. The focus is on how BOP firms themselves use their business models to simultaneously create commercial and social value. The explicit research questions are the following: (1) In the BOP context, what are the factors that influence whether social value creation is an objective of business formation? (2) In the BOP context, how is social value creation related to business model formulation and dynamics?

The authors frame these research questions through a literature review that synthesises the literature on the relationship between social value creation and business activities. An overarching theme that emerges from the literature is that enterprises that have social value creation as their main objective face a certain degree of conflict between the social and commercial dimensions of their business model (McDonald, 2007). However, Sinkovics et al. (2014) argue that the truth value of this statement may vary across contexts. More specifically, they propose that the meaning of social value may differ greatly across economies, according to the extent of economic development. Furthermore, they argue that it is not possible to create a sustainable business at the BOP, without engaging with BOP consumers, producers, entrepreneurs and employees.

This research framing sets the context at the BOP. The authors then delineate three main conceptual building blocks (patterns) that they go on to explore in the cases. The first building block is the business model. The case firms' business models are explored

through the following 12 dimensions: customer segment, key resources, key partners/supporters, key activities, value proposition, clients/customers, competitors, channels, cost, revenue, change in offering over time and change in strategy over time. The second building block is the constraint concept. The underlying assumption is that for any business to survive, it needs to be able to identify and respond to the main constraints it faces. By identifying three studies that list known constraints in developing countries (Chowdhury, 2007; Dahan et al., 2010; London et al., 2010), the authors put together an initial template of constraints that a BOP business could face. This initial constraint template consists of 19 types of constraints, subsumed under two main categories, namely, productivity/value creation constraints and transactional/value capture constraints. The third conceptual building block is the social value concept. Sinkovics et al. (2014) use the three core values of development (i.e. sustenance, self-esteem and freedom from servitude) listed by Todaro and Smith (2011) to operationalise social value creation.

The selection criteria for the cases are the impact of the business on the local community and the sustainability of the enterprise. The data were collected in the form of face-to-face interviews and secondary material where available. The findings confirm the proposition that the meaning of social value is context-dependent. Due to space limitations, it is not possible to demonstrate the flexible pattern-matching process and outcomes for all three conceptual building blocks here. However, to provide an example, Table 28.1 illustrates the pattern-matching outcomes for the constraint dimension. The initial template columns give an overview of the dimensions that were derived from the literature prior to the data analysis. The final template columns show both instances of the data matching the initially predicted dimensions and instances of new dimensions emerging from the data. Table 28.1 also shows that, in addition to new dimensions in the initial two categories, an

Table 28.1 A demonstration of flexible pattern matching through template analysis

Productivity/value creation constraints			Transactional/value capture constraints		Trigger constraints
Initial template	Final template	Initial template	Final template	No initial template, merged from data	
Production input resources	Production input resources	Market access	Market access	Changed industry conditions	
lack of access to high-quality input material (London et al. 2010)	lack of access to high-quality input material (London et al. 2010)	poor infrastructure (roads, communication networks, transportation system) (London et al. 2010; Chowdhury 2007)	poor infrastructure (roads, communication networks, transportation system) (London et al. 2010; Chowdhury 2007)	(e.g. diminishing competitive advantage)	
low quality of local materials (London et al. 2010)	low quality of local materials (London et al. 2010) supplier power (price, quantity)	lack of awareness of market expectations (London et al. 2010) inability to meet market expectations (London et al. 2010; Chowdhury 2007)	lack of awareness of market expectations (London et al. 2010) inability to meet market expectations (London et al. 2010; Chowdhury 2007)	Act of God (e.g. drought)	
Financial resources	Financial resources			Socio-cultural factors	
lack of working and investment capital (London et al. 2010; Chowdhury 2007; Dahan et al. 2010)	investment capital (London et al. 2010; Chowdhury 2007; Dahan et al. 2010)		lack of awareness in the (domestic/ international) market about company's products/services export barriers	(e.g. unemployment due to immobility)	
exploitation by extra-legal lenders (e.g. loan sharks) (London et al. 2010)	exploitation by extra-legal lenders (e.g. loan sharks) (London et al. 2010)		market scepticism	Social constraints	
no access to insurance (London et al. 2010)	no access to insurance (London et al. 2010)		community acceptance/legitimacy	(e.g. injustice, exploitation, lack of employment opportunities)	
Production resources	Production resources	Market power	Market power		
inadequate or lacking technology/ equipment/infrastructure (e.g. electricity, broadband, water) (London et al. 2010; Chowdhury 2007)	inadequate or lacking technology/ equipment/infrastructure (e.g. electricity, broadband, water) (London et al. 2010; Chowdhury 2007)	lack of capacity to link directly with buyers (London et al. 2010; Dahan et al. 2010)	lack of capacity to link directly with buyers (London et al. 2010; Dahan et al. 2010)		

lack of expertise/know-how/education (technical, business, industry-related) (London et al. 2010; Chowdhury 2007)	lack of expertise/know-how/education (technical, business, industry-related) (London et al. 2010; Chowdhury 2007)	lack of direct access to end markets (London et al. 2010)	lack of direct access to end markets (London et al. 2010)
storage space (London et al. 2010)	storage space (London et al. 2010)	exploitation by middlemen (London et al. 2010)	exploitation by middlemen (London et al. 2010)
underdeveloped human resources (Dahan et al. 2010)	underdeveloped human resources (Dahan et al. 2010)	Market security	Market security
		lack of consistent buyers (London et al. 2010)	lack of consistent buyers (London et al. 2010)
		price fluctuation (London et al. 2010)	price fluctuation (London et al. 2010)
		bureaucracy, corruption (Chowdhury 2007)	bureaucracy, corruption (Chowdhury 2007)
		Law-and-order situation, strikes, lack of government assistance (Chowdhury 2007)	Law-and-order situation, strikes, lack of government assistance (Chowdhury 2007)

Source: adapted from Sinkovics, Sinkovics, and Yamin (2014: 700)

entirely new category of constraints emerged from the data. The authors term this new category ‘trigger constraints’, defined as ‘limitations the entrepreneur as an individual, a particular community, or society as a whole is facing’ (Sinkovics et al., 2014, p. 698). Two of the five case firms started their businesses as a response to such trigger constraints. This finding has significant theoretical implications for theorising about the formation of BOP businesses in general and about entrepreneurial businesses in particular. In addition to a number of summary tables, the investigators also provide detailed descriptions of the cases based on the pre-defined dimensions.

Partial Pattern Matching

The first category in Figure 28.1, denominated with the letter (a), is named ‘partial pattern matching’. It can be divided into a top-down and a bottom-up approach to initial theorising. Both approaches aim at engaging

the investigator’s mental models in the theorising process, but from different perspectives. The bottom-up approach is based on an inductive process and builds on empirical observations and data. Grounded theory is a good example (Glaser & Strauss, 1967) because it starts out in the observational realm, and the patterns that emerge from the empirical data are used to formulate propositions/hypotheses for further exploration or testing in a subsequent study. However, due to space limitations, it is not possible to include a published example of a grounded-theory-based partial pattern-matching study, here. Instead, the rest of this section will be dedicated to providing a detailed outline of the top-down approach, including an illustration.

Top-down pattern work is carried out in the theoretical realm and constitutes a potential starting point for the full-fledged pattern-matching process. A good example of this approach is bibliometric concept mapping for theorising (see Figure 28.3). This builds on the interplay between existing literature and the researcher’s

Figure 28.3 The logic of pattern matching in bibliometric concept mapping for initial theorizing

Source: adapted from Sinkovics (2016)

Figure 28.4 Bibliometric concept map displaying 6000 concepts

Source: Sinkovics (2016)

internal, to a certain degree implicit, mental models. This is done through the visualisation of bodies of literature for the purpose of identifying interesting research avenues/ideas based on observed patterns in the concept maps. Figure 28.4 illustrates a bibliometric concept map of 410 article abstracts (Sinkovics, 2016). This method is especially useful in cases of researchers searching for new research ideas or wanting to familiarise themselves with an unfamiliar body of literature (cf. Sinkovics, 2013, 2016). The most important idea behind bibliometric mapping as a tool for idea generation can be derived from Weick's (1989) proposition that the feeling that something is interesting represents the beginning of an externalisation process. This process consists of the recognition and verbalisation of one's own implicit assumptions, which are most frequently also anchored in or influenced by the assumptions of a discipline. The use of bibliometric concept maps fulfils a similar conceptualisation purpose to that of Trochim's (1985) initial concept maps that are generated from stakeholder consultation and brainstorming.

Before the study by Sinkovics (2016) can be introduced as an example, there is a need to go into more detail about bibliometric

concept maps. They can be created from titles, abstracts and keywords of published articles. It is also possible to include conclusions and future research sections of academic papers, although this would require considerable additional effort. The main purpose of concept maps is to visualise keyword co-occurrences, showing which keywords are most likely to occur together in a specific body of literature. Put differently, the number of co-occurrences of two keywords is the number of publications in which both keywords occur together. The distance between two keywords on the map approximately indicates their relatedness (van Eck & Waltman, 2014). For example, a keyword map based on management articles is very likely to display the words 'firm performance' and 'management capability' in close proximity to each other, indicating a relationship between the two concepts.

Bibliometric concept maps can be generated using a variety of software tools. The author's preferred software is the freely available VOSviewer (www.vosviewer.com) due to its user friendliness, flexibility and the fact that it produces very high-quality visualisation outputs. The VOSviewer software

operates based on the VOS (visualisation of similarities) mapping technique and can be used to generate maps based on both text corpus and networks. Van Eck and Waltman (2010) provide an in-depth review of the software for the interested reader. To create bibliometric term/concept maps from selected articles, their titles, abstracts and keywords need to be downloaded from the Web of Science™ database (or from an alternative database such as Scopus) into a text file.

After the visualisation has been carried out, VOSviewer provides users with two ways to display the concepts: network visualisation and density visualisation. The network visualisation option uses importance as the main criterion for highlighting concepts. The font size of the label and the size of the circle are representative of the importance of the concept. The colour of the circle helps users identify the cluster to which a concept belongs. However, displaying all the concepts would make the maps difficult to read. For this reason, only a subset of labels is represented on the map. The researcher can then use the zoom function to explore the map in more detail. The density visualisation view highlights the importance of areas on the concept map based on the number of connected items. From within this view, the user can also opt for the cluster density view that assigns individual concepts to clusters and visualises their densities. Clusters help the investigator to identify major themes in a specific body of literature. When creating concept maps from texts, one can choose between binary counting and full counting. Binary counting only takes into account the presence or absence of a term in or from a document and is not concerned with how frequently a concept is mentioned within a document. In contrast, the full counting option considers all the occurrences (Sinkovics, 2016).

In the article 'Enhancing the foundations for theorising through bibliometric mapping', Sinkovics (2016) sets out to achieve two objectives. First, the paper aims at introducing the technique of bibliometric concept

mapping and demonstrating how it can be used to visualise a fairly large body of literature. Second, the author demonstrates how bibliometric concept maps can be used as a starting point for more in-depth explorations with the help of a Computer Assisted Qualitative Data Analysis Software (CAQDAS) package. Although the author chose NVivo, any other software capable of performing similar functions would be suitable. For more operational details about NVivo, the reader is advised to refer to the QSR International website (www.qsrinternational.com) and to dedicated manuals (e.g. Richards, 1999).

The main research questions in the paper were the following: (1) How are ethics and related issues represented in the marketing literature? (2) Which potential future research avenues can be derived from this body of literature? The initial search strategy in the Web of Science™ database consisted of terms such as corporate social responsibility (CSR), human rights, ethics and ethical. The first search resulted in 14,747 peer-reviewed journal papers. To reduce the number of journal articles and to increase the relevance of the hits, the search was subsequently limited to marketing and international marketing journals. This narrower search strategy yielded 410 articles. The titles and abstracts were exported to EndNote (reference manager software) and to a text file.

The next step involved the visualisation of the concepts extracted from the 410 abstracts. If the purpose is to gain a general understanding of what the main themes are in a body of literature, the minimum threshold for occurrences and the number of clusters should be set such that the number of generalisations is manageable. In Sinkovics' (2016) study, the threshold for occurrences was set at two and the number of clusters was left at the default setting. This yielded a concept map of 846 concepts and 17 clusters. In contrast, if the purpose of the exploration is to look at concepts as widely as possible, the number of occurrences can be set at one, which will yield a very large map. In this case, this

setting resulted in a map consisting of 6,000 concepts. Figure 28.4 shows the large concept map displaying 6,000 concepts from Sinkovics' (2016) study. Smaller maps are very useful for identifying general trends, whereas large maps are an excellent tool for brainstorming and spotting interesting concepts. Figure 28.6 shows the network visualisation of the 846 concepts.

In the next step, all the concepts that were perceived by the investigator as 'interesting' were compiled into a list that represented the initial template for the textual analysis. After the initial template was created, by zooming in and out in the concept map, the full abstracts of the 410 journal articles, including their bibliographic information, were imported into NVivo for further analysis. The initial template included concepts such as 'abusive supervision', 'mindful consumption', 'corporate social irresponsibility', 'corporate hypocrisy', etc. The concept of 'mindful consumption', for example, led to a more in-depth investigation of all the abstracts that mentioned consumption. This further investigation yielded the following collection of concepts (for a graphical representation refer to Figure 28.5): sustainable consumption, green consumption, environmentally friendly consumption, socially responsible consumption, ethical consumption, mindful consumption, fashion consumption, ritualistic consumption, negative effects of consumption, anti-consumption, consumer resistance, consumer cynicism, ethical segmentation of consumption, political activism, Fairtrade and voluntary simplicity.

The analysis furthermore uncovered a potential relationship between consumer cynicism, consumer resistance and anti-consumption. There also seems to be a relationship between environmentally friendly consumption and voluntary simplicity. Moreover, political activism and Fairtrade emerged in connection with ethical consumption. Based on these concepts and relationships one could immediately formulate basic research questions and propositions for

further investigation. For instance, one might ask the following questions: What are the drivers of ethical consumption? What types of ethical consumption are there? Are certain consumer groups more likely to become ethical consumers than others? For additional possible research questions around ethical consumption, and for a more detailed step-by-step guide to carrying out the analysis, the reader is referred to the original article (Sinkovics 2016). In terms of propositions, one might formulate the following basic ones: the more visible the negative effects of consumption become, the more consumers will adopt ethical consumption practices; the more mindful consumers are, the more likely they are to engage in voluntary simplicity.

As can be seen from Figure 28.3 above, pattern matching occurs at two levels. The first-level pattern match takes place between the researcher's mental model (a combination of his/her past experiences, academic training, beliefs, values, etc.) and the observed patterns that emerge from the bibliometric concept map. For example, following on from the previous example, the investigator may hold the assumption that consumers are more likely to engage in purchase behaviour that is convenient to them, even if they do not agree with the negative environmental and/or social implications of the production process. This is also well documented in the literature, and is known as the attitude-behaviour gap (cf. Papaoikonomou et al., 2011). The concept of 'voluntary simplicity' that emerged from the concept map challenged this assumption, leading to the following question: Under which circumstances are attitudes translated into action?

The second level of pattern matching follows on from this point. In the first instance, the investigator's assumption about consumer behaviour was challenged (consumers prioritise convenience over ethics), leading to the formulation of a new research question (regarding what drives voluntary simplicity) and possible propositions (e.g. that the more mindful consumers are, the more likely they

Source: Sinkovics (2016)

articles). If there was a documented relationship, one could then read the full paper, do additional literature searches and determine whether there was a need for further research. If there was no documented relationship between the concepts in the NVivo database, one could do a wider literature search in the Web of Science™, ProQuest, Scopus, etc. If the proposed relationship had not yet been explored, the investigator could start designing a study to examine the relationship. If the

Source: based on Sinkovics (2016)

relationship was already documented, one could determine the extent to which it had been investigated and design a subsequent study, if justifiable. To sum up, bibliometric concept maps serve as an aid to formulating initial research questions and/or propositions to be further explored in NVivo.

CONCLUSION

Understanding the basic principles of the pattern-matching logic, as well as its historical and philosophical roots, can be a tremendous help in designing and conducting qualitative research studies, regardless of the form they take. As mentioned at the beginning of this contribution, from a meta-theoretical point of view, the general theory of pattern matching originates from probabilistic functionalism (cf. Hammond, 1966b). This position between a strictly subjectivist and a strictly objectivist approach to social science (cf. Burrell & Morgan, 1979) gives pattern matching its unique structured flexibility. Being aware of the different types and levels of possible pattern matches can help researchers in their initial theorising, irrespective of their approach, that is, irrespective of whether they apply deductive, inductive or abductive reasoning. Moreover, a thorough understanding of the general logic of pattern matching will also enhance the quality of researchers' efforts in terms of conceptualisation, construct definition and operationalisation.

Metaphorizing the Research Process

Mats Alvesson and Jörgen Sandberg

INTRODUCTION

Management and organization studies (hereafter MOS) is a large and lively research field, comprising an enormous variety of perspectives, methodologies and research styles. Or is it? Quite the contrary, despite all the good work being produced, contemporary MOS – like many other fields – is frequently accused of being dull, narrow, incremental and irrelevant.

Scholars have increasingly expressed concerns and frustrations about the lack of more novel, influential and relevant ideas published in organizational journals. Gap-spotting, formulaic, pedantic, parochial and boring are frequent pejorative characterizations of current management research (Alvesson & Sandberg, 2013; Gabriel, 2010; Grey, 2010). Many ask for more imaginative and influential work, acknowledging that is not what academics do these days (George, 2014; Starbuck, 2006; Suddaby et al., 2011). Instead, isomorphism and parochialism rule,

which have resulted in highly constricted ways of doing and writing research.

Many suggestions for boosting the development of more interesting and influential research have been made, such as using problematization for generating research questions (Alvesson & Sandberg, 2013); applying a metaphoric lens on the object of study (Cornelissen & Durand, 2014); and focusing on problem-oriented rather than theory-driven research (Corley & Gioia, 2011).

In this chapter, we concentrate on a possible way forward, namely *metaphorizing* the entire research process. In contrast to the above attempts, which focus on single elements of the research process (research question, object of study, literature review), metaphorizing the entire research process provides a more comprehensive approach for opening up the prevalent tunnel vision of the research process. Specifically, we aim to make a case for the value of a systematic, self-critical and reflexive metaphorization of a number of key elements of the research

process (hereafter: RP). We contend that such a broad and comprehensive metaphorization of RP has the potential of increasing the chances for researchers to generate more interesting and influential ideas and engaging research texts by (a) stimulating provocations and insights, and (b) encouraging the reader to think differently and more actively about several issues that normally are taken for granted or normalized in research. Hence, our intention is not to conduct research on metaphors per se, but to elaborate a *metaphorical framework* that can function as a heuristic device both for unsettling taken-for-granted ways of conducting research and for finding alternative ways of doing research that can lead to more imaginative and impactful research.

Metaphorical frameworks that stimulate rethinking on broad and profound levels, like those proposed by Burrell and Morgan (1979) and Morgan (1980, 1986), are as valuable as rare. Without placing the chapter in the same class of contributions, our aim is still to encourage a broadening and a rethinking of how we conduct research rather than adding precision and systematization to specific parts or details of the conventional research process. Most knowledge contributions are focused, often motivated but increasingly subspecialized and narrow in scope (Alvesson & Sandberg, 2014). This chapter is wide-angled and aims at enhancing the capacity of researchers on a broad scale through disclosing a wealth of options, only partly indicated so far. In particular, our metaphorization of the research process provides a *kaleidoscopic* view of RP, which offers a heuristic toolbox that can be used both for becoming aware of taken-for-granted ways of conducting research and for creating new opportunities for carrying out more imaginative and interesting research and writing.

The outline of the chapter is as follows. We begin by discussing some key characteristics of ‘metaphors’ followed by a brief note on methods. Against this background we elaborate a spectrum of ten key elements of RP

portrayed as a kaleidoscope of RP metaphors. Thereafter, we formulate a set of guidelines for putting the metaphors to work. We then examine how the framework can be used for generating alternative ways of conducting research by applying it to Barley’s (1986) highly praised article about technology and organizational structure. Finally, we discuss how the metaphorization of the entire RP can contribute to the development of more interesting research and writing.

METAPHOR PARAPHERNALIA

Meaning(s) of Metaphor

Since Lakoff and Johnson’s (1980) classic text *Metaphors We Live By*, the use of metaphors has expanded within the social sciences and is now important in almost every discipline within the social sciences, including MOS (Cornelissen et al., 2008; Gibbs, 2008; Putnam & Boys, 2006; Steen et al., 2010).

In a narrow, traditional sense, a metaphor is simply an *illustrative device* stipulating that metaphors are words that make language richer or more felicitous (Brown, 1976). However, a central insight that spans across most disciplines and schools is that metaphors are not only ornamental aspects of language but also frame our thinking and doings in important ways (Brown, 1976; Cornelissen, 2005; Gibbs, 2008; Lakoff & Johnson, 1980; Morgan, 1980, 1983; Weick, 1992). We never relate to reality ‘as such’, but always do so through forming metaphors or images of the phenomena we address. For example, organizations are seen as if they are ‘machines’, ‘organisms’, ‘political arenas’, ‘theatres’ or ‘psychic prisons’ (Morgan, 1980, 1986). As Morgan (1996, p. 228) writes, the use of metaphors is ‘a primal, generative process that is fundamental to the creation of human understanding and meaning in all aspects of life’. Metaphors – in the sense of root or organizing images, rather than poetic language

use – draw attention to implicit or hidden aspects of different perspectives and vocabularies (Morgan, 1980, 1986) and may function as powerful starting points for new ways of seeing phenomena, such as organizational change (e.g. Illes & Ritchie, 1999).

Hence, in contrast to ‘the metaphor as the illustrative-device view’, it can be argued that all knowledge is basically metaphorical in that it emerges or is ‘constructed’ from some point of view. So, too, are our experiences, for ‘our ordinary conceptual system, in terms of which we both think and act, is fundamentally metaphorical in nature’ (Lakoff & Johnson, 1980, p. 3). Metaphorizing can thus be seen as *a crucial element in how people relate to reality*.

Metaphor Work

A metaphor is created when a term (sometimes referred to as ‘modifier’) is transferred from one system or level of meaning to another (the principal subject), thereby illuminating central aspects of the latter and shadowing others, like seeing ‘organization’ (principal subject) *as a* ‘pyramid’ (modifier). A metaphor thus allows an object (‘organization’) to be perceived and understood from the viewpoint of another object (‘pyramid’). Using words as metaphors therefore means a departure from their literal meaning: ‘A word receives a metaphorical meaning in specific contexts within which they are opposed to other words taken literally; this shift in meaning results mainly from a clash between literal meanings, which excludes literal use of the word in question’ (Ricoeur, 1978, p. 138, see also Steen et al., 2010).

Brown (1976, p. 173) points to the following characteristics as central to metaphors. Metaphors involve what Aristotle called ‘giving the thing a name that belongs to something else’. If a metaphor is taken literally, it usually appears absurd. The necessary ingredient of difference has a specific cognitive function: ‘it makes us stop in our tracks

and examine it. It offers us a new awareness’. Metaphors are intended to be understood: ‘they are category errors with a purpose, linguistic madness with a method’ (ibid., p. 173). Metaphors must be approached and understood as if they were true at the same time that we are aware that they are fictitious – created and artificial.

A good metaphor, therefore, depends on an appropriate mix of similarity and difference between the transferred word and the focal one. Where there is too much or too little similarity or difference, the point may not be understood. As a result, metaphor generation is a precarious enterprise. However, according to Cornelissen and Kafouros (2008, p. 365), impactful metaphors in MOS are those that are: ‘(1) seen to capture multiple salient features of organizations and (2) the ease with which the metaphor is understood’.

Advantages and Problems in Using Metaphors

The most frequently expressed advantage of using metaphors is their ability to encourage creativity, generate new ideas and guide analysis in novel ways, as well as their capacity to communicate (Cornelissen & Durand, 2014; Grant & Oswick, 1996; Morgan, 1980; Schön, 1979). Metaphors can also enable critical scrutiny of organizational research and practice. For example, a focus on (root) metaphors may facilitate examination of our basic assumptions of organizational phenomena.

There are of course also problems using metaphors. One is that metaphors may have a strong rhetorical and even seductive appeal, but score lower on precision and rigour (Pinder & Bourgeois, 1982). Another risk is the supermarket orientation to metaphors (Reed, 1990) leading to shallowness; metaphorical expressions are (seemingly) easy to use, but may be followed by low ability to master and use them productively in research. An additional problem is that sometimes a

specific image or idea is difficult to capture through a distinct metaphorical formulation.

Metaphors can thus be seen as a double-edged sword. On the one hand, they have the potential to help us to transcend and see our daily practices in a new and novel light. On the other, dominant (but also novel alternative) metaphors can easily become a prison, locking us into unquestioned forms of understanding and doing research. A good dosage of reflexivity appears therefore central in metaphor work (Alvesson et al., 2008). In this study, reflexivity involves a preparedness to employ various ‘seeing as’ tactics in addressing various elements of RP.

AWAKENING THE DEAD

By metaphorizing RP we want to loosen up and challenge the current *rigidity* and standardization of carrying out research within MOS. A key reason for this rigidity is that the current tunnel vision of RP is underpinned by a huge set of ‘dead’ or ‘frozen’ metaphors, i.e. metaphors that are no longer understood as metaphors but have been taken for granted and have assumed a self-evident, literal meaning. RP elements and expressions like ‘theory building’, ‘data collection’, ‘design’ and ‘codification’ are often treated not as metaphors but as precise representations of specific research activities. By reminding ourselves of taken-for-granted metaphors, we can become more (self-)critical and receptive to alternatives and, thus, new ways of doing research. The point here is of course not that dead or taken-for-granted metaphors indicate ‘bad’ ways of doing research. Instead, the problem is that they have lost their metaphorical quality and, therefore, tend to freeze our understanding rather than stimulate imagination and reflexivity.

In order to wake up and become aware of such ‘dead’ metaphors and loosen up their grip on the way we do research, generating counter-metaphors is key; meaning that our

task is not a conservative one of mapping and reproducing what is out there (in contemporary texts), but – in line with Morgan’s (1980, 1986) project – to stimulate imagination, creativity and rethinking. In order to accomplish this, we generate a range of metaphorical tensions between common and alternative metaphors. Such a reflexive metaphorical approach can be formulated in dialectical terms: starting point, negation and transcendence. The starting point is the common (and often taken-for-granted) metaphorical views on elements of RP and/or the specific (perhaps non-common) view held by the researcher and her field. Thereafter, radically different metaphors (to the one celebrated by the researcher and/or her community) are invoked, followed by confronting different metaphorical views of the targeted RP elements against each other with the aim of generating new and imaginative ideas about the elements and how to carry them out.

METAPHORIZING THE RESEARCH PROCESS: A KALEIDOSCOPE OF RP METAPHORS

We focus on the following key elements usually seen as central characteristics of RP: overall point of research, researcher’s role, literature review, theoretical framework, method, design, data, analysis, writing and contributions. Using these elements as a basis, we point at dominant or at least common metaphors and less common ones, generating a spectrum of imaginative options of what RP is basically about. We begin metaphorizing more conventional understandings and then add alternatives. The key point is not that the latter is ‘better’ than the former, as all kinds of metaphors are potentially useful (and problematic). More specifically, our aim is not to provide an alternative way of conducting research but rather a *kaleidoscopic* view of RP, which has the capacity to generate a huge variety of novel

patterns and angles for carrying out more imaginative research and writing more stimulating research texts.

A kaleidoscope is a cylinder consisting of one section of mirrors attached together in specific angles, and then another section of objects such as coloured pieces of glass. When looking into it and rotating it, the kaleidoscope generates a large variety of new and shifting patterns and images due to the reflections off the mirrors. In a similar way as the 'real' kaleidoscope, our RP kaleidoscope consists of two interrelated sections: one section of interrelated metaphors and another section of elements of the research processes. When looking into it, the RP kaleidoscope has the potential to generate several new and novel patterns and images of RP, due to the interactions between the RP metaphors. As Gunning (1997, p. 32) noted, 'Brewster [the inventor of the kaleidoscope] praised his invention as a labor saving art-making machine which would: "create in an hour, what a thousand artists could not invent in the course of a year"'. Of course, in research we do not accomplish much in an hour but rethinking our projects in a distinct way may save some time and effort.

We structure the metaphorization of RP in three large interrelated groupings: inputs, process and outcome elements. These categories should not be over-emphasized: the production/factory metaphor we implicitly use here should be read ironically. Inputs are often best seen in process, and the latter is often more or less given by the assumptions and commitments through which the researcher enters a project. Nevertheless, the categories offer some help in sorting the elements making up RP. The kaleidoscope of RP metaphors is summarized in Figure 29.1, and further developed below.

Input Elements

The input elements include the overall point of research and researcher's role, and refer to

how RP is framed through the researcher's socialization into a specific social identity/collective affiliation and its view of what research is about. These elements point largely at what Kuhn (1970) referred to as the paradigmatic underpinnings of research. Here, encouraging frame-breaking and non-conformity are vital for increased imagination.

The overall point of research

The idea here is not what a particular study is about or how to conceptualize the target of study, but what research as such is about, i.e. why do we do research at all? Normally, the point of research is seen as *building knowledge* in the sense of piecing together an enormous 'theoretical jigsaw puzzle' that is assumed to gradually lead us to the true picture of reality. Another way of putting it is that research is about *mapmaking*. Sometimes there are white spots on the map that need to be filled, sometimes more details are required to make the map more reliable, and on other occasions an aspect of the existing map provides an inaccurate picture of reality. References to 'gaps' in knowledge are common, perhaps too common.

A counter-metaphor to knowledge building can be that research is about *knowledge demolition* in the sense of challenging received wisdom (Davis, 1971). Such research introduces frictions, preventing the smooth following of a particular route on the map, or, alternatively, challenges the idea of map-(re-)making more generally. Another alternative metaphor could be to regard research as *point-making*. Delivering a knowledge product versus making a point evokes rather different overall conceptions of what research as such is about. Perhaps even more radical would be to see the point of research as *reality creation*. Regarding research as reality creation challenges the assumption that we, through scientific research, can map reality as it is in itself. Instead, the reality creation metaphor suggests that we create realities through our research texts, possibly

Figure 29.1 A Kaleidoscope of RP metaphors

in harmful ways (Foucault, 1980; Ghoshal, 2005). For example, the creation of a social world where leadership and strategy dominate is at least partly driven by discourses (cf. Knights & Morgan, 1991), and economic theories work as self-fulfilling prophecies (Ferraro et al., 1993). This can be seen as quite grandiose, the researcher-king/queen rules the world, but more modest understandings are of course possible.

The researcher's role

The researcher is still very much seen as a *truth-finder* in most research, although the exact meaning of this varies with different notions of truth (Alvesson & Sköldbberg, 2009). Even in some qualitative work with a poststructuralist inclination, the empirical study is somehow often portrayed as delivering some form of truth (Wray-Bliss, 2002). Following from the metaphors used to describe the point of research one could see the researcher's role as a *mapmaker* making 'true pictures' of reality.

But if research is seen as point-making it is likely that the researcher's role would be more like an *insight generator*, and in research as knowledge demolition, the researcher may take on the role as a *provocateur* or even 'partisan' (Silverman, 2006). However, when regarding research as reality creation, it may be more suitable to see the researcher as a *reality narrator*. Of course, everything can be seen as narrating, but a typical academic text, written in a formulaic manner, scores rather badly as a narrative.

Process Elements

Although every aspect of RP is process(ed), we here address the more active elements involved in carrying out a specific empirical study, namely: literature review, theoretical framework, method, design, data and analysis. These major process elements can be thought of in terms of various images problematizing the ways we think about and

carry out empirical work and how we relate to empirical material.

Literature review

In the prevalent view of research as knowledge building or mapmaking, the literature review may be portrayed as 'vacuum cleaning' or *gap-spotting* (Alvesson & Sandberg, 2013). Those metaphors regard the literature review as thoroughly and methodically reviewing existing literature in order to identify missing pieces in the communal jigsaw puzzle or white spots in the knowledge map that need to be filled and, based on that, pointing to how one's study will contribute to existing literature by adding yet another piece to the theoretical jigsaw puzzle. However, how literature is connected and packed in reviews is often arbitrary (Locke & Golden-Biddle, 1997). For example, sometimes the literature review may be seen as a *construction project* rather than as a vacuum cleaning job in the sense that the researcher selectively brings together different bodies of literature in order to legitimize a specific research study.

As an alternative to vacuum cleaning and gap-spotting, the literature review can be seen as a *sparring partnership* for creating counter-thinking in a field. But if the point of research is seen as knowledge demolition, the literature review may be regarded as *assumption digging* – an exercise in identifying and challenging assumptions (Alvesson & Sandberg, 2013; Davis, 1971). Here, the researcher does not look for gaps but digs down under the theory to lay bare its footing and, based on that, generate a new set of assumptions that form the foundation of an alternative theory. But in cases when research is seen as reality creation, the literature review may be viewed as a *reservoir of narrative material* for producing new and powerful stories that help us see our world and ourselves in a new light. Another metaphor for connecting to existing literature could be *idea-picking*. Rather than an authoritative, well-packaged summary of the state of the

art in a subfield, the literature is reviewed broadly and unsystematically with the aim of getting some unexpected inputs to a study.¹

Theoretical framework

Another common element of RP is the particular theory or theoretical framework that is used to inform a specific study in various ways. When research is seen as knowledge building, theory is often seen as a specific *mirror* or *map* of reality. For example, in much deductive research, the idea is to test to what extent a specific theory mirrors reality. The same holds true for more traditional inductive research, where the theory generated from data should represent that data as exactly as possible (Glaser & Strauss, 1967). However, when research is seen as *point-making*, theory may be seen more as a specific ‘perspective’ or *lens*, indicating that theory is perspectival rather than an objective picture of reality. In cases where research is seen as reality construction, theory may be seen as a ‘performative force’ shaping social reality. In critical studies, theory is more a matter of provocation and triggering emancipatory thinking. Theory is then understood as an *eye opener* rather than as a mirror or a device for sorting impressions of the phenomenon studied (Alvesson & Deetz, 2000).

Methods

Research methods are often seen as a ‘recipe’ or *formula*, consisting of specific steps and procedures for the researcher to follow and obey, in order to generate an accurate representation of reality. For example, in standard method books (e.g. Flick, 2006; Sekaran, 2000) deductive research methods stipulate that the researcher needs to adhere to the following sequential steps: theory formulation, hypothesizing, operationalization, sampling, data collection, analysis and validation. Inductive research methods are often depicted as more *pattern-detecting* than linear consisting of collecting and analysing data, and strictly comparing cases. It moves back and forth between data collection, analysis

and case comparison over and over until the theory is ‘fully’ developed. However, if the point of research is seen as point-making, knowledge demolition or reality creation, method may be seen of as *searching for negations*, *de-familiarization* (Alvesson & Deetz, 2000) or *intellectual wandering*. Considering such a spectrum of metaphors provides considerably more room for creativity, imagination and responsiveness regarding how to carry out research. However, it may also encourage wild ideas and lack of discipline and rigour, and may need therefore to be balanced with considerations of coherence and careful reasoning.

Design

The metaphorical meaning of design is often taken for granted. As the editors of *Academy of Management Journal* point out to its readers, ‘choosing the appropriate design is critical to the success of a manuscript at *AMJ*, in part because the fundamental design of a study cannot be altered during the revision process’ (Bono & McNamara, 2011, p. 657). Referring to parts of the research process as design is of course in itself quite heavily metaphorical, although typically not recognized as such. The design can be conceptualized as a *master plan* or a ‘blueprint’ for how to conduct research. In cases where research is seen as more open-minded, design seems to become a misleading term – indicating something fixed and solid to be executed. Possible alternative metaphors could be *journey*, ‘exploration’ or even ‘intellectual adventure’. Yet another alternative is *mystery creation* – the researcher encounters or aims for an unexpected empirical observation challenging dominant understandings (such as in the Hawthorne studies) – which calls for a more flexible and open study than one informed by a strict design (Alvesson & Kärreman, 2011). These metaphors highlight that research can be about confronting or preventing a particular logic or mode of thought from being outlined and thus creating a breakdown in existing assumptions and

beliefs. In research as reality construction, 'design' becomes even more of an oxymoron. A more suitable metaphor may be *disciplined imagination* (Weick, 1989).

Data

The term 'data' is perhaps one of the most commonly used terms in research texts. It is typically joined with other words such as 'data collection' or 'data analysis'. When the point of research is building theory or testing hypotheses, data are often seen as the basic *building blocks* of reality mirroring. Here data are also often regarded as a *referee*, who decides whether a knowledge map is true or false. Similarly, data can be seen as *road-signs*, showing the way to knowledge/theory in line with grounded theory and other dataistic inductivists (Alvesson & Kärreman, 2011).

If research is about point-making, data may be seen more as *rhetorical tropes* that can be lined up to make the point forcefully. When research is regarded as knowledge demolition and reality creation, the idea of data as basic building blocks of reality becomes problematic and even misleading. Instead, data are seen as 'artefacts' or 'representations'. That is, as something constructed and produced through human activities, giving rise to what Baudrillard (1994) called 'hyper-reality'; a situation in which what is 'real' and what is 'map' are an entangled whole impossible to distinguish from one another.

Researchers often talk about *collecting* data, as if data are something that can be picked from the ground, like mushrooms, i.e. data collection as *mushroom picking*. Regarding data as something to be collected easily leads to a view of the researchers as data gatherers busy trying to tap the informants-workers on the raw material to be used in the process of building knowledge. For example, the interview is seen as a *tapping device* used to tap the interviewees on important data, and observation can be seen as a *camera* for capturing the actual reality.

When the point of research is seen as reality creation, where reality and map are seen

as seamlessly blended together into a hyper-reality, it may be more suitable to talk about 'generation' or 'construction' of data than collection (i.e. mushroom picking). Interviews may be seen as specific sites for data construction in a complex interaction between interviewer and interviewee involved in impression management, political action or identity work (Alvesson, 2011). Observation may be seen more as an *artistic portrait*, perhaps of an impressionist or confessional nature (van Maanen, 1988). Artistically portraying data does not of course mean that the researcher is free to invent or make up any kind of knowledge claim or 'story'. The use of artistic qualities in observations may simply mean less 'square', superficial and conventional and more imaginative, lively, insightful and 'deeper' ways of portraying something (e.g. Geertz, 1973).

Analysis

When data are seen as building blocks of reality, the analysis is typically seen as *coding* of data. It involves classifying and sorting the collected data into distinct categories and gradually abstracting those categories into a new piece that will add to the never-ending theoretical jigsaw puzzle. Here one may somewhat ironically see the code as a way of turning the well-known into something cryptic and secretive, as it tends to transform something that may appear to be 'natural' into something de-contextualized, abstract and standardized – often with the loss of sensitivity for social context and meaning (Brinkmann, 2014; Potter & Wetherell, 1987). Other aspects of the data analysis could be indicated by the metaphor 'data-processing', indicating a factory-like treatment of empirical material.

Researchers who interpret rather than analyse data often take the standpoint that although data are 'out there' (to be 'collected'), they do not speak for themselves but must be interpreted. This is because data are always experienced or understood from a subject's point of view. This kind of

interpretive work can be seen as *intelligent guess-work* (Geertz, 1973). However, in cases where the point of research is seen as reality creation where ‘data’ and ‘map’ have dissolved into each other, more suitable metaphors may be *free imagination* (to borrow an expression from phenomenology) or ‘promiscuous analysis’ (Childers, 2014). These metaphors/images encourage researchers to release themselves from strictly following a specific recipe and instead be more responsive and sensitive to the complexity of reality.

Outcome Elements

The outcome elements entail writing and contribution, which are mainly involved in expressing and communicating the finished research and its contribution. Even though these elements are key issues a long time before the researcher starts to craft the contribution, they become more salient and significant when the more intensive empirical stages have been carried out.

Writing

Language is commonly seen as a *representation tool* or as a ‘mirror of reality’ and as a ‘transparent medium’ for the objective transport of information about reality. These metaphors often guide ideas on data collection, such as the assumption that questionnaires or interviews are transmission vehicles for writing up the results (Potter & Wetherell, 1987). Writing is often viewed as a ‘template driven exercise’ for the effective communication and transmission of results. The established format stands for superior rationality, viewed as a recipe for effective and rigorous reporting. Often, no subject seems to be writing the text. Instead, scientific rationality, manifested in ‘the study’ or ‘the article’ seems to write the text.

But when research is seen as point-making, writing can be portrayed as a *rhetorical exercise* – the text as a piece of rhetoric (Richardson, 2000) – rather than as a correct

representation of reality. Beauty is here emphasized. (Of course, issues around ‘correctness’ and rhetoric can never be fully disregarded. Both data reflecting reality and/or persuasive writing can be emphasized as key elements in thinking about research texts.) Alternatively, writing can be seen as *exploration* – you think when you write. Van Maanen (1988) uses the notion of ‘tales of the field’ to point at variations of ethnographic writing. In cases when research is seen as reality creation, writing may be seen as *path-making* in the sense that ‘to write ... is to carve out a new path through the terrain of the imagination’ (Solnit, 2001, p. 72). Although non-conventional writing does not mean ‘anything goes’, such as neglecting empirical grounding, it may lead to richer and more vivid representations of empirical contexts (e.g. Grey & Sinclair, 2006; Kunda, 1992; Rosen, 1985).

Contribution

In many versions of research, contributions are often seen as delivery of ‘jigsaw puzzle pieces’. The conducted study has identified and developed a new piece to be added to the ongoing theoretical jigsaw puzzle of organization studies. An alternative set of metaphors may be to see contributions as *result delivery*, *idea generation* or *rich story*. When seen as result delivery, the contribution may be regarded as end-heavy – the empirical finding, the synthesis of findings, extension of theory, etc. When contributions are seen as idea generation they may be beginning-heavy; the author has a point or theoretical idea that drives the text. Here the thesis, the new framework or idea is offered. In cases when contribution is seen as rich story, the contribution may be seen as mid-heavy, focused on following the account where the author presents empirical material or reason so that the reader is stimulated to get a rich understanding or follow (be inspired or upset by) the text’s reasoning, e.g. in thick description (Geertz, 1973). Yet, when the point of research, as within strongly ‘constructionist’ (discursive) understandings, is seen as reality

creation, contributions may be seen more as ‘reality invention’. As Foucault (1980) emphasized, a problem with knowledge is that it creates reality. Taken together, the metaphorization of the above key RP elements generates a whole range of new ways of understanding and conducting research and, thus, has the potential to lead to more imaginative and engaging research. How, we further discuss below.

FROM A LINEAR TO A KALEIDOSCOPIC VIEW OF RP

In most conventional understandings RP follows a linear path. Interest and literature review leads to a research question, the elaboration of a firm theoretical position informs the latter, the specification of the research question points to a specific design, followed by data collection, thereafter data analysis that produces findings, which subsequently informs writing and research contributions. Linearity and adherence to conventions may appear convincing on paper, but is often largely a fabrication, aiming to portray the researcher as rational, rigorous and truthful. It also tends to reduce recognition and amplification of creative elements in research. Linearity is seldom the route to good ideas and stimulating research texts. As a way to counteract this linear tunnel vision of RP, we propose a kaleidoscopic view, in which all the elements outlined above (and summarized above in Figure 29.1), can be re-imagined more or less constantly – or at least in various stages of RP.

A kaleidoscopic view of RP does not of course mean that everything goes. Instead, it offers an ability of increased *disciplined imagination* (Weick, 1989) in the sense that it allows researchers to generate greater heterogeneity in research. As Weick (1989, p. 522) notes ‘a greater number of diverse conjectures produce better theory than a [theorizing] process characterized by a smaller number of homogenous conjectures’.

The metaphorized *input* RP elements provide resources for creating a space for doing research differently and potentially more creatively than through following received wisdom in the starting phase. Energy is used to imagine the range of options for the overall point of research (gap-filling, knowledge demolition) and researcher identity (footnote-adder to theory, trouble-maker), etc. This may then lead to either a revision (or reinforcement) of an input position or the clarification of some possibilities being accessible (and creatively exploited) in interacting with emergent ideas and choices enfolding during RP. This could encourage researchers to seriously think through the overall purpose of their research and, relatedly, their research identity. Against an institutionalized logic that drives researchers into strong conformism in terms of basic orientations, it is possible to re-imagine one’s work and re-position it into something more novel and unpredictable for one’s sub-tribe. The poststructuralist provocateur could try to take seriously the possibility of mapping the world or the gap-spotting knowledge builder could take a devil’s advocate position and aim for knowledge demolition. Something creative and unexpected may arise when one is trying to think in ‘alien’ or counter-mainstream ways, and to do work inspired by (temporary) different subject positions of doing research.

Using (one or several of) the metaphorized *process* elements as resources means starting RP more or less as usual but then during the inquiry engaging in more ambitious process reflexivity than what is common. Is the literature review an effective compass for leading my study straight away, or an occasion for critical questioning and problematization? What are the best ways of imagining the nature of the data/empirical material? Building blocks for authoritative knowing (mirror reality) or uncertain hints for informed guesses (creative portrayals)? Is the empirical material suitable for rigorous codification work? Or does it consist of a mix of informants that have given more or less well-informed/questionable

empirical accounts of the research object, calling for intensive detective work and source-critique to sort out who and what is worth one's attention?

Process elements offer a range of options for breaking away from habitual modes of thinking and doing research. For example, through planning the research and/or when working with data, one could seriously consider alternative approaches based on a spectrum of metaphors. Am I controlling data to make a rigorous knowledge building case? Can data be mobilized as elements in a story, where the accuracy of details matter less than the credibility and insightfulness of the narrative, or are data of potentially most interest and value through kicking back at established frameworks and discourses, being a vehicle for knowledge demolition and the inspiration of rethinking? In a similar way, other process themes can be compared and confronted and the researcher may consider if an alternative to the conventional one would lead to new ideas, descriptions and results.

Using the metaphorized *output* RP elements means that the ambitious work is done mainly during the later stages of research in real time, although the researcher can for example actively think about options of the text production already before starting the actual research. Writing and contribution issues are then upgraded as perhaps the key elements in RP and are re-thought through imagining a variety of options. For example, language can be re-metaphorized as a creative device or a mirror of reality, writing as performative enterprise or as a medium for delivery of results, and contribution as adding to the knowledge map or as story-telling, as ongoing conversation or as a box-breaking conversation-stopper (calling for radical rethinking and dropping certain topics).

Outcome-themes are of course related to other elements in the RP, but the researcher can also work backwards. Fairly late in the process there are choices of how to write. Perhaps choosing publication outlets such as a book, an essay, a chapter or a journal article

are less significant than the type of writing aimed for. Again, being careful and reflexive about the type of writing style is central for interesting studies. Rather than imitating others and following the formula, researchers can seriously consider alternative writing styles, select and embrace a chosen style or a combination thereof (e.g. through reading inspiring texts and practising, getting feedback and support etc.) and then try to accomplish a good text. Hopefully, our chapter can help in providing some legitimization through lining up alternatives and pointing out the non-given nature of the writing project. Similar ideas are relevant for views of contributions – as well as all the other elements in the RP.

Taken together, the value of using a kaleidoscopic view of RP is to provide ideas and support for rethinking, picking and/or developing metaphors that can generate some new insights or increased (or more disciplined/self-critical) playfulness, creativity and opportunity spotting when doing research and writing research texts and, thus, generate greater disciplined imagination in the research process. Such metaphor mobilization enables researchers to both become aware of and distance themselves from conventional and 'dead' metaphors (or one's own habitual thinking) and to discover new ways of generating ideas and communicating their research. Perhaps the researcher thinks, 'Aha, I can approach the research task, my self-understanding, the literature I am struggling with, design issues, view on the nature of data or writing quite differently than I thought earlier and/or what the "mainstream" prescribes and, thereby, produce less predictable and dull ideas and texts than are common'.

SOME GENERAL GUIDELINES FOR PUTTING THE KALEIDOSCOPE OF RP METAPHORS TO WORK

Below we outline some general guidelines for how the proposed spectrum of RP metaphors

can be used for generating ideas, empirical material and texts that are seen as novel, interesting and less predictable and formulaic than is common. The guidelines are not to be read as a set of formulas or recipes but as potentially helpful resources to generate more varied and imaginative studies and engaging texts.

- 1 *Identify* the current, taken-for-granted metaphors in use. This means stepping back and thinking through the varieties of meanings of what the researcher and his/her research tribe are doing in terms of basic meanings of the RP. Researchers approach their research project/subfield with some critical distance, making an effort in de-familiarization. The key question then becomes 'what is really going on here that is not self-evidently sensible?' What appears self-evident may not be the case. This identification work can be done during or in between projects. One looks at a previous project and re-reads one's text or scrutinizes the work of those of similar inclinations in the subfield with the aim of uncovering some peculiarities and oddities of the ways one does (or is claiming to do) research. The metaphors in use are thus clarified.
- 2 Awakening the *dead* metaphors. Part of the identification exercise is to make what is not directly acknowledged as underlying images or ideas more accessible for reflection. Apart from bringing these out, it is especially important to identify some metaphors that are *dead* – not in any absolute sense but for the researcher and her community – and awaken them, for him-/herself and others. In other words, the researcher should try to get some intellectual control over what normally is controlling him or her in the research process. This is not only about targeting the usual suspects like 'design', 'data' or 'theory building'. It is also about pursuing seemingly progressive and live metaphors, which are so much taken for granted that they have received a zombie-like status, e.g. 'narrative', 'resistance' or 'discourse as a reality constructor'. Identifying half-dead metaphors is often as productive as identifying stone dead metaphors as objects for life-saving enterprises. This is not entirely easy, but the framework and examples in this chapter may be helpful. In particular, based on an awareness of what is used or taken for granted, it is possible to

mobilize a number of *alternative metaphors* that are not typically used in the researcher's work or in the subfield, but are possibly relevant. Here, a spectrum of options can be put forward, some of which encourage a break with the researcher's routinized way of being and doing. Such alternatives can stretch thinking and challenge the researcher and clearly add something in the sense of perspectivating research in a novel way.

- 3 Through these moves the researcher hopefully has *access to a set of metaphors* for various parts of RP. Here choices can be made. This is of course not like a supermarket situation, where it is possible to freely select anchoring points for studies. Constraints are strong. They include the researcher's background, preferences, competence, identity, affiliations and other sources of constrained or fixed subjectivity, as well as external restrictions such as norms and pressures in the professional environment. But there is always space for some discretion – and this can be expanded. Facilitating such an expansion of options is the very purpose of this chapter. The metaphorical framework provides the researcher with a repertoire of choices – something in between conformist reproduction of mainstream formulas and free choices between paradigms. The spectrum of metaphors could work as a resource base for the selection of one or several *anchoring points* in the research process, as well as offering resources for confrontation and mind-stretching. When used as anchoring points, these metaphors ensure there are at least some key issues in RP where alternative metaphors (to the ones conventionally used by the research field/researcher in question) are available for reflection. Pursuing alternative metaphors means that the researcher is challenging his/her comfort zone as well as his/her research habits in some respects. Guiding criteria here are a mix of familiarity with unfamiliarity and a good initial grasp of a new metaphor, or seeing a well-used metaphor as strange and problematic.
- 4 Develop an *operative strategy* for metaphorizing RP in a specific project based on privileging a certain set of key elements. Somewhat ironically, we can talk about a metaphorizing 'design'. (This is different from point 1 above, where one uses distributed anchoring points.) This 'strategy' (another metaphor, of course) may focus on input, process or output. Specifically, this strategy enables the researcher to combine the opening

up associated with new metaphors with a tactic for reducing variation and attaining some closure in order to provide direction and produce some discipline in order to create a convincing study.

AN APPLICATION OF THE KALEIDOSCOPE OF RP METAPHORS

In order to illustrate how the kaleidoscope of RP metaphors and its principles can be used to generate new and more imaginative ways of doing research, we have chosen to apply it to Barley's (1986) highly influential and praised paper 'Technology as an occasion for structuring: Evidence from observations of CT scanners and the social order of radiology departments' – voted by a number of prominent academics (the editorial board of *AMJ*) as the most interesting paper in the entire MOS field (Bartunek et al., 2006).

It is not entirely easy to demonstrate how to use the kaleidoscope of RP metaphors more concretely based on one published text, and we cannot fully use all the ideas or steps suggested above, as we are not familiar with the researcher's specific situation or the sub-field at the time of the study. We do think, however, that taking a renewed look at a well-known and celebrated study may be instructive and perhaps inspirational. Would it be possible to turn Barley's study into something even more 'interesting' (the concern of our chapter), that is, could further research learn not only from Barley's existing study but also of alternative ways of approaching the topic in Barley's study? Our metaphorization of Barley's study is not meant to suggest an entirely new 'design' of his study, but rather to show how alternative metaphors at selected areas of the research process could lead to other (perhaps more) interesting ways of conducting such a study.

Barley (1986) notes that evidence for technology's influence on organizational structure is confusing and contradictory. As a way of overcoming and making sense of the

contradictory evidence, he proposes structuration and negotiated order theories. From a combination of these perspectives, 'technologies are better viewed as occasions that trigger social dynamics which, in turn, modify or maintain an organization's contours' (p. 81). Using the framework of structuring theory as a basis, Barley then conducted a study of two radiology departments in hospitals and observed how new technology affected the interaction patterns between radiologists and technicians. Exactly what ideas/metaphors that informed the various parts of the study is hard to tell. The text is also 'tight', leaving few openings for the reader to think differently about the research enacted by Barley. Neither does the study contain any signs of doubt, reflexivity or self-critique as, for example, suggested by advocates of reflexivity (e.g. Alvesson & Sköldborg 2009; Hardy & Clegg, 1997).

When it comes to *the metaphors in use*, Barley presents the study as rationally carried out according to the plan where all ingredients fall neatly into place. It appears almost to be a transport along a fixed route, where all stations (literature review indicating unexplained phenomena, theoretical framework, data collection, analysis) are passed without frictions or surprises. All data have a uniform, clear-cut meaning that can be reduced to standardized categories for interaction (e.g. role reversal, direction giving). The research is presented as a labour process, largely following the logic of a factory. An efficient research machine is in operation: well thought through, processed and with a high-quality, predictable delivery of results to the general MOS audience. The researcher comes out as a very clever operator of the scientific machinery, contributing to knowledge building.

In fact, the research reported appears almost to have been conducted without a researcher (facing dilemmas or ambiguity, using judgement, having to deal with complexities of accessing reality). It is mentioned that 'I began observation' (p. 84) and there

is a reference to 'my field notes', but otherwise, and in all-important respects, it is the research (Science) that is the subject. The text is full of formulations like 'were observed', 'field notes revealed' and 'scripts traced'. Furthermore, claims like 'authority was centralized' are made without any hint that this may be an interpretation, or that the construction of something as 'centralized' may not only be an outcome of objective reality, but rather an effect of the researcher being more than a skilled operator of the Science Machine.

Dead Metaphors

The question of 'dead' is difficult, as it is always a matter of dead for whom. It is hard to know if a person is using an expression in a conscious metaphorical ('live') way or not. However, certain expressions indicate some underlying understandings in the text where the metaphors may have been taken for granted – or perhaps encourage the reader to confuse the metaphor for the literal and precise meaning. Barley has for example a section named 'Mapping the evolution of structure' (p. 81). Here 'evolution' of 'structure' is simply there to be 'mapped' like the flow of the Nile. All data are addressed as robust building blocks for the study. Data were 'gathered'. They were easily turned into something standardized. 'Each episode was then reduced to an initial plot' (p. 85). Expressions like distribution, centralization and roles are used in the paper as if these were unproblematic representations of underlying phenomena, lacking any metaphorical quality. They seem to be employed in order to make the link between the interactions between people from two occupations into a credible case for organizational structure. Another possible dead metaphor enacted by Barley is 'coding', like 'measures of centralization were constructed by coding instances of routine decision making' (p. 86) and 'dummy variable that coded each scan's

date' (p. 105) further emphasizing research as mapmaking.

An *alternative* metaphor to Barley's 'knowledge building enterprise' could be to emphasize 'point-making' more strongly as the key element of the study. This could be done through the idea of 'knowledge demolition', where the researcher challenges and provokes the mainstream views of technology and structure in favour of a structuring perspective. A more radical view of the methodology needed for understanding technology in relationship to organizational structure could then be put forward. Writing as following 'templates for result transmission' could be confronted with a more radical, challenging and upsetting 'path-making' understanding. Here established literature in the field could be addressed as a failure and a superior alternative put forward and advocated as part of a paradigm war or confrontation. Such confrontation would not only make Barley's contribution stronger but also open up space for clearer alternatives. The author then would be a 'provocateur' rather than a 'cautious reformist'.

Another example on how to broaden the spectrum of choices is re-metaphorizing the study's relationship to the literature. Barley views earlier research as characterized by 'contradictory evidence as replicated finding' (p. 78). The literature review is thus easily summarized as inconclusive. The metaphor for this is gap-spotting. Earlier studies are deficient in an important sense and therefore require something new/else. However, the text downplays any substantive challenge of existing literature. Instead, Barley portrays his study as relating positively to the community, reassuring the reader that 'to view technology as an occasion for structuring is not to deny the worth of previous work on technology's relation to structure, but rather to modify and specify that work' (p. 106).

The theoretical framework proposed by Barley offers an authoritative source for truth-telling. It allows us to see how the relation between technology and organizational

structure really works, if studied carefully. The structure is mapped and explained by theory emphasizing structuring. However, the major anchoring point for the study is not the theoretical framework but the data. In fact, two-thirds of the article deals with data and modes of dealing with them. The collection and analysis of data are absolutely crucial to the study. The robustness of massive data, very cleverly and diligently handled, gives the study authority. The paper appears to be a true masterpiece of data management.

Above we have just illustrated possible alternatives. Through articulating these *choices*, it is easier to motivate and legitimize deviations from the standardized path (mainly taken by Barley).

Alternative themes for design could suggest work that moves away from the rather strict theory application and data management. If we, inspired by Barley's title, change the view of theory application to an occasion for alternative thinking, we could move from viewing the theory as a means for mapping reality and guide to the truth (providing perfect theory/data fit), to seeing it as a 'lens' giving a selective and sharp picture or inspiring a rich portrayal of the possibly exotic world of radiologists and technicians. Making (some of) the episodes studied into a set of richly constructed events, portrayed in ways allowing the reader to get a feeling for what goes on, including their meanings (considering more fully the views of those studied), could have been an alternative. Here data are less neat objects to be collected and coded than occasions for thick descriptions of encounters between the people at the site, not entirely easy to be reduced to standardized categories. Alternatives to the methodological metaphors of mapping and gathering data and the theoretical ones of distribution, centralization and roles could be respectively portrayed as asymmetries, domination and re-positioning. The latter could be even more opened up, and not as in the paper closed and fixed (at least in specific episodes), by using process thinking and its talk about temporal

subject positions. Rather than 'role negotiations', the material could be addressed as the doings of 'social class work' in the med-tech context. (One could then highlight a strong class element in the relationships and interactions of people studied where radiologists and technicians come out as upper and lower class groups.)

In terms of operative strategy, Barley follows, at least in the article (that gives the reader no reason to believe that the text is anything else than a mirror of the research), established methodology by the book. Participants' interpretations were 'sought and recorded', 'field notes revealed', while observations provided 'raw data for the analysis' (p. 85). Research as a mirror of reality was then the *modus operandi* of the study. Here the formal roles/labels/occupations of radiologists and technicians are taken for granted and invite the portrayal of workplaces populated by units, where the only further differentiation is the degree of experience with the technology. (Gender, age, ethnicity, personal characteristics are never mentioned. Subjects are stripped of human characteristics and come out as one with their occupation.)

An alternative design could also include thinking of elements in the process through metaphors such as empirical material as 'inspirations for insights', 'appealing to intuition', or 'raw material for confessional or impressionistic writing', allowing for richer portrayals (van Maanen, 1988). One could, for example, keep most of the metaphors of the entire RP used by Barley more or less in place, but view data as reality constructions and see writing as telling a personal story of a 'structurationist/negotiated order enthusiast' entering the world of radiology at the time of the introduction of a new technology. Let the drama begin.

In *summary*, the (re-)metaphorization of Barley's study, the tensions between some key metaphors underlying central elements of his research and the set of alternative metaphors of those elements, open up different ways of thinking and doing research about

the technology-structure relation. In the published study, Barley is largely portraying himself as a cautious reformist effectively running the scientific machine: scans the literature and identifies a confusion gap in the sense of contradictory evidence about how technology influences organizational structure; proposes structuring theory as a sharper mirror of reality and as a way to overcome and transcend the perceived contradictory evidence; collects data through close observations and interviews; analyses the data by coding and reducing them to standardized categories; portrays the findings as they mirror reality; and, thus, delivers a significant piece to the theoretical jigsaw puzzle of the technology-structure relation.

In contrast, our *alternative* metaphorization of Barley's study suggests that the researcher could take up the role as a provocateur, trying more strongly to make a specific point rather than trying to tell the truth. Instead of identifying gaps in existing literature to be filled, the provocateur is identifying and challenging some of the assumptions underlying existing literature as flawed and, based on that, providing a set of alternative assumptions that provides a superior inquiry space. Moreover, instead of regarding structuration theory as a mirror of reality in the sense of perfect theory/data fit, the provocateur suggests seeing the theoretical framework more as a lens that offers an interesting but selective perspective of the technology-structure relation. Instead of seeing data as stable building blocks of reality, the provocateur treats it more as ongoing constructions made by research participants and the researchers. Finally, instead of regarding writing as a template for delivering yet another piece to the existing jigsaw puzzle of how technology influences organizational structure, the provocateur uses writing more as a rhetorical exercise and exploration for idea generation and rich stories about the technology-structure relation, perhaps shaking up parts of the MOS community.

Our point here is not to suggest a superior set of metaphors to Barley's, only to

indicate that there are options. Even an exemplary study can be re-thought in interesting ways and inspire not only more of the same but something that stands out as different. Working with alternative metaphors shows how this can be done.

CONCLUSION

The aim of this chapter has been to illuminate the metaphors that guide our understanding of various elements in the research process: overall point of research, researcher's role, literature review, theoretical framework, method, design, data, analysis, writing and contributions. A variety of common and alternative metaphors are summarized in Figure 29.1. The kaleidoscopic of RP metaphors proposed provides a comprehensive overview. Compared to how researchers normally think about research issues, it offers a broader platform for generating more imaginative and engaging research. In particular, the proposed spectrum of RP metaphors and associated guiding principles offer a *meta-approach* rather than a specific methodology for generating more imaginative and engaging research. Most existing methodologies suggest a specific path from 'a' to 'b', e.g. moving from gap-spotting to problematization (Alvesson & Sandberg, 2013), or focusing on problem-oriented rather than theory-developing research (Corley & Gioia, 2011). Instead of going from 'a' to 'b', the proposed kaleidoscope of RP metaphors acknowledges that there is a spectrum from 'a' to 'n' RP elements to consider and perhaps further develop. In other words, rather than focusing on a single RP element, we encourage the researcher to work on a meta-level with a variety of metaphors, as well as going back and forth between these, and then choose the one(s) that appears to offer the best support to say something new or, alternatively, develop new one(s) that can provide better support for something new in the

specific case of research. The researcher needs of course to carefully integrate the (novel, unconventional) understandings with established knowledge/theory and consider reasonable ways of using empirical material and writing in such a way that is understood by the intended audience.

The proposed kaleidoscope of RP metaphors is not intended to be an instruction manual. Instead, the very idea is that the researcher must think through issues and make more broadly considered choices, which is the opposite of offering strict guidelines. There is no formula for being more imaginative in research. Our ambition with this chapter is to encourage moves that bring more 'life' into academic work through metaphorizing RP. It means both to identify and wake up common and 'dead' metaphors and target them for reflection, and to identify and mobilize some alternative metaphors that open up possibilities to do research in more varied and imaginative ways. Our pluralistic and promiscuous kaleidoscope of RP metaphors – a hypermarket of metaphorical possibilities – aims to point at the wealth of options, rather than to follow the conventional, narrow route of 'adding to the literature' through a focused and limited message carving out a small piece of novelty.

Metaphors are an excellent, although far from unproblematic, reference point in dealing with and bringing out more creativity and imagination. With a playful metaphorization of the entire RP or selected parts of it, we can perhaps become a bit less dull, predictable and cautious. Increasing the joys of doing research (or search) and, perhaps even more urgent, of reading the fruits (or deliveries) of it appears to be important for coming up with more imaginative ideas and stimulating research texts. This is not to deny the need for rigour, discipline and credibility, but we are less concerned about these qualities in the present chapter. 'Rigour' often means sticking to conventions and reproducing taken-for-granted assumptions (relying on dead metaphors) and treating data at face value.

Imagination and novelty are hardly visible virtues in contemporary published research. One rarely gets surprised or encouraged to think more than marginally differently when reading academic articles. What is badly needed is more imagination and creativity in the development of ideas, understandings of the research process and forms of writing.

Note

- 1 Although this point may seem to be a bit 'wild', our intention is not to neglect conventional academic concerns about relating to earlier work. Idea-picking literature reviews would differ from conventional, 'vacuum-cleaning' dittos, but include elements such as the covering of important works in the focal area and making sure there is an ongoing dialogue with existing studies such as relating one's results to existing literature.
